The copie of the ſaid Letter, written as touching the Tranſlation of Plinie.

MY beloued, in twentie yeeres and better, ſo many tokens of our mutuall loue paſsing betweene vs, I need not now to profeſſe my affection to your ſelfe; and my daily conuerſing with you, hath yeelded my approbation of your tedious labor in tranſlating Plinie. Theſe few lines therefore ſhall onely ſerue to witneſſe vnto others the deſerued account which for your learning I haue alwaies made of you, and my conceit of this your trauaile in opening to your countrymen the treaſurie of Nature: therein to ſee and to admire the wiſedome, power, and the goodneſſe of the onely true God, the Framer of Nature. I am not of their minds, who deſire that all humane learning in Arts and Naturall Philoſophie ſhould be reſerued vnder locke and key of ſtrange language, without the which no other man ſhould haue acceſſe vnto it: For as ſuch knowledge is a branch of that excellencie wherein man was formed, ſo the repaire thereof (though it bee not the chiefe) is yet a thing vnworthily neglected, as well in regard of our owne comfort therein gained, as for the glory of God thereby promoted. And it was the wiſdome and prouident hand of the All-ſufficient, ſo to guide the wiſe heathen in Arts and Nature, that they ſhould publiſh ſuch their skill vnto their countrimen in mother tongue: partly to correct the rudeneſſe which is in ignorance, and in part to leaue them the more inexcuſable: In Tit.1. which regard, they may in ſome ſort be called, The Prophets and Teachers of the heathen. And though Plinie and the reſt were not able by Natures light to ſearch ſo far as to find out the God of Nature, who ſitteth in the glorie of light which none attaineth, but contrariwiſe in the vanitie of their imagination bewrayed the ignorance of fooliſh hearts, ſome doting vpon Nature her ſelfe, and others vpon ſpeciall creatures as their God: yet feare we not that Chriſtians in ſo cleare light ſhould be ſo farre bewitched by ſuch blind teachers, as to fall before theſe heathen Idols. Yea, though ſome of them (as namely Plinie) haue ſpoken diſhonourably of the onely true God and of his prouidence, becauſe they knew him not; which ſpeeches (if it might ſtand with the lawes of Tranſlation) I could wiſh were vtterly omitted; yet may we hope that Chriſtian men ſo long taught by the light of grace out of the holy word of God, will no leſſe therefore giue him his deſerued honour, than when they doe in like ſort heare the blaſphemie of Sanneherib king of Aſhur, who ſent to 2.Reg.19. raile vpon the liuing God. I feare not the corrupting of vnſtable minds any thing ſo much by theſe fooliſh Gentiles which are without, as by the deceitfull ſpirit of error ſpeaking in the mouth of men within: ſuch I meane as are within the boſome of the Church. Theſe are the foxes by whom we feare the ſpoile of the Lords vines when as the grapes firſt begin to Cant.2. cluſter; for whoſe taking I deſire that all Gods husbandmen would be more carefull. As for the ſpeeches of theſe blind heathen, the true Chriſtian may well thereby be prouoked to extoll the mercie of God, who ſitteth in ſo glorious a light as hath daſled the ſharpeſt ſight of Nature; but for our comfort hath put a vaile vpon his glorie, and by his grace hath ſo cleared

cleared the eye of our vnderſtanding, that we might ſee his face in his beloued, and know him to be the onely true God, and his bleſſed prouidence vpon all his creatures. And
Pſal.19. Rom.1. when they ſhall perceiue that the wiſeſt clearke in naturall skill could not learne by the booke of heauen and earth to know their Maker, whoſe glorie they declare, and handiworkes ſet
Gen.1. out; nor who it was that framed Nature, when by his word he firſt created them in ſuch excellencie, and then, by his bleſſing gaue, and by his prouidence working all in all, doth yet
Gen 3. Rom.8. maintaine ſuch an operatiue power, as by the which they are ſtill coutinued in their kindes: nor how it came to paſſe that Nature loſt her excellencie in all creatures, and her power vnto good was not onely weakened (whence we ſee her faile in many of her
Pſal.119. & 147. purpoſes) but alſo peruerted vnto euill; then (I ſay) they will the more be ſtirred vp by Gods grace to make reuerent account of the holy Scriptures, which God in rich mercie hath giuen to them to be a light in all things for to direct them through the errors in Natures blindneſſe, and to bring them to the heauenly Jeruſalem and happie world of all the holie where he dwelleth, whom they worſhip in vnitie and trinitie. Proceed then my beloued friend to bring vnto the birth your ſecond labour; whereof I pray that God may haue honour in the praiſe of his works throughout nature, and wiſh you comfort in good acceptance with the reader, and your countrie vſe and pleaſure in the skill thereof. Vnto him which onely hath immortalitie and dwelleth in that light which none attaineth, to God only wiſe be all honour and glorie. Iunij xij. 1601.

Your louing friend in the Lord,

H. F.

TO THE RIGHT HONOVRABLE SIR *ROBERT CECIL* KNIGHT, PRINCIPALL SECRETARIE TO THE QVEENS MAIESTIE, MASTER OF COVRT OF THE WARDS AND LIVERIES, Chancellor of the Vniuerſitie of Cambridge, and one of her *Maieſties moſt Honorable Priuie Counſell.*

THe friendly acceptance which T. Livius *of Padua, hath found in this Realme, ſince time hee ſhewed himſelfe in Engliſh weed vnto her ſacred Majeſtie, hath trained ouer vnto him his neighbour* Plinius Secundus, *from Verona. Whome, being now arraied in the ſame habit, yet fearefull to ſet foot forward in the forreine ground, without the countenance of ſome worthie perſonage, who might both giue him his hand at his firſt entrance, in token of welcome, and alſo grace him afterwards with a fauourable regard to win acquaintance, I bumbly preſent vnto your Honour. For conſidering the qualitie of the man, a Philoſopher diſcourſing ſo deepely in all Learning, where may hee looke for better acceptance than of him, who is moſt iuſtly ſtyled, Patron of Learning? Which dignitie conferred of late vpon your H. by the generall ſuffrages of a Noble Vniuerſitie (and that for your ſingular inſight in all literature) as a complement to thoſe high places vnhereunto the fauour of a moſt prudent and iudicious Princeſſe hath aduanced you, and the ſame correſpondent to the ſame wiſedom, iuſtice, and eloquence, which concurre in your perſon, like the ſeuerall beauties of the Rubie, Amethyſt, and Emeraud meeting in one faire Opal, giueth a louely luſtre to your other titles, no leſſe, than if the nine* Muſes *and* Apollo, *repreſented naturally in that rich Agat of* K. Pyrrhus, *were inſerted therein. Now if, as wee read of* * Alexander *and* * Demetrius, *two mightie monarchs, who amid their deſſeines and making conqueſts and beſieging cities, beheld otherwhiles* Apelles *and* Protogenes *how they handled their pencils; it may pleaſe your Honour betweene the managing of State-affaires vnder her Majeſtie, to caſt your eie eftſoones vpon* Plinie *for your recreation, and ſee how liuely hee depeincteth, not* Venus Anadyomene, *drawne haply to the patterne of* Campaſpe *a courtizan; nor* Ialyſus *with his dog, in which picture,* fecit Fortuna naturam; *but euen Nature her ſelfe, the immediat mother and nource of all things vnder the Almightie; I ſhall not onely thinke him patronized thereby and ſufficiently commended to the world, but alſo acknowledge my ſelfe much deuoted to your H. and bound for euer to pray for the encreaſe thereof, with long life and true happineſſe.*

* Magnus.
* Polyorcetes.

Your Honours moſt readie at command,

Philemon Holland.

The Preface to the Reader.

HAppie were they in times paſt reputed (and not vnworthily) who had that gratious and heauenly gift, *aut facere ſcribenda, aut ſcribere legenda:* that is to ſay, either to do ſuch things as deſerued to bee written, or to write that which was worth the reading. Thoſe that could not attaine to theſe two branches of felicitie, and yet vtterly miſliked idlenes, contented themſelues in a third degree, namely to take in hand the old workes of their ancients, and by new labours to immortalize their memorie. Thus *Nicophanes* (a famous painter in his time) gaue his mind wholly to antique pictures, partly to exemplifie and take out their patternes after that in long continuance of time they were decaied; and in part to repaire and reforme the ſame, if haply by ſome iniurious accident they were defaced. The ingenious mind of this artizan thus deuoted to antiquitie, as I doe highly commend; ſo I cannot chuſe but embrace his policie, ſeeking hereby to auoid the enuie and reproofe of others. In this number I muſt range thoſe learned men in ſeuerall ages, who to illuſtrate the monuments left by former writers, haue annexed vnto them their Commentaries; to ſaue them entire and vncorrupt, haue ſet thereto iudiciall obſeruations; and to publiſh them for a generall benefit of poſteritie, haue tranſlated the ſame into their mother language. As for my ſelfe, ſince it is neither my hap nor hope to attaine to ſuch perfection, as to bring forth ſomewhat of mine owne which may quit the paines of a reader; and much leſſe to performe any action that might miniſter matter to a writer; and yet ſo farre bound vnto my natiue countrey and the bleſſed ſtate wherein I haue liued, as to render an account of my yeeres paſſed and ſtudies employed, during this long time of peace and tranquilitie, wherein (vnder the moſt gratious and happy gouernement of a peereleſſe Princeſſe, aſſiſted with ſo prudent, politique, and learned Counſell) all good literature hath had free progreſſe and flouriſhed, in no age ſo much: mee thought I owed this dutie, to leaue for my part alſo (after many others) ſome ſmall memoriall, that might giue teſtimonie another day what fruits generally this peaceable age of ours hath produced. Endeauoured I haue therefore to ſtand in this third ranke, and beſtowed thoſe houres which might be ſpared from the practiſe of my profeſſion, and the neceſſarie cares of this life, to ſatisfie my countrimen now liuing, and to gratifie the age enſuing, in this kinde. Like as therefore I haue trauelled alreadie in *Titus Liuius* a renowmed Hiſtoriographer, ſo I haue proceeded to deale with *Plinius Secundus* the elder, as famous a Philoſopher. Now albeit my intention and only ſcope was, to doe a pleaſure vnto them that could not read theſe authours in the original: yet needs I muſt confeſſe that euen my ſelfe haue not only gained thereby encreaſe of the Latine tongue (wherein theſe workes were written) but alſo growne to further knowledge of the matter and argument therein contained. For this benefit wee reape by ſtudying the bookes of ſuch ancient authours,

That

20030
copy 1

That the oftner we read them ouer, the more ſtill we find and learne in them: as beeing ſo judiciouſly and pithily penned, that, as the Poet ſaid very well, *decies repetita placerent*. Well may the neweſt ſongs and laſt deuiſed plaies delight our ears at the firſt, and for the preſent rauiſh our ſenſes: like as horarie and earely Summer fruits content our taſt and pleaſe the appetite: but ſurely it is antiquitie that hath giuen grace, vigor, and ſtrength to writings; euen as age commendeth the moſt generous and beſt wines. In which regard, and vpon this experience of mine owne, I nothing doubt but they alſo whom I might iuſtly feare as hard cenſours of theſe my labours, will not onely pitie mee for my paines, but alſo in ſome meaſure yeeld mee thankes in the end, when either by the light of the Engliſh (if they be young ſtudents) they ſhall bee able more readily to goe away with the darke phraſe and obſcure conſtructions of the Latine; or (being great ſchollers and taking themſelues for deepe Critickes) by conferring the one with the other, haply to eſpie wherein I haue tripped, they ſhall by that meanes peruſe once againe, and conſequenly gather new profit out of that authour whom peraduenture they had laid by for many yeers as ſufficiently vnderſtood. When ſome benefit (I ſay) ſhall accrew vnto them likewiſe by this occaſion, I leſſe dread their fearefull doome, to which ſo wilfully I haue expoſed my ſelfe. Well I wiſt, that among the Athenians, order was taken by law, That an enterlude newly acted ſhould be heard with ſilence and applauſe: which cuſtome, as it was reſpectiue and fauourable to the firſt endeauours of the actours, ſo it implied an ineuitable danger of hiſſing out an vtter diſgrace, if afterwards they chanced to miſſe and faile in their parts. Hauing ſhewed my ſelfe once before vpon the ſtage, preſuming vpon this priuiledge and the curteſie of the theatre, I might haue now ſitten ſtill and ſo reſted: In mounting vp thus ſoon againe, I may ſeeme either in the aſſured confidence of mine owne worthineſſe, to proclaime a challenge to all mens cenſures; or elſe vpon a deepe conceit of ſome generall conniuencie make reckoning of an extraordinarie and wonderfull fauor. But as the choiſe that I haue made to publiſh the monuments of other men, without fathering any thing of mine owne, doth excuſe and acquit mee for the one; ſo the froward diſpoſition of carpers in theſe daies wherein wee liue, will checke the other. Howbeit conſidering ſuch paines vndergone by me one man, for the pleaſure of ſo many; ſo much time ſpent of mine, for gaining time to others; and ſome opportunities of priuat lucre ouerſlipt and loſt, to win profit vnto all; I feare not but theſe regards may deſerue a friendly acceptance, & counterweigh all defects and faults eſcaped, whatſoeuer. The perſuaſion hereof, but principally the priuitie of my affectionat loue vnto my countrey (which aſſured me of a ſafe-conduct to paſſe peaceably through their hands who are of the better ſort and well affected) induced mee to a reſolution not onely to enter vpon this new taske, but alſo to breake through all difficulties, vntill I had brought the ſame, if not to a full and abſolute perfection, yet to an end and finall concluſion. Beſides this naturall inclination and hope which carried mee this way, other motiues there were that made ſaile and ſet mee forward. I ſaw how diuerſe men before me had dealt with this authour, whiles ſome laboured to reforme whatſoeuer by iniurie of time was growne out of frame: others did their beſt to tranſlate him into their own tongue, and namely, the Italian and French: moreouer, the Title prefixed therto ſo vniuerſall as it is, to wit, *The Hiſtorie of the World*,

or *Reports of Nature*, imported (no doubt) that hee firſt penned it for the generall good of mankind. Ouer and beſides, the Argument enſuing full of varietie, furniſhed with diſcourſes of all matters, not appropriate to the learned only, but accommodat to the rude peiſant of the countrey; fitted for the painefull artizan in towne and citie: pertinent to the bodily health of man, woman, and child; and in one word, ſuiting with all ſorts of people liuing in a ſocietie and commonweale. To ſay nothing of the precedent giuen by the authour himſelfe who endited the ſame, not with any affected phraſe, but ſorting well with the capacitie euen of the meaneſt and moſt vnlettered: who alſo tranſlated a good part thereof out of the Greeke. What ſhould I alledge the example of former times, wherein the like hath euermore been approued and practiſed? Why ſhould any man therefore take offence hereat, and enuie this good to his naturall countrey, which was firſt meant for the whole world? and yet ſome there be ſo groſſe as to giue out, That theſe and ſuch like bookes ought not to bee publiſhed in the vulgar tongue. It is a ſhame (quoth one) that *Liuie* ſpeaketh Engliſh as hee doth: Latiniſts onely are to bee acquainted with him: as Who would ſay, the ſouldiour were to haue recourſe vnto the vniuerſitie for militarie skill and knowledge: or the ſcholler to put on armes and pitch a campe. What ſhould *Plinie* (ſaith another) bee read in Engliſh, and the myſteries couched in his bookes divulged: as if the husbandman, the maſon, carpenter, goldſmith, painter, lapidarie, and engrauer, with other artificers, were bound to ſeeke vnto great clearkes or linguiſts for inſtructions in their ſeuerall arts. Certes, ſuch *Momi* as theſe, beſides their blind and erronious opinion, thinke not ſo honourably of their natiue countrey and mother tongue as they ought: who if they were ſo well affected that way as they ſhould be, would wiſh rather, and endeauour by all meanes to triumph now ouer the Romans in ſubduing their literature vnder the dent of the Engliſh pen, in requitall fo the conqueſt ſometime ouer this Iſland, atchieued by the edge of their ſword. As for our ſpeech, was not Latine as common and naturall in Italie, as Engliſh here with vs. And if *Plinie* faulted not but deſerued well of the Romane name, in laying abroad the riches and hidden treaſures of Nature, in that Dialect or Idiome which was familiar to the baſeſt clowne: why ſhould any man be blamed for enterpriſing the ſemblable, to the commoditie of that countrey in which and for which he was borne. Are wee the onely nation vnder heauen vnworthie to taſt of ſuch knowledge? or is our language ſo barbarous, that it will not admit in proper tearmes a forreine phraſe? I honor them in my heart, who hauing of late daies troden the way before mee in *Plutarch*, *Tacitus*, and others, haue made good proofe, that as the tongue in an Engliſhmans head is framed ſo flexible and obſequent, that it can pronounce naturally any other language; ſo a pen in his hand is able ſufficiently to expreſſe Greeke, Latine, and Hebrew. And my hope is, that after mee there will ariſe ſome induſtrious *Flavij* who may at length *cornicum oculos configere*. For if my ſelfe, a man by profeſſion otherwiſe carried away, for gifts farre inferiour to many, and wanting ſuch helps as others bee furniſhed with, haue in ſome ſort taught thoſe to ſpeake Engliſh who were ſuppoſed very vntoward to bee brought vnto it; what may be expected at their hands, who for leiſure may attend better; in wit are more pregnant; and being graced with the opinion of men and fauour of the time, may attempt what they will, and effect whatſoe-

uer

20030
copy 1

ver they attempt with greater felicitie? A painfull and tedious travaile I confesse it is; neither make I doubt but many doe note mee for much follie in spending time herein, and neglecting some compendious course of gathering good, and pursing vp pence. But when I looke backe to the example of *Plinie*, I must of necessitie condemne both mine owne sloth, and also reproue the supine negligence of these daies. A courtiour he was, and great favourit of the *Vespasians* both father and sonne: an oratour besides, and pleaded many causes at the barre: a martiall man withall, and serued often times a leader and commander in the field: within the citie of Rome hee mannaged civile affaires, and bare honourable offices of State. Who would not thinke but each one of these places would require a whole man? and yet amid these occasions wherewith he was possessed, he penned Chronicles, wrate Commentaries, compiled Grammaticall treatises, and many other volumes which at this day are vtterly lost. As for the Historie of Nature now in hand, which sheweth him to be an excellent Philosopher and a man accomplished in all kinds of literature (the onely monument of his that hath escaped all dangers, and as another Palladium beene reserued entire vnto our time) wherein hee hath discoursed of all things even from the starrie heauen to the centre of the earth; a man would marveile how hee could possibly either write or doe any thing else. But considering the agilitie of mans spirit alwaies in motion: an ardent desire to benefit posteritie, which in these volumes hee hath so often protested; his indefatigable studie both day and night, euen to the iniurie of nature, and the same continued in euerie place, as well abroad as within-house; in his iourney vpon the high way, where his manner was to read and to indite; in his ordinarie passage through the streets betweene court and home, where he gaue himselfe no rest, but either read, or else found his notarie worke to write; and for that purpose rode vsually in an easie litter, with the said Notarie close by his side: lesse wonder it is, that hee performed his service to Prince and state according to his calling; and withall deliuered vnto posteritie so many fruits of wit and learning. For what is not the head of man able to compasse? especially making saile with a feruent desire and resolution to see an end, and besides taking the vantage of all moments, and losing no time, whereof hee was *unus omnium parcissimus*. Touching his affection to search into the secrets of Nature, it was that and nothing else that shortened his daies, and hastened his vntimely death: for hauing liued not much aboue the middle age of man, desirous he was to know the reason, Why the hill Nesuvius burned as it did? and approched so neare, that with the strong vapours and smoake issuing from thence, his breath was suddenly stopped, and himselfe found dead in the place: a man worthie to haue liued for euer. What remaineth now, but onely to recommend vnto my countrimen this worke of his (which for mine owne part I wish to bee immortall) were it not for one scruple to bee cleared, which at the first troubled my selfe a little, and might peraduenture otherwise offend some readers. In attributing so much vnto Nature, *Plinie* seemeth to derogat from the Almightie God, to him ἐναντία; and therefore dangerous (saith one) to bee divulged. Farre be it from mee, that I should publish any thing to corrupt mens manners, and much lesse to preiudice Christian religion. After conference therefore with sundrie diuines about this point, whom for their authoritie I reuerence; whose learning I honor and embrace; and in whom for iudgement & synceritie of religion

I rest,

I reſt, confirmed I was in my firſt purpoſe, and reſolved to finiſh that which I had begun, namely, not to defraud the world of ſo rich a gem, for one ſmall blemiſh appearing therein. And that it may appeare how I did not abound in mine owne ſence, but had regard as well to ſatisfie the conſcience of others as mine owne, I haue thought good to annex immediately hereunto, in manner of a Corollarie, the opinion of one graue and learned preacher concerning this doubt, as it was deliuered vnto mee in writing; which for that it is grounded vpon ſufficient reaſons, and according with the iudgement of the reſt, the leſſe I reſpect the raſh projects of ſome fantaſticall ſpirits: nothing doubting but the ſame will ſettle the minds of the weake, and free my labours from the taint of irreligion.

THE FIRST BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

*The Preface or Epiſte Dedicatorie to * Prince Veſpaſian, his [friend] C. Plinius Secundus ſendeth greeting.* * i. Titus.

THeſe bookes containing the Hiſtorie of Nature, which a few daies ſince I brought to light (a new worke in Latine, and namely among the Romanes your Citizens and Countrymen) I purpoſe by this Epiſtle of mine to preſent and conſecrate vnto you, moſt ſweet and gentle Prince [for * this title accordeth fitteſt vnto you, ſeeing that the name of [*Moſt mighty] ſorteth well with the age of the Emperor your father:] which haply might ſeeme boldneſſe and preſumption in me, but that I know how at other times * *you were wont to haue ſome good opinion of my toies and fooleries.* Where, by the way, you muſt giue me leaue to mollifie a little the verſes which I borrow of my *countryman Catullus.* (See alſo how I light vpon * *a word* vſed among ſouldiers, which you are acquainted with, ſince time we ſerued both together in the camp:) For he as you wot full well, changing the former ſillables of his verſes one for another, made himſelfe ſomewhat more harſh than he would ſeeme to be vnto the fine eares of his familiar friends, the *Veranioli* & *Fabulli*. And withall, I would be thought by this my malapert writing vnto you, to ſatisfie one point, which, as you complained in your anſwer of late to another rude & audacious letter of mine, I had not performed, to wit, That all the world might ſee (as it were vpon record) how the Empire is managed by you and your father equally: and notwithſtanding this imperial majeſtie wherunto you are called, yet is your affability and maner of conuerſing with your old friends, fellow-like, & the ſame that alwaies heretofore it had been. For albeit you haue triumphed with him for your noble victories, bin Cenſor in your time, and Conſull * ſix times, executed the ſacred authoritie of the Tribunes, Patrones, and protectors of the Commons of Rome, together with him: albeit I ſay you haue otherwiſe ſhewed your noble heart in honouring and gracing both the court of the Emperor your father, and alſo the whole ſtate of Knights and Gentlemen of Rome, whiles you were captaine of the guard, and grand-maſter of his houſe and roiall pallace (in which places all, you carried your ſelfe reſpectiuely to the good of the Commonweale) yet to all your friends, and eſpecially to my ſelfe, you haue borne the ſame countenance as in times paſt within the campe, when wee ſerued vnder the ſame colours, and lodged together in one pauilion. So as in all this greatneſſe and high eſtate whereunto you are mounted, there is no other change and alteration ſeene in your perſon but this, That your power is now anſwerable to your will, & able you are to doe and performe that good which you euer meant, and ſtill intend.

* *Suaviſſimus.*

* *Maximus.*

* *Namque in ſoleis, id eſt eſſe aliquid putare nugas.* * *Conterraneum.*

It ſeemes that *Pliny* read thus in *Catullus*, *Tu putare namque Nugas eſſe aliquid meas ſoleas*, which indeed was but an hard compoſition and couching of the words.

* *Sexies*, or rather *Septies*, out of *Suetonius*.

And howſoeuer this great maieſtie, reſplendent in you on euery ſide, in regard of thoſe high dignities aboue rehearſed, may induce the whole world beſides to reuerence your perſon in all obeiſance; yet I for my part am armed onely with a kinde of audacitie and confidence to ſhew my dutie and devoire vnto you, after a more familiar manner than others: and therfore, this my aduenturous raſhnes, whatſoeuer, you muſt impute vnto your own courteſie: and if I chaunce to fault therein, thanke your ſelfe therefore, and ſeeke pardon at your own hands. Well, baſhfulneſſe I haue laid aſide, and put on a bold face, and all to no purpoſe. For why? although your gentleneſſe and humanitie be one way attractiue, and inuiteth me to draw neare vnto your preſence, yet another way you appeare in great maieſtie: the ſublimitie I ſay of your mind, your deepe reach, high conceit, and rare perfections, ſet me as far back: no lictors & huiſhers marching before you, ſo much, that I dare not approach. In the firſt place: was there euer any man, whoſe words paſſed from him more powerfull, & who more truly might be ſaid to flaſh forth as lightning the force of eloquence? What Tribune was there known at any time to perſuade & moue the people with good language, more effectually? How admirable was your vtterance in thoſe publicke Orations, wherin you thundred out the praiſe-worthy acts of the Emperor your father, that all the grand-place rung therwith? what a ſingular teſtimonie ſhewed you of rare kindneſſe & affection to your brother, in ſetting out his praiſes to the full? As for your skill in Poetrie, how excellent, how accompliſhed is it. Oh the bounty of your mind! Oh the fertility of your pregnant ſpirit! that you ſhould find means to imitate, yea, and to match your * brother in that kind. But who is able boldly to giue an eſtimate of theſe gifts to their worth? How may a man enter into the due conſideration therof, without feare of exquiſit cenſure, and exact iudgement of your wit, eſpecially being prouoked and challenged thereunto as you are. For to ſay a truth, the caſe of them who publiſh a worke in generall tearmes, is farre vnlike to theirs that will ſeem to dedicat it particularly, and by name, to a Prince ſo iudicious as your ſelfe. For had I ſet forth this my booke ſimply, and ſtaied there without any perſonal dedication, thē I might haue come vpon you & ſaid, Sir, what ſhould a mightie Commander and Generall of the field, as you are, buſie himſelfe to read ſuch matters? written theſe treatiſes were to the capacitie of the vulgar people, for baſe commons, rude husbandmen, and peaſants of the countrie, for poore artiſans; and in one word, to gratifie them who had no other means of great emploiment, nor time & leiſure but to ſtudie vpon ſuch points and nothing elſe: What ſhould you make your ſelfe a cenſor of this worke? and verily, when I made firſt ſhew of this enterpriſe of mine, I never reckned you in the number of thoſe iudges that ſhould paſſe their ſentence vpon theſe writings; I wiſt full well, that you were a greater perſon far, & I ſuppoſed that you would neuer abaſe your ſelfe nor ſtoupe ſo low as to read this booke of mine. Ouer and beſides, a common caſe it is, and incident to men of deepe learning and great conceit, that otherwhiles exception may be taken againſt them, and their iudgement reiected in this behalfe. Euen *M. Tullius* that renowmed Orator, and who for wit and learning had not his fellow, taking the vantage of that libertie, vſeth the benefit thereof: and (whereat wee may well maruell) maintaineth the action by an aduocate, and taketh example (for his defence) from *Lucilius*: for in one part of his workes thus hee ſaith, *I would not haue learned* Perſius *to read theſe bookes of mine, loth I am that hee ſhould cenſure mee.*

*For *Domitian Veſpaſian* was reputed an excellent Poet.

As

20030
copy 1

As for *Lælius Decimus*, I am content to ſubmit them to his opinion. Now if ſuch an one as *Lucilius*, who was the firſt that durſt controule the writing of others, and tooke vpon him to ſcoffe at their imperfections, had rather thus to ſay; if *Cicero* tooke occaſion to borrow the ſaid ſpeech of him for to ſerue his owne turne, and namely in his Treatiſe of Politiques, where he wrote of a Common-weal; how much greater cauſe haue I to diſtruſt my ſelf, and to decline and auoid the cenſure of ſome judge of deepe vnderſtanding? But cut I am from this refuge and meanes of defence, in that I expreſſely make choiſe of you in this dedication of my worke: for one thing it is to haue a judge, either pricked by pluralitie of voices, or caſt vpon a man by drawing lots; and a farre other thing to chuſe and nominate him from all others: and great difference there is between that cheare and prouiſion which we make for a gheſt ſolemnely bidden and inuited, and the ſuddaine fare and intertainement which is ready for a ſtranger who commeth to our houſe vnlooked for. *Cato*, that profeſſed enemie of ambition, vain-glory, and indirect ſuit for offices, who took as great contentment in thoſe eſtates and dignities which he refuſed and reiected, as in them which he enioied, attained to this good name of vprightneſſe and ſinceritie, that when in the hotteſt broile about election of Magiſtrates that euer was in his time, they that ſtood therefore, put into his hands their mony vpon truſt, as a cautionary pawne and aſſurance of their integritie and fidelitie that way; they profeſſed that they did it in teſtimony of their conceit of his equitie and innocence, the chiefe and onely thing that a man is to regard in this life: whereupon enſued the noble and memorable exclamation of *M. Cicero*, who ſpeaking of the ſaid *Cato*, brake out into theſe words: Oh gentle *M Portius*, how happy and bleſſed art thou, whom no man was euer ſo hardie as to ſollicite to any leaud thing, or contrary to right and honeſtie! *L. Scipio*, ſurnamed *Aſiaticus*, at what time as hee appealed vnto the Tribunes of the Commons, and beſought their lawfull fauour (among whom, *C. Gracchus* was one, a man whom hee tooke for his mortall enemie) preſuming vpon the goodneſſe of his cauſe, gaue out and ſaid, That his very enemies, if they were his iudges, could not chuſe but quit him, and giue ſentence on his ſide. Thus wee ſee how euerie man maketh him peremtorily the ſupreme and higheſt iudge of his cauſe, whom himſelfe chuſeth and appealeth vnto: which manner of choiſe the Latines call *Prouocatio*. As for your ſelfe verily, who are ſet in the moſt eminent & chiefe place among men, and otherwiſe endued with ſingular eloquence and profound knowledge, no maruell is it, if thoſe that doe their dutie vnto you, ſalute you, kiſſe your hand, and come with great reſpect and reuerence: In which regard, exceeding care aboue all things would be had, that whatſoeuer is ſaid or dedicated vnto you, may beſeem your perſon, and be worth acceptation. And yet the gods reject not the humble prayers of poore countrey peaſants, yea, and of manie nations, who offer nothing but milke vnto them: and ſuch as haue no Incenſe, find grace and fauour many times with the oblation of a plaine cake made onely of Meale and ſalt; and neuer was any man blamed yet for his deuotion to the gods, ſo he offered according to his abilitie, were the thing neuer ſo ſimple.

For mine owne part, challenged I may be more ſtill for this my importune and inconſiderat boldneſſe, in that I would ſeeme to preſent theſe bookes vnto you, compriſed of ſo ſlender ſtuffe and matter as they be: for therein can be touched no

great wit (which otherwiſe in me was euer meane and ſimple) neither admit they any digreſſions, orations, ſpeeches, and diſcourſes, ne yet admirable caſes and variable chanſes, or any other occurrent, either pleaſant to rehearſe, or delectable to heare. The truth is this, the nature of all things in this world, that is to ſay, matters concerning our daily and ordinarie life, are here deciphered and declared, and that in barrein terms, without any goodly ſhew of gay and glorious phraſes: and whatſoeuer I haue put downe, concerne it doth the baſeſt points thereof, inſomuch as for the moſt part I am to deliver the thing in hand, either in ruſticall ſpeech, or elſe in forraine, nay, in barbarous language, ſuch alſo as may not well be vttered, but with reſeruing honour to the hearers, and reuerence to the readers.

Moreouer, the way that I haue entred into, hath not bin troden beforetime by other writers, being indeed ſo ſtrange and vncouth, as a mans mind would not willingly trauell therin. No Latin author among vs hath hitherto once ventured vpon the ſame argument, no one Grecian whatſoeuer hath gone through it and handled all: and no maruell, for many of vs loue not to take any paines, but ſtudy rather to pen matters of delight and pleaſure. True it is, I muſt needs ſay, that others haue made profeſſion hereof, but they haue done it with ſuch ſubtiltie and deepeneſſe, that all their trauels and writings by that means, lie as it were dead and buried in darkeneſſe. Now come I, and take vpon me to ſpeak of euery thing, and to gather as it were a compleat body of arts and ſciences (which the Greeks call ἐγκυκλοπαιδείαν) that are either altogether vnknowne, or become doubtfull, through the ouermuch curioſitie of fine wits: again, other matters are deciphered in ſuch long diſcourſes, that they are tedious to the readers, inſomuch as they loath and abhor them. A difficult enterpriſe it is therfore to make old ſtuffe new, to giue authoritie & credit to nouelties, to poliſh and ſmooth that which is worne and out of vſe, to ſet a gloſſe and luſtre vpon that which is dim and darke, to grace & countenance things diſdained, to procure beleefe to matters doubtful; & in one word, to reduce nature to all, and al to their own nature. And verily to giue the attempt only and ſhew a deſire to effect ſuch a deſſeigne as this, although the ſame be not brought about and compaſſed, were a braue and magnificent enterpriſe. Certes of this ſpirit am I, that thoſe learned men and great ſtudents, who making no ſtay, but breaking through al difficulties, haue preferred the profit of poſteritie before the tickling and pleaſure of itching eares in theſe daies; which I may proteſt that I haue aimed at, not in this worke only, but alſo in other of my bookes alreadie: and I profeſſe, that I wonder much at *T. Livius*, otherwiſe a moſt renowned & famous writer, who in a preface ro one of his books of the Roman hiſtory which hee cõpiled from the foundation of Rome, thus proteſted, That hee had gotten glorie ynough by his former writing, and might ſit ſtill now & take his eaſe, but that his mind was ſo reſtleſſe, and ſo ill could abide repoſe, that contrariwiſe it was fed and nouriſhed with trauel, & nothing elſe But ſurely me thinks, in finiſhing thoſe Chronicles, he ſhould in dutie haue reſpected the glory of that people which had conquered the World, and aduanced the honour of the Romane name, rather than diſplaied his owne praiſe and commendation: Ywis, his demerit had beene the greater, to haue continued his ſtory as he did, for loue of the ſubiect matter, and not for his priuat pleaſure; to haue I ſay performed that peece of worke more to gratifie the ſtate of Rome, than to content his owne minde and affection. As touching my ſelfe (foraſmuch as *Domitius Piſo* ſaith, That bookes ought to be

to

20030
copy 1

treaſuries & ſtore houſes indeed, and not bare and ſimple writings) I may be bold to ſay and averre, That in 36 bookes I haue compriſed 20000 things, all worthie of regard & conſideration, which I haue recollected out of 2000 volumes or therabout, that I haue diligently read (and yet very few of them there be that, men learned otherwiſe, and ſtudious, dare meddle withall, for the deepe matter and hidden ſecrets therein contained) and thoſe written by 100 ſeuerall elect and approued authors: beſides a world of other matters, which either were vnknowne to our forefathers and former writers, or elſe afterward inuented by their poſteritie. And yet I nothing doubt that many things there be, which either ſurpaſſe our knowledge, or elſe our memorie hath ouerſlipt: for men we are, and men emploied in many affaires. Moreouer, conſidered it would be, that theſe ſtudies wee follow at vacant times and ſtolne houres, that is to ſay by night ſeaſon onely; to the end that you may know, how wee to accompliſh this haue neglected no time which was due vnto your ſeruice: The daies we wholly employ and ſpend in attendance about your perſon; we ſleepe onely to ſatisfie nature, euen as much as our health requireth, and no more; contenting our ſelves with this reward, That whiles wee ſtudy and muſe (as *Varro* ſaith) vpon theſe things in our cloſet, we gaine ſo many houres to our life; for ſurely we liue then only, when we watch and be awake. Conſidering now thoſe occaſions, thoſe lets and hinderances aboue-named, I had no reaſon to preſume or promiſe much; but in that you haue emboldened me to dedicate my bookes vnto you, your ſelfe performeth whatſoeuer in me is wanting: not that I truſt vpon the goodneſſe and worth of the worke, ſo much, as that by this means it will be better eſteemed and ſhew more vendible: for many things there be that ſeeme right deare and be holden for pretious, only becauſe they are conſecrate to ſome ſacred temples.

As for vs verily, we haue written of you all, your father *Veſpaſian*, your ſelfe, and your brother *Domitian*, in a large volume which wee compiled touching the hiſtorie of our times, beginning there where *Aufidius Baſſus* ended. Now if you demand and aske me, Where that hiſtorie is? I anſwer, that finiſhed it was long ſince, and by this time is iuſtified and approued true by your deeds: otherwiſe I was determined to leaue it vnto my heire, and giue order that it ſhould be publiſhed after my death, leſt in my life time I might haue bin thought to haue curried fauour of thoſe, whoſe acts I ſeemed to pen with flatterie, & beyond all truth. And therfore in this action I do both them a great fauour who haply were minded before me to put forth the like Chronicle, and the poſteritie alſo which ſhall come after; who, I make reckning and know, will enter into the liſts with vs, like as we haue done with our predeceſſors. A ſufficient argument of this my good mind & frank hart that way you ſhal haue by this, That in the front of theſe books now in hand, I haue ſet down the very names of thoſe writers, whoſe help I haue vſed in the compiling of thē: for I haue euer bin of this opinion, That it is the part of an honeſt minded man, & one that is ful of grace & modeſty, to confeſſe frankly by whom he hath profited & gotte any good: not as many of thoſe vnthankful perſons haue done, whom I haue alledged for my authors. For to tell you a plain truth, know thus much from me, that in conferring thē together about this worke of mine, I haue met with ſome of our moderne writers, who word for word haue exemplified & copied out whole books of old authors, and neuer vouchſafed ſo much as the naming of them, but haue taken their labors & trauels to themſelues.

And

And this they haue not done in that courage and spirit to imitate, yea & to match them, as *Virgil* did *Homer*: much lesse haue they shewed that simplicitie and apert proceeding of *Cicero*, who in his bookes of Policie and Common-weale professeth himselfe to hold with *Plato*; in his Consolatorie Epistle written to his daughter, confesseth and saith plainely thus, I follow *Crantor*, and *Panætius* likewise in his Treatise concerning Offices. Which worthy monuments of his (as you know well) deserue not onely to be seene, handled, and read daily, but also to be learned by heart euery word. Certes, I hold it for a point of a base and seruile mind, and wherein there is no goodnesse at al, to chuse rather to be surprised and taken in theft, than to bring home borrowed good, or to repay a due debt, especially when the occupying, vse, and interest thereof, hath gained a man as much as the principall.

Now as touching the titles and inscriptions of Bookes, the Greekes therein haue a wonderfull grace and great felicitie: some haue intituled them Κηρία, whereby they would giue vs to vnderstand of A sweet hony-combe:* others Κέρας Ἀμαλθείας, that is to say, The horne of plenty and store: in such sort, that whosoeuer readeth these goodly titles, must needs hope for some great matters in such bookes, and as the proverb goeth, looke to drinke there or else no where, a good draught of hens milke. You shall haue moreouer their bookes set out with these glorious inscriptions, The Muses, The * Pandects, * Enchiridion, * Ἀσπίδες, * Πανδέκται: Goodly names all, and such, as who would not make default of appearance in court, and forfeit a recognisance or obligation, to vnclaspe such books and turne ouer the leafe? But let a man enter into them and reade forward, Lord! how little or no substance at all shall he find within the verie mids, answerable to that braue shew in the front or outside thereof? As for our countreymen (Latines I meane, and Romans) they be nothing so fine and curious as the Greeks, grosse are they in comparison of them in giuing titles to their books: they come with their Antiquities, Examples and Arts, and those also be such authors as are of the most pleasant and finest inuention amongst them all. *Valerius* who (as I take it) was named *Antias*, both for that hee was a Citizen of Antium, and also because the ancestors of his house were so called, vvas the first that gaue to a booke of his owne making, the title of *Lucubratio*, as a man would say, Candleworke or Night-studie. *Varro*, he tearmeth some of his Satyres *Sesculyxes* and *Flexibulæ*. *Diodorus* among the Greekes was the first that laied aside toyish titles, and because he would giue some braue name to his Chronicles, entituled it *Bibliotheca*, *i.* a Librarie. *Apion* the famous Grammarian, euen hee whom *Tiberius Cæsar* called the Cymball of the world (whereas indeed hee deserued to bee named a Timbrill or Drum rather, for ringing and sounding publique fame) was so vain-glorious, that he supposed all those immortalized, vnto whom hee wrote or composed any pamphlet whatsoeuer. For mine owne part, although I nothing repent mee that I haue deuised no pretier Title for my Booke than plaine *Naturalis Historia*, *i.* The reports of Nature, without more ceremonie; yet because I would not be thought altogether to course and rate the Greekes, I can be content, nay I am willing to bee thought in this behalfe like vnto those excellent grand-masters in Greece, for Painting and Imagerie, whom you shall finde in these Reports of mine, to haue entituled those rare and absolute peeces of worke (vvhich the more wee view and looke vpon, the more wee admire and wonder

* Tow. Hesichius. 2. Thessalus.

* Containing all things, as Tyro Tullius did
* A manuel to be carried alwaies in hand.

wonder at for their perfection) with halfe titles and vnperfect inſcriptions, in this manner, *Apelles* * *went in hand with this Picture:* or, *Polycletus was a making this Image:* as if they were but begun, neuer finiſhed and laid out of their hands: which was done (no doubt) to this end, that for all the varietie and diuerſitie of mens iudgements ſcanning of their workemanſhip, yet the Artificer thereby had recourſe to make excuſe; had meanes (I ſay) to craue and haue pardon for any faults and imperfections that could be found, as if hee meant to haue amended any thing therein amiſſe or wanting, in caſe hee had not beene cut off and preuented by death. Theſe noble workemen therefore herein ſhewed right great modeſtie, that they ſet ſuperſcriptions vpon all their painted tables, pourtraitures and perſonages, as if they had beene the laſt peeces of their workemanſhip, and themſelues diſſabled by vnexpected death that they could not make a finall end of any one of them: for there were not knowne (as I take it) aboue three in all, which had their abſolute titles written vpon them in this forme, *Ille fecit, i.* This *Apelles* wrought: and thoſe pictures will I write of in place conuenient: By which it appeared euidently, that the ſaid three tables were fully finiſhed, and that the workeman was ſo highly contented with their perfection, that he feared the cenſure of no man: No maruaile then, if all three were ſo much enuied and admired throughout the world, no marueile if euerie man deſired to be maſter of them.

* *Apelles faciebat.*

Now For my ſelfe, I know full well and confeſſe freely, that many more things may be added, not to this ſtory alone, but to all my bookes that I haue put forth alreadie: which I ſpeake by the way, becauſe I would preuent and auoid thoſe fault-finders abroad thoſe correctors and * ſcourgers of *Homer*, (for ſurely that is their very name (becauſe I hear ſay there be certaine Stoike Philoſophers, profeſſed Logicians, yea, and Epicurians alſo (for at Grammarians hands and Criticks I neuer looked for other) who are with child ſtill and trauaile vntill they be deliuered of ſomewhat againſt my bookes which I haue ſet forth as touching Grammer: and for this ten yeares ſpace, nothing is come to light, but euermore the fruit miſcarieth belike before the full time, as the ſlip of an vnperfect birth; whereas in leſſe ſpace than ſo, the verie Elephant bringeth forth her calfe, be it neuer ſo big. But this troubleth me neuer a whit, for I am not ignorant that a ſilly woman, euen an harlot, and no better, durſt encounter *Theophraſtus*, and write a booke againſt him, notwithſtanding hee was a man of ſuch incomparable eloquence that thereupon hee came by his diuine name *Theophraſtus*: from whence aroſe this prouerbe and by-word, *Marie then go chuſe a tree to hang thy ſelfe.* And ſurely I cannot containe and hold my tongue, but I muſt needs ſet downe the verie words of *Cato Cenſorius*, ſo pertinent to this purpoſe; whereby it may appeare, that euen *Cato* himſelfe a moſt worthy perſonage, who wrote of militarie Diſcipline, who had beene brought vp and trained to feats of warre vnder Great *Scipio Africanus*, or rather indeed vnder *Anniball*, who in the end could not endure *Africanus* himſelfe, but was able to controll him in martiall affaires: and who beſides hauing the conduct as L. Generall of the Romane armie, atchieued the better hand ouer his enemies in the field, and returned with victorie: this *Cato* (I ſay) could not auoid ſuch backbiters and ſlanderers, but knowing that there would be many of them readie to purchaſe themſelues ſome name and reputation by reprouing the knowledge and skill of others, brake out into

* *Homeromaſtiges.*

* If women may be allowed to controll mens writings, we may be weary of our liues and goe hāg our ſelues well enough.

a cer-

a certaine ſpeech againſt them: And what was it? I know right well (quoth hee, in that booke aforeſaid) that if theſe writings of mine come abroad once and be publiſhed to the view of the world, there will be many ſtep forth to quarrell and cauill therewith; ſuch fellows ſooneſt and moſt of all who are quite void of vertue and honeſtie, and know not what belongeth to true honour. But ſurely ſay what they will, I let their words runne by, like raine water. It was a prettie ſpeech alſo and a pleaſant apothegme, that *Plancus* vttered in the ſemblable caſe: for being informed that *Aſinius Pollio* was deuiſing and framing certaine inuectiue Orations againſt him, which ſhould be ſet forth either by himſelfe or his children, after the deceaſe of *Plancus* and not before, to the end that they might not bee anſwered by him; hee ſaid readily by way of a ſcoffe, That none but vaine bugs and hobgoblings vſe to fight with the dead: with which word hee gaue thoſe orations ſuch a counterbuffe, that (by the iudgement of the learned) none were accounted afterward more impudent and ſhameleſſe than they. For mine owne part, being ſure that theſe buſie bodies ſhall neuer be able to bite me (and verily *Cato* hath giuen ſuch fellowes a proper name, and called them *Vitiligatores*, by a tearme elegantly compounded of vices and quarrels: for to ſay a truth, what did they elſe but picke quarrels and make brawls?) I will proceed and go one ſtill in my intended purpoſe.

Now to conclude and knit vp mine Epiſtle: knowing as I doe, that for the good of the Commonweale, you ſhould be ſpared and not impeached by any priuat buſineſſe of your owne, and namely in peruſing theſe long volumes of mine; to preuent this trouble therefore, I haue adioyned immediatly to this Epiſtle, and prefixed before theſe books, the Summarie or Contents of euery one: and very carefully haue I endeauoured, that you ſhould not need to read them throughout, whereby all others alſo after your example, may eaſe themſelues of the like labour: and as any man is deſirous to know this or that, he may ſeeke and readily find in what place to meet with the ſame. This learned I of *Valerius Sorranus* one of our owne Latine writers, who hath done the like before me and ſet an Index to theſe Bookes which he entituled Exercitat.

THE INVENTORIE OR INDEX

CONTAINING THE CONTENTS OF XXXVII BOOKS, TOVCHING THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS, WHICH IS RECEIVED FOR THE FIRST BOOKE OF THEM.

¶ *The Summarie of euery Booke.*

THe firſt Booke containeth the Dedicatorie Epiſtle or Preface of the whole worke, addreſſed to *Titus Veſpaſian* the Emperour. Alſo the names of the Authors out of which hee gathered the Hiſtorie, which he proſecuteth in 36 Bookes: together with the Summarie of euerie Chapter: and beginneth, *The Books, &c.*

The ſecond, treateth of the World, Elements, and Starres: and beginneth thus, *The World, &c.*

The third, deſcribeth the firſt and ſecond gulfe, which the Mediterranean ſea maketh in Europe: and beginneth in this manner, *Hitherto, &c.*

The fourth, compriſeth the third gulfe of Europe, beginning, *The third, &c.*

The fifth, containeth the deſcription of Affricke, and beginneth thus, *Africke, &c.*

The ſixt, handleth the Coſmographie of Aſia, beginning thus, *The ſea called, &c.*

The ſeuenth treateth of man, and his inuentions, beginning, *Thus as you ſee, &c.*

The eighth ſheweth vnto vs, land creatures and their kindes, and beginneth after this manner, *Paſſe we now, &c.*

The ninth, laieth before vs all fiſhes, and creatures of the water, beginning in this wiſe, *I haue thus ſhewed, &c.*

The tenth ſpeakes of flying foules and birds, and beginneth thus, *It followeth, &c.*

The eleuenth telleth vs of Inſects, and beginneth thus, *It remaineth now, &c.*

The twelfth treateth of drugs and odoriferous plants, beginning, *Thus you, &c.*

The thirteenth deſcribeth ſtrange and forreine trees: beginning with theſe words, *Thus farre forth, &c.*

The fourteenth ſheweth of vine-plants, &c. beginning thus, *Thus far forth, &c.*

The fifteenth comprehendeth all fruitfull trees, thus beginning, *There were, &c.*

The ſixteenth deſcribeth vnto vs all wild trees, beginning with, *Hitherto, &c.*

The ſeuenteenth containeth tame trees within hortyards, and beginneth with theſe words, *As touching the nature &c.*

The eighteenth booke treateth of the nature of corne, and all ſorts thereof, together with the profeſſion of husbandmen, and agriculture, beginning after this manner, *Now followeth, &c.*

The nineteenth diſcourſeth of Flax, Spart, and Gardenage, beginning after this manner, *In the former booke,&c.*

The twentieth ſheweth of garden herbs, good to ſerue both the kitchin for meat, and the Apothecaries ſhop for medicine, & beginneth thus, *Now will we,&c.*

The one and twentieth treateth of flours and garlands, & beginneth, *In Cato,&c.*

The two and twenty containeth the chaplets and medicines made of hearbes, with this beginning, *Such is the perfection,&c.*

The three and twentie ſheweth the medicinable vertues of wine, and tame trees growing in hortyards, beginning thus, *Thus haue we,&c.*

The foure and twentie declareth the properties of wild trees ſeruing in Phyſick, beginning thus, *Nature,&c.*

The fiue and twentie treateth of the herbes in the field comming vp of their own accord, and thus beginneth, *The excellencie,&c.*

The ſix and twentie ſheweth of many new and ſtrange maladies, the medicinable vertues alſo of certaine herbes, according to ſundry diſeaſes, beginning thus, *The very face,&c.*

The ſeuen and twenty goeth forward to certaine other hearbes and their medicines, and thus beginneth. *Certes,&c.*

The eight and twentie ſetteth downe certaine receits of remedies in Phyſicke, drawne from out of man and other bigger creatures, and it beginneth in this manner, *Heretofore,&c.*

The nine and twentie treateth of the firſt authours and inuentors of Phyſicke, alſo of medicines taken from other creatures, and beginneth, *The nature,&c.*

The thirtieth booke ſpeaketh of Magicke, and certaine medicines appropriat to the parts and members of mans bodie, beginning thus, *The vanitie,&c.*

The one and thirtie containeth the medicinable vertues of fiſhes and water creatures, with this beginning, *Now follow,&c.*

The two and thirtie ſheweth other properties of fiſhes, &c. and beginneth in this manner, *Now are we come,&c.*

The three and thirtie treateth of gold and ſiluer mines, and hath this beginning, *Time it is,&c.*

The foure and thirtie ſpeaketh of copper and braſſe mines, alſo of lead, alſo of excellent braſſe-founders and workemen in copper, beginning after this manner, *In the next place,&c.*

The fiue and thirtie diſcourſeth of painting, colour, and painters, beginning in this ſort, *The diſcourſe,&c.*

The ſix and thirtie treateth of marble and ſtone for building, and hath this beginning, *It remaineth,&c.*

The ſeuen and thirtie concludeth with pretious ſtones, and beginneth at theſe words, *To the end that,&c.*

20030
copy 1

¶ IN THE SECOND BOOKE IS CONTAINED the diſcourſe of the World, of cœleſtiall impreſſions and meteors, *as alſo of them that appeare in the Aire, and vpon Earth.*

Chap.

1. Whether the World be finite and limited within certaine dimenſions or no? whether there be many, or but one?
2. The forme and figure of Heauen and the world.
3. The motion of Heauen.
4. Why the world is called Mundus?
5. Of the Elements.
6. Of the ſeuen Planets.
7. Concerning God.
8. The nature of the fixed ſtarres and Planets: their courſe and reuolution.
9. The nature of the Moone.
10. The eclipſe of Sun and Moone: alſo of the night.
11. The bigneſſe of ſtarres.
12. Diuerſe inuentions of men, and their obſeruations touching the cœleſtiall bodies.
13. Of Eclipſes.
14. The motion of the Moone.
15. Generall rules or canons touching planets or lights.
16. The reaſon why the ſame planets ſeeme higher or lower at ſundry times.
17. Generall rules concerning the planets or wandring ſtars.
18. What is the cauſe that planets change their colours?
19. The courſe of the Sunne: his motion: and from whence proceedeth the inequalitie of daies.
20. Why lightenings be aſſigned to *Iupiter*.
21. The diſtances betweene the planets.
22. The harmonie of ſtars and planets.
23. The geometrie and dimenſions of the world.
24. Of ſtars appearing ſodainly.
25. Of comets or blaſing ſtars, and other prodigious appearances in the skie: their nature, ſituation, and ſundry kinds.
26. The opinion of *Hipparchus* the Philoſopher as touching the ſtars, fire-lights, lamps, pillars or beames of fire, burning darts, gapings of the skie, and other ſuch impreſſions, by way of example.
27. Strange colours appearing in the firmament.
28. Flames and leams ſeene in the skie.
29. Circles of guirlands ſhewing aboue.
30. Of cœleſtiall circles and guirlands that continue not, but ſoone paſſe.
31. Of many Suns.
32. Of many Moones.
33. Of nights as light as day.
34. Of meteors reſembling fierie targuets.
35. A ſtrange and wonderfull apparition in the skie.
36. The extraordinarie ſhooting and motion of ſtars.
37. Of the ſtars named Caſtor and Pollux.
38. Of the Aire.
39. Of certaine ſet times and ſeaſons.
40. The power of the Dog-ſtar.
41. The ſundrie influences of ſtars according to the ſeaſons and degrees of the ſignes.
42. The cauſes of raine, wind, and clouds.
43. Of thunder and lightning.
44. Whereupon commeth the redoubling of the voice, called Echo.
45. Of winds againe.
46. Diuerſe conſiderations obſerued in the nature of winds.
37. Many ſorts of winds.
48. Of ſodaine blaſts and whirle-puffs.
49. Other ſtrange kinds of tempeſts & ſtorms.
50. In what regions there fall thunderbolts.
51. Diuers ſorts of lightnings, and wonderous accidents by them occaſioned.
52. The obſeruations [of the Tuſcanes in old time] as touching lightening.
53. Conjuring for to raiſe lightning.
54. Generall rules concerning leames and flaſhes of lightning.
55. What things be exempt and ſecured from lightning and thunderbolts.
56. Of monſtrous and prodigious ſhowres of raine,

Chap.
raine, namely of milke, bloud, flesh, yron, wooll, bricke, and tyle.
57. The rattling of harnesse and armour: the sound also of trumpets heard from heauen.
58. Of stones falling from heauen.
59. Of the Rain-bow.
60. Of Haile, Snow, frost, Mists, and Dew.
61. Of diuers formes and shapes represented in clouds.
62. The particular propertie of the skie in certaine places.
63. The nature of the Earth.

In summe, there be compriſed in this booke of notable matters, ſtories, and obſeruations 520, collected out of

Latine Authours.

Feneſtella, Fabianus, Virgill, Cornelius, Valerianus, Celſus, Cato Cenſorius, Sarſennæ (both father and ſonne) *Scropha, Mar. Varro, D. Syllanus, Fabius Pictor, Trogus, Hyginus, Flaccus Verrius, Græcinus, Atticus, Iulius Sabinus, Tergilla, Cotta Meſſalinus, Columella, L. Piſo, Pompeius Lenæus, M. Accius Plautius, Fabius Dorſenus, Scæuola, Ælius, Atteius Capito, Sextus Niger*, and *Vibius Rufus*.

Forreine writers.

Heſiodus, Ariſtotle, Democritus, king *Hiero, Architas*, king *Philometor*, king *Attalus, Xenophon, Amphilochus* the Athenian, *Anaxipolis* the Thaſian, *Apollodorus* of Lemnos, *Ariſtophanes* the Mileſian, *Antigonus* the Cymæan, *Agathocles* of Chios, *Apollodorus* of Pergamus, *Ariſtander* the Athenian, *Bacchus* the Mileſian, *Bion* of Soli, *Chæreas* of Athens, and *Chariſtus* likewiſe the Athenian, *Diodorus* of Priene, *Dion* the Colophonian, *Epigenes* the Rhodian, *Evagoras* the Thaſian, *Euphronius*, the Athenian, *Androcion* and *Æſchrion* (who writ both of Husbandry) *Dionyſius*, that tranſlated the books of *Mago*, and *Dionyſius* the Epitomiſt, who brought them all into a Breuiarie. *Aſclepiades* and *Eraſiſtratus*, both Phyſitians, *Comiades*, who wrate as touching the confectures of wine, *Ariſtomachus, Hiceſius*, who both treated of the ſame matter, *Themiſon* the Phyſition, *Oneſicritus*, and king *Iuba*.

¶ IN THE SIXTEENTH BOOKE ARE CONtained the natures of wild trees.

Chap.
1. Countries wherein no trees doe grow: miraculous wonders of trees in the North countries.
2. Of the great forreſt Hircynia.
3. Trees that beare maſt.
4. Of the Ciuick guirland, and who in old time were adorned and honoured with chaplets of tree leaues.
5. Of Maſt thirteene kinds.
6. Of Beech Maſt, and other ſorts of Maſt: of Coale, and the feeding of Hogs.
7. Of Gals, and how many things beſides Maſt and Acornes Maſt trees do beare.
8. Of Cachrys, and of the Skarlet graine: alſo of Agaricke and Corke.
9. Of what trees the barke is in vſage.
10. Of ſhindles to couer houſes, of the Pine-tree and the wild Pine, of the Fir & Pitch-tree, of the Larch-tree, of the Torch-tree Tœda, aad the Eugh-tree.

11. The

20030
copy 1

Chap.
11. The manner of making ſundrie ſorts of Pitch and Tar: how the virgin pitch called Cedrium is made: of the thicke ſtone pitch how it is made: and the waies to boile roſin.
12. Of the ſhip pitch called Zopiſſa: of Sapium: and thoſe trees that yeeld timber good for building.
13 Of the Aſh tree, foure kinds.
14. Of the Teil or Linden tree, two ſeuerall ſorts thereof.
15. Ten diuerſe ſorts of Maples.
16. Of the knot in Maple called Bruſcus and Molluſcum: of a kind of Fiſticke tree called Staphylodendron: of Box tree three ſorts.
17. Of the Elme, foure kinds.
18. The nature of trees according to their ſcituation and places where they grow.
19. A generall diuiſion of trees.
20. What trees neuer ſhed their leaues quite: of the Oleander tree called Rhododendron.
21. Againe what trees loſe not their leaues, but ſhew alwaies greene, which be they that ſhed their leaues in part. In what countries no trees at all doe loſe their leaues.
22. The nature of thoſe trees which let fall their leaues, and which haue leaues of ſundry colours.
23. Three ſorts of Aſps or Poplers: & of what trees the leaues do alter their forme and faſhion.
24. What leaues vſe to turne euerie yeere: the manner how to order the leaues of Date trees and to vſe them. Alſo ſtrange and admirable things as touching leaues.
25. The order and courſe that Nature holdeth in plants: the bloſſomes of trees: their manner of conception, blouming, budding, and bearing fruit: and in what order they put out floures.
26. Of the Corneil tree: the right ſeaſon wherin euerie tree beareth fruit: what trees bee fruitleſſe, and therefore are ſuppoſed vnhappie: which they bee that ſoone loſe their fruit: and laſt of all what trees ſhew fruit before they be put forth.

Chap.
27. Of trees that beare fruit twice and thrice in one yeere: what trees ſodainely wax old: the age of trees.
28. Of the Mulberrie tree.
29. Of trees growing wild.
30. Of the Box tree, and the great Beane tree or Lotus.
31. Of the boughs, branches, barke, rinde, and root of trees.
32. Of prodigious trees that preſage ſomewhat to come: of trees that ſpring and grow of themſelues. Alſo a diſcourſe, that all trees grow not in euery place: and what trees will not liue but in this or that one place.
33. Of the Cyprus tree. Alſo, that the ground will bring forth ſome new plants that neuer were ſet, ſowne, or growing there before.
34. Of Yvie.
35. Of the Ivie called Smilax.
36. Of Reeds, Canes, and ſhrubs growing in water.
37. Of the oſier or willow, eight ſorts thereof: alſo what twigs beſides oſiers and willowes are good for winding and to bind withall: of buſhes and grieues.
38. The juice and liquor of trees: the nature of their wood and timber: alſo of hewing downe and falling trees.
39. Of the Larch tree, the Fir and the Sapine: the time of cutting them downe, and ſuch like.
40. Sundry ſorts of wood: the extraordinarie bigneſſe of trees: what wood is not ſubject to be worme-eaten nor to decay: other trees that be euerlaſting.
41. Of Woodwormes.
42. Of timber fit for carpentrie and building: what timber is good for this or that vſe; and namely, which is beſt and more firme and durable for rouſes of houſes.
43. The maner of glewing bourds and planks: alſo of rent and clouen ſtuffe.
44. The age of trees: which be they that laſt not long: of Miſſelto, and of the Prieſts Druydæ.

In ſumme, this booke comprehendeth of notable things, hiſtories, and obſeruations, an hundred and fiue and thirtie.

Latine Authors alledged.

M. Varro, Facialis, Nigidius, Cornelius Nepos, Hyginus, Maſſurius, Cato, Mutianus, Lucius Piſo, Trogus, Calphurnius, Baſſus, Cremutius, Sextius Niger, Cornelius Bocchus, Vitruvius, and *Gracinus.*

The first Booke of

Forreine Writers.

Alexander Polyhistor, Hesiodus, Theophrastus, Democritus, Homer, Timæus the Mathematician.

¶ THE SEVENTEENTH BOOKE CONTAIneth the nature of trees planted, set, and well *kept in Hort-yards.*

Chap.

1. Trees of wonderfull price.
2. Of the nature of heauen and the skie respectiue vnto trees: and what part of the skie they ought to regard.
3. The societie and accord of the clymat and the soile requisit for trees.
4. The qualities of the grounds in diuers regions.
5. Sundry kinds of ground and earth.
6. Of a kind of earth or marle that they in Britaine and France set much store by.
7. What the Greekes haue taught, and what rules they haue giuen as touching this point
8. Of more kinds of earth.
9. The vse of ashes, and of dung: what plants will enrich the ground and make it more battell: contrariwise, which they bee that burne out the heart thereof.
10. The planting or setting of trees: how to make a sion or slip to take and grow againe that is plucked from the root of the stocke.
11. Of transplanting out of Seminaries, yong trees that came of pepins and seeds.
12. The spaces betweene, and distance to bee regarded in planting trees: the shadow and droppings, either from house eaues or other trees.
13. What trees grow apace, and which thriue but slowly: also of the Savine.
14. The setting and graffing imps and sions of trees in the stocke or cliffe.
15. Of the manner how to graffe a vine.
16. Of inoculation or graffing in the leafe or scutcheon with a plaster.

Chap.

17. An example or experiment of this kinde of graffing.
18. The order of planting and husbanding oliues: and which is the proper time for graffing.
19. What trees loue the companie and societie of others: the skill of baring the roots about trees, cutting off their superfluous spurns, and raising hils about the roots.
20. Of willow banks and rows of osiers: of places where reeds and canes are nourished: of other plants vsed to be cut, for poles, pearches, stakes, and forkes.
21. The manner of planting vines: the skill of trimming them.
22. The furrow about vines: and the pruning of them.
23. The manner of planting trees to serue for vines to run vpon.
24. How to keepe and preserue grapes: the diseases incident to trees.
25. Of sundrie prodigious and monstrous sights shewed in trees: also of an olive yard which in old time remooued, and was transplanted from one side of a great high way to the other.
26. Remedies against the diseases and imperfections or faults in trees.

7. How many daies it will be after the seeds of herbes be sowne, or their slips set, ere they come vp: the nature of seeds: how herbes are to be sown or set, and in what course and ranke: which herbes are but one of a kinde, and which they be that haue many kinds.
8. The nature of such garden herbes as are good for the pot, or to make sallads, and to season meat withal; their kinds to the number of 46, with their stories & descriptions.
9. Of Fennell, and Hempe.
10. The diseases and maladies that annoy gardens:

20030
copy 1

Chap.
dens, the remedies againſt the ſame: as alſo how to kill ants, caterpillers, and gnats.
21. What ſeeds be more or leſſe able to endure any hardneſſe or injurie, and which they be that ſalt waters are good for.

Chap.
22. The manner of watering gardens: what herbes they be, which beeing tranſplanted and removed, prooue the better: and finally, the juice, the ſweet ſauours, and reliſhnes of garden-herbes.

In ſumme, here are compriſed memorable things, ſtories, and obſeruations, a thouſand one hundred fortie and three.

Latine Authours cited.

M. Actius Plantus, M. Varro, D. Syllanus, Cato Cenſorius, Hyginus, Virgil, Mutianus, Celſus, Columella, Calphurnius Baſſus, Manlius Sura, Sabinus Tyro, Licinius Macer, Q. Hirtius, Vibius Rufus, Ceſennius who wrote Sepurica, [*i.* a treatiſe of Gardening] *Caſtritius* likewiſe, and *Firmius*, (who both twaine made a worke of the ſame matter) and laſt of all *Petreius*.

Forreine Writers.

Herodotus, Theophraſtus, Democritus, Ariſtomachus, Menander, (who wrote a booke intituled Brochreſta, *i.* of things profitable for our life and diet) and *Anaxilaus*.

¶ THE TWENTIETH BOOKE COMPRISETH medicines out of thoſe Simples which are ſet and *ſowed in Gardens.*

Chap.
1. Of the wild Cucumber, and the juice therof Elaterium.
2. Of the Cucumber as wel that which wandereth & groweth abroad called Anguinum, as that of the garden: alſo of the Pompion.
3. Of the wild gourds, and the Rape or Naves.
4. Diuers ſorts of Navewes: of the wild Radiſh, of the garden Radiſh, and the Parſnep or Carot.
5. Of Staphylinum or the tame Parſnip. The herbe Gingidium or Chervill: of Seſelis or Siler-mountaine: of Elecampane, and of Onyons.
6. Of Porret or Leekes vſed to be cut, and of cabbage Leeks or headed, alſo of Garlicke.
7. Of wild Lettuce or Hawke-weed, called alſo Lactuca Caprina, of another kinde named Eſopus, of Woad, & tame garden Lettuce.
8. Diuerſe kindes of Beets, of Endive, and Cichorie, of garden Endiue.
9. Of Cawle or Coleworts, of the wild Coleworts Lapſana, of Soldanella, of Squilla or the Sea-onion, of Scallions or Chibbols, and of Dog-leeks.
10. Of Sparage both tame and wild, of Libycum and Clarie.
11. Of Parſley, of Baulme, Smallage, & mountaine Parſley.
12. Of Aliſanders, and garden Baſill.

Chap.
13. Of wild Baſill, of Rocket, of Creſſes, and Rue.
14. Of wild Mints, of garden Mints, of Peniroyall, of Nep, and Cumin.
15. Of Æthiopian Cumin, which ſtaieth vrine, of Capers, of Lovach, of Panace, of wild Origan or Majoram ſavage.
16. More of wild Oragan and Heracleotica, called alſo Gallinacea Cunila, *i.* Small majoram, Savorie or Orgament, Roſemarie, ſweet Majoram of the garden and of the mountaine.
17. Of Cockweed, Pepperwort, or Dittander, of garden Origan, of a kinde of Orgament called Onitis of Praſon, of Tragoriganum or wild Peniroyall, the water Lillie or Nenuphar, of Lepidium, of Gith or Nigella Romana, and of Aniſe.
18. Of Dill, of Sacopænium, of Sagapen, of Poppies both white and blacke: the manner how to draw the juice of herbes: and of Opium.
19. Of the wild Poppie, of horned Poppie, of Glaucium or Paralium, of Heraclium or Aphrum, of the confection Diacodium made of Poppie heads, of Tythimall.
20. Of Purcellane or Peplium, of Coriander and Orach.
21. Of Mallowes, and Malope, of Althæa or Marſh-

Chap.
Marshmallow, of Dockes, foure Docke or Sorell, the water Docke, the herbe Patience or Bulapathum.
22. Three kindes of Senvie, of Horehound, of running Thyme, of water Mints or Savorie, of Lineseed and Bleets.
Chap.
23. Of Meu, of garden Fennell, of wild Fennell or Myrsineum, of Hempe, of Fennel-geant, of Thystles, and Artichokes.
24. The confection called Triacle, the composition of *Antiochus*.

In summe, there be be comprised in this book of medicines, stories, and obseruations, one hundred sixtie and seven.

Out of Latine Authors.

Cato Censorius, Mar. Varro, Pompeius Lenæus, Gallio, Hyginus, Sextius Niger who wrote in Greeke, and *Iulius Bassus* likewise, who wrote in the same language, *Celsus*, and *Antonius Cæsar*.

Forreine Authours.

Democritus, Theophrastus, Orpheus, Menander who made the booke *Biochresta, Pythagoras*, and *Nicander*.

Out of Physitians.

Nicander, Hippocrates, Chrysippus, Diocles, Ophion, Heraclides, Hicesius, Dionysius, Apollodorus of Tarentum, *Apollodorus* the Citien, *Praxogoras, Philistonicus, Medius, Dienches, Cleophantus, Philistio, Asclepiades, Cratevas, Petronius, Diodorus, Iolla, Erasistratus, Diagoras, Andreas, Menesicles, Epicharmus, Damion, Dalion, Sosimenes, Theopolemus, Metrodorus, Solon, Lycus, * Olympiades* of Thebes, *Phyllinus, Petreius, Miction, Glaucia* and *Xenocrates*.

* A woman who was a Midwife.

¶ IN THE XXI. BOOKE ARE CONTAINED the natures of Floures and Hearbs to make *Guirlands of*.

Chap.
1. The nature of floures and herbes that serve for Chaplets, the wonderfull varietie of floures.
2. Of Chaplets and nosegaies of floures. Who first deuised to set floures in order one with another. When Coronets or Guirlands of floures were inuented and took their name, and vpon what occasion.

Chap.
1. The firſt beginning and originall of the Art of Phyſicke: when Phyſicians began firſt to viſit Patients lying ſicke in their beds: the firſt Phyſitians that practiſed the cure of ſick perſons, by frictions, ointments, baths, hot-houſes, &c. Of *Chryſippus* and *Eraſiſtratus* their courſe and manner of practiſe: of Empiricke Phyſicke: of *Herophilus* and other famous Phyſitians: how often the Art and ſtate of Phyſicke hath altered: the firſt profeſſed Phyſician at Rome; when it was that hee practiſed: what opinion the ancient Romans had of Phyſicians: finally the imperfection and faults in that Art.
2. The medicinable vertues and properties obſerued in wooll.
3. The nature of eggs, and the vertues thereof good in Phyſicke.
4. Remedies in Phyſicke receiued from doggs and other creatures that are not tame but wild: alſo from foules: and namely againſt the ſtings of the venomous ſpiders Phalangia.
5. Of the Oſtrich greace, and the vertues thereof: of a mad dog: alſo remedies had from him, a lizard, geeſe, doues, and weaſils.
6. Medicines againſt the falling of the haire, and to make it grow againe: to kill nits: to recouer the haire of the eye-lids: to cure the dimneſſe and redneſſe, and generally all diſeaſes and accidents of the eyes, as alſo the ſwellings and inflammations in the kernils vnder the eares.

In ſum, there be medicines and other things worth obſeruation in this booke, to the number of fiue hundred twentie and one.

Latine Authors alledged.

M. Varro, L. Piſo, Verrius Flaccus, Antias, Nigidius, Caſſius Hemina, Cicero, Plautus, Celſus, Sextius Niger who wrote in Greeke, *Cæcilius* the Phyſician, *Metellus Scipio, Ovid* the Poet, and *Licinius Macer*.

Forteine Authours.

Philopater, Homerus, Ariſtotle, Orpheus Democritus, Anaxilaus.

Phyſitians.

Botrys, Apollodorus, Archidemus, Anaxilaus, Ariſton, Xenocrates, Diodorus, Chryſippus the Philoſopher, *Horus, Nicander, Apollonius* of Pytane.

¶ IN THE XXX. BOOKE ARE CONTAINED. medicines for liuing creatures, ſuch as were not obſerued *in the former Booke.*

Chap.
1. The beginning of the black Science & Art magicke, when it began, who practiſed it firſt, and who were they that brought it into requeſt and reputation. Alſo the reſt of the medicines taken from beaſts.
2. Sundrie kinds of Magicke: the execrable and curſed parts plaid by *Nero*, and of Magicians.
3. Of Wants or Mouldwarps: of liuing creatures as well tame as ſauage which affourd remedies, and thoſe are digeſted in order according to the diſeaſes.
4. How to make the breath ſweet: againſt mols and ſpots disfiguring the face: remedies for to cure the diſeaſes of the throat and chaws.
5. Againſt the Kings euill, and namely when the ſwelling is broken and doth run: to eaſe the pain of the ſhoulders, the heart and the parts about it.
6. For

Chap.
6. For the diseases of the lungs and liver: also to cure the casting and reiection of bloud vpward.
7. Remedies for the bloudie flix, and generally for all diseases of the bellie and the guts.
8. For the gravell and stone, for paines of the bladder, for swelling of the stones and the groine, of apostems or swellings in the kirnels and emunctories.
9. Against the gout of the feet and paines of other ioynts.
10. Remedies against many diseases that hold the whole bodie.
11. Against the jaundise, the phrensie, fevers, and dropsie.
12. Against the wild fire, carbuncles, fellons or vncoms, burnes, scaldings, and shrinking of the sinews.
13. To staunch bloud, to allay swellings in wounds: also to cure vlcers, greene wounds, and other maladies, diverse remedies, all taken from liuing creatures.
14. To cure womens secret maladies, and to helpe conception.
15. Many receits and remedies huddled together one with another.
16. Certaine miraculous things obserued in beasts.

In summe, this booke sheweth vnto vs medicines and memorable obseruations 54.

Latine Authors cited.

M. Varro, Nigidius, M. Cicero, Sextius Niger who wrate in Greeke, and *Licinius Macer.*

Forreine Writers.

Eudoxus, Aristotle, Hermippus, Homer, Apion, Orpheus, Democritus, and *Anaxilaus.*

Physicians.

Botrys, Horus, Apollidorus, Menander, Archimedes, Ariston, Xenocrates, Diodorus, Chrysippus, Nicander, Apollonius, Pitanæus.

¶ THE XXXI. BOOKE SHEWETH MEDICINES gathered from fishes and water creatures: also it deliuereth vnto vs strange *and wonderfull things as touching the Waters.*

Chap.
1. Admirable matter obserued in the waters.
2. The difference of waters.
3. The nature and qualitie of waters: how to know good and wholesome waters from them that be naught.
4. The reason of some waters, that spring on a suddain, & so likewise cease and giue ouer.
5. Many historicall obseruations of waters.
6. The manner of water conduits, and how to draw them from their heads: when and how waters are to bee vsed which naturally are medicinable: how farre forth navigation or sailing vpon the salt water is good for the health: medicines made of sea water.
7. Divers kinds of salt: the preparing and making thereof, together with the vertues medicinable of salt, and other considerations thereto belonging.
8. Of the fish Scamber or the Mackrell: of fish pickle: of Alex, a kind of brine or fish sauce
9. The nature of Salt, and the medicines made of it.
10. Sundrie sorts of Nitre, the handling and preparation thereof, the medicines and obseruation to it pertaining.
11. The nature of Spunges.

This booke comprehendeth medicines and notable obseruations 266.

Latine Authours alledged.

M Varro, Cassius of Parma, *Cicero, Mutius, Cor. Celsus, Trogus, Ovid, Polybius,* and *Sornatius.*

Forreine Writers.

Callimachus, Ctesias, Eudicus, Theophrastus, Eudoxus, Theopompus, Polyclitus, Iuba, Lycus, Apion, Epigenes,

20030
copy 1

Epigenes, Pelops, Apelles, Democritus, Thrasillus, Nicander, Memander the Comicall Poet, *Attalus, Sallustius, Dionysius, Andreas, Nicreatus, Hippocrates, Anaxilaus.*

¶ IN THE XXXII. BOOKE ARE CONTAINED other medicines behind, from fishes and water creatures.

Chap.
1. Of the fish Echeneis, his wonderfull propertie: of the Torpedo, and the Sea-hare: maruellous things reported of the red sea.
2. The naturall industrie, docilitie, and gentlenesse of some fish: where they will come to hand and take meat at a mans hand: in what countries fishes serue in stead of oracles.
3. Of those fishes that liue both on land and water: the medicines and obseruations as touching Castoreum.
4. Of the sea Tortoise: many vertues medicinable obserued in sundry fishes.
5. Receits of medicins taken from water creatures, digested and set in order according to sundry diseases; & first against poyson and venomous beasts.
6. Of Oisters, Purple shell-fishes, & sea-weeds called Reits: their vertues medicinable.
7. Medicins against the shedding of the haire: how to fetch haire againe: also against the infirmities of eies, ears, teeth, and to amend the vseemely spots in the face.
8. Many medicins set down together vnorderly.
9. Remedies for the diseases of the liuer and sides, stomacke and bellie: others also disorderly put downe.
10. Against feuers and agues of all sorts, and many other infirmities.
11. A rehearsall of all creatures liuing in the sea, to the number of 122.

In summe, ye haue here medicines, stories, and obseruations, 928.

Latine Authors.

Licinius Macer, Trebius Niger, Sextius Niger who wrote in Greeke, *Ouid* the Poet, *Cassius Hemina, Mecænas*, and *L. Atteius.*

Forreine Writers.

K. *Iuba, Andreas*, * *Salpe, Pelops, Apelles* of Thasos, *Thrasillus*, and *Nicander.*

* A Woman.

¶ THE XXXIII. BOOKE DECLARETH the natures of Mettals.

Chap.
1. In what estimation were the mines of gold at the first in the old world: the beginning of gold rings: the proportion of gold that our ancestors had in their treasure: the degree of knights or gentlemen at Rome: the priuiledge to weare gold rings, and who only might so do.
2. The courts and chambers of judges or justices at Rome: how often the gentlemen of Rome and men of armes changed their title: the presents giuen to valiant souldiours for their braue seruice in the wars: the first crowns of gold that were seene.
3. The ancient vse of gold besides, both in men & women: of the golden coine: when copper and brasse money was first stamped: when gold and siluer was put into coine: before mony was coined, how they vsed brasse for exchange in old time. At the first taxation and leuie made of Tribute, what was thought to be the greatest wealth; and at what rate were the best men sessed. How often and at what time gold grew into credit and estimation.
4. The mines of gold, and how naturally it is found: when the statue or image of gold was first seene: medicinable vertues in gold.
5. Of Borras, and six properties of Borras in matters of Physicke: the wonderfull nature that it hath to soder all mettals, and giue them their perfection.
6. Of Siluer, Quick-siluer, Antimonie, or Alabaster: the drosse or refuse of siluer: also the scum or some of siluer called Litharge.
7. Of Vermilion: in what account it was in old time among the Romanes: the inuention thereof:

Chap.
thereof: of Cinnabaris or Sangdragon vsed in painting and Physick: diuers sorts of vermillion, and how painters vse it.
8. Of Quicksiluer artificiall: the maner of gilding siluer: of touchstones: diuers experiments to trie siluer: the sundry kinds therof
9. Of mirroirs or looking-glasses: of the siluer in Ægypt.
10. Of the excessiue wealth of some men in money: who were reputed for the richest men: when it was that at Rome they began to make largesse and scatter money abroad to the commons.
11. Of the superfluitie of coine, and the frugalitie of others as touching siluer plate, beds and tables of siluer: when began first the making of excessiue great and massiue platters and chargers of siluer.
12. Of siluer statues: the grauing and chasing in siluer, & other workmanship in that mettall
13. Of Sil, of Azur, of superfice Azur named Nestorianum: also of the Azur called Cœlum: that euery yere these kinds be not sold at one price.

This booke hath in it of medicines, stories, and obseruations, 1215.

Latine Authors alledged.

L. Piso Antius, Verrius, M. Varro, Cor. Nepos, Messula, Rufus, Marsus the Poet, *Buthus, Iulius Bassus*, and *Sextius Niger*, (who wrote both of Physicke in Greeke) and *Fabius Vestalis*.

Forreine Writers.

Democritus, Metrodorus Sceptius, Menæchmus, Xenocrates, and *Antigonus*, who wrate all three of the feat and skill of grauing, chasing and embossing in mettall: *Heliodorus*, who wrote a booke of the rich ornaments and oblations of the Athenians: *Pasiteles*, who wrote of wonderfull pieces of worke: *Nymphodorus, Timæus* who wrate of Alchymie or minerall Physicke: *Iolla, Apollodorus, Andreas, Heraclydes, Diagoras Botryensius, Archimedes, Dionysius, Aristogenes, Democritus, Mnesicles, Attalus* the Physician, *Xenocrates* the sonne of *Zeno*, and *Theomnestes*.

¶ THE XXXIIII. BOOKE TREATETH of other Mettals.

Chap.
1. Mines of Brasse, Copper, Iron, Lead, & Tin.
2. Sundry kinds of Brasse, namely Corinthian, Deliacke, and Ægineticke.
3. Of goodly candlesticks, & other ornaments of temples.
4. The first images made at Rome: the originall of statues: the honour done to men by statues: sundry sorts and diuers forms of them.
5. Of statues pourtraied in long Robes; and of many others who first erected images vpon columnes and pillars at Rome: when they were allowed first at the cities charges: also what maner of statues the first wer at Rome.
6. Of statues without gowne or cassocke, and some other: the first statue pourtraied on horsebacke at Rome: when the time was that all Images as well in publike places as priuat houses were abolished at Rome and put downe: what women at Rome were allowed to haue their statues; and which were the first erected in publike place by forrein nations.
7. The famous workemen in making & casting Images: the excessiue price of Images: of the most famous and notable colosses or gyant-like images in the citie of Rome.
8. Three hundred sixtie and six peeces of work wrought in brasse by most curious and excellent artificers.
9. What difference there is in Brasse: the diuers mixtures with other mettals: how to keepe brasse.
10. Of Brasse ore called Cadmia, and for what it is good in Physicke.
11. The refuse or scum of Brasse, Verdegris: the skales of brasse and copper, steele, copper rust, or Spanish greene: of the collyrie or eye-salue called Hieracium.
12. Of a kinde of Verdegris named Scolecia: of Chalcitis, *i.* red Vitrioll, Mysy, Sory, and Copporose or Vitrioll, *i.* blacke Nil.
13. Of the foile of Brasse named white Nil or Tutia: of Spodium, Antispodium, of Diphryges, and the Trient of Servilius.

14. Of

20030
copy 1

Chap.
14. Of Iron and mines of Iron: the difference alſo of Iron.
15. Of the temperature of Iron: the medicinable vertues of Iron, and the ruſt of Braſſe and Iron: the skales of Iron, and the liquid plaſtre named of the Greekes Hygemplaſtrum.
16. The mines of Lead: of white and blacke Lead.
17. Of Tin, Of Argentine Tin, and ſome other minerals.
18. Medicins made of Lead & refuſe of Lead, of Lead ore, of Ceruſe or Spaniſh white, of Sandaricha of red Orpiment.

In ſumme, here are contained natable matters, ſtories, and obſeruations, 815.

Latine Authours cited.

L. Piſo, Antias, Verrius, M. Varro, Meſſala, Rufus, Marſus the Poet, *Buthus, Iulius Baſſus*, and *Sextius Niger*, who wrote both in Greeke of Phyſicke, and *Fabius Veſtalis*.

Forreine Writers.

Democritus, Metrodorus Scepſius, Menechmus, Xenocrates, Antigonus, and *Duris*, (who all foure wrote of grauing, chaſing, and emboſſing mettals, a worke entituled *Toreutice:*) *Heliodorus*, who deſcribed the ornaments and oblations hanged vp in Athens: *Nymphodorus, Andreas, Heraclides, Diagoras, Botryenſis, Iolla, Apollodorus, Archimedes, Dionyſius, Ariſtogenes, Diomedes, Mneſicles, Xenocrates* the ſonne of *Zeno*, and *Theomneſtus*.

¶ IN THE XXXV. BOOKE IS SHEWED IN what account Painting was in old time.

Chap.
1. The honour and regard of Pictures in times paſt.
2. In what price Images were of old.
3. When Images were firſt erected and ſet vp in publicke place, as alſo in priuat houſes, with their ſcutcheons and armes: the beginning of pictures: the firſt draught of Picturs in one ſimple colour: the firſt Painters, and how ancient they were in Italie.
4. Of Roman Painters: the firſt time that Painting and Picturs grew into credit: who they were that drew their victories in colors vpon tables, and ſet them forth to be ſeen: and when forrein Pictures began to be of ſome good reckoning at Rome.

THE SECOND BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I.

¶ *Whether the World be finite, and but one.*

C THE World, and this, which by another name men haue thought good to call heauen (vnder the pourprise and bending cope whereof, all things are emmanteled and couered) beleeue we ought in all reason to be a God, eternall, vnmeasurable, without beginning, and likewise endlesse. What is without the compasse hereof, neither is it fit for men to search, nor within mans wit to reach and conceiue. Sacred it is, euerlasting, infinit, all in all, or rather it selfe all and absolute: finite and limited, yet seeming infinite: in all motions orderly and certaine: howbeit in shew and iudgement of man, vncertaine: comprehending and containing all whatsoeuer, both without and within: Natures worke, and yet very Nature it selfe, producing all things. Great folly it is then, and meere madnesse, that D some haue deuised and thought in their minde to measure it; yea, and durst in writing set down the dimensions thereof: that others againe, by occasion hereupon taken or giuen, haue deliuered and taught, That worlds there were innumerable: as if we were to beleeue so many natures as there were Heauens: or if all were reduced to one, yet there should be so many Sunnes and Moones neuertheless, with the rest also of those vnmeasurable and innumerable starres in that one: as though in this pluralitie of worlds we should not alwaies meet with the same question still at euery turne of our cogitation, for want of the vtmost and some end to rest vpon: or if this infiniteness could possibly be assigned to Nature, the worke-mistresse and mother of all; the same might not be vnderstood more easily in that one Heauen which wee see; so great a worke especially and frame as it is. Now surely a fantasticall folly it is of all other follies, to go E forth of it, and so to keepe a seeking without, as if all things within were well and clearely knowne already; as who would say, a man could take the measure iust of any third thing, who knoweth not his owne: or the minde of man see those things, which the very World it selfe may not receiue.

CHAP. II.

¶ *Of the forme and figure of the World.*

F THat the forme of heauen is round, in fashion of an absolute and perfect globe, the name thereof principally, and the consent of all men agreeing to call it in Latine *Orbis*, (*i.*) a roundle; as also many naturall reasons, do euidently shew: to wit, not onely for that such a figure euery way falleth and bendeth vpon it selfe, is able to beare and vphold it selfe, includeth and compriseth it selfe, hauing need thereto of no ioints, as finding in any part thereof no end nor beginning: or because this forme agreeth best to that motion, whereby euer and anon it must turne about:

(as hereafter it ſhall appeare) but alſo becauſe the eieſight doth approue the ſame: in that look G
which way ſoeuer you will thereupon, it ſeemeth to bend downeward, round, and euen on all ſides, ſhewing a iuſt Hemiſphere; a thing not incident poſſibly to any other figure.

Chap. III.

¶ *Of the motion of Heauen.*

THat the world thus framed, in a continuall and vnceſſant circuit, with vnſpeakable ſwiftneſſe turneth round about in the ſpace of foure and twenty houres, the riſing and ſetting ordinarily of the Sunne hath left cleare and doubtleſſe. Now, whether it be-
ing in height infinite, and therefore the ſound of ſo huge a frame, whiles it is whir- H
led about, and neuer reſteth in that reuolution, cannot be heard with our eares, I cannot ſo eaſily reſolue and pronounce: no more I aſſure you, than I may auouch the ringing of the ſtarres that are driuen about therewith, and roll with all their owne ſpheres: or determine, that as the Heauen moueth, it doth repreſent indeed a pleaſant and incredible ſweet harmonie both day and night: although to vs within, it ſeemeth to paſſe in ſilence. That there be imprinted therein the pourtraicts of liuing creatures, and of all things beſides without number, as alſo that the body thereof is not all ouer ſmooth and ſlicke (as we ſee in birds egs) which excellent Authors haue termed *Tenerum* is ſhewed by good arguments: for that by the fall of naturall ſeeds from thence of all things, and thoſe for the moſt part blended and mixed one with another, there are ingendred in the world, and the ſea eſpecially, an infinite number of ſtrange and monſtrous I
ſhapes. Ouer and beſides, our eie-ſight teſtifieth the ſame; whiles in one place there appeareth the reſemblance of a waine or chariot, in another of a beare, the figure of a bull in this part, of a
* letter in that, and principally the middle circle ouer our head, more white than the reſt, to-
* Δ ward the North pole.

Chap. IIII.

¶ *Why the World or Heauen is called Mundus.*

VErily for mine owne part, moued I am and ruled by the generall conſent of all nations. For, the World, which the Greekes by the name of ornament, called K
κοσμος, we for the perfect neatneſſe and abſolute elegancie thereof, haue termed *Mundus*. And without all queſtion, Heauen we haue named *Cælum*, as it were Engrauen and garniſhed, according as *M. Varro* interpreteth it. And hereto maketh much the orderly ranke of things therein, and namely the circle called *Signifer*, or the Zodiake ſet forth and diuided by the formes of twelue liuing creatures therein portraied: together with the manner of the Sunnes race throughout them, keeping euer the ſame courſe ſtill, for ſo many ages paſt.

Chap. V.

L

¶ *Of the foure Elements.*

NEither ſee any doubt made as touching the Elements, That they be foure in number. The higheſt, Fire: from whence are thoſe bright eies of ſo many ſhining ſtarres. The next, Spirit which the Greekes and our countrey men by one name called Aire: Vitall this element is, and as it giueth life to all things, ſo it ſoone paſſeth through all, and is intermedled in the whole: by the power wherof, the earth hangeth poiſed and ballanced iuſt in the midſt, together with the fourth element of the Waters. Thus by a mutuall entertainment one of another, diuers natures are linked and knit together: ſo as the light elements are kept in & reſtrained by certain weights of the heauier, that they flie not out: and contrariwiſe the maſſier be held vp, that they M
fall not downe, by means of the lighter, which couet to be aloft. So, through an equall endeuor to the contrary, each of them hold their owne, bound as it were by the reſtleſſe circuit of the very world: which, by reaſon that it runneth euermore vpon it ſelfe, the earth falleth to be loweſt, and the middle of the whole: and the ſame hanging ſteadily by the poles of the heauen, peiſeth thoſe

20030
copy 1

A thoſe elements by which it hangeth in a counterballance. Thus it alone reſteth vnmoueable; whiles the whole frame of the world turneth about it: and as it is knit and vnited by all, ſo all reſt and beare vpon the ſame.

Chap. VI.

¶ *Of the ſeuen Planets.*

B BEtweene the earth and heauen there hang in the ſame ſpirit or element of aire aboue named, ſeuen ſtars, ſeuered one from another, and diſtant aſunder certaine ſpaces, which of their variable motion wee call wandring planets, whereas indeed none ſtray and wander leſſe than they. In the middeſt of them the Sun taketh his courſe, as being the greateſt and moſt puiſſant of all the reſt: the very ruler, not of times and ſeaſons onely, and of the earth, but alſo of the ſtarres and heauen it ſelfe. Beleeue we ought, this Sun to be the very life, and (to ſpeake more plainely) the ſoule of the whole world, yea, and the principall gouernance of nature: and no leſſe than a God or diuine power, conſidering his workes and operations. He it is that giueth light to all things, and riddeth them from darkneſſe: he hideth the other ſtarres, and ſheweth them again: he ordereth the ſeaſons in their alternatiue courſe: he tempereth the yeare, ariſing euer freſh and new againe, for the benefit and good of the world. The lowring dimneſſe of the skie he diſpatcheth, yea, and cleareth the darke miſts and clowdineſſe of mans minde: to other ſtars likewiſe he lendeth out his owne light. Moſt excellent, right ſingular he is, as ſeeing all, & hearing C all. For this, I ſee, is the opinion of *Homer* (the prince of learning) as touching him alone.

Chap. VII.

¶ *Of God.*

D IS Suppoſe therefore that to ſeeke after any ſhape of God, and to aſſigne a forme and image to him, bewraieth mans weakeneſſe. For God, whoſoeuer hee be [if haply there be any other, but the very world] and in what part ſoeuer reſiant, all ſenſe he is, all ſight, all hearing: he is all life, all ſoule, all of himſelfe. And verily to beleeue that there be gods innumerable, and thoſe according to mens vertues and vices, to wit, Chaſtitie, Concord, Vnderſtanding, Hope, Honour, Clemencie, Faith; or (as *Democritus* was of opinion) that there are two gods onely, and no more; namely, Puniſhment, and Benefit: Theſe conceits, I ſay, make mens idleneſſe and negligence the greater. But all commeth of this, That fraile and craſie mortall men, remembring wel their owne infirmitie, haue digeſted theſe things apart, to the end that each one might from thence chuſe to worſhip and honour that whereof he ſtood in need moſt. And hereupon it is, that in ſundry nations we finde the ſame gods named diuerſly, according to mens deuotion: and in one region ye ſhall haue innumerable gods. The infernall powers beneath likewiſe, yea, and many plagues haue been raunged by themſelues, and reckoned for gods in their kinde, whileſt E with trembling feare wee deſire that they were pacified. Which ſuperſtition hath cauſed a chappell to be dedicated to the Feuer, in the mount Palatium, euen by publicke order from the State. Likewiſe an altar to *Orbona*, neere the temple of *Lares*: becauſe another erected to Bad Fortune in Eſquiliæ. And thereby we may conceiue that there are a greater number of gods in heauen aboue, than of men vpon earth: ſince that euery one of their owne accord make ſo many gods as they liſt, fitting themſelues with *Iunoes* and *Genij* for their patrons. Now certain Nations there be that account beaſts, yea, and ſome filthie things for gods; yea and many other matters more ſhamefull to be ſpoken: ſwearing by ſtinking meats, by garlicke, and ſuch like. But ſurely, to beleeue that gods haue contracted mariage, and that in ſo long continuance of rime no children ſhould be borne between them: alſo that ſome are aged, and euer hoarie and F gray: others againe young and alwaies children: that they be blacke of colour and complexion, winged, lame, hatched of egs, liuing and dying each other day; are meere fooleries, little better than childiſh toies. But it paſſeth and exceedeth all ſhameleſſe impudencie, to imagine adulteries amongſt them: eftſoones alſo chiding, ſcolding, hatred, and malice: and more than that, how there be gods, patrons of theft and wickedneſſe. Whereas in very deed, a god vn-

to a man is he, that helpeth a man: and this is the true and direct path-way to euerlaſting glo- G
ry. In this way went the noble Romans in old time: and in this tract at this day goeth, with heauenly pace, *Veſpaſian Auguſtus*, both he and his children: *Veſpaſian*, I ſay, the moſt mightie ruler of the whole world: whiles he relieueth the afflicted State of the Romane Empire and Common-weale. And this is the moſt antient manner of requitall to ſuch benefactours, That they ſhould be canonized gods. And hereof came the names as well of all other gods, as of the ſtars and planets (which I haue mentioned before) in recognisance of mens good deſerts. As for *Iupiter* verily and *Mercurie*, and other princes raunged among the gods, who doubteth that they were called otherwiſe among themſelues? and who confeſſeth not how theſe be celeſtiall denominations, to expreſſe and interpret their nature.

*Here let Chriſtians take heed, and be thankefull to God for the light reuealed vnto them out of the holy ſcriptures.

Now, That the ſoueraigne power and deity, whatſoeuer it is, ſhould haue regard of mankind H
* is a toy and vanity worthy to be laughed at. For can we chuſe but beleeue, can we make any doubt, but needs that Diuinity and Godhead muſt be polluted with ſo baſe & manifold a miniſtery? And hardly in manner may it be iudged, whether of the twain be better and more expedient for mankinde to beleeue, that the gods haue regard of vs; or to be perſuaded that they haue none at all: conſidering, That ſome men haue no reſpect and reuerence at all of the gods; others againe ſo much, as it is a very ſhame to ſee their ſuperſtition. Addicted theſe are and deuoted to ſerue them by forrein magicke ceremonies: they weare their gods vpon their fingers in rings, yea, they worſhip and adore monſters: they condemne and forbid ſome meats; yet they deuiſe others for them. Impoſe they do vpon them hard and vengible charges to execute, not I
ſuffering them to reſt and ſleep in quiet. They chuſe neither mariages nor children, ne yet any one thing els, but by the approbation & allowance of ſacred rites and myſteries. Contrariwiſe, others there are ſo godleſſe, that in the very capitoll they vſe deceit, and forſweare themſelues euen by *Iupiter*, for all that he is ready to ſhoot his thunderbolts: and as ſome ſpeed wel enough with their wicked deeds and irreligion; ſo others again feele the ſmart and are puniſhed by the ſaints whom they adore, and the holy ceremonies which they obſerue.

Howbeit, betweene both theſe opinions, men haue found out to themſelues a middle Godhead and diuine power, to the end that we ſhould giue ſtil a more vncertaine coniecture as touching God indeed. For throughout the whole world, in euery place, at all times, and in all mens mouths, Fortune alone is ſought vnto and called vpon: ſhe only is named and in requeſt; ſhee K
alone is blamed, accuſed, and endited. None but ſhe is thought vpon; ſhe only is praiſed, ſhe only is reproued and rebuked: yea, and worſhipped is ſhe with railing and reprochfull tearms: and namely when ſhe is taken to be wauering & mutable: and of the moſt ſort ſuppoſed alſo blind; rouing at randon, vnconſtant, vncertaine, variable, and fauoring the vnworthy: whatſoeuer is laid forth, ſpent, and loſt, whatſoeuer is receiued, woon and gotten: all that comes in, all that goes out is imputed to Fortune: and in all mens reckonings and accounts ſhe makes vp the booke, and ſets all ſtreight. So abiect we are, ſo ſeruile alſo and enthralled to Lots, that euen the very chance of Lots is taken for a god, than which nothing maketh vs more doubtfull and ignorant of God.

Now there are another ſort, that reiect Fortune & Chance both, and wil not abide them, but L
attribute the euents and iſſues of things, to their owne ſeuerall ſtars, and go by the fatall horoſcope or aſcendent of their natiuitie: affirming that the ſame ſhall euer befall, which once hath bin ſet downe and decreed by God: ſo as he for euer after may ſit ſtill and reſt himſelfe. And this opinion beginneth now to ſettle and take deep root, inſomuch as both the learned, and alſo the rude and ignorant multitude, run that way on end. From hence (behold) proceed the warnings & admonitions of lightenings, the fore-knowledge by Oracles, the predictions of Soothſayers, yea, and other contemptible things not worthy to be once ſpoken of; as ſneeſing, and ſtumbling with the foot, are counted matters of preſage. *Auguſtus Cæſar* of famous memorie hath made report and left in writing, that his left foot ſhooe was vntowardly put on before the right, on that very day, when he had like to haue miſcarried in a mutiny among his ſouldiers. M

Thus theſe things euery one doe enwrap and entangle ſilly mortall men, void of all forecaſt and true vnderſtanding: ſo as this only point among the reſt remaines ſure and certain, namely, That nothing is certaine: neither is there ought more wretched and more proud withall; than man. For all liuely creatures elſe take care onely for their food, wherein Natures goodnes and bountie of it ſelfe is ſufficient: which one point verily is to be preferred before all good

things

20030

A things whatſoeuer, for that they neuer thinke of glory, of riches, of ſeeking for dignities and promotions, nor ouer and aboue, of death. Howbeit, the beleefe that in theſe matters the gods haue care of mens eſtate, is good, expedient, and profitable in the courſe of this life: as alſo that the vengeance and puniſhment of malefactors may well come late (whiles God is buſily occupied otherwiſe in ſo huge a frame of the world) but neuer miſſeth in the end: and that man was not made next in degree vnto God, for this, That he ſhould be wel-neare as vile and baſe as the bruit beaſts. Moreouer, the chiefe comfort that man hath, for his imperfections in Nature, is this, That euen God himſelfe is not omnipotent, and cannot do all things: for neither he is able to worke his owne death, would he neuer ſo faine, as man can do when he is wearie of his life; the beſt gift which he hath beſtowed vpon him, amid ſo great miſeries of his life (nor indow
B mortall men with euerlaſting life: ne yet recall, raiſe, and reuiue thoſe that once are departed
2 and dead) nor bring to paſſe, that one who liued, did not liue; or he that bare honorable offices, was not in place of rule and dignity. Nay, he hath no power ouer things done and paſt, ſaue only obliuion: no more than he is able to effect (to come with pleaſant reaſons and arguments to proue our fellowſhip therin with God) that twiſe ten ſhould not make twenty: and many ſuch things of like ſort. Whereby (no doubt) is euidently proued, the power of Nature, and how it is ſhe, and nothing els, which we call God. I thought it not impertinent thus to diuert and digreſſe to theſe points, ſo commonly divulged, by reaſon of the vſuall and ordinarie queſtions as touching the Eſſence of God. Every thing is possible to God, but what is an absolute
Contradiction — 1. 2. And not Contradictions — therefore both possible & probable —

C

Chap. VIII.

¶ *Of the Nature of Planets, and their circuit.*

LEt vs returne now to the reſt of Natures workes. The ſtars which we ſaid were fixed in heauen, are not (as the common ſort thinketh) aſſigned to euery one of vs; and appointed to men reſpectiuely; namely, the bright & faire for the rich; the leſſe for the poore: the dim for the weak, the aged and feeble: neither ſhine they out more or leſſe according to the lot and fortune of euery one, nor ariſe they each one together with that perſon vnto whom they are appropriate; and die likewiſe with the ſame: ne yet as they ſet and fall, do they ſignifie that any bodie is dead.
D There is not, ywis, ſo great ſocietie betweene heauen and vs, as that together with the fatall neceſſitie of our death, the ſhining light of the ſtarres ſhould in token of ſorrow go out and become mortall. As for them, the truth is this; when they are thought to fall, they doe but ſhoot from them a deale of fire, euen of that aboundance and ouermuch nutriment which they haue gotten by the attraction of humiditie and moiſture vnto them, like as we alſo obſerue daily in the wikes and matches of lampes or candles burning, with the liquour of oile. Moreouer, the cœleſtiall bodies, which make and frame the world, and in that frame are compact and knit together, haue an immortall nature; and their power and influence extendeth much to the earth; which by their effects and operations, by their light and greatneſſe might be knowne, notwithſtanding they are ſo high and ſubtill withall, as we ſhal in due place make demonſtration. The
E manner likewiſe of the heauenly Circles and Zones ſhall be ſhewed more fitly in our Geographicall treatiſe of the earth, foraſmuch as the conſideration thereof appertaineth wholly thereunto: onely we will not put off, but preſently declare the deuiſers of the Zodiake, wherin the ſignes are.

The obliquitie and crookedneſſe thereof, *Anaximander* the Mileſian is reported to haue obſerued firſt, and thereby opened the gate and paſſage to Aſtronomie, and the knowledge of all things: and this happened in the 58 Olympias. Afterwards *Cleoſtratus* marked the ſignes therin, and namely thoſe firſt of *Aries* and *Sagitarius*. As for the ſphere it ſelfe, *Atlas* deuiſed long before. Now for this time we will leaue the very bodie of the ſtarry heauen, and treat of all the reſt betweene it and the earth.

F Certaine it is, that the Planet which they call *Saturne*, is the higheſt; and therefore ſeemeth leaſt: alſo that he keepeth his courſe, and performeth his reuolution in the greateſt circle of all: and in thirtie yeares ſpace at the ſooneſt, returneth againe to the point of his firſt place. Moreouer, that the mouing of all the Planets, and withall of Sun and Moone, go a contrarie courſe vnto the ſtarrie heauen, namely, to the left hand (*i.* Eaſtward:) whereas the ſaid heauen alwaies

haſteneth to the right[*i.* Weſtward.] And albeit in that continuall turning with exceeding celerity, thoſe planets be lifted vp aloft, and carried by it forcible into the Weſt, and there ſet: yet by a contrarie motion of their owne, they paſſe euery one through their ſeuerall waies Eaſtward, and all for this, that the aire rolling euer one way, and to the ſame part, by the continuall turning of the heauen, ſhould not ſtand ſtill, grow dul, & as it were congealed, whiles the globe thereof reſteth idle, but diſſolue and cleaue, parted thus, & diuided, by the reuerberation of the contrarie beams, and violent croſſe influence of the ſaid planets. Now, the Planet *Saturne* is of a cold and frozen nature, but the circle of *Iupiter* is much lower than it, and therfore his reuolution is performed with a more ſpeedy motion, namely, in twelue yeres. The third of *Mars*, which ſome call the Sphere of *Hercules*, is firy and ardent, by reaſon of the Suns vicinity, and wel-neere in two yeares runneth his race. And hereupon it is, that by the exceeding heate of *Mars*, and the vehement cold of *Saturne*, *Iupiter*, who is placed betwixt, is well tempered of them both, and ſo becommeth good and comfortable. Next to them is the race of the Sun, conſiſting verily of 360 parts [or degrees:] but to the end that the obſeruation of the ſhadowes which he caſteth, may return againe iuſt to the former marks, fiue daies be added to euery yeare, with the fourth part of a day ouer and aboue. Whereupon euery fifth yeere leapeth, and one odde day is ſet to the reſt: to the end that the reckoning of the times and ſeaſons might agree vnto the courſe of the Sun. Beneath the Sun a goodly faire ſtar there is, called *Venus*, which goeth her compaſſe, wandring this way and that, by turnes: and by the very names that it hath, teſtifieth her emulation of Sun and Moone. For all the while that ſhe preuenteth the morning, and riſeth Orientall before, ſhe taketh the name of *Lucifer* (or Day-ſtar) as a ſecond Sun haſtning the day. Contrariwiſe, when ſhe ſhineth from the Weſt Occidentall, drawing out the day light at length, and ſupplying the place of the Moone, ſhe is named *Veſper*. This nature of hers, *Pythagoras* of Samos firſt found out, about the 42 olympias, which fel out to be the 142 yere after the foundation of Rome. Now this planet in greatneſſe goeth beyond all the other fiue: and ſo cleare and ſhining withall, that the beames of this one ſtar caſt ſhadowes vpon the earth. And hereupon commeth ſo great diuerſitie and ambiguitie of the names thereof: whiles ſome haue called it *Iuno*, other *Iſis*, and otherſome the Mother of the gods. By the naturall efficacie of this ſtar, all things are engendred on earth: for whether ſhe riſe Eaſt or Weſt, ſhe ſprinckleth all the earth with dew of generation, and not onely filleth the ſame with ſeed, cauſing it to conceiue, but ſtirreth vp alſo the nature of all liuing creatures to engender. This planet goeth through the circle of the Zodiake in 348 daies, departing from the Sun neuer aboue 46 degrees, as *Timæus* was of opinion. Next vnto it, but nothing of that bigneſſe and powerful efficacie, is the ſtar *Mercurie*, of ſome cleped *Apollo*: in an inferiour circle he goeth, after the like manner, a ſwifter courſe by nine daies: ſhining ſometimes before the Sun-riſing, otherwhiles after his ſetting, neuer farther diſtant from him than 23 degrees, as both the ſame *Timæus* and *Soſigenes* doe ſhew. And therefore theſe two planets haue a peculiar conſideration from others, and not common with the reſt aboue named. For thoſe are ſeene from the Sun a fourth, yea, and third part of the heauen: oftentimes alſo in oppoſition ful againſt the Sun. And all of them haue other greater circuits of full reuolution, which are to be ſpoken of in the diſcourſe of the great yeare.

Saturne. *Iupiter.* *Mars.* *The Sunne.* *Venus.* *Mercury.*

How much was the great Mart mistaken? L

Chap. IX.

¶ *Of the Moones nature.*

The Moone.

BVt the Planet of the Moone, being the laſt of all, moſt familiar with the earth, and deuiſed by Nature for the remedie of darkneſſe, out-goeth the admiration of all the reſt. She with her winding and turning in many and ſundry ſhapes, hath troubled much the wits of the beholders, fretting and fuming, that of this ſtarre, being the neereſt of all, they ſhould be moſt ignorant, growing as it doth, or elſe waining euermore. One while bended pointwiſe into tips of hornes: another whiles diuided iuſt in the halfe, and anon againe in compaſſe round: ſpotted ſometime and darke, and ſoone after on a ſudden exceeding bright: one while big and full, and another while all at once nothing to bee ſeene. Sometime ſhining all night long, and otherwhiles late it is ere ſhe riſeth: ſhee alſo helpeth the Sunnes light ſome part of the day: eclipſed, and yet in that eclipſe to be ſeene. The ſame at the moneths end lieth hidden, at what time (it is ſuppoſed) ſhee laboureth,

M

20030

A reth and trauelleth not. At one time yee ſhall ſee her below, and anon aloft: and that not after one manner, but one while reaching vp cloſe to the higheſt heauen, and another while ready to touch the mountains: ſometimes mounted on high into the North, and ſometime caſt down below into the South. Which ſeuerall conſtitutions and motions in her, the firſt man that obſerued, was *Endymeon*: and thereupon the voice went, That he was enamoured vpon the Moone. Certes, thankfull we are not, as we ought to be, vnto thoſe who by their trauell and carefull endeuour haue giuen vs light in this light. But delighted rather we are wonderouſly (ſuch is the peſtilent wit and wicked diſpoſition of man) to record in Chronicles, bloudſhed and murders: that lewd acts and miſchieuous deeds ſhould be knowne of them, who otherwiſe are ignorant of the world it ſelfe. Well, to proceed, the Moon being next to the Centre, and therfore of leaſt
B compaſſe, performes the ſame courſe and circuit in ſeuen and twentie daies, and one third part of a day; which *Saturne* the higheſt planet runnes (as we ſaid before) in thirty yeres. After this, making ſtay in coniunction with the Sun two daies, forth ſhe goes, and by the thirtieth day at the moſt, returneth to the ſame point and miniſtery againe: the miſtreſſe, if I may ſo ſay, and the teacher of all things Aſtronomicall, that may be known in heauen. Now by her meanes are we taught that the yeere ought to be diuided into twelue moneths: for as much as, the Moone meeteth or ouertaketh the Sun ſo many times before he returneth to the ſame point where he began his courſe. Likewiſe that ſhee loſeth her light (as the reſt of the planets) by the brightnes of the Sun, when ſhe approcheth neere. For borrowing wholly of him her light, ſhee doth ſhine: much like to that which we ſee glittering and flying too and fro in the reflection and re-
C uerberation of the Sun-beames from the water. And hereupon it is, that ſhe, by her more mild and vnperfect power diſſolueth, yea and increaſeth, ſo great moiſture as ſhe doth; which the ſun beames may conſume. Hence it comes alſo, that her light is not euen and equall in ſight, becauſe then only when ſhe is oppoſite vnto the Sunne, ſhe appeareth full: but all other daies ſhe ſheweth no more to vs here on earth, than ſhe conceiueth light of the Sunne. In time verily of coniunction or change, ſhe is not ſeene at all: for that whiles ſhe is turned away, all the draught of light, ſhe caſteth thither backe againe, from whence ſhe receiued it. Now, that theſe planets are fed doubtles with earthly moiſture, it is euident by the Moone: which ſo long as ſhe appeareth by the halfe in ſight, neuer ſheweth any ſpots, becauſe as yet ſhee hath not her full power of light ſufficient, to draw humour vnto her. For theſe ſpots be nothing elſe but the dregs of
D the earth, caught vp with other moiſture among the vapors.

Chap. X.

¶ *Of the Sunne and Moones eclipſe: and of the Night.*

MOreouer, the eclipſe of the Moone and Sunne (a thing throughout the vniuerſall contemplation of Nature moſt maruellous, and like a ſtrange and prodigious wonder) doth ſhew the bigneſſe and ſhadow of theſe two planets. For euident it is, that the Sunne is hidden by the comming betweene of the Moone: and the Moone againe by the oppoſition of the Earth: alſo that the one doth quit the other, in that the Moone by her inter-
E poſition bereaueth the Earth of the Sunnes raies, and the earth againe doth the ſemblable by the Moone. Neither is the Night any thing elſe but the ſhade of the Earth. Now the figure of this ſhadow reſembleth a pyramis, pointed foreward, or a top turned vp ſide downe: namely, when as it falleth vpon it with the ſharpe end thereof, nor goeth beyond the heights of the Moone; for that no other ſtarre is in that manner darkened: and ſuch a figure as it, alwaies endeth point-wiſe. And verily, that ſhadowes grow to nothing in great ſpace of diſtance, appeareth by the exceeding high flight of ſome foules. So as the confines of theſe ſhadowes, is the vtmoſt bound of the aire, and the beginning of the fire. Aboue the Moone all is pure and lightſome continually. And we in the night doe ſee the ſtarres, as candles or any other lights from out of darkeneſſe. For theſe cauſes alſo the Moone in the night ſeaſon is eclipſed onely.
F But the reaſon why the Sun and Moone, are not both in the eclipſe ta ſet times and monethly, is the winding obliquitie of the Zodiake, and the wandering turnings of the Moone one while farre South, and another while as much North (as hath been ſaid:) and for that theſe planets do not alwaies in their motion meet juſt in the points of the eclipticke line, to wit, in the head or taile of the Dragon.

G

Chap. XI.

¶ *Of the magnitude of Starres.*

THe reaſon of this lifteth vp mens mindes into heauen: and as if they beheld and looked downe from thence, diſcouer vnto them the magnitude of the three greateſt parts of the whole world. For the Sunnes light could not wholly be taken away from the earth, by the Moone comming betweene, in caſe the earth were bigger than the Moone. But the huge greatneſſe of the Sunne is more certainely knowne, both by the ſhadow of the Earth, and the bodie of the Moone: ſo as it is needleſſe to ſearch and inquire into the largeneſſe thereof, either by proofe of eie-ſight, or by coniecture of the minde. How vnmeaſurable it is, appeareth H
euidently by this, That trees which are planted in limits from Eaſt to Weſt, caſteth ſhadowes equall in proportion; albeit they be neuer ſo many miles aſſunder in length: as if the Sunne were in the middeſt of them all. This appeareth alſo about the time of the equinoctiall in all regions meridionall, when the Sunne ſhineth directly plumbe ouer mens heads, and cauſeth no ſhadow. In like manner, the ſhadowes of them that dwell Northerly vnder the Solſtitiall circle in Summer, falling all at noone tide, Northward, but at Sunne-riſing, Weſtward, doing the ſame demonſtration. Which poſſibly could not be, vnleſſe the Sunne were far greater than the earth. Moreouer, in that, when he riſes, he ſurpaſſes in breadth the hil Ida, compaſſing the ſame at large both on the right hand and the left, and namely, being ſo farre diſtant as he is. The eclipſe of the Moone doth ſhew alſo the bigneſſe of the Sunne, by an infallible I
demonſtration; like as himſelfe eclipſed, declareth the littleneſſe of the earth. For whereas there be of ſhadowes three formes and figures: and euident it is, that if the darke materiall body which caſteth a ſhadow, be equall in bigneſſe to the light, then the ſhadow is faſhioned like a colume or piller, and hath no point at the end: if it be greater, it yeeldeth a ſhadow like a top directly ſtanding vpon the point, ſo as the nether part therof is narroweſt, and then the ſhadow likewiſe is of infinite length: but if the ſaid body be leſſe than the light, then is repreſented a pyramidall figure like an hey-cocke, falling out ſharpe pointed in the top; which manner of ſhadow appeareth in the Moones eclipſe: it is plaine, manifeſt, and without all doubt, that the Sunne is much bigger than the earth. The ſame verily is ſeen by the ſecret and couert proofes of Nature it ſelfe. For why in diuiding the times of the yeere, departeth the Sunne from vs in K
the winter? marry, euen becauſe by meanes of the nights length and cooleneſſe, he would refreſh the earth, which otherwiſe no doubt he ſhould haue burnt vp: for, it notwithſtanding, he burneth it in ſome meaſure, ſo exceſſiue is the greatneſſe thereof.

Chap. XII.

¶ *The inuentions of man as touching the obſeruation of the heauens.*

THe reaſon verily of both eclipſes, the firſt Romane that publiſhed abroad and diuulged, was *Sulpitius Gallus*, who afterward was Conſull, together with *M. Marcellus*: but at that time being a Colonell, the day before that King *Perſeus* was vanquiſhed by L
Paulus, he was brought forth by the Generall into open audience before the whole hoſt, to fore-tell the eclipſe which ſhould happen the next morning: whereby he deliuered the armie from all penſiueneſſe and feare, which might haue troubled them in the time of battell, and within a while after he compiled alſo a booke thereof. But among the Greeks, *Thales Meleſius* was the firſt that found it out, who in the eight and fortieth Olympias, and the fourth yeere thereof, did prognoſticate and foreſhew the Sunnes eclipſe that happened in the reigne of *Halyattes*, and in the 170. yeere after the foundation of the citie of Rome. After them, *Hipparchus* compiled his Ephemerides, containing the courſe and aſpects of both theſe planets, for ſix hundred yeeres enſuing: comprehending withall the moneths according to the calculation & reckonings of ſundry nations, the daies, the houres, the ſcituation of places, the aſpects, M
and latitudes of diuers townes and countries; as the world will beare him witneſſe: and that no leſſe aſſuredly, than if he had been priuie to Natures counſels. Great perſons and excellent theſe were doubtleſſe, who aboue the reach of all capacitie of mortall men, found out the reaſon of the courſe of ſo mighty ſtarres and diuine powers: and whereas the fillie minde of men

was

20030

A was before ſet and to ſeeke, fearing in theſe eclipſes of the ſtarres, ſome great wrong and violence, or death of the planets, ſecured them in that behalfe: in which dreadful feare ſtood *Steſichorus* and *Pindarus* the Poets (notwithſtanding their lofty ſtile,) and namely at the eclipſe of the Sun, as may appeare by their poems. As for the Moone, mortall men imagine, that by magicke, ſorceries, and charmes, ſhe is inchanted, and therefore helpe her in ſuch a caſe when ſhe is eclipſed by diſſonant ringing of baſons. In this fearefull fit alſo of an eclipſe, *Nicias* the Generall of the Athenians, as a man ignorant of the courſe thereof, feared to ſet ſaile with his fleet out of the hauen, and ſo greatly endangered and diſtreſſed the ſtate of his countrey. Faire chieue yee then for your excellent wit, O noble Spirits, interpretors of the heauens, capable of Natures works, and the deuiſers of that reaſon whereby ye haue ſurmounted both God and
B man. For who is he, that ſeeing theſe things, and the painfull ordinarie trauels, ſince that this terme is now taken vp, of the ſtars; would not beare with his owne infirmitie, and excuſe this neceſſitie of being born to die? Now for this preſent I will briefly and ſummarily touch thoſe principall points which are confeſſed and agreed vpon as touching the ſaid eclipſes, hauing lightly rendred a reaſon thereof in moſt needfull places: for neither ſuch prouing and arguing of theſe matters belongs properly to our purpoſed worke; neither is it leſſe wonder to be able to yeeld the reaſon and cauſes of all things, than to be reſolute and conſtant in ſome.

Chap. XIII.

¶ *Of Eclipſes.*

C

CErtaine it is, that all Eclipſes in 222 moneths haue their reuolutions, and return to their former points: as alſo that the Sun's eclipſe neuer happeneth but vpon the change of the Moone, namely either in the laſt of the old, or firſt of the new, which they call conjunction: and that the Moone is neuer eclipſed but in the full, and alwaies ſomewhat preuents the former Eclipſe. Moreouer, that euery yeare both planets are eclipſed at certaine dayes and houres vnder the earth. Neither be theſe eclipſes in all places ſeene when they are aboue the earth, by reaſon ſomerimes of cloudy weather, but more often, for that the globe of the earth hindereth the ſight of the bending conuexitie of the heauen. Within theſe two hundred yeres was it found out by the witty calculation of *Hipparchus*, that the Moone ſometimes was eclip-
D ſed twice in fiue moneths ſpace, and the Sun likewiſe in ſeuen: alſo that the Sun and Moone twice in thirty dayes were darkned aboue the earth: howbeit ſeene this was not equally in all quarters, but of diuers men in diuers places: and that which maketh me to maruell moſt of all in this wonder, is this, that when agreed it is by all, that the Moone light is dimmed by the ſhadow of the earth, one while this eclipſe hapneth in the Weſt, and another while in the Eaſt: as alſo by what reaſon it hapned, that ſeeing after the Sunne is vp, that ſhadow which dusketh the light of the Moone muſt needs be vnder the earth; it fell out once, that the Moone was eclipſed in the Weſt, and both planets to be ſeene aboue the ground in our horiſon: for that in twelue daies both theſe lights were miſſing, and neither Sun nor Moon were ſeen, it hapned in our time, when both the *Veſpaſians* (Emperors) were Conſuls, the father the third time, and the
E ſon the ſecond.

Chap. XIV.

¶ *Of the Moones motion.*

CLeare it is, that the Moone alwaies in her encreaſing hath the tips of her hornes turned from the Sun toward the Eaſt: but in the waine contrariwiſe Weſtward. Alſo that ſhe ſhines the firſt day of her apparition, $\frac{1}{4}$ parts, and the foure and twentieth part of an houre, and ſo riſeth in proportion the ſecond day forward, vnto the full: and likewiſe decreaſeth in the ſame manner to the change. But alwaies ſhe is hidden in the change within four-
F teene degrees of the Sunne. By which argument we collect, that the magnitude of the other Planets is greater than that of the Moone, for ſo much as they appeare otherwhiles when they be but ſeuen degrees off. But the cauſe why they ſhew leſſe, is their altitude: like as alſo the fixed ſtarres, which by reaſon of the brightneſſe of the Sunne are not ſeene in the day time; whereas indeed they ſhine as clearely by day as by night. And that is manifeſtly proued by

ſome

ſome eclipſes of the Sun, and exceeding deepe pits, for ſo they are to be ſeene by day light. G

Chap. XV.

¶ *Generall rules touching the motions and lights of other Planets.*

THoſe three which we ſay are aboue the Sun be hidden when they goe their courſe together with him. They ariſe in the morning, and be called Orientall Matutine, and neuer depart farther than eleuen degrees. But afterwards meeting with his raies and beames, they are couered, and in their triple aſpect retrograde, they make their morning ſtation a hundred and twenty degrees off, which are called the firſt; and anon in a contrarie aſpect or oppoſition, 180 degrees off, they ariſe in the euening, and are Occidentall Veſpertine. In like ſort H approching from another ſide within an hundred and twenty degrees, they make their euening ſtations, which alſo they call the ſecond, vntill he ouertake them within twelue degrees, and ſo hide them, and theſe are called the euening ſettings. As for *Mars*, as he is neerer vnto the Sun, ſo feeleth he the Sun beames by a quadrant aſpect, to wit ninetie degrees, whereupon that motion tooke the name, called the firſt and ſecond Nonagenarie from both riſings. The ſame planet keepeth his ſtationarie reſidence ſix moneths in the ſignes: whereas otherwiſe of his owne nature but two moneths. But the other planets in both ſtations or houſes continue not all out foure moneths apiece. Now the other two inferiour planets vnder the Sun go downe and are hidden after the ſame manner in the euening Coniunction, and in as many degrees they make their morning riſing: and from the fartheſt bounds of their diſtance they follow I the Sun, and after they haue once ouertaken him, they ſet againe in the morning, and ſo outgo him. And anon keeping the ſame diſtance, in the euening they ariſe againe vnto the ſame limits which we named before, from whence they are retrograde, and return to the Sun, and by the euening ſetting they be hidden. As for *Venus*, ſhe likewiſe maketh two ſtations, according to the two manners of her apparance, morning and euening, when ſhe is in fartheſt bounds and vtmoſt points of her Epicycle. But *Mercurie* keepeth his ſtations ſo ſmall a while that they cannot be obſerued. This is the manner and order as well of the lights and appearances of the planets, as of their occultations, and keeping cloſe intricate in their motion, and enfolded within many ſtrange wonders. For change they do their magnitudes and colours; ſometime they approch into the North, the ſame againe go backe toward the South, yea, and all on a K ſudden they appeare one while neerer to the earth, and another while to the heauen: wherein if we ſhall deliuer many points otherwiſe than former Writers, yet confeſſe we do, that for theſe matters we are beholden vnto them, who firſt made demonſtration of ſeeking out the wayes thereto: howbeit let no man diſpaire, but that hee may profit and goe forward alwaies in further knowledge from age to age. For, theſe ſtrange motions fall out vpon many cauſes. The firſt is, by reaſon of thoſe eccentrique circles or Epicycles in the ſtars, which the Greekes call *Abſides*; for needs we muſt vſe in this treatiſe the Greeke termes. Now euery one of the planets haue particular Auges or circles aforeſaid by themſelues, and theſe different from thoſe of the ſtarry heauen: for that the earth from thoſe two points which they call Poles, is the very centre of the heauen, as alſo of the Zodiacke, ſcituate ouerthwart betweene them. All which L things are certainly knowne to be ſo by the compaſſe, that neuer can lie. And therefore for euery centre there ariſe their owne *Abſides*, whereupon it is, that they haue diuers circuits, and different motions, becauſe neceſſarie it is, that the inward and inferiour *Abſides* ſhould be ſhorter.

Chap. XVI.

¶ *Why the ſame Planets ſeeme ſometime higher, and ſome lower.*

THe higheſt *Abſides* therefore from the centre of the earth are of *Saturne*, in the ſigne Scorpio: of *Iupiter*, in Virgo: of *Mars*, in Leo: of the Sun, in Gemini: of *Venus* in M Sagittarius: of *Mercury* in Capricorne: and namely in the middle or fifteenth degree of the ſaid ſignes: and contrariwiſe the ſaid planets in the ſame degrees of the oppoſite ſignes are loweſt, and to the centre of the earth neereſt. So it commeth to paſſe, that they ſeeme to moue more ſlowly when they goe their higheſt circuit: not for that

20030

A that naturall motions doe either haſten or ſlacke, which be certaine and ſeuerall to euery one: but becauſe the lines which are drawne from the top of the *Abſis*, muſt needs grow narrow and neere together about the centre, as the ſpokes in cart wheeles: and the ſame motion by reaſon of the neereneſſe of the centre, ſeemeth in one place greater, in another leſſe. The other cauſe of their ſublimities is, for that in other ſignes they haue the *Abſides* eleuated higheſt from the centre of their own eccentrique circles. Thus *Saturne* is in the height of his Auge in the 20. degree of Libra, *Iupiter* in the 15. of Cancer, *Mars* in the 28. of Capricorne, the Sunne in the 29. of Aries, *Venus* in the 16. of Piſces, *Mercurie* in the 15. of Virgo, and the Moone in the 4. of Taurus. The third reaſon of their altitude or eleuation, is not taken from their Auges or circles accentrique, but vnderſtood by the meaſure and conuexitie of heauen, for that theſe planets ſeeme to
B the eie as they riſe and fall, to mount vp or ſettle downward through the aire. Hereunto is knit and vnited another cauſe alſo, to wit, the Zodiaks obliquitie, & latitude of the planets, in regard of the eclipticke: For through it the ſtarres which we called wandering, do moue and take their courſe. Neither is there any place inhabited vpon earth, but that which lieth vnder it. For al the reſt without the poles, are fruitles, deſart, and ill fauoured. Only the planet *Venus* goeth beyond the circle of the Zodiake, 2. degrees: which is ſuppoſed to be the very efficient cauſe, that certaine liuing creatures are ingendred and bred euen in the deſart and vnhabitable parts of the world. The Moone likewiſe rangeth throughout all the bredth of it, but neuer goeth out of it. Next after theſe, the ſtarre of *Mercurie* hath the largeſt ſcope in the Zodiake, but yet ſo, as of 12. degrees (for that is the bredth thereof) he wandreth but 8. and thoſe not equally, but two in
C the midſt, foure aboue, and two beneath. Then the Sunne in the midſt, goeth alwaies betweene the two extremities of the Zodiake: but in his declining courſe from South and North, he ſeemeth to wind bias after the maner of Dragons or Serpents, vnequally. *Mars* in his latitude leaueth the eclipticke line foure halfe degrees, *Iupiter* two degrees and a halfe, *Saturne* no more but two, like as the Sunne. Thus you ſee the manner of the latitudes, as they deſcend Southward, or aſcend Northward. And vpon this is the reaſon grounded alſo of the 3. opinion of them, who imagine that the planets do ariſe and mount from the earth vpward into heauen. For very many haue thought, although vntruly, that they climbe in this manner. But to the end that they may be reproued and confuted, we muſt lay open an infinite and incomprehenſible ſubtiltie, & that which containeth all thoſe cauſes & reaſons aboueſaid. Firſt therfore this is agreed on and re-
D ſolued, that theſe ſtars or planets in their euening ſetting, are neereſt to the earth, both in regard of latitude, & alſo of altitude: and then they be called Occidentall Veſpertine, when the Sun toward the euening couereth them with his raies: alſo, when they be fartheſt from the earth, as wel in latitude as eleuation, they be Orientall Matutine, & ariſe or appeare in the morning before the Sun is vp: as alſo that then they are Stationaries in their houſes, which be in the middle points of the latitudes which they call eclipticks. Likewiſe, confeſſed it is, that ſo long as the planets are neer to the earth, their motion ſeemeth to encreaſe & be quicke: but as they depart on high, to decreaſe and be ſlow. And this reaſon is approued & confirmed principally by the eleuations and depreſſions of the Moone. As doubtles it is alſo, and held for an infallible rule, that euery planet being Orientall Matutine, riſeth euery day higher than other. The ſuperior
E three aboue the Sun diminiſh euen from their firſt ſtations vnto the ſecond. Which being ſo, it will plainly appeare, that euery planet Orientall Matutine, riſing before the Sun, beginns to mount the latitude Septentrionall, & decline from the Ecliptick Northward: in ſuch ſort, that from the time they begin to diſmarch, their motion increaſes by little and little more ſparely. But in the firſt Stations, they are at the higheſt altitude & aſcent: for then and not before, the numbers begin to be withdrawne, & the planets to go backward, and be retrograde. Whereof a particular reaſon by it ſelfe may be giuen, in this maner: The Planets being ſmitten in that part wherof we ſpake, they are both inhibited by the triangular beames or Trine aſpect of the ſun, to hold on a ſtraight and direct courſe in the longitude of heauen, and ſo be retrograde: and ſo are raiſed vp aloft by the firie power of the ſaid ſun. This cannot preſently at the firſt be vn-
F derſtood by our eieſight: whereupon they are ſuppoſed to ſtand, and hereof their Stations took the name. Then proceedeth forward the violence of the Sun beames or aſpect, and the vapour thereof by repercuſſion, forceth them to be euidently retrograde, and go backward. And much more is this perceiued in their euen riſing, when they be Orientall Veſpertine, when the Sun is wholly againſt them, and when they be driuen to the very top of their *Abſides*, and ſo not ſeene

at

at all, becauſe they are at the higheſt, and goe their leaſt motion, which is ſo much the leſſe, G when as it hapneth in the higheſt ſignes of their Auges or *Abſides*. From the euen ariſing after the Sunne ſetting, they deſcend toward the latitude meridion all, for now the motion leſſe diminiſheth, but yet encreaſeth not before the ſecond ſtations: for that they are forced to deſcend, by reaſon of the Sun beames comming from the other ſide of their Epycicle: and the ſame force beareth them downeward againe to the earth, which by the former triangular aſpect raiſed them aloft towards heauen. So much skilleth it whether the ſaid beames came from beneath or aboue. The ſame happeneth much more in the euen ſetting, when they be hidden with the raies of the Sun. This is the reaſon of the ſuperiour planets aboue the Sunne: but the Theorique is more difficult of the reſt, and hath by no man before vs been deliuered.

H

Chap. XVII.

¶ *Generall rules as touching the Planets.*

FIrſt and formoſt therefore let vs ſet downe the cauſe why *Venus* ſtarre neuer departeth from the Sunne more than 46. degrees, and *Mercurie* not aboue 23. and (being as they are diuers Planets) why oftentimes they retyre backe vnto the Sunne within that compaſſe. For to be reſolued in this point, note we muſt, that both of them haue their *Abſides* turned oppoſite to the reſt, as being ſeated vnder the Sun: and ſo much of their circles is vnderneath, as the forenamed were aboue: and therefore farther off they cannot be, becauſe the curuature and roundle of their *Abſides* in that place hath no I greater longitude. Therefore both edges of their *Abſides*, by a like proportion keepe an indifferent meane, & their courſe is limited: but the ſhort ſpaces of the longitudes, they recompence againe with the wandring of their latitudes. But what is the reaſon that they reach not alwaies to 46. degrees, and to 23? yes ywis do they: but this the Canonicall Aſtronomers haue miſſed of in their Aphoriſmes. For it is apparent, that their *Abſides* alſo or Auges do moue, becauſe they neuer ouerpaſſe the Sunne. And therefore when their edges from either ſide are perceiued to fall vpon the very point, then the planets alſo are ſuppoſed to reach vnto their longeſt diſtances: but when their edges or the points of their Epicicles be ſhort ſo many degrees, the ſtarres themſelues are thought to returne more ſpeedily in their retrogradation, than in their direct courſe forward, albeit the vtmoſt extremitie which they both haue, is euer the ſame. And from K hence is the reaſon vnderſtood of the contrary motions of theſe two planets. For the ſuperiour planets moue moſt ſwiftly in the euen ſetting, but theſe moſt ſlowly. They, I ſay, be fartheſt from the earth, when they moue ſloweſt; and theſe when they goe ſwifteſt: for as in the former the neereneſſe of the centre haſteneth them; ſo in theſe, the extremitie of the circle: they, from their morne riſing begin to ſlack their celeritie; but theſe, to encreaſe it: they returne back from their morning Station to their euening manſion; but *Venus* contrariwiſe is retrograde from the Station Veſpertine, to the Matutine. Howbeit, ſhe from the morne riſing beginneth to climbe the [illegible]itude Septentrionall: but to follow the altitude and the Sunne, from the morning ſtation; as being moſt ſwift, and at the higheſt, in the morn ſetting. Moreouer, ſhee beginnes to digreſſe in latitude, and to diminiſh her motion from the morn riſing: but, to be retrograde, and withall to L digreſſe in altitude, from the euening ſtation. Againe, the planet *Mercury*, being Oriental Matutin, begins both waies to climb, that is, to mount higher day by day; but to digreſſe in latitude, being Orientall Veſpertine: and when the Sunne hath ouertaken him within the diſtance of fifteene degrees, he ſtands ſtill for foure daies vnmoueable. Within a while he deſcendeth from his altitude dayly, and goeth backe retrograde from the euen ſetting, namely, when the Sunne hideth him with his raies, to the Moone riſing, when hee appeareth before the Sunne is vp. This ſtarre onely, and the Moone, deſcend in as many daies as they aſcend. But *Venus* aſcendeth vp to her ſtation in fifteene daies and the vantage. Againe, *Saturne* and *Iupiter* are twice as long deſcending, and *Mars* foure times. See how great variety is in their nature, but the reaſon thereof is euident. For they which go againſt the vapour and heate of the Sunne do alſo hardly M deſcend. Many ſecrets more of Nature, and lawes whereunto ſhe is obedient, might be ſhewed about theſe things. As for example: The planet of *Mars*, whoſe courſe of all others can be leaſt obſerued, neuer maketh ſtation but in quadrate aſpect: as for *Iupiter*, in triangle aſpect: and very ſeldome ſeuered from the Sunne 60. degrees, which number maketh ſix angled formes of the heauen,

20030

A heauen, that is to ſay, is the iuſt ſixth part of the heauen: neither doth *Iupiter* ſhew his riſing in the ſame ſigne this yeare, as in the former, ſaue onely in two ſignes, *Cancer* and *Leo*. The planet *Mercurie* ſeldome hath his euen riſing in *Piſces*, but very often in *Virgo*, and the morne riſing in *Libra*. In like manner, the morne riſing in *Aquarius*, but very ſeldome in *Leo*. Neither becommeth he retrograde in *Taurus* and *Gemini*: and in *Cancer*, not vnder the 25 degree. As for the Moone, ſhe entreth not twice in coniunction with the Sun in any other ſigne but in *Gemini*; and ſometime hath no coniunction at all, and that only in *Sagitarius*. As for the laſt and firſt of the Moone, to be ſeene in one and the ſelfe ſame day or night, hapneth in no other ſigne but *Aries*, and few men haue had the gift to ſee it: and hereupon came *Linceus* to be ſo famous
B for his eye ſight. Alſo the planets *Saturne* and *Mars* are hidden with the Sun beames, and appeare not in the heauen at the moſt 170 dayes: *Iupiter* 36, or at leaſt ten daies wanting, *Venus* 69, or when leaſt 52. *Mercury* 31, or at leaſt 17.

Chap. XVIII.

¶ *What is the cauſe that the Planets alter their colour.*

THe reaſon of the Planets altitudes is it that tempereth their colours, according as they be neerer or farther off from the earth. For they take the likeneſſe of the aire, into the coaſts whereof they enter in their aſcent: and the circle or circumference of another Planets motion coloureth them as they paſſe either way, aſcending or deſcending. The colder
C ſetteth a pale colour, the hotter a red, and the windie a fearefull and rough hue. Onely the points and coniunctions of the *Abſides*, and the vtmoſt circumferences ſhew a darke blacke. Each planet hath a ſeuerall colour: *Saturne* is white, *Iupiter* cleare and bright, *Mars* fierie and red, *Venus* Orientall (or *Lucifer*) faire, Occidentall (or *Veſper*) ſhining, *Mercury* ſparkeling his raies; the Moone pleaſant, the Sunne when he riſeth burning, afterwards glittering with his beames. Vpon theſe cauſes the ſight is intangled, and diſcouereth euen thoſe ſtars alſo which are contained and fixed in the ſky, more or leſſe. For one while a number of them appeare thicke about the halfe Moone, when in a cleare and calme night ſhe gently beautifieth them. Another while they are ſeen but here and there, inſomuch as we may wonder that they are fled vpon the full Moone, which hideth them: or when the beams either of the Sun or other aboue
D ſaid haue dazled our ſight. Yea, the very Moone her ſelfe hath a feeling doubtleſſe of the Sun beames, as they come vpon her: for thoſe raies that come ſidelong, according to the conuexitie of the heauen, giue but a darke and dim light to the Moone, in compariſon of them that fall directly with ſtraight angles. And therefore in the quadrangle aſpect of the Sun ſhe appeareth diuided in halfe: in the triangle ſhe is well neere inuironed, but her circle is half emptie and void, howbeit in the oppoſition ſhe ſeemeth full: and againe, as ſhe is in the waine ſhe repreſenteth the ſame formes, decreaſing by quarters as ſhe increaſed, with like aſpects as the other three planets aboue the Sun.

Chap. XIX.

E ¶ *The reaſon of the Suns motion, and the vnequalitie of daies.*

AS for the Sun himſelfe, a man may obſerue foure differences in his courſe, twice in the yeare making the night equall with the day, to wit, in the Spring and Autumne, for then he falleth iuſt vpon the entre of the earth, namely in the eight degree of *Aries* and *Libra*. Twice likewiſe exchanging the compaſſe of his race; to lengthen the day from the *Bruma* or mid-winter, in the eighth degree of Capricorne: and againe to lengthen the night from the Sommer Sunſted, being in as many degrees of *Cancer*. The cauſe of vnequall daies is the obliquitie of the Zodiake: whereas the one halfe iuſt of the world, to wit, ſix ſignes of the Zodiake, is at all times aboue and vnder the earth. But thoſe ſignes which mount vpright in their
F riſing, hold light a longer tract, and make the daies longer: whereas they which ariſe crooked and go by as paſſe away in ſhorter and ſwifter time.

CHAP.

G

Chap. XX.

¶ *Why lightnings are attributed to Iupiter.*

MOſt men are ignorant of that ſecret, which by great attendance vpon the heauens, deepe Clerkes and principall men of learning haue found out: namely, that they be the fires of the three vppermoſt planets, which falling to the earth carry the name of lightnings: but thoſe eſpecially which are ſeated in the midſt, to wit, about *Iupiter*, haply becauſe participating the exceſſiue cold and moiſture from the vpper circle of *Saturne*, and the immoderate heate from *Mars* that is next vnder, by this meanes he diſchargeth the ſuperfluitie, and hereupon it is commonly ſaid, that *Iupiter* ſhooteth and darteth lightnings. Therefore, as out of a H
burning piece of wood a cole of fire flieth forth with a cracke; euen ſo from a ſtar is ſpit out as it were and voided forth this cœleſtiall fire, carrying with it preſages of future things: ſo as the heauen ſheweth diuine operations euen in theſe parcels and portions which are reiected and caſt away as ſuperfluous. And this moſt commonly hapneth when the aire is troubled, either becauſe the moiſture that is gathered moueth and ſtirreth forward that aboundance to fall; or elſe for that it is diſquieted with the birth (as it were) proceeding from a great bellied ſtarre, and therefore would be diſcharged of ſuch excrements.

Chap. XXI.

I

¶ *The diſtances of the Planets.*

MAny haue eſſaied to finde out the diſtance and eleuation of the planets from the earth, and haue ſet downe in writing, that the Sun is diſtant from the Moon 18 degrees, euen much as the Moone from the earth. But *Pythagoras*, a man of a quicke ſpirit, hath collected, that there are 126000 furlongs from the earth to the Moone, and a duple diſtance from her to the Sun, and ſo from thence to the twelue ſignes three times ſo much. Of which opinion was alſo our countreyman *Gallus Sulpitius*.

Chap. XXII.

K

¶ *Of the Planets muſicke and harmonie.*

BVt *Pythagoras* otherwhiles vſing the termes of Muſicke, calleth the ſpace betweene the earth and the Moone a Tonus, ſaying, that from her to *Mercurie* is halfe a tone; and from him to *Venus* in manner the ſame ſpace. But from her to the Sun as much and half again: bnt from the Sunne to *Mars* a Tonus, that is to ſay, as much as from the earth to the Moone. From him to *Iupiter* halfe a Tonus: likewiſe from him to *Saturne* halfe a Tonus: and ſo from thence to the ſigniſer Sphere or Zodiacke, ſo much and halfe againe. Thus are compoſed ſeuen tunes, which harmonie they call Diapaſon, that is to ſay, the Generalitie, or whole ſtate of
conſent and concord, which is perfect muſicke. In which, *Saturne* moueth by the Dorick tune: L
Mercury by Phthongus; *Iupiter* by the Phrygian; and the reſt likewiſe. A ſubtilty more pleaſant yw is than needfull.

Chap. XXIII.

¶ *The Geometry or dimenſion of the world.*

A Stadium or Furlong maketh of our paces an hundred twentie and fiue, that is to ſay, ſix hundred twenty and fiue foot. *Poſſidonius* ſaith, That from the earth it is no leſſe than forty ſtadia, to that height or altitude wherein thicke weather, windes, and clouds doe engender. Aboue which, the aire is pure, cleare, and light, without any troubled darkeneſſe. M
But from the cloudy and muddy region to the Moone is 2000000 ſtadia: from thence to the Sun fiue thouſand. By means of which middle ſpace betweene it commeth to paſſe, that ſo exceeding great as the Sun is, he burneth not the earth. Many there be moreouer, who haue taught, that the clouds are eleuated to the hight of nine hundred ſtadia. Vnknown theſe points

are,

20030

A are, and ſuch as men cannot wind themſelues out of: but as well may they now be deliuered to others, as they haue bin taught to vs: in which notwithſtanding, one infallible reaſon of a Geometricall collection which neuer lieth, cannot be reiected, if a man will ſearch deep into theſe matters. Neither need a man to ſeeke a iuſt meaſure hereof; for to deſire that, were in maner a point of fond and fooliſh idleneſſe, as if men had nothing elſe to do, but onely to make an eſtimate, and reſolue vpon a gueſſe and coniecture therof. For, whereas it is plaine and apparent by the courſe of the Sunne, that the circle through which he paſſeth, doth containe three hundred threeſcore, and almoſt ſix degrees: and alwaies the dimetrent line, or diameter, taketh a third part of the circumference, and little leſſe than a ſeuenth part of a 3. it is plain, that deducting one halfe thereof (by reaſon that the earth ſcituate as a centre, commeth betweene) the ſixt part
B well neere of this great circuit which he makes about the earth (ſo farre as our mind doth comprehend) is the very height from the earth vp to the Sunne, but the twelfth part to the Moone, becauſe ſhe runneth ſo much a ſhorter compaſſe than the Sun: whereby it appeareth, that ſhe is in the middeſt betweene the earth and the Sun. A wonder it is to ſee how farre the preſumpteous minde and heart of man will proceed, and namely being inuited and drawne on by ſome little ſucceſſe, as in the aboue named matter. The reaſon whereof miniſtreth plenteous occaſion of impudencie, for they who dared once to giue a gueſſe at the ſpace betweene the Sun and the earth, are ſo bold to do the like from thence to heauen. For preſuming, that the Sunne is in the middeſt, they haue at their fingers ends by and by the very meaſure alſo of the whole world. For look how many ſeuen parts the dimetrent hath, ſo many 22. parts or thereabout hath the whole
C circle: as if they had gotten the juſt and certain meaſure of the heauen by leuel, and the plumb or perpendicular line. The Ægyptians according to the reckoning which *Petoſiris* and *Necepſos* haue inuented, do collect, That euery degree in the circle of the Moone, which is the leaſt (as hath been ſaid) of all other, containeth 33. ſtadia, and ſomewhat more: in *Saturne*, the greateſt of all the reſt, duple ſo much: and in the Sunne, which we ſaid was the middeſt, the halfe of both meaſures. And this computation hath very great importance, for he that will reckon the diſtances betweene the circle of *Saturne* and the Zodiake, by this calculation ſhall multiplie an infinite number of Stadia.

Chap. XXIIII. ¶ *Of ſudden Starres.*

D THere remaine yet ſome few points as touching the world: for in the very heauen there be Starres that ſuddenly ariſe and appeare, whereof be many kindes.

Chap. XXV.

¶ *Of Comets or blazing ſtars, and cæleſtiall prodigies, their nature, ſcituation, and diuers ſorts.*

E THeſe blaſing ſtarres the Greekes call *Cometas*, our Romanes *Crinitas*: dreadfull to be ſeene, with bloudy haires, and all ouer rough and ſhagged in the top like the buſh of haire vpon the head. The ſame Greekes call thoſe ſtarres *Pogonias*, which from the nether part haue a maine hanging downe, in faſhion of a long beard. As for thoſe named *Acontiæ*, they brandiſh and ſhake like a ſpeare or dart, ſignifying great ſwiftneſſe. This was it, whereof *Tiberius Cæſar* the Emperour wrot an excellent Poeme in his fift Conſulſhip, the laſt that euer was ſeen to this day. The ſame, if they be ſhorter and ſharpe pointed in the top, they vſe to call *Xiphiæ*: and of all other paleſt they be, and glitter like a ſword, but without any reies or beames: which another kind of them, named *Diſceus* (reſembling a diſh or coit, whereof it beareth the name, but in colour like to amber) putteth forth here and there out of the brimmes and edges thereof. As for *Pitheus*, it is ſeene in forme of tunnes, enuironed within a ſmokie light, as if it were a concauitie. *Ceratias* reſembleth an horne: and ſuch a one appeared when the whole manhood of Greece fought
F the battell of Salamis. *Lampadias* is like to burning torches: and *Hippeus* to horſe maines, moſt ſwift in motion, & turning round. There is alſo a white Comet with ſiluer haires, ſo bright and ſhining, that hardly a man can endure to looke vpon it, and in mans ſhape it ſheweth the very image of a god. Moreouer, there be blazing ſtarres that become all ſhaggie, compaſſed round with hairie fringe, and a kind of maine. One heretofore appearing in the forme of a main, chan-

Pogonias. *Acontias.* *Xyphias.* *Diſceus.* *Pitheus.* *Ceratias.* *Lampadias.* *Hippeus.*

ged into a speare, namely in the 108 Olympia's, and the 398 yeare from the foundation of Rome. Noted it hath bin, that the shortest time of their appearance is a seuen-night, and the longest eighty daies: some of them moue like the wandering planets; others are fixed fast, and stir not. All in maner are seen vnder the very North star called *Charlemaignes* Wain: some in no certain part thereof, but especially in that white, which hath taken the name of the * Milk circle. *Aristotle* saith that many are seene together, a thing that no man else hath found out, so far as I can learne. Mary, boisterous windes and much heate of weather are foretokened by them. There are of them seene also in Winter season, and about the Antarticke South pole; but in that place without any beames. A terrible one likewise was seene of the people in Ethiopia and Egypt, which the King who reigned in that age named Typhon. It resembled fire, and was pleited and twisted in manner of a wreath, grim and hideous to be looked on, and no more truly to be counted a star than some knot of fire. Sometimes it falleth out, that the planets and other stars are bespred all ouer with haires: but a Comet lightly is neuer seen in the west part of the heauen.

* Galazi.

Typhon.

A fearefull star for the most part this Comet is, and not easily expiated; as it appeared by the late ciuill troubles when *Octauius* was Consul: as also a second time, by the intestine war of *Pompey* and *Cæsar*. And in our dayes about the time that *Claudius Cæsar* was poysoned, and left the Empire to *Domitius Nero*, in the time of whose reigne and gouernment there was another in manner continually seen, and euer terrible. Men hold opinion, that it is materiall for presage to obserue into what quarters it shooteth, or what stars power and influence it receiueth: also what similitudes it resembleth, and in what parts it shineth out and first ariseth. For if it be like vnto flutes or hautboies it portendeth somewhat to Musitians: if it appeare in the priuy parts of any signe, then let ruffians, whore-masters, and such filthy persons take heed. It is respectiue to fine wits, and learned men, if it put forth a triangular or foure-square figure, with euen angles, to any scituations of the perpetuall fixed stars. And it it is thought to presage, yea to sprinkle and put forth poison, if seen in the head of the Dragon either North or South.

In one only place of the whole world, namely in a Temple at Rome, a Comet is worshipped and adored, euen that which by *Augustus Cæsar* himselfe, of happy memorie, was iudged verie lucky and happy to him; who when it began to appeare, gaue attendance in person, as ouerseer of those playes and games which he made to *Venus genetrix*, not long after the death of his father *Cæsar*, in the colledge by him instituted and erected: testifying his ioy in these words, *In those very daies during the solemnities of my Plaies, there was seen a blasing star for seuen daies together, in that region of the sky which is vnder the North star* Septentriones. *It arose about the* 11 *houre of the day, bright it was and cleare, and euidently seene in all lands: by that star it was signified, as the common sort beleeued, that the soule of* (Iulius) Cæsar *was receiued among the diuine powers of the immortal gods. In which regard, that marke or ensigne of a star was set to the head of that statue of* Iulius Cæsar, *which soone after we dedicated in the Forum Romanum.* These words published he abroad: but in a more inward ioy, to himselfe he interpreted and conceiued thus of the thing, That this Comet was made for him, and that himselfe was in it borne. And verily, if we wil confesse a truth, a healthfull, good, and happy presage that was to the whole world. Some there be who beleeue, that these be perpetuall stars, and go their course round, but are not seen vnlesse they be left by the Sun. Others againe are of opinion, that they are ingendred casually by some humour, and the power of fire together, and thereby do melt away and consume.

Chap. XXVI.

¶ *Hipparchus his opinion of the Stars. Also historicall examples of Torches, Lamps, Beames, Fiery Darts, opening of the Firmament, and other such impressions.*

Hippaachus the foresaid Philosopher (a man neuer sufficiently praised, as who proued the affinitie of stars with men, and none more than he; affirming also that our soules were parcell of heauen) found out and obserued another new star ingendred in his time, and by the motion thereof on what day it first shone, he grew presently into a doubt, Whether it hapned not very often that new stars should arise; and whether those starres also moued not, which we imagined to be fixed. The same man went so farre, that he attempted (a thing euen hard

20030

A hard for God to performe, to deliuer to poſteritie the iuſt number of ſtarres. He brought the ſame ſtars within the compaſſe of rule and art, deuiſing certaine inſtruments to take their ſeueral places, and ſet out their magnitudes: that thereby it might be eaſily diſcerned, not only whether the old died, and new were borne, but alſo whether they moued, and which way they tooke their courſe, likewiſe whether they increaſed or decreaſed. Thus he left the inheritance of heauen vnto all men, if haply any one could be found able to enter vpon it as lawfull heire.

There be alſo certaine flaming torches ſhining out in the ſky, howbeit neuer ſeene but when they fall. Such a one was that which at the time that *Germ. Cæſar* exhibited a ſhew of Sword-fencers at vtterance, ran at noontide in ſight of all the people. And two ſorts there be of them,
B namely *Lampades*, which they call plaine torches; and *Bolides*, *i.* Lances, ſuch as thé Mutinians ſaw in their calamitie when their city was ſacked. Herein they differ, for that thoſe lampes or torches make long traines, whiles the forepart only is on a light fire: but *Bolis* burnes all ouer, and draweth a longer taile. There appeare and ſhine out after the ſame manner certain beams, which the Greekes call *Docus*: like as when the Lacedemonians being vanquiſhed at ſea, loſt the empire and dominion of Greece. The firmament alſo is ſeene to chinke and open, and this they name *Chaſma*.

Lampades. *Bolides.* *Docus.* *Chaſma.*

Chap. xxvij.

¶ *Of the ſtrange colours of the Sky.*

C THere appeareth in the Sky alſo a reſemblance of bloud, and (than which nothing is more dread and feared of men) a fiery impreſſion, falling from out of heauen to earth; like as it hapned in the 3 yeare of the 107 Olympias, at what time King *Philip* made all Greece to ſhake with fire and ſword. And theſe things verily I ſuppoſe to come at certaine times by courſe of nature, like as other things, and not as the moſt part thinke, of ſundry cauſes, which the ſubtill wit and head of man is able to deuiſe. They haue indeed been fore-runners of exceeding great miſeries; but I ſuppoſe thoſe calamities hapned not becauſe theſe impreſſions were, but theſe therefore were procreated to foretell the accidents that enſued afterward. Now for that they fall out ſo ſeldome, the reaſon thereof is hidden and ſecret, and ſo not knowne, as the riſing of planets aboue ſaid, the eclipſes, and many other things.

D

Chap. xxviij. ¶ *Of the Heauen flame.*

LIkewiſe there are ſeen ſtars together with the Sun all day long; yea, and very often about the compaſſe of the Sun other flames, like vnto garlands of corne eares; alſo circles of ſundry colours, ſuch as thoſe were when *Auguſtus Cæſar* in the prime of his youth entered the city of Rome after the deceaſe of his father, to take vpon him his great name and imperial title.

Chap. xxjx. ¶ *Of Cæleſtiall Crownes.*

E ALſo the ſame garlands appeare about the Moone and other goodly bright ſtars which are fixed in the firmament. Round about the Sun there was ſeene an arch, when *Lu. Opimius* and *Q. Fabius* were Conſuls: as alſo a round circle, when *L. Porcius* and *M. Acilius* were Conſuls.

Chap. xxx. ¶ *Of ſudden Circles.*

THere appeared a circle of red colour when *L. Iulius* and *P. Rutilius* were Conſuls. Moreouer, there are ſtrange eclipſes of the Sunne, continuing longer than ordinarie; as namely when *Cæſar* Dictator was murthered. Moreouer, in the wars of *Antony* the Sun continued almoſt a whole yeare of a pale wan colour.

F

Chap. xxxj. ¶ *Many Suns.*

OVer and beſides, many Suns are ſeene at once, neither aboue nor beneath the bodie of the true Sunne indeed, but croſſe-wiſe, and ouerthwart: neuer neere nor directly againſt the earth, neither in the night ſeaſon, but when the Sun either riſeth or ſetteth. Once

they are reported to haue beene ſeene at noone day in Boſphorus, and continued from morne G
to euen. Three Suns together our Anceſtors in old time haue often beheld, as namely when *Sp. Poſthumus*, with *Q. Mutius*, *Q. Martius*, with *M. Porcius*, *M. Antonius*, with *P. Dolabella*, and *Mar. Lepidus*, with *L. Plancus*, were Conſuls. Yea, and we in our daies haue ſeene the like, when *Cl. Cæſar* (of famous memorie) was Conſul, together with *Cornelius Orfitus* his Colleague. More than three we neuer to this day finde to haue been ſeene together.

Chap. XXXII. ¶ *Many Moones.*

THree Moones alſo appeared at once, and namely when *Cn. Domitius* and *C. Fannius* were Conſuls, which moſt men called Night Sunnes.

Chap. XXXIII. ¶ *Day light in the Night.* H

OVt of the Firmament by night there was ſeen a light, when *C. Cælius* and *Cn. Papyrius* were Conſuls, yea and oftentimes beſides, ſo as the night ſeemed as light as the day.

Chap. XXXIV. ¶ *Burning Shields or Targuets.*

A Burning ſhield ran ſparkling from the Weſt to the Eaſt, at the Suns ſetting, when *L. Valerius* and *C. Marius* were Conſuls.

Chap. XXXV. ¶ *A ſtrange ſight in the Sky.*

BY report there was once ſeene, and neuer but once, when *Cn. Octauius* and *C. Scribonius* were I
Conſuls, a ſparkle to fall from a ſtar: and as it approched the earth, it waxed greater; and after it came to the bigneſſe of the Moone it ſhined out and gaue light, as in a cloudy and darke day: then being retyred againe into the ſky, it became, to mens thinking, a burning Lampe. This, *Licinius Syllanus* the Proconſull ſaw, together with his whole traine.

Chap. XXXVI. ¶ *The running of Stars to and fro in the Sky.*

SEene there be alſo Stars to ſhoot hither and thither, but neuer for nought and to no purpoſe: for, from the ſame quarter where they appeare, there riſe terrible windes, and after them ſtormes and tempeſts both by ſea and land.

Chap. xxxvij. ¶ *Of the Stars called Caſtor and Pollux.* K

I Haue ſeene my ſelfe in the campe, from the ſoldiers ſentinels in the night watch, the reſemblance of lightning to ſticke faſt vpon the ſpeares and pikes ſet before the rampier. They ſettle alſo vpon the croſſe Saile yards and other parts of the ſhip, as men do ſaile in the ſea, making a kinde of vocall ſound, leaping to and fro, and ſhifting their places as birds do which fly from bough to bough. Dangerous they be and vnlucky when they come one by one without a companion; and they drowne thoſe ſhips on which they light, and threaten ſhipwrack, yea, and they ſet them on fire if haply they fall vpon the bottome of the keele. But if they appeare two and two together, they bring comfort with them, and foretell a proſperous courſe in the voiage, as by whoſe comming, they ſay, that dreadfull, curſed, and threatning meteor cal- L
led Helena is chaſed and driuen away. And hereupon it is that men aſſigne this mighty power to *Caſtor* and *Pollux*, and inuocate them at ſea no leſſe than gods. Mens heads alſo in the euen tyde are ſeene many times to ſhine round about, and to be of a light fire, which preſageth ſome great matter. Of all theſe things there is no certain reaſon to be giuen, but ſecret theſe be, hidden with the maieſtie of Nature, and reſerued within her cabinet.

Chap. xxxviij. ¶ *Of the Aire.*

IT remaineth now (thus much and thus far being ſpoken of the world it ſelfe) to wit, the ſtarry heauen and the planets) to ſpeake of other memorable things obſerued in the Skie. For
euen that part alſo hath our forefathers called *Cælum, (i.)* the Skie, which otherwiſe they M
name aire: euen all that portion of the whole, which ſeeming like a void and empty place, yeeldeth this vitall ſpirit whereby all things do liue. This region is ſeated beneath the Moone, and farre vnder that Planet (as I obſerue it is in a manner by euery man agreed vpon.) And mingling together an infinite portion of the ſuperiour cœleſtiall nature or elementarie fire,

with

20030
copy 1

A with an huge deale likewiſe of earthly vapours, it doth participate confuſedly of both. From hence proceed clouds, thunders, and thoſe terrible lightenings. From hence come haile, froſts, ſhoures of raine, ſtormes and whirlewindes: from hence ariſe the moſt calamities of mortall men, and the continuall warre that nature maketh with her owne ſelfe. For theſe groſſe exhalations as they mount vpward to the heauen, are beaten backe and driuen downeward by the violence of the ſtarres: and the ſame againe when they liſt, draw vp to them thoſe matters, which of their owne accord aſcend not. For thus we ſee, that ſhoures of raine do fall, foggie miſts and light clouds ariſe, riuers are dried vp, haile ſtormes come downe amaine, the Sunne beames doe ſcorch and burne the ground, yea, and driue it euery where to the middle centre: but the ſame againe vnbroken, and not loſing their force, rebound backe and take vp with them whatſoeuer
B they haue drunke vp and drawne. Vapours fall from aloft, and the ſame returne againe on high: winds blow forcibly, and come emptie, but backe they goe with a bootie, and carry away euery thing before them. So many liuing creatures take their wind and draw breath from aboue: but the ſame laboureth contrariwiſe, and the earth infuſeth into the aire a ſpirit and breath, as if it were cleane void and empty. Thus whiles the Nature goes too and fro, as forced by ſome engin, by the ſwiftneſſe of the heauen, the fire of diſcord is kindled and groweth hot. Neither may ſhe abide by it, and ſtand to the fight, but being continually carried away, ſhe rolleth vp and down: and as about the earth ſhee ſpreadeth and pitcheth her tents, as it were, with an vnmeaſurable globe of the heauen, ſo euer and anon of the clouds ſhe frameth another skie. And this is that region where the winds raigne. And therefore their kingdome principally is there to be ſeene,
C where they execute their forces, and are the cauſe well neere of all other troubles in the aire. For thunderbolts and flaſhing lightenings moſt men attribute to their violence. Nay, more than that, therefore it is ſuppoſed that otherwhiles it raineth ſtones, becauſe they were taken vp firſt by the winde: ſo as we may conclude, that they cauſe many like impreſſions in the aire. Wherefore many matters beſides are to be treated of together.

Chap. XXXIX. ¶ *Of ordinary and ſet ſeaſons.*

D IT is manifeſt, that of times and ſeaſons, as alſo of other things, ſome cauſes be certaine; others, caſuall and by chance; or, ſuch as yet the reaſon thereof is vnknowne. For who need to doubt, that Summers and Winters, and thoſe alternatiue ſeaſons which we obſerue by yearely courſe, are occaſioned by the motion of the Planets. As therefore the Sunnes nature is vnderſtood by tempering and ordering the yeare: ſo the reſt of the ſtarres and planets alſo haue euery one their proper and peculiar power, and the ſame effectuall to ſhew and performe their owne nature. Some are fruitfull to bring forth moiſture, that is turned into liquid raine: others to yeeld an humour either congealed into froſts, or gathered and thickened into ſnow, or elſe frozen and hardened into haile: ſome afford winds: others warmth: ſome hot and ſcorching vapours: ſome, dewes: and others, cold. Neither yet ought theſe ſtarres to be eſteemed ſo little as they ſhew in ſight, ſeeing that none of them is leſſe than the Moone, as may appeare by the reaſon of their exceeding height. Well then, euery one in their own motion, exerciſe their ſeuerall
E natures: which appeareth manifeſtly by *Saturne* eſpecially, who ſetteth open the gates for raine and ſhoures to paſſe. And not onely the ſeuen wandering ſtarres be of this power, but many of them alſo that are fixed in the firmament; ſo often as they be either driuen by the exceſſe and approch of thoſe planets, or pricked and prouoked by the caſting and influence of their beams; like as we find it happeneth in the ſeuen ſtars called *Suculæ*, which the Grecians of raine name *Hyades*, becauſe they euer bring foule weather. Howbeit ſome, of their owne nature, and at certaine ſet times do cauſe raine, as the riſing of the Kids. As for *Arcturus*, he neuer lightly appeareth without ſome tempeſtuous and ſtormie haile.

Chap. XL. ¶ *The power of the Dog-ſtarre.*

F WHo knoweth not, that when the Dogge-ſtarre ariſeth, the heate of the Sunne is fiery and burning? the effects of which ſtarre are felt exceeding much vpon the earth. The ſeas at his riſing do rage and take on, the wines in ſellars are troubled, pooles alſo and ſtanding waters doe ſtirre and moue. A wilde beaſt there is in Ægypt, called *Orix*, which the Ægyptians ſay doth ſtand full againſt the Dog-ſtarre when it riſeth,

looking

looking wistly vpon it,and testifieth after a sort by sneezing,a kind of worship. As for dogs,no man doubteth verily,but all the time of the canicular daies they are most ready to run mad. G

Chap. XLI.

¶ *That the starshaue their seuerall influences in sundry parts of the signes, and at diuers times.*

MOreouer, the parts of certaine signes haue their peculiar force,as appeareth in the Equinoctiall of Autumne,and in mid-winter;at what time we perceiue, that the Sun maketh tempests. And this is proued,not onely by raines and stormes,but by many experiments in mens bodies,and accidents to plants in the countrey. For some men are stricken by the Planet,and blasted : others are troubled and diseased at certaine times ordinarily, in their belly,sinewes,head,and minde. The Oliue tree,the Aspe or white Poplar, and Willowes, turne or wryth their leaues about at Mid-summer,when the Sun entreth Cancer. And contrariwise, in very Mid-winter,when he entreth Capricorne,the herbe Penyroiall floureth fresh,euen as it hangs within house,drie and ready to wither. At which time all parchments & such like bladders or skinnes are so pent and stretched with spirit and wind,that they burst withall. A man might maruell hereat,who marketh not by daily experience, that one herbe called * *Heliotropium*,regardeth and looketh toward the Sun euer as he goeth, turning with him at all houres, notwithstanding he be shadowed vnder a cloud. Now certaine it is,that the bodies of Oysters, Muskles,Cocles,and all shell fishes,grow by the power of the Moone, and thereby againe diminish : yea,and some haue found out by diligent search into Natures secrets, that the fibres or filaments in the liuers of rats and mice, answer in number to the daies of the Moones age : also that the least creature of all others,the Pismire,feeleth the power of this Planet, and alwaies in the change of the Moone ceaseth from worke. Certes,the more shame it is for man to be ignorant and vnskilfull,especially seeing that he must confesse, that some labouring beasts haue certaine diseases in their eyes,which with the Moone do grow and decay. Howbeit the excessiue greatnesse of the heauen and exceeding height thereof,diuided as it is into 72 signes, maketh for him,and serueth for his excuse. Now these signes are the resemblances of things or liuing creatures,into which the skilfull Astronomers haue with good respect digested the firmament. For example sake, in the taile of Taurus there be seuen, which they named in old time *Vergiliæ*;in the forehead other seuen called *Suculæ*;and *Boötes*,who followeth after the wain or great Beare *Septentriones*. H I K

* Some take it for Ruds or Wert-wort: others for Turn-sol, or the Marygold.

Chap. XLII.

¶ *The causes of raine,showers,winds,and cloudes.*

ICannot denie but without these causes there arise raines and windes : for that certaine it is, how there is sent forth from the earth a mist sometimes moist, otherwhiles smokie,by reason of hot vapours and exhalations. Also that clouds are ingendered by vapours which are gone vp on high,or else of the aire gathered into a waterie liquour : that they be thicke, grosse, and of a bodily consistence,wee guesse and collect by no doubtful argument,considering that they ouer-shadow the Sun,which otherwise may be seene through the water,as they know well that diue to any depth whatsoeuer. L

Chap. XLIII.

¶ *Of Thunder and Lightening.* M

DEnie I would not therefore,but that the fierie impressions from starsaboue may fall vpon these clouds,such as we oftentimes see to shoot in cleare and faire weather: by the forceble stroke whereof,good reason it is,that the aire should be mightily shaken, seeing that arrowes and darts when they are discharged,sing and keepe a noise as they flie. But when they incounter a cloud,there arises a vapor with a dissonant sound (like as when a red hot yron maketh

20030
copy 1

A keth an hiſſing being thruſt into water) & a ſmokie ſume walmeth vp with many turnings like waues. Hereupon ſtormes do breed. And if this flatuoſitie or vapour doe ſtruggle and wreſtle within the cloud, from thence it commeth that thunderclaps be heard; but if it breake through ſtill burning, then flieth out the thunderbolt: if it be longer time a ſtrugling, and cannot pierce through, then leams and flaſhes are ſeene. With theſe, the cloud is clouen; with the other, burſt in ſunder. Moreouer, thunders are nothing els but the blows and thumps giuen by the fires beating hard vpon the clouds: and therefore preſently the firy chinkes and rifts of thoſe clouds do glitter and ſhine. Poſſible it is alſo, that the breath and winde eleuated from the earth, being repelled back, and kept downe by the ſtars, & ſo held in and reſtrained within a cloud, may thun-
B der, whiles Nature choketh the rumbling ſound, all the while it ſtriueth and quarelleth; but ſendeth forth a crack when it breaketh out, as we ſee in a bladder puffed vp with winde. Likewiſe it may be, that the ſame wind or ſpirit whatſoeuer, is ſet on fire by fretting and rubbing, as it violently paſſeth headlong downe. It may alſo be ſtricken by the conflict of two clouds, as if two ſtones hit one againſt another; and ſo the leams and flaſhes ſparkle forth, ſo as all theſe accidents happen by chance-medley, and be irregular. And hereupon come thoſe bruitiſh & vain lightenings, ſuch as haue no natural reaſon, but are occaſioned by theſe impreſſions aboueſaid. With theſe are mountains and ſeas ſmitten: and of this kind be all other blaſts and bolts that do no hurt to liuing creatures. As for thoſe that come from aboue, and of ordinary cauſes, yea, and from their proper ſtars, they alwaies preſage and foretell future euents. In like manner as touching the windes, or rather blaſts, I would not denie but that they may proceed from a dry
C exhalation of the earth, void of all moiſture: neither is it impoſſible, but that they do ariſe out of waters, breathing and ſending out an aire, which neither can thicken into a miſt, nor gather into clouds: alſo they may be driuen by the lugitation and impulſion of the Sun, becauſe the winde is conceiued to be nought els but the fluctuation and waiuing of the aire, and that by many means alſo: for ſome we ſee to riſe out of riuers, firths, and ſeas, euen when they be ſtil and calme: as alſo others out of the earth, which winds they name *Altani*. And thoſe verily when they come backe againe from the ſea, are called *Tropæi*: if they go onward, *Apogæi*.

Chap. XLIIII.

¶ *What is the reaſon of the reſounding and doubling of the Eccho.*

D

BVt the windings of hils, and their often turuings, their many tops, their creſts and ridges alſo bending like an elbow or broken, and arched as it were into ſhoulders, together with the hollow noukes of vallies, do cut vnequally the aire that reboundeth them fro: which is the cauſe of reciprocall voices called Ecchoes, anſwering one another in many places, when a man doth holla or houpe among them.

Chap. XLV.

¶ *Of Windes againe.*

E NOw there be certaine caues and holes which breed windes continually without end: like as that is one which we ſee in the edge of Dalmatia, with a wide mouth gaping, & leading to a deep downfall: into which if you caſt any matter of light weight, be the day neuer ſo calm otherwiſe, there ariſeth preſently a ſtormie tempeſt like a whirle puffe. The places name is Senta. Moreouer, in the prouince Cyrenaica there is reported to be a rock conſecrated to the South-wind, which without prophanation may not be touched with mans hand; but if it be, preſently the South wind doth ariſe and caſt vp heaps of ſand. Alſo in many houſes there be hollow places deuiſed & made by mans hand for receipt of wind, which being incloſed with ſhade and darkneſſe, gather their blaſts. Whereby we may ſee how all winds haue one cauſe or other. But great difference there is betweene ſuch blaſts and winds. As for theſe, they be ſetled
F and ordinarie, continually blowing; which, not ſome ſmal tracts & particular places, but whole lands do feele; which are not light gales nor ſtormy puffes, named *Aurꝛ* and *Procellæ*, but ſimply called winds, by the Maſculine name *Venti*: which whether they ariſe by the continuall motion of the heauen, and the contrary courſe of the Planets; or whether this winde be that ſpirit of Nature that engendreth all things, wandering to and fro as it were in ſome wombe; or rather

the

the aire, beaten and driuen by the vnlike influences and raies of the ſtraying ſtarres or planets, G
and the multiplicitie of their beames: or whether all winds come from their owne ſtars, namely theſe planets neerer at hand; or rather fall from them that be fixed in the firmament. Plaine and euident it is, that guided they by an ordinary law of Nature, not altogether vnknowne, although it be not yet throughly knowne.

Chap. XLVI.

¶ *The Natures and obſeruations of the Windes.*

THe old Greeke writers, not ſo few as twentie, haue ſet downe and recorded their obſeruations of the Winds. I maruell ſo much the more, that the World be- H
ing ſo at diſcord, and diuided into kingdomes, that is to ſay, diſmembred as it was; ſo many men haue had care to ſeek after theſe things, ſo intricate and hard to be found out, and namely in time of wars, and amid thoſe places where was no ſafe lodging nor abode, and eſpecially when pyrats and rouers, common enemies to mankinde, held welneere all paſſages: I maruell, I ſay, that at this day each man in his owne tract and countrey taketh more light and true knowledge of ſome things by their commentaries and bookes, who neuer ſet foot there, than they doe by the skill and information of home-born inhabitants; whereas now in time of ſo bleſſed and ioious peace, and vnder a prince who taketh ſuch delight in the progreſſe of the State and of all good arts, no new thing is learned by farther inquiſition, nay, nor ſo much as the inuentions of old writers are throughly vn- I
derſtood. And verily it cannot be ſaid, that greater rewards were in thoſe daies giuen, conſidering that the bountie of Fortune was diſperſed, and put into many mens hands: and in truth moſt of theſe deepe Clerkes and learned men, ſought out theſe ſecrets for no other reward or regard, than to doe good vnto poſteritie. But now, mens manners are waxen old and decay; now, all good cuſtomes are in the waine: and notwithſtanding that the fruit of learning be as great as euer it was, and the recompences as liberall, yet men are become idle in this behalfe. The ſeas are open to all, an infinite multitude of ſaylers haue diſcouered all coaſts whatſoeuer, they ſaile through and arriue familiarly at euery ſhore: all for gaine and lucre, but none for knowledge and cunning. Their mindes altogether blinded, and bent vpon nothing but coue- K
touſneſſe, neuer conſider that the ſame might with more ſafetie be performed by skill and learning. And therfore ſeeing there be ſo many thouſand poore ſailers that hazard themſelues on the ſeas, I will treat of the winds more curiouſly and exquiſitly than perhaps beſeemes the preſent worke that is begun.

Chap. XLVII.

¶ *Many ſorts of Windes.*

MEn in old time obſerued foure Windes only, according to ſo many quarters of the world (and therefore *Homer* nameth no more:) a blockiſh reaſon this was, as ſoone
after it was iudged. The Age enſuing added eight more; and they were on the o- L
ther ſide in their conceit too ſubtill and conciſe. The Modern ſailers of late daies found out a meane betweene both: and they put vnto that ſhort number of the firſt, foure windes and no more, which they tooke out of the later. Therefore euery quarter of the Heauen hath two windes apiece. From the equinoctiall Sunne-riſing bloweth the Eaſt-winde *Sub-ſolanus*: from the riſing thereof in the Mid-winter, the South-eaſt *Vulturnus*. The former of theſe twaine the Greekes call *Apeliotes*, and the later *Eurus*. From the Mid-day, riſeth the South winde: and from the Sun-ſetting in Mid-winter the South-weſt, *Africus*. They alſo name theſe two, *Notus* and *Libs*. From the Equinoctiall going down of the Sun, the Weſt winde *Fauonius* commeth: but from that in Summer ſeaſon, the North-weſt *Corus*. And by
the ſame Greekes they are termed *Zephyrus* and *Argeſtes*. From the North waine or pole Ar- M
cticke, bloweth the North winde *Septentrio*: betweene which and the Sun-riſing in Summer, is the North-eaſt winde *Aquilo*, named *Aparctias* and *Boreas* by the Greekes. A greater reckoning than this for number, is brought in by ſome, who haue thruſt in foure more betweene; namely, *Thracias* betweene the North and the Summer-ſetting of the Sunne: in like manner

Cacias

20030
copy 1

A *Cæcias* in the midſt betweene the North-eaſt *Aquilo*, and that of the Sun riſing in the Equinoctiall *Sub-ſolanus*. Alſo, after the Sun-riſing in Sommer, *Phœnicias* in the middeſt, betweene the South-eaſt and the South. Laſt of all, betweene the South and the South-weſt, *Lybonotus*, iuſt in the middeſt, compounded of them both, namely, betweene the Nooneſtead, and the Sunſetting in Winter. But here they could not lay a ſtraw, and ſee to make an end. For others haue ſet one more yet called *Meſe*, betweene the North-eaſt winde *Borias* and *Cæcias*: alſo *Euronotus* betweene the South and the Southweſt winds. Beſides all theſe, there be ſome winds appropriate and peculiar to euery nation, which paſſe not beyond one certaine tract and region: as namely *Scyros* among the Athenians, declining a little from *Argeſtes* a winde vnknowne to other parts
B of Greece. In ſome other place it is more aloft, and the ſame then is called *Olympias*, as comming from the high hill Olimpus. But the vſuall and cuſtomable manner of ſpeech vnderſtandeth by all theſe names *Argeſtes* only. Some call *Cæcias*, by the name of *Helleſpontias*, and giue the ſame winds in ſundry places diuers names. In the prouince likewiſe of Narbone, the moſt notorious winde is *Circius*, and for violence inferiour to none, driuing directly before it very often, the current at Oſtia, into the Ligurian ſea. The ſame wind is not only vnknown in all other climats of the heauen, but reacheth not ſo much as to Vienna, a citie in the ſame prouince. As great & boiſterous a wind as he is otherwiſe, yet a reſtraint he hath before he come thither, and is kept within few bounds by the oppoſition of a meane and ſmall hill. *Fabianus* alſo auouches, that the South winds enter not ſo far as into Ægypt. Whereby, the law of Nature ſheweth it ſelfe plainely, that euen windes haue their times and limits appointed.

C To proceed then; the Spring openeth the ſea for ſailers: in the beginning whereof, the Weſt winds mitigate the Winter weather, at what time as the Sun is in the 25 degree of Aquarius, and that is the ſixt day before the Ides of February. And this order holdeth in manner with all other winds, that I will ſet downe one after another; ſo that in euery leape yeare ye anticipate and reckon one day ſooner, and then againe keep the ſame rule throughout all the foure yeares following. Some call *Fauonius* (which beginneth to blow about the 7 day before the Calends of March) by the name of *Chelidonius*, vpon the ſight of the firſt Swallows; but many name it *Orinthias*, comming the 71 day after the ſhorteſt day in winter; by occaſion of the comming of birds: which wind bloweth for nine dayes. Oppoſite vnto *Fauonius* is the VVind which we called *Sub-ſolanus*. Vnto this VVind is attributed the riſing of the *Vergiliæ* or ſeuen ſtars, in as ma-
D ny degrees of Taurus, ſix daies before the Ides of May; which time is a ſoutherly conſtitution: and to this Winde the North is contrarie. Moreouer, in the hotteſt ſeaſon of the Sommer, the Dog-ſtar ariſeth, at what time as the Sun entreth into the firſt degree of Leo, which commonly is the 15 day before the Calends of Auguſt. Before the riſing of this ſtar for eight daies ſpace or thereabout, the Northeaſt winds are aloft, which the Greekes call *Prodromi*, *i.* forerunners. And two daies after it is riſen, the ſame winds hold ſtill more ſtiffely, and blow for the ſpace of fortie daies, which they name *Eteſiæ*. The Suns heate redoubled by the hotneſſe of that ſtar, is thought to be aſſwaged by them: and no winds are more conſtant, nor keep their ſet times better than they. Next after them come the Southerne winds againe, which are vſually vp, vntill the ſtar *Arcturus* riſeth, and that is nine daies before the Æquinoctiall in Autumne. With it
E entereth *Corus*, and thus *Corus* beginneth the Autumne. And to this *Vulturnus* is contrarie. After that Æquinoctiall, about 44 daies the *Virgiliæ* go downe, and begin winter, which ſeaſon vſually falleth vpon the third day before the Ides of Nouember. This is the winter Northeaſt wind, which is far vnlike to that in Sommer, oppoſit and contrary to *Africus*. Now, a ſeuen night before the Mid-winter day, and as much after, the ſea is allaied and calme for the ſitting and hatching of the birds Halciones, whereupon theſe daies tooke the name *Alcionis*: the time behind, plaieth the part of Winter. And yet theſe boiſterous ſeaſons full of tempeſts, ſhut not vp the ſea: for pyrats and rouers at the firſt forced men with preſent perill of death, to run headlong vpon their death, and to hazard themſelues in Winter ſeas; but now a daies couetouſneſſe cauſeth men to do the like.

F The coldeſt winds of all other, be thoſe which we ſaid to blow from the North-pole, and together with them their neighbor, *Corus*. Theſe winds do both allay and ſtill all others, and alſo ſcatter and driue away clouds. Moiſt winds are *Africus*, and eſpecially the South wind of Italy called *Auſter*. Men report alſo, that *Cæcias* in Pontus gathereth & draweth to it ſelfe clouds. *Corus* and *Vulturnus* are dry, but onely in the end when they giue ouer. The Northeaſt and the North;

North,engender ſnow. The North winde alſo bringeth in haile,ſo doth *Corus*. The South wind G
is exceeding hot and troublous withall. *Vulturnus* and *Favonius* be warme. They alſo be drier than the Eaſt:and generally all winds from the North and Weſt are drier than from the South and Eaſt. Of all winds the Northern is moſt heathfull : the Southern wind is noiſome, and the rather when it is drie;haply,becauſe that when it is moiſt,it is the colder. During the time that it bloweth,liuing creatures are thought to be leſſe hungry:the *Eteſiæ* giue ouer ordinarily in the night,& ariſe at the third houre of the day. In Spaine and Aſia they blow from the Eaſt:but in Pontus,from the North : in other quarters from the South. They blow alſo after the Mid-winter,when they be called *Orinthiæ*,but thoſe are more milde,& continue fewer daies. Two there be that change their nature together with their ſite and place:the South winde in Affrick bringeth faire weather,and the North wind there is cloudy. All winds keep their courſe in order for the more part,or els when one ceaſeth,the contrary beginneth. When ſome are laid,& the next H
to them do ariſe,they go about from the left hand to the right,according to the Sun. Of their manner and order monthly,the prime or fourth day after the change of the Moone, doth moſt commonly determine. The ſame windes wil ſerue to ſaile contrariwiſe,by means of ſetting out the ſailes: ſo as many times in the night,ſhips in ſailing run one againſt another. The South winde raiſeth greater billowes and more ſurging waues than the North : for that the South wind ariſeth below from the bottome of the Sea;the other bluſtereth aloft, and troubleth the top of the water. And therfore after Southern winds,earth-quakes are moſt hurtful. The South wind in the night time is more boiſterous,the Northerne wind in the day. The winds blowing from the Eaſt,hold and continue longer than thoſe from the Weſt. The Northern winds giue I
ouer commonly with an odde number: which obſeruation ſerueth to good vſe in many other parts of naturall things,and therfore the male winds are iudged by the odde number. The Sun both raiſeth,and alſo laieth the windes. At riſing and ſetting hee cauſeth them to be aloft : at noon-tide he repreſſeth and keepeth them vnder,in Summer time. And therefore at mid-day or mid-night commonly the winds are down and lie ſtill,for both cold and heat if they be immoderate,do ſpend and conſume them. Alſo rain doth lay the winds : and moſt commonly from thence they are looked for to blow,where clouds break and open the skie to be ſeen. And verily *Eudoxus* is of opinion (if wee liſt to obſerue the leaſt reuolutions) that after the end of euery fourth yere,not only all winds,but other tempeſts and conſtitutions alſo of the weather,return again to the ſame courſe as before. And alwaies the Luſtrum or computation of the fiue yeres K
beginneth at the leap yere,when the Dog-ſtar doth ariſe. Thus much touching general winds.

Chap. XLVIII.

¶ *Of ſudden Blaſts.*

NOw wil we ſpeake of ſudden blaſts;which being riſen (as hath bin ſaid before) by exhalations of the earth,and caſt downe againe ; in the meane while appeare of many faſhions, encloſed within a thin courſe of clouds newly ouercaſt. For ſuch as be vnconſtant,wandering,and ruſhing in manner of land flouds (as ſome men were of opinion,as wee haue ſhewed) bring forth thunder and lightening. But if they come with a greater force, ſway , and violence,and withall burſt and cleaue a dry cloud aſunder all abroad,they breed a ſtorme,which of L
the Greeks is called *Ecnephias* : but if the clift or breach be not great,ſo that the wind be conſtrained to turne round,to roll and whirle in his diſcent,without fire(*i.*) lightening,it makes a whirle-puffe or ghuſt called *Typhon*(*i.*) the ſtorme *Ecnephias* aforeſaid,ſent out with a winding violence. This takes with it a piece broken out of a congealed cold cloud,turning,winding,and rolling it round,and with that weight maketh the owne fall more heauie, and changeth from place to place with a vehement and ſudden whirling ; the greateſt danger and miſchiefe that poore ſailers haue at ſea,breaking not onely their croſſe ſaile yards, but alſo writhing and burſting in pieces the very ſhips : and yet a ſmall matter is the remedy for it, namely, the caſting of vinegre out againſt it as it commeth,which is of nature moſt cold. The ſame ſtorme beating M
vpon a thing,is it ſelfe ſmitten backe againe with a violence, and ſnatcheth vp whatſoeuer it meeteth in the way aloft into the skie,carrying it back,and ſwallowing it vp on high. But if it breake out from a greater hole of the ſaid cloud,by it ſo borne down,and yet not altogether ſo broad as the abouenamed ſtorm *Procella* doth,nor without a cracke ; they call this boiſterous

winde

20030
copy 1

A wind *Turbo*, caſting downe and ouerthrowing all that is next it. The ſame, if it be more hot and catching a fire as it rageth, is named *Preſter*; burning, and withall laying along, whatſoeuer it toucheth and encountereth.

Chap. XLIX.

¶ *Other enormious kindes of Tempeſts.*

NO *Typhon* commeth from the North, ne yet any *Ecnephias* with ſnow, or while ſnow lieth on the ground. This tempeſtuous winde, if when it brake the cloud burned light withall, hauing fire of the owne before, and catched it not afterward, it is very lightning; and
B differeth from *Preſter*, as the flame from a cole of fire. Againe, *Preſter* ſpreadeth broad with a flaſh and blaſt; the other gathereth round with forcible violence. *Typhon* moreouer or *Vortex*, differeth from *Turben* in flying backe, and as much as a craſh from a cracke. The ſtorme *Procella* from them both, in breadth: and to ſpeake more truly, rather ſcattereth than breaketh the cloud. There riſeth alſo vpon the ſea a darke miſt, reſembling a monſtrous beaſt; and this is euer a terrible cloud to ſailers. Another likewiſe called a Columne or Pillar, when the humour and water ingendred is ſo thicke and ſtiffe congealed, that it ſtandeth compact of it ſelfe. Of the ſame ſort alſo is that cloud which draweth water to it, as it were into a long pipe.

Chap. L.

C

¶ *In what Lands Lightenings fall not.*

IN Winter and Summer ſeldome are there any Lightnings, and that is long of contrary cauſes: becauſe in Winter the aire is driuen cloſe together, and thickened with a deeper courſe of clouds: beſides, all the exhalations breathing and riſing out of the earth, being ſtark, congealed, and frozen hard, do extinguiſh cleane what firie vapour ſoeuer otherwiſe they receiue: which is the reaſon that Scythia and other cold frozen quarters thereabout, are free from lightenings. And Ægypt likewiſe vpon the contrarie cauſe, and exempt from Lightnings; namely, exceeding heate: for the hot and dry exhalations of the earth, gather into very ſlender, thin, and
D weake clouds. But in the Spring and Autumne, lightnings are more rife; becauſe in both thoſe ſeaſons, the cauſes as well of Summer as Winter, are confuſed and corrupt. And this is the reaſon alſo, that lightnings are common in our Italie; for that the aire being more moueable and wauering, by reaſon of a kinder Winter and a cloudie Summer, is alwaies of the temperature of Spring or Autumne. In thoſe parts alſo of Italy which lie off from the North, and encline to warmth (as namely in the tract about Rome and Campania) it lightneth in Winter and Summer alike, which happeneth in no other part thereof.

Chap. LI.

¶ *Sundry ſorts of Lightnings, and Wonders thereof.*

E VErie many kindes of Lightnings are ſet downe by Authors. Thoſe that come drie, burne not at all, but onely diſſipate and diſperſe. They that come moiſt, burne not neither, but blaſt things, and make them looke duskiſh. Now a third kinde there is, which they call Bright and Cleare, and that is of a moſt ſtrange and wonderfull nature; whereby tuns and ſuch like veſſels are drawne drie, and their ſides, hoops, and heads, neuer toucht therewith or hurt, nor any other ſhew and token thereof is left behinde: Gold, copper, and ſiluer money is melted in the bags, and yet the very bags no whit ſcorched, no nor the wax of the ſeale hurt and defaced, or put out of order. *Martia* a noble Ladie of Rome being great with childe, was ſtrucke with lightning: the childe ſhe went withall was killed within her, and ſhe without any harme at all
F liued ſtill. Among the *Catiline* prodigies it is found vpon Record, that *M. Herennius* (a Counſellor and States-man of the incorporate towne Pompeianum) was in a faire and cleare day ſmitten with Lightning.

Chap. LII.

¶ *Of obſeruations as touching Lightning.*

THe Antient Tuſcanes by their learning do hold, that there be nine gods that ſend forth Lightnings, and thoſe of eleuen ſorts: for *Iupiter* (ſay they) caſteth three at once. The Romans haue obſerued two of them, and no more; attributing thoſe in the day time to *Iupiter*, and them in the night to *Summanus* or *Pluto*. And theſe verily be more rare, for the cauſe aforenamed; namely, the coldneſſe of the aire aboue. In Hetruria, they ſuppoſe that lightnings break alſo out of the earth, which they call *Infera, i*. Infernall; and ſuch be made in Mid-winter. And theſe they take to be terrene and earthly, and of all moſt miſchieuous and execrable: neither be thoſe generall and vniuerſall lightnings, nor proceeding from the ſtars, but from a very neere and more troubled cauſe. And this is an euident argument for diſtinction, that all ſuch as fall from the vpper skie aboue, ſtrike aſlant and ſide-wiſe: but thoſe which they call earthly, ſmite ſtraight and directly. But the reaſon why theſe are thought to iſſue forth of the earth is this; becauſe they fall from out of a matter nearer to the earth, foraſmuch as they leaue no markes of a ſtroke behind: which are occaſioned by force not from beneath, but comming full againſt. Such as haue ſearched more ſubtilly into theſe matters, are of opinion, that theſe lightnings come from the Planet *Saturne*, like as the burning lightning from *Mars*: And with ſuch lightning was Volſinij (a moſt welthy citie of the Tuſcanes) burnt full and whole to aſhes. Moreouer, the Tuſcanes call thoſe lightnings Familiar, which preſage the fortune of ſome race, and are ſignificant during their whole life: and ſuch are they that come firſt to any man, after he is newly entred into his owne patrimonie or familie. Howbeit their iudgement is, that theſe priuat lightnings are not of importance and fore-tokening aboue ten yeres; vnleſſe they happen either vpon the day of firſt mariage, or of wedding. As for publique lightnings, they be not of force aboue 30 yeares, except they chance at the very time that townes or colonies be erected and planted.

Chap. LIII. ¶ *Of raiſing or calling out Lightnings by Coniuration.*

IT appeareth vpon record in Chronicles, that by certaine ſacrifices and prayers, Lightnings may be either compelled or eaſily intreated to fall vpon the earth. There goeth a report of old in Hetruria, that ſuch a lightning was procured by exorciſmes and coniurations, when there entered into the citie Volſinij (after all the territory about it was deſtroyed) a monſter which they named *Volta*. Alſo, that another was raiſed and coniured by *Porſenna* their King. Moreouer, *L. Piſo* (a writer of good credit) reporteth in his firſt booke of Annales, that *Numa* before him practiſed the ſame feat many a time and often: and when *Tullus Hoſtilius* would haue imitated him and done the like (for that he obſerued not all the ceremonies accordingly) was himſelfe ſtrucke and killed with lightning. And for this purpoſe, ſacred groues we haue and altars, yea and certaine ſacrifices due thereto. And among the *Iupiters* ſurnamed *Statores, tonantes*, and *Feretrij*, we haue heard that one alſo was called *Elicius*. Sundry and diuers are mens opinions as touching this point, and euery man according to his owne liking and fancie of his minde. To beleeue that Nature may be forced and commanded, is a very audacious and bold opinion: but it is as blockiſh on the other ſide, and ſenceleſſe, to make her benefits of no power and effect; conſidering that in the interpretation of Lightning, men haue thus farre forth proceeded in skill and knowledge, as to foretell when they will come at a ſet and preſcript day: and whether they will fordoe and fruſtrate the dangers pronounced, or rather open other deſtinies, which lie hidden: and an infinite ſort of publicke and priuat experiments of both kinds are to be found. And therefore (ſince it hath ſo pleaſed Nature) let ſome men be reſolued herein, and others doubtfull: ſome may allow thereof, and others condemne the ſame. As for vs, we will not omit the reſt which in theſe matters are worth remembrance.

Chap. LIIII. ¶ *Generall rules of Lightning.*

THat the Lightning is ſeene before the Thunderclap is heard, although they come indeed iointly both together, it is certainely knowne. And no maruell, for the eye is quicker to ſee light, than the eare to heare a ſound. And yet Nature doth ſo order the number and meaſure,

20030
copy 1

A measure, that the stroke and the sound should accord together. But when there is a noise, it is a signe of the lightning proceeding of some naturall cause, and not sent by some god: and yet euermore this is a breath or winde that commeth before the thunderbolt: and hereupon it is, that euery thing is shaken and blasted ere it be smitten, neither is any man stricken, who either saw the lightning before, or heard the thunderclap. Those lightnings that are on the left hand, be supposed to be luckie and prosperous, for that the East is the left side of the world: but the coming therof is not so much regarded as the return, whether the fire leap back afresh the stroke giuen; or whether after the deed done and fire spent, the spirit and blast aboue said retire backe
B againe. In that respect the Tuscans haue diuided the heauen into 16 parts. The first is from the North to the Suns rising in the Equinoctiall line: the second, to the Meridian line, or the South: the third, to the Sun-setting in the Equinoctiall: and the fourth taketh vp all the rest from the said West to the North star. These quarters againe they haue parted into foure regions apiece: of which eight from the Sun-rising, they called the Left, & as many again from the contrary part, the Right. Which considered, most dreadfull and terrible are those lightnings, which from the Sun-setting reach into the North; and therefore it skilleth very much, from whence lightnings come, and whither they go. the best thing obserued in them is, when they re-
C turn into the Easterly parts. And therefore when they come from that first and principall part of the skie, and haue recourse again into the same, it is holden for passing good hap: & such was the signe and token of victories giuen (by report) to *Sylla* the Dictatour. In all other parts of the element they be lesse fortunate or fearful. They that haue written of these matters, haue deliue-
red in writing, that there be lightnings, which to vtter abroad is held vnlawful, as also to giue eare vnto them, if they be disclosed, vnlesse they be declared either to parents, or to a friend and gueſt. How great the vanity is of this obseruation, was at Rome, vpon the blasting of *Iunoes* temple, found by *Scaurus* the Consull, who soone after was President of the Senate. It lightneth without thunder, more in the night than day time. Of all creatures that haue life and breath, man only it doth not alwaies kill; the rest, it dispatcheth presently. This priuiledge & honour we see Nature hath giuen to him; whereas otherwise so many great beasts surpasse him in
D strength. All other creatures smitten with lightning, fall downe vpon the contrary side; man onely (vnlesse he turne vpon the parts stricken) dyeth not. Those that are smitten from aboue vpon the head, lie downe and sinke directly. He that is stricken watching, is found dead with his eies winking and close shut; but whosoeuer is smitten sleeping, is found open eied. A man thus comming by his death, may not by law be burned: Religion hath taught, that he ought to be enterred and buried in the earth. No liuing creature is set a fire by lightning, but it is breathlesse first. The wounds of them that be smitten with thunderbolts, are colder than all the body besides.

Chap. LV.

¶ *What things are not smitten with Lightning.*

E OF all those things which grow out of the earth, Lightning blasteth not the Laurell tree, nor entreth at any time aboue fiue foot deep into the ground; and therefore, men fearfull of lightning, suppose the deeper caues to be the surest and most safe: or els booths made of skins of sea-beasts, which they call Seales, or Sea-calues; for of all creatures in the sea, this alone is not subiect to the stroke of lightning; like as of all flying foules the Eagle, (which for this cause is imagined to be the armour-bearer of *Iupiter*, for this kinde of weapon.) In Italie betweene Tarracina and the temple of *Feronia*, they gaue ouer in time of warre, to make towers and forts, for not one of them escaped, but was ouerthrowne with lightning.

Chap. LVI.

F ¶ *Of strange and prodigious raine, to wit, of Milke, Bloud, Flesh, Iron, Wooll, Tyles, and Brickes.*

BEsides these things aboue, in this lower region vnder heauen, we finde recorded in monuments, that it rained milke and bloud, when *M. Acilius* and *C. Porcius* were Consuls. And many times else besides it rained flesh, as namely, whiles *L. Volumnius* and *Serv. Sul-*

pitius were Conſuls: and look what of it the foules of the aire caught not vp nor carried away, it neuer putrified. In like manner, it rained yron in the Lucanes countrey, the yere before that *M. Craſſus* was ſlaine by the Parthians, and together with him all the Lucanes his ſouldiers, of whom there were many in his army. That which came downe in this raine reſembled in ſome ſort Sponges: and the Wiſards and Southſayers being ſought vnto, gaue warning to take heed of wounds from aboue. But in the yere that *L. Paulus*, and *C. Marcellus* were Conſuls, it rained wooll about the Caſtle Cariſſa, neare to which a yeare after, *T. Annius Milo* was ſlaine. At the time that the ſame *Milo* pleaded his owne cauſe at the bar, there fell a raine of tyles and bricks, as it is to be ſeen in the Records of that yeare. G

Chap. LVII. H

¶ *Of the ruſtling of Armour and ſound of Trumpets heard from Heauen.*

IN the time of the Cimbrian warres, we haue bin told, that Armour was heard to ruſtle, and the trumpet to ſound out of heauen. And this happened very often both before and after thoſe wars. But in the third Conſulſhip of *Marius*, the Amerines and Tudertes ſaw men in armes in the skie, ruſhing and running one againſt another from the Eaſt and Weſt; and might behold thoſe of the Weſt diſcomfited. That the very firmament it ſelfe ſhould be of a light fire, it is no maruel at all; for oftentimes it hath been ſeene, when clouds haue caught any greater deale of fire. I

Chap. LVIII.

¶ *Of Stones falling downe from the Skie.*

AMong the Greeks there is much talke of *Anaxagoras Clazomenius*, who by his learning and skill that he had in Aſtronomie, foretold in the ſecond yeare of the 78 Olympias, what time a ſtone ſhould fall from out of the Sun: and the ſame happened accordingly in the day time, in a part of Thracia neere the riuer Aegos; which ſtone is ſhewed at this day as big as a waine load, carrying a burnt and aduſt colour: at what time as a comet or blazing ſtarre alſo burned in thoſe nights. Which if any man beleeue that it was fore-ſignified, muſt needs alſo confeſſe, that this diuinitie or fore-telling of *Anaxagoras* was more miraculous and wonderfull than the thing it ſelfe: and then farewell the knowledge of Natures workes, and welcome confuſion of al; in caſe we ſhould beleeue that either the Sun were a ſtone, or that euer any ſtone were in it. But, that ſtones fall oftentimes downe, no man will make any doubt. In the publicke place of Exerciſe in Abydos, there is one at this day vpon the ſame cauſe preſerued and kept for to be ſeene, and held in great reuerence: it is but of a meane and ſmall quantity, yet it is that which the ſelfe-ſame *Anaxagoras* (by report) fore-ſignified that it ſhould fal in the mids of the earth. There is one alſo at Caſſandria, which was in old time vſually called Potidæa, a colony from thence deducted. I my ſelfe haue ſeene another in the territorie of the Vocantians, which was brought thither but a little before. K L

Chap. LIX. ¶ *Of the Rainebow.*

THoſe which we call Rain-bowes are ſeene often without any wonder at all, or betokening any great matter: for they portend not ſo much as rainy or faire daies, to truſt vpon. But manifeſt it is, that the Sun beames ſtriking vpon an hollow cloud, when their edge is repelled, are beaten backe againſt the Sun: and thus ariſeth varietie of colours by the mixture of clouds, aire, and firie light together. Certes, they neuer are knowne but oppoſite to the Sun; nor at any time otherwiſe than in forme of a Semicircle: ne yet in the night ſeaſon, although *Ariſtotle* ſaith there was a Rain-bow ſeen by night: howbeit he confeſſeth, that it could not poſſibly be but at the full of the Moone. Now they happen for the moſt part in winter, namely from the Autumne Equinoctiall, as the daies decreaſe and wax ſhorter. But as daies grow longer againe, that is to ſay, after the Spring Equinoctiall, they be not ſeene no more than about the Summer Sunſtead, when daies are at longeſt. But in Bruma, namely when they bee ſhorteſt M

20030
copy 1

A teſt, they chance very often. The ſame appeare aloft, when the Sun is low; and below, when he is aloft. Alſo, they be of narrower compaſſe, when the Sun either riſeth or ſetteth, but their body ſpreadeth broad: and at noone narrower it is, and ſmal, yet greater and wider in circumference. In Sommer time they be not ſeene about noon-tide, but after the Autumne Equinoctial, at all houres; and neuer more at once than twaine. The reſt of the ſame nature I ſee few men doe make any doubt of.

Chap. LX.

¶ *Of Haile, Snow, Froſt, Miſt, and Dew.*

B HAile is ingendred of Raine congealed into an Ice: and Snow of the ſame humor growne together, but not ſo hard. As for froſt, it is made of dew frozen. In winter Snowes fall, and not haile. It haileth oftner in the day time than in the night, yet haile ſooner melteth by farre than ſnow. Miſts be not ſeene neither in Summer, nor in the cold weather. Dewes ſhew not either in froſt, or in hot ſeaſons; neither when winds be vp, but only after a calm and cleere night. Froſts dry vp wet and moiſture; for when the yce is thawed and melted, the like quantitie of water in proportion is not found.

Chap. LXI.

¶ *Of the ſhapes of Clouds.*

C SVndry colours and diuers ſhapes are ſeene in clouds, according as the fire intermingled therein is either more or leſſe.

Chap. LXII.

¶ *Of the properties of weather in diuers places.*

MOreouer, many properties there be of the weather, peculiar to certain places: the nights in Africke be dewie in Winter. In Italy, about Locri and the lake Velinus, there is not a day but a Rainbow is ſeene. At Rhodes and Syracuſæ, the aire is neuer ſo dimme and
D cloudy, but one houre or other the Sun ſhineth out. But ſuch things as theſe ſhall be related more fitly in due place. Thus much of the Aire.

Chap. LXIII.

¶ *Of Earth, and the nature thereof.*

THe Earth followeth next: vnto which alone of all parts of the world, for her ſingular benefits we haue giuen the reuerend and worſhipfull name of Mother. For like as the Heauen is the (mother) of God, euen ſo is ſhe of men. She it is that taketh vs when wee are comming into the world, nouriſheth vs when we are new borne: and once being come abroad,
E euer ſuſtaineth and beareth vs vp: and at the laſt when wee are reiected and forlorne of all the world beſides, ſhe embraceth vs: then moſt of all other times, like a kinde mother, ſhe couereth vs all ouer in her boſom; by no merit more ſacred than by it, wherwith ſhe maketh vs holy and ſacred; euen bearing our tombes, monuments, and titles, continuing our name, and extending our memorie, therby to make recompence and weigh againſt the ſhortnes of our age: whoſe laſt power we in our anger wiſh to be heauy vnto our enemy, and yet ſhe is heauy to none, as if wee were ignorant that ſhe alone is neuer angry with any man: waters aſcend vp, & turn into clouds, they congeale and harden into haile, ſwel they do into waues and billows, & down they haſten headlong into brooks and land-flouds. The aire is thickened with clouds, & rageth with winds
F and ſtormes. But ſhe is bountifull, mild, tender ouer vs, & indulgent, ready at all times to attend and wait vpon the good of mortall men. See what ſhe breeds being forced! nay, what ſhe yeeldeth of her owne accord! what odoriferous ſmells, and pleaſant ſauors! what wholeſome iuices and liquors, what ſoft things to content our feeling, what louely colors doth ſhe giue to pleaſe our eie, how faithfully and iuſtly doth ſhe repay with vſury that which was lent and credited out vnto her! Finally, what ſtore of all things doth ſhee feed and nouriſh for our ſake! Alas

poor wretch, peſtiferous and hurtfull creatures, when the vitall breath of the aire was too blame G
to giue them life, ſhe could not otherwiſe chuſe but receiue them, after they were ſown in her;
and being once ingendred and bred, keepe and maintain them. But in that they prooued afterwards bad and venomous; the fault was to be laid vpon the parents that ingendred them, and
not to be imputed vnto her. For, ſhee entertaineth no more a venomous ſerpent after it hath
ſtung a man: nay, more than that, ſhe requireth puniſhment, for them that are ſlow and negligent of themſelues to ſeeke it. She it is that bringeth forth medicinable herbes, and euermore
is in trauell to be deliuered of ſome thing or other, good for man. Ouer and beſides, it may be
thought and beleeued, that for very pittie of vs ſhe ordained and appointed ſome poiſons, that
when we were weary of our life, curſed famine (moſt aduerſe and croſſe of all other to the merits of the earth) ſhould not conſume and waſte vs with languiſhing and pining conſumption, H
and ſo procure our death; that high and ſteepe rockes ſhould not daſh and cruſh our bodies in
pieces; nor the ouerthwart and prepoſterous puniſhment by the halter, wreathe our necks, and
ſtop that vital breath which we ſeek to let out and be rid of: laſt of all, that we might not worke
our owne death in the deep ſea, and being drowned feed fiſhes, and be buried in their bellies; ne
yet the edge and point of the ſword cut and pierce our bodie, and ſo put vs to dolorous paine.
So that it is no doubt, but in a pittifull regard and compaſſion of vs, ſhee hath ingendred that
poyſon, by one gentle draught whereof, going moſt eaſily downe, we might forgoe our life, and
die without any hurt and skin broken of our body, yea, and diminiſh no one drop of bloud:
without grieuous paine, I ſay, and like onely to them who be athirſt: that being in that manner
dead, nether foule of the aire, nor wilde beaſt prey vpon or touch our bodies, but that he ſhould I
be reſerued for the earth, who periſhed by himſelfe and for himſelfe: and, to confeſſe and ſay the
troth, the earth hath bred the remedy of all miſeries, how ſoeuer we haue made it a venome and
poiſon to our life. For after the like ſort we imploy iron and ſteele, which we cánot poſſibly be
without. And yet we ſhould not do well and iuſtly to complain, in caſe ſhe had brought it forth
for to do hurt and miſchiefe. Now ſurely to this only part of Nature and the world, we are vnthankfull, as though ſhee ſerued not mans turne for all dainties; not for contumely and reproch
to be miſuſed. Caſt ſhe is into the ſea, or elſe to let in peeres and frithes, eaten away with water.
With yron tooles, with wood, fire, ſtone, burdens of corne tormented ſhe is euery houre: and all
this much more to content our pleaſures and wanton delights than to ſerue vs with naturall
food and neceſſary nouriſhment. And yet theſe miſuſages which ſhe abideth aboue, and in her
outward skin, may ſeeme in ſome ſort tolerable. But we, not ſatisfied therewith, pierce deeper K
and enter into her very bowels, we ſearch into the veines of gold and ſiluer, we mine and dig for
copper and lead mettals. And for to ſeek out gemmes and ſome little ſtones, we ſinke pits deep
within the ground. Thus we plucke the very heart-ſtrings out of her, and all to weare on our finger one gemme or precious ſtone, to fulfill our pleaſure and deſire. How many hands are worne
with digging and deluing, that one ioynt of our finger might ſhine again. Surely, if there were
any diuels or infernall ſpirits beneath, ere this time verily theſe mines (for to feed couetouſnes
and riot) would haue brought them vp aboue ground. Maruell we then, if ſhe hath brought
forth ſome things hurtfull and noiſome? But ſauage beaſts (I well thinke) ward and ſaue her,
they keepe ſacrilegious hands from doing her iniurie. Nay ywis it is nothing ſo. Dig we not
amongſt dragons and ſerpents? and togethet with veines of gold, handle we not the roots of L
poiſoned and venomous herbes? howbeit this goddeſſe we finde the better appaied, and leſſe
diſcontented for all this miſuſage, for that the end and iſſue of all this wealth tends to wickedneſſe, to murder and wars, and her whom we drench with our bloud, we couer alſo with vnburied bones. Which neuertheleſſe, as if ſhe did reprooue and reproch vs for this rage and furie of ours, ſhe her ſelfe couereth in the end, and hideth cloſe euen the wicked parts of mortall
men. Among other imputions of an vnthankfull minde, I may well count this alſo, That we
be ignorant of her nature.

Chap. LXIIII. ¶ *Of the forme of the earth.*

THe firſt and principall thing that offereth it ſelfe to be conſidered, is her figure, in which M
by a generall conſent we doe all agree. For ſurely we ſpeake and ſay nothing more commonly, than the round ball of the earth; and confeſſe that it is a globe encloſed within
2 poles. But yet the forme is not of a perfect and abſolute roundle, conſidering ſo great heigth

of

20030
copy 1

A of hills and ſuch plaines of downs: howbeit, if the compaſſe therof might be taken by lines, the ends of thoſe lines would meet iuſt in circuit, and proue the figure of a iuſt circle. And this the very conſideration of naturall reaſon doth force and conuince, although there were not thoſe cauſes which we alledged about the heauen. For in it the hollow bending conuexitie boweth and beareth vpon it ſelfe, and euery way reſteth vpon the centre thereof, which is that of the earth. But this, being ſolid and cloſe compact, ariſeth ſtill like as if it ſwelled, ſtretching and growing forth. The heauen bendeth and inclineth toward the centre, but the earth goeth from the centre, whiles the world with continuall volubilitie and turning about it, driueth the huge and exceſſiue globe thereof into the forme of a round ball.

B

Chap. lxv.

¶ *Of the Antipodes, whether there be any ſuch. Alſo of the roundneſſe of water.*

MVch adoe there is here, and great debate betweene learned men; and contrariwiſe thoſe of the leaud and ignorant multitude: for they hold, that men are ouerſpread on all parts vpon the earth, and ſtand one againſt another, foot to foot: alſo that the Zenith or point of the heauen is euen and alike vnto all: and in what part ſoeuer men be, they go ſtill and tread after the ſame manner in the middeſt. But the common ſort aske the queſtion and demand, How it happeneth that they oppoſite iuſt againſt vs fall not into Heauen? as if there
C were not a reaſon alſo ready, That the Antipodes againe ſhall maruell why we fell not downe. Now there is reaſon that commeth betweene, carrying a probabilitie with it euen to the multitude, were it neuer ſo blockiſh and vnapt to learne; That in an vneuen and vnequall Globe of the Earth, with many aſcents and degrees, as if the figure thereof reſembled a Pine-apple; yet neuertheleſſe it may be well enough inhabited all ouer in euery place. But what good doth all this, when another wonder as great as it ariſeth? namely, That it ſelfe hangeth, and yet falleth not together with vs: as if the power of that Spirit eſpecially which is encloſed in the World were doubted: or that any thing could fall, eſpecially when nature is repugnant thereto, and affordeth no place whither to fall: for like as there is no ſeat of Fire, but in fire; of Water, but in water; of Aire and Spirit, but in aire; euen ſo, there is no roome for Earth but
D in earth, ſeeing all the Elements beſides, are ready to put it backe from them. Howbeit, wonderfull it remaineth ſtill, How it ſhould become a Globe, conſidering ſo great flatneſſe of Plaines and Seas! Of which doubtfull opinion, *Dicæarchus* (a right learned man as any other) is a fauourer; who, to ſatisfie the curious endeauours of Kings and Princes, had a charge and commiſſion to leuell and take meaſure of mountaines: of which he ſaid, that Pelion the higheſt, was a mile and a halfe high by the plumbe rule; and collected thereby, that it was nothing at all to ſpeake of, in compariſon of the vniuerſall rotunditie of the whole. But ſurely in my conceit, this was but an vncertaine gueſſe of his, ſince that I am not ignorant, that certaine tops of the Alpes, for a long tract together, ariſe not vnder fiftie miles in heigth.

But this is it that troubles the vulgar ſort moſt of all, if they ſhould be forced to beleeue, that
E the forme of water alſo gathers round in the top. And yet there is nothing in the whole world more euident to the ſight, for the drops euery where not onely as they hang, appeare like little round bals, but alſo if the light vpon duſt, or reſt vpon the hairy downe of leaues, we ſee they keep a perfect and exquiſite roundnes. Alſo in cups that are filled brim full, the middle part in the top ſwell moſt. Which thing conſidering the thinnes of the humour, and the ſoftnes thereof ſetling flat vpon it ſelfe, are ſooner found out by reaſon, than by the eie. Nay, this is a thing more wonderfull, that when cups are filled to the ful, put neuer ſo little more liquor thereto, the ouerplus will run ouer all about: but contrariwiſe it falleth out, if you put in any ſolid weights, yea, and it were to the weight of twenty deniers or French crowns in a cup. Forſooth the reaſon is this, for that theſe things receiued within lift vp the liquor aloft to the top, but poured vpon
F the tumour that beareth aloft aboue the edges, they muſt needs glide off and run by. The ſame is the reaſon why the land cannot be ſeen by them that ſtand vpon the hatches of the ſhip, but very plainly at the ſame time from the top of the maſts. Alſo as a ſhip goeth a far off from the land, if any thing that ſhineth and giueth light be faſtened to the top-gallant, it ſeemeth from the land ſide to goe downe and ſinke into the ſea by little and little, vntill at laſt it be hidden

cleane.

clean. Laſt of all the very Ocean, which we confeſſe to be the vtmoſt and fartheſt bound enuironing the whole globe, by what other figure elſe could it hold together, and not fall downe, ſince there is no other banke beyond it to keepe it in? And euen this alſo is as great a wonder, how it commeth to paſſe, although the ſea grow to be round, that the vtmoſt edge thereof falleth not downe? Againſt which, if the ſeas were euen, flat, and plaine, and of that forme as they ſeem to be, the Greeke Philoſophers to their own great ioy and glory do conclude, and proue by Geometricall ſubtill demonſtration, that it cannot poſſibly be that the waters ſhould fall. For ſeeing that waters run naturally from aloft to the lower parts, and that all men confeſſe, that this is their nature, and no man doubteth that the water of the ſea came euer in any ſhore ſo far as the deuexitie would haue ſuffered; doubtleſſe it appeares, that the lower a thing is, the neerer it is to the centre; and that all the lines which from thence are ſent out to the next waters, are ſhorter than thoſe which from the firſt waters reach to the vtmoſt extremitie of the ſea. Hereupon the whole water from euery part thereof bends to the centre, and therfore falls not away, becauſe it inclines naturally to the inner parts. And this we muſt beleeue that Nature the work-miſtreſſe framed and ordained ſo, to the end that the earth being dry, could not by it ſelfe alone, without ſome moiſture keepe any conſiſtence; and the water likewiſe could not abide and ſtay vnleſſe the earth vpheld it; in which regard they were mutually to embrace one another, and ſo be vnited, whiles the one opened all the creeks and nouks, and the other ran wholly into the other, by means of ſecret veins within, without, and aboue, like ligaments to claſpe it, yea, and ſo break out at the vtmoſt tops of hils; whether being partly caried by a ſpirit, and partly expreſſed forth by the ponderoſitie of the earth, it mounteth as it were in pipes: and ſo far is it from danger of falling away, that it leapeth vp to the higheſt and loftieſt things that be. By which reaſon it is euident alſo, why the ſeas ſwell not and grow, notwithſtanding ſo many riuers daily run into them.

Chap. lxxvj.

¶ *How the matter is vnited and knit to the earth.*

THe earth therefore in his whole globe is in the midſt thereof, hemmed in by the ſea running round about it. And this need not to be ſought out by reaſon and argument, for it is knowne already by good proofe and experience.

Chap. lxxvij.

¶ *Nauigation vpon the ſea and great Riuers.*

FRom Gades and *Hercules* pillars, the Weſt ſea is at this day nauigable and ſailed all ouer euen the whole compaſſe of Spaine and France. But the North Ocean was for the moſt part diſcouered vnder the conduct of *Auguſtus Cæſar* of famous memorie, who with a fleet compaſſed all Germanie, and brought it about as far as to the cape of the Cimbrians: and ſo from thence hauing kenned and viewed the vaſt and wide ſea, or elſe taken notice thereof by report, he paſſed to the Scythian Clymat and thoſe cold coaſts, frozen, and abounding with too much moiſture. For which cauſe there is no likelihood that in thoſe parts the ſeas are at an end, whereas there is ſuch exceſſiue wet that all ſtands with water. And neere vnto it from the Eaſt, out of the Indian ſea, that whole part vnder the ſame clyme of the world which bendeth vnder the Caſpian ſea, was ſailed throughout by the Macedonian armies, when *Seleuchus* and *Antiochus* reigned, who would needs haue it ſo, that *Seleuchus* and *Antiochus* ſhould beare their names. About the Caſpian ſea alſo many coaſts and ſhores of the Ocean haue bin diſcouered, and by piece-meale rather than all whole at once, the North of one ſide or other hath been ſailed or rowed ouer. But yet to put all out of coniecture, there is a great argument collected out of the Mere Mæotis, whether it be a gulfe and arme of that Ocean (as I know many haue beleeued) or an ouerflowing of the ſame, and diuided from it by a narrow piece of the continent. In another ſide of Gades, from the ſame Weſt, a great part of the South or Meridian gulfe round about Mauritania is at this day ſailed. And the greater part verily of it, like as of the Eaſt alſo, the victories of *Alexander* the Great viewed and compaſſed on euery ſide, euen as farre as vnto the Arabian Gulfe. Wherein when *Caius Cæſar*, the ſonne of *Auguſtus*, warred,

20030
copy 1

A warred in thoſe parts, the marks and tokens by report were ſeen remaining after the Spaniards ſhipwracke. *Hanno* likewiſe in the time that Carthage flouriſhed in puiſſance ſailed round about from Gades to the vtmoſt bounds and lands end of Arabia, and ſet downe that his voyage in writing. Like as alſo *Himilco* was at the ſame time ſent out in a voyage to diſcouer the vtter coaſts of Europe. Moreouer, *Cornelius Nepos* writeth, that in his time one *Eudoxius* a great ſailer, at what time he fled from King *Lathyrus*, departed out of the Arabian gulfe, and held on his courſe as far as Gades. Yea, and *Cœlius Antipater* long before him reporteth, that he ſaw the man who had ſailed out of Spain to Æthiopia for traffique of merchandiſe. The ſame *Nepos* maketh report as touching the compaſſing about of the North, That vnto *Qu. Metellus Celer*,
B Colleague to *C. Afranius* in the Conſulſhip, but at that time Proconſull in Gaule; certain Indians were giuen by a King of the Sueuians, who as they ſailed out of India for traffick as merchants, were driuen by tempeſts, and caſt vpon Germanie. Thus the ſeas flowing on all ſides about this globe of the earth, diuided and cut into parcels, bereaue vs of a part of the world, ſo as neither from thence hither, nor from hence thither there is a thorow-faire and paſſage. The contemplation whereof ſeruing fit to diſcouer and open the vanitie of men, ſeemes to require and challenge of me, that I ſhould proiect to the view of the eye, how great all this is, whatſoeuer it be, and wherein there is nothing ſufficient to ſatisfie and content the ſeuerall appetite of each man.

Chap. lxviij.

C ¶ *What portion of the earth is habitable.*

NOw firſt and formoſt me thinks men make this reckoning of the earth, as if it were the iuſt halfe of the globe, and that no portion of it were cut off by the Ocean: which notwithſtanding, claſping round about all the midſt thereof, yeelding forth and receiuing againe all other waters beſides, and what exhalations ſoeuer that go out for clouds, and feeding withall the very ſtars, ſo many as they be, and of ſo great a bigneſſe, what a mighty ſpace thinke you will it be thought to take vp and inhabit, and how little can there be left for men to inhabit? ſurely the poſſeſſion of ſo vaſt and huge a deale muſt needs be exceeding great and infinite. What ſay you then to this, That of the earth which is left the heauen hath taken a-
D way the greater part? For whereas there be of the heauen fiue parts, which they call Zones, all that lieth vnder the two vtmoſt, to wit, on both ſides about the poles, namely this here, which is called *Septentrio*, that is to ſay, the North, and the other ouer againſt it, named the South, it is ouercharged with extreme and rigorous cold, yea, and with perpetuall froſts and ice. In both Zones it is alwaies dim and darke, and by reaſon that the aſpect of the more milde and pleaſant planets is diuerted cleane from thence, the light that is, ſheweth little or nothing, and appeareth white with the froſt onely. Now the middle of the earth, whereas the Sun hath his way, and keepeth his courſe, ſcorched and burnt with flames, is euen parched and fried againe with the hot gleames thereof, being ſo neere. Thoſe two only on either ſide about it, namely betweene this burnt Zone and the two frozen, are temperate; and euen thoſe haue not acceſſe
E and paſſage the one to the other, by reaſon of the burning heate of the ſaid planet. Thus you ſee that the heauen hath taken from the earth three parts, and what the Ocean hath plucked from it beſides no man knoweth. And euen that one portion remaining vnto vs, I wot not whether it be not in greater danger alſo. For the ſame Ocean entring, as we will ſhew, into many armes and creekes, keepeth a roaring againſt the other gulfes and ſeas within the earth, and ſo neere comes vnto them, that the Arabian gulfe is not from the Egyptian ſea aboue 115 miles: the Caſpian likewiſe from the Ponticke but 375. Yea, and the ſame floweth between, and entreth into ſo many armes, as that thereby it diuideth Africke, Europe, and Aſia aſunder. Now what a quantity of land it taketh vp may be collected and reckoned at this day, by the meaſure and proportion of ſo many riuers, and ſo great Meres. Adde thereto both Lakes and pooles,
F and withall take from the earth the high mountaines bearing vp their heads aloft into the sky, ſo as the eye can hardly reach their heights: the woods beſides, and ſteepe deſcents of the vallies, the Wildernеſſes, and waſte wildes left deſart vpon a thouſand cauſes. Theſe ſo many pieces of the earth, or rather, as moſt haue written, this little pricke of the world (for ſurely the earth is nothing elſe in compariſon of the whole) is the only matter of our glory. This, I ſay,

is

clean. Laſt of all the very Ocean, which we confeſſe to be the vtmoſt and fartheſt bound enui- G
roning the whole globe, by what other figure elſe could it hold together, and not fall downe, ſince there is no other banke beyond it to keepe it in? And euen this alſo is as great a wonder, how it commeth to paſſe, although the ſea grow to be round, that the vtmoſt edge thereof falleth not downe? Againſt which, if the ſeas were euen, flat, and plaine, and of that forme as they ſeem to be, the Greeke Philoſophers to their own great ioy and glory do conclude, and proue by Geometricall ſubtill demonſtration, that it cannot poſſibly be that the waters ſhould fall. For ſeeing that waters run naturally from aloft to the lower parts, and that all men confeſſe, that this is their nature, and no man doubteth that the water of the ſea came euer in any ſhore ſo far as the deuexitie would haue ſuffered; doubtleſſe it appeares, that the lower a thing is, the neerer it is to the centre; and that all the lines which from thence are ſent out to the next wa- H
ters, are ſhorter than thoſe which from the firſt waters reach to the vtmoſt extremitie of the ſea. Hereupon the whole water from euery part thereof bends to the centre, and therfore falls not away, becauſe it inclines naturally to the inner parts. And this we muſt beleeue that Nature the work-miſtreſſe framed and ordained ſo, to the end that the earth being dry, could not by it ſelfe alone, without ſome moiſture keepe any conſiſtence; and the water likewiſe could not abide and ſtay vnleſſe the earth vpheld it; in which regard they were mutually to embrace one another, and ſo be vnited, whiles the one opened all the creeks and nouks, and the other ran wholly into the other, by means of ſecret veins within, without, and aboue, like ligaments to claſpe it, yea, and ſo break out at the vtmoſt tops of hils; whether being partly caried by a ſpi-
rit, and partly expreſſed forth by the ponderoſitie of the earth, it mounteth as it were in pipes: I
and ſo far is it from danger of falling away, that it leapeth vp to the higheſt and loftieſt things that be. By which reaſon it is euident alſo, why the ſeas ſwell not and grow, notwithſtanding ſo many riuers daily run into them.

Chap. lxxvj.

¶ *How the matter is vnited and knit to the earth.*

THe earth therefore in his whole globe is in the midſt thereof, hemmed in by the ſea running round about it. And this need not to be ſought out by reaſon and argument, for it is knowne already by good proofe and experience. K

Chap. lxxvij.

¶ *Nauigation vpon the ſea and great Riuers.*

FRom Gades and *Hercules* pillars, the Weſt ſea is at this day nauigable and ſailed all ouer euen the whole compaſſe of Spaine and France. But the North Ocean was for the moſt part diſconered vnder the conduct of *Auguſtus Cæſar* of famous memorie, who with a fleet compaſſed all Germanie, and brought it about as far as to the cape of the Cimbrians: and ſo from thence hauing kenned and viewed the vaſt and wide ſea, or elſe taken notice thereof by report, he paſſed to the Scythian Clymat and thoſe cold coaſts, frozen, and abounding with L
too much moiſture. For which cauſe there is no likelihood that in thoſe parts the ſeas are at an end, whereas there is ſuch exceſſiue wet that all ſtands with water. And neere vnto it from the Eaſt, out of the Indian ſea, that whole part vnder the ſame clyme of the world which bendeth vnder the Caſpian ſea, was ſailed throughout by the Macedonian armies, when *Seleuchus* and *Antiochus* reigned, who would needs haue it ſo, that *Seleuchus* and *Antiochus* ſhould beare their names. About the Caſpian ſea alſo many coaſts and ſhores of the Ocean haue bin diſcouered, and by piece-meale rather than all whole at once, the North of one ſide or other hath been ſailed or rowed ouer. But yet to put all out of coniecture, there is a great argument collected out of the Mere Mæotis, whether it be a gulfe and arme of that Ocean (as I know many haue beleeued) or an ouerflowing of the ſame, and diuided from it by a narrow piece of the M
continent. In another ſide of Gades, from the ſame Weſt, a great part of the South or Meridian gulfe round about Mauritania is at this day ſailed. And the greater part verily of it, like as of the Eaſt alſo, the victories of *Alexander* the Great viewed and compaſſed on euery ſide, euen as farre as vnto the Arabian Gulfe. Wherein when *Caius Cæſar*, the ſonne of *Auguſtus*, warred,

20030
copy 1

A warred in thoſe parts, the marks and tokens by report were ſeen remaining after the Spaniards ſhipwracke. *Hanno* likewiſe in the time that Carthage flouriſhed in puiſſance ſailed round about from Gades to the vtmoſt bounds and lands end of Arabia, and ſet downe that his voyage in writing. Like as alſo *Himilco* was at the ſame time ſent out in a voyage to diſcouer the vtter coaſts of Europe. Moreouer, *Cornelius Nepos* writeth, that in his time one *Eudoxius* a great ſailer, at what time he fled from King *Lathyrus*, departed out of the Arabian gulfe, and held on his courſe as far as Gades. Yea, and *Cælius Antipater* long before him reporteth, that he ſaw the man who had ſailed out of Spain to Æthiopia for traffique of merchandiſe. The ſame *Nepos* maketh report as touching the compaſſing about of the North, That vnto *Qu. Metellus Celer*,
B Colleague to *C. Afranius* in the Conſulſhip, but at that time Proconſull in Gaule; certain Indians were giuen by a King of the Sueuians, who as they ſailed out of India for traffick as merchants, were driuen by tempeſts, and caſt vpon Germanie. Thus the ſeas flowing on all ſides about this globe of the earth, diuided and cut into parcels, bereaue vs of a part of the world, ſo as neither from thence hither, nor from hence thither there is a thorow-faire and paſſage. The contemplation whereof ſeruing fit to diſcouer and open the vanitie of men, ſeemes to require and challenge of me, that I ſhould proiect to the view of the eye, how great all this is, whatſoeuer it be, and wherein there is nothing ſufficient to ſatisfie and content the ſeuerall appetite of each man.

Chap. lxviij.

C ¶ *What portion of the earth is habitable.*

NOw firſt and formoſt me thinks men make this reckoning of the earth, as if it were the iuſt halfe of the globe, and that no portion of it were cut off by the Ocean: which notwithſtanding, claſping round about all the midſt thereof, yeelding forth and receiuing all other waters beſides, and what exhalations ſoeuer that go out for clouds, and ſeehall the very ſtars, ſo many as they be, and of ſo great a bigneſſe, what a mighty ſpace ouwill it be thought to take vp and inhabit, and how little can there be left for men it? ſurely the poſſeſſion of ſo vaſt and huge a deale muſt needs be exceeding great and . What ſay you then to this, That of the earth which is left the heauen hath taken ane greater part? For whereas there be of the heauen fiue parts, which they call Zones; all t lieth vnder the two vtmoſt, to wit, on both ſides about the poles, namely this here, which is called *Septentrio*, that is to ſay, the North, and the other ouer againſt it, named the South, it is ouercharged with extreme and rigorous cold, yea, and with perpetuall froſts and ice. In both Zones it is alwaies dim and darke, and by reaſon that the aſpect of the more milde and pleaſant planets is diuerted cleane from thence, the light that is, ſheweth little or nothing, and appeareth white with the froſt onely. Now the middle of the earth, whereas the Sun hath his way, and keepeth his courſe, ſcorched and burnt with flames, is euen parched and fried againe with the hot gleames thereof, being ſo neere. Thoſe two only on either ſide about it, namely betweene this burnt Zone and the two frozen, are temperate; and euen thoſe haue not acceſſe
E and paſſage the one to the other, by reaſon of the burning heate of the ſaid planet. Thus you ſee that the heauen hath taken from the earth three parts, and what the Ocean hath plucked from it beſides no man knoweth. And euen that one portion remaining vnto vs, I wot not whether it be not in greater danger alſo. For the ſame Ocean entring, as we will ſhew, into many armes and creekes, keepeth a roaring againſt the other gulfes and ſeas within the earth, and ſo neere comes vnto them, that the Arabian gulfe is not from the Egyptian ſea aboue 115 miles: the Caſpian likewiſe from the Ponticke but 375. Yea, and the ſame floweth between, and entreth into ſo many armes, as that thereby it diuideth Africke, Europe, and Aſia aſunder. Now what a quantity of land it taketh vp may be collected and reckoned at this day, by the meaſure and proportion of ſo many riuers, and ſo great Meres. Adde thereto both Lakes and pooles,
F and withall take from the earth the high mountaines bearing vp their heads aloft into the ſky, ſo as the eye can hardly reach their heights: the woods beſides, and ſteepe deſcents of the vallies, the Wilderneſſes, and waſte wildes left deſart vpon a thouſand cauſes. Theſe ſo many pieces of the earth, or rather, as moſt haue written, this little pricke of the world (for ſurely the earth is nothing elſe in compariſon of the whole) is the only matter of our glory. This, I ſay,

is the very ſeat thereof: here we ſeeke for honors and dignities; here we exerciſe our rule and G
authoritie: here we couet wealth and riches: here all mankinde is ſet vpon ſtirs and troubles;
here we raiſe ciuill wars ſtill one after another, and with mutuall maſſacres and murthers wee
make more roome in the earth. And to let paſſe the publique furious rages of nations abroad,
this is it, wherein we chaſe and driue out our neighbor borderers, and by ſtealth dig turfe from
their ſoile to put vnto our owne: and when a man hath extended his lands, and gotten whole
countries to himſelfe far and neere, what a goodly deale of earth enioyeth he: and ſay that he
ſet out his bounds to the full meaſure of his couetous deſires, what a great portion thereof ſhal
he hold when he is once dead, and his head laid low.

Chap. LXIX. H

¶ *That the earth is in the middeſt of the world.*

THat the earth is in the midſt of the whole world it appeareth by manifeſt and vndoubted reaſons: but moſt euidently by the equal houres of the Equinoctial; for vnleſſe it were in the midſt, the Aſtrolabe and inſtruments called *Diophæ* haue proued, that nights and daies could not poſſibly be found equall: and thoſe aboue-ſaid inſtruments aboue all other confirme the ſame: ſeeing that in the Equinoctial, by one and the ſame line both riſing and ſetting of the Sun are ſeen; but the Sommer Sun riſing, and the Winter ſetting, by their owne ſeuerall lines: which could by no means happen, but that the earth reſteth in the centre. I

Chap. LXX.

¶ *Of the vnequall riſing of the ſtars: of the Eclipſe, both where and how it commeth.*

NOw three circles there be infolded within the Zones afore named, which diſtinguiſh the inequalities of the dayes: namely the Sommer Solſtitiall Tropicke, from the higheſt part of the Zodiacke in regard of vs, toward the North Clyme. And againſt it another called the Winter Tropicke toward the other Southern Pole: and in like maner the Equinoctial, which goes in the mids of the Zodiacke circle. The cauſe of the reſt, which wee wonder K
at, is in the figure of the very earth, which together with the water is by the ſame arguments knowne to be like a globe: for ſo doubtleſſe it commeth to paſſe, that with vs the ſtars about the North pole neuer go downe; and thoſe contrariwiſe about the Meridian neuer riſe. And againe, theſe here be not ſeene of them, by reaſon that the globe of the earth ſwelleth vp in the mids between. Again, Trogloditine and Egypt confining next vpon it, neuer ſet eye vpon the North pole ſtars, neither hath Italy a ſight of Canopus, named alſo Berenices haire. Likewiſe another, which vnder the Empire of *Auguſtus* men ſirnamed *Cæſaris Thronon*: yet be they ſtars there of ſpeciall marke. And ſo euidently bendeth the top of the earth in the riſing, that Canopus at Alexandria ſeemeth to the beholders eleuate aboue the earth almoſt one fourth part L
of a ſigne: but if a man looke from Rhodes, the ſame appeareth after a ſort to touch the verie horizon: and in Pontus, where the eleuation of the North pole is higheſt, not ſeene at all: yea, and this ſame pole at Rhodes is hidden, but moſt in Alexandria. In Arabia all hid it is at the firſt watch of the night in Nouember, but at the ſecond it ſheweth. In Meroe, at Midſommer in the euening it appeareth for a while; but ſome few daies before the riſing of Arcturus ſeene it is with the very dawning of the day. Sailers by their voiages finde out and know theſe ſtars moſt of any other, by reaſon that ſome ſeas are oppoſite vnto ſome ſtars; but other lie flat and incline forward to other: for that alſo thoſe pole ſtars appeare ſuddenly, and riſing out of the ſea, which lay hidden before vnder the winding compaſſe as it were of a ball. For the heauen riſeth not aloft in this higher pole, as ſome men haue giuen out; elſe ſhould theſe ſtars be ſeen M
in euery place: both thoſe that vnto the next Sailers are ſuppoſed to be higher, the ſame ſeeme to them afarre off drowned in the ſea. And like as this North pole ſeemeth to be aloft vnto thoſe that are ſcituate directly vnder it; ſo to them that be gone ſo far as the other deuexitie or fall of the earth, thoſe aboueſaid ſtarres riſe vp aloft there, whiles they decline downeward which here were mounted on high. Which thing could not poſſibly fall out but in the figure

of

20030
copy 1

A of a ball. And hereupon it is that the inhabitants of the Eaſt perceiue not the eclipſes of Sun or Moone in the euening, no more than thoſe that dwell Weſt in the morning: but thoſe that be at noone in the South they ſee very oft. At what time *Alexander* the great won that famous victorie at Arbela, the Moone by report was eclipſed at the ſecond houre of the night; but at the very ſame time in Sicily ſhe aroſe. The eclipſe of the Sun, which chanced before the Calends of May, when as *Vipſanus* and *Fonteius* were Conſuls (being not many yeares paſt) was ſeene in Campania, betweene the 7 and 8 houres of the day: but *Corbulo*, a General Commander then in Armenia, made report, that it was ſeene there betweene the tenth and 11 houres of the ſame day; by reaſon that the compaſſe of the globe diſcouereth and hides ſome things to ſome, and other to others. But if the earth were plaine and leuell, all things ſhould appeare at
B once to all men; for neither ſhould one night be longer than another, ne yet ſhould the day of 12 houres appeare euen and equall to any, but to thoſe that are ſeated in the mids of the earth, which now in all parts agree and accord together alike.

Chap. lxxj.

¶ *What is the reaſon of the day light vpon earth.*

AND hence it commeth, that it is neither night nor day at one time in all parts of the world, by reaſon that the oppoſition of the globe brings night, and the round compaſſe or circuit thereof diſcouereth the day. This is knowne by many experiments. In Africk
C and Spaine there were raiſed by *Hanibal* high watch-towers; and in Aſia for the ſame feare of rouers and pyrats, the like helpe of beacons was erected; wherein it was noted oft times, that the fires giuing warning afore-hand (which were kindled at the ſixt houre of the day) were deſcried by them that were fartheſt off in Aſia at the third houre of the night. *Philonides* the curror or Poſt of the ſame *Alexander* aboue named, diſpatched in 9 houres of the day 1200 ſtadia, euen as far as from Sicyone to Elis: and from thence againe (albeit he went downe hill all the way) he returned oftentimes, but not before the third houre of the night. The cauſe was, for that he had the Sun with him in his firſt ſetting out to Elis, and in his returne backe to Sicyone he went full againſt it, met with it, and ere he came home ouerpaſſed it, leauing it in the Weſt behind going from him. Which is the reaſon alſo, that they who by day light ſaile weſt-
D ward in the ſhorteſt day of the yeare, rid more way than thoſe who ſaile all night long at the ſame time, for that the other do accompany the Sun.

Chap. lxxij.

¶ *The Gnomonicke art of the ſame matter: as alſo of the firſt Diall.*

ALſo the inſtruments ſeruing for the houres, as Quadrants and Dials, will not ſerue for all places, but in euery 300 ſtadia, or 500 at the fartheſt, the ſhadowes that the Sun caſteth change; and therefore the ſhadow of the ſtyle in the Dial, called the Gnomon, in Egypt at noone tide in the Æquinoctial day is little more in length than halfe the Gnomon. But in
E the city of Rome the ſhadow wanteth the ninth part of the Gnomon. In the towne Ancona it is longer than it in a 35 part. But in Venice at the ſame time and houre the ſhadow and the Gnomon be all one.

Chap. lxxiij.

¶ *Where and when there be no ſhadowes at all.*

IN like manner they ſay, that in the towne Syene (which is aboue Alexandria 50 ſtadia) at noone tide in the midſt of Sommer there is no ſhadow at all: and for further experiment thereof, let a pit be ſunke in the ground and it will be light all ouer in euery corner. Wher-
F by it appeareth, that the Sun then is iuſt aud directly ouer that place, as the very Zenith thereof. Which alſo at the ſame time hapneth in India aboue the riuer Hypaſis, as *Oneſicratus* hath ſet downe in writing. Yea and it is for certaine knowne, that in Berenice a city of the Troglodites, and from thence 4820 ſtadia in the ſame countrey, at the towne of Ptolemais (which was built at the firſt vpon the very banke of the Red ſea, for the pleaſure of chaſing and hunting

of Elephants) the ſelfe ſame is to be ſeen 45 daies before the Summer Sunſted, and as long af- G
ter, and that for 90 daies ſpace all ſhadowes are caſt into the South. Again, in the Iſle Meroe, the capitall place of the Æthiopian nation, inhabited 5000 ſtadia from Syene vpon the Riuer Nilus, twice in the yeare the ſhadowes are gon, and none at all ſeen; to wit, when the Sun is in the 18 degree of Taurus, and the 14 of *Leo*. In the country of the Oretes within India there is a mountaine named Maleus, neere which the ſhadowes in Summer are caſt into the South, and in Winter into the North. There for 15 nights and no more is the ſtar Charles-wain neere the pole to be ſeen. In the ſame India at Patales (a moſt famous and frequented port) the Sun ariſeth on the right hand, and all ſhadowes fall to the South, Whiles *Alexander* made abode there, *Oneſicritus* a captaine of his wrot, that it was obſerued there, that the North ſtar was ſeen the firſt part only of the night: alſo in what places of India there were no ſhadowes, there the H
North ſtar appeared not: and that thoſe quarters were called *Aſcia*, (*i.* without ſhadow) neither keepe they any reckoning of houres there.

Chap. lxxiv.

¶ *Where twice in the yeare the ſhadowes go contrarie waies.*

BVt throughout all Trogliditine, *Cratoſthenes* hath written, that the ſhadowes two times in the yeare for 45 daies fall contrarie waies.

Chap. LXXV.

¶ *Where the day is longeſt, and where ſhorteſt.* I

IT comes thus to paſſe, that by the variable increment of the day light, the longeſt day in Meroe doth comprehend 12 Equinoctial houres, and 8 parts of one houre aboue; but in Alexandria 14, in Italy 15, in Britaine 17: where in Sommer time the nights being light and ſhort, by infallible experience ſhew that which reaſon forceth to beleeue; namely, that at Midſummer time, as the Sun maketh his approch neere vnto the pole of the world, the places of the earth lying vnderneath hath day continually for ſix moneths, and contrariwiſe night, when the Sun is remote as far as Bruma. The which *Pythias* of Maſſiles hath written of Thule, an Iſland diſtant Northward from Britaine ſix daies ſailing. Yea, and ſome affirme the ſame of Mona, an Iſland diſtant from Camalodunum, a towne of Britaine, about 200 miles. K

Chap. LXXVI. ¶ *Of Dials and Quadrants.*

THis cunning and skill of ſhadowes, named Gnonomice, *Anaximines* the Mileſian, the diſciple of *Anaximander* aboue named, inuented: and hee was the firſt alſo that ſhewed in Lacedemon the Horologe or Dial which they call Sciotericon.

Chap. LXXVII. ¶ *How the dayes are obſerued.*

THe very day it ſelfe men haue after diuers manners obſerued. The Babylonians count for day all the time betweene two Sun-riſings: the Athenians, betweene the ſettings. The L
Vmbrians from noone to noone. But all the common ſort euery where, from day light vntill it be darke. The Roman Prieſts, and thoſe that haue defined and ſet out a ciuil day, likewiſe the Egyptians and *Hipparchus*, from midnight to midnight. That the ſpaces or lights are greater or leſſe betwixt Sun riſings, neere the Sunſteds, than the equinoctials, it appeareth by this, that the poſition of the Zodiake about the middle parts therof is more oblique and crooked, but toward the Sunſted more ſtreight and direct.

Chap. lxxviij.

¶ *The reaſon of the varietie and difference of ſundry Countries and Nations.*

HEreunto we muſt ioyne ſuch things as are linked to celeſtiall cauſes. For doubtleſſe it M
is, that the Æthiopians by reaſon of the Sunnes vicinitie are ſcorched and tanned with the heate thereof, like to them that be aduſt and burnt, hauing their beards and buſh of haire curled. Alſo, that in the contrarie Clime of the world to it, in the frozen and icie re-

gions

20030
copy 1

A gions the people haue white skins, haire growing long downeward, and yellow; but are fierce and cruell by reaſon of the rigorous cold aire: howbeit the one as well as the other in this mutabilitie are dull and groſſe, and the very legs do argue the temperature: for in the Æthiopians the iuice or bloud is drawne vpward againe by the naturall heate. But among the nations Septentrionall the ſame is driuen to the inferior parts, by reaſon of moiſture apt to fall downward. Here breed noiſome and hurtfull wilde beaſts; but there be ingendred creatures of ſundry and diuers ſhapes, eſpecially birds. Tall they are of bodily ſtature, as well in one part as the other; in the hot regions by the occaſionall motion of fire: in the other by the moiſt nouriſhment. But in the midſt of the earth there is an wholeſome mixture from both ſides: the whole Tract is fertill and fruitfull for all things, the habit of mens bodies of a mean and indifferent conſti-
B tution, the colour alſo ſhewing a great temperature. The faſhions and manners of the people are ciuill and gentle, their ſences cleare and lightſome, their wits pregnant and capable of all things within the compaſſe of Nature: they alſo beare ſoueraigne rule, and ſway empires and monarchies, which thoſe vttermoſt nations neuer had. Yet true it is, that euen they who are out of the temperate Zones may not abide to be ſubiect, nor accommodate themſelues to theſe: for ſuch is their ſauage and brutiſh nature that it vrgeth them to liue ſolitarie by themſelues.

Chap. lxxix.

¶ *Of Earthquakes.*

C THe Babylonians were of this opinion, that earthquakes and gaping chinks, and all other accidents of that nature are occaſioned by the power and influence of the planets, but of thoſe three only to which they attribute lightnings: and by this means, namely as they keepe their courſe with the Sun, or meet with him; and eſpecially when this concurrence is about the quadratures of the heauen. And ſurely if it be true which is reported of *Anaximander*, the Mileſian naturall Philoſopher, his preſcience and foreknowledge of things was excellent, and worthy of immortalitie; who, as it is ſaid, forewarned the Lacedemonians to looke wel to their city and dwelling houſes, for that there was an earthquake toward: which hapned accordingly, when not only their whole city was ſhaken, and fell downe, but alſo a great part of the
D mountain Taygetus, which bare out like to the poupe of a ſhip, broken as it were from the reſt, came down too, wholly couering the foreſaid ruines. There is reported another ſhrewd gueſſe of *Pherecydes*, who was *Pythagoras* his maſter, and the ſame likewiſe diuine and prophetical: he by drawing water out of a pit both foreſaw and alſo foretold an earthquake there. Which if they be true, how far off I pray you may ſuch men ſeeme to be from God, euen while they liue here on earth. But as for theſe things verily, I leaue it free for euery man to weigh and deeme of them according to their owne iudgement; and for mine owne part I ſuppoſe, that without all doubt the windes are the cauſe thereof. For neuer beginneth the earth to quake but when the ſea is ſtill, and the weather ſo calme withall, that the birds in their flying cannot houer and hang in the aire, by reaſon that all the ſpirit and winde which ſhould beare them vp is withdrawne from them: ne yet at any time, but after the windes are laid, namely when the blaſt is
E pent and hidden within the veines and hollow caues of the earth. Neither is this ſhaking in the earth any other thing than is thunder in the cloud; nor the gaping chinke thereof ought elſe but like the clift whereout the lightning breaketh, when the ſpirit incloſed within ſtrugleth and ſtirreth to go forth at libertie.

Chap. LXXX.

¶ *Of the gaping chinks of the earth.*

F AFter many and ſundry ſorts the earth therefore is ſhaken, and thereupon enſue wondrous effects: in one place the walls of cities are laid along: in another they be ſwallowed vp in a deepe and wide chawne: here are caſt vp mighty heaps of earth; there are let out Riuers of water, yea and ſomtimes fire doth breathe forth, and hot ſprings iſſue abroad: in another place the courſe and chanell of riuers is turned clean away and forced backward. There goeth before and commeth with it a terrible noiſe: one while a rumbling more like the loowing

and bellowing of beaſts: otherwhiles it reſembles a mans voice, or elſe the clattering and ruſtling of armor and weapons, beating one vpon another according to the qualitie of the matter that catcheth and receiueth the noiſe, or the faſhion either of the hollow cranes within, or the cranny by which it paſſeth, whiles in a narrow way it taketh on with a more ſlender and whiſtling noiſe: and the ſame keepeth an hoarſe din in winding and crooked caues, rebounding againe in hard paſſages, roaring in moiſt places, wauing and floting in ſtanding waters, boiling and chafing againſt ſolid things. And therefore a noiſe is often heard without any earthquake, and neuer at any time ſhaketh it ſimply after one and the ſame manner, but trembles and waggeth to and fro. As for the gaping chink, ſometimes it remaineth wide open, and ſheweth what it hath ſwallowed vp; otherwhiles it cloſeth vp the mouth, and hideth all, and the earth is knit together ſo againe, as there remaine no marks and tokens to be ſeene: notwithſtanding many times it hath deuoured cities, and drawne into it a whole tract of ground and fields. Sea coaſts and maritime regions moſt of all other feele earthquakes. Neither are the hilly countries without this calamitie: for I my ſelfe haue known for certain, that the Alps and Apenine haue often trembled. In the Autumne alſo and Spring there happen more earthquakes than at other times, like as lightnings. And hereof it is that France and Egypt leaſt of all other are ſhaken: for that in Egypt the continuall Sommer, and in France the hard Winter, is againſt it. In like manner, earthquakes are more rife in the night than in the day time: but the greateſt vſe to be in the morning and euening. Toward day light there be many; and if by day, it is vſually about noon. They fortune alſo to be when the Sun and Moone are eclipſed, becauſe then all tempeſts are aſleepe and laid to reſt. But eſpecially, when after much raine there followes a great time of heate; or after heate ſtore of raine. G H I

Chap. lxxxj.

¶ *Signes of Earthquake comming.*

SAilers alſo haue a certaine foreknowledge thereof, and gueſſe not doubtfully at it, namely when the waues ſwel ſuddenly without any gale of wind, or when in the ſhip they are ſhocked with billowes ſhaking vnder them: then are the things ſeen to quake which ſtand in the ſhip, as well as thoſe in houſes, and with a ruſtling noiſe giue warning before-hand. The foules likewiſe of the aire ſit not quietly without feare. In the ſky alſo there is ſigne thereof; for there goeth before an earthquake, either in day time, or ſoon after the Sun is gon downe, a thin ſtreake or line as it were of a cloud, lying out in a great length. Moreouer, the water in wels and pits is more thicke and troubled than ordinary, caſting out a ſtinking ſent. K

Chap. lxxxij.

¶ *Remedies or helps againſt Earthquakes toward.*

BVt a remedie there is for the ſame, ſuch as vaults and holes in many places do yeeld: for they vent and breathe out the wind that was conceiued there before: a thing noted in certain townes, which by reaſon they ſtand hollow, and haue many ſinks and vaults digged to conuey away their filth, are leſſe ſhaken: yea, and in the ſame towns, thoſe parts which be pendant be the ſafer: as is well ſeen in Naples, where that quarter thereof which is ſollid and not hollow is ſubiect to ſuch caſualties. And in houſes the arches are moſt ſafe, the angles alſo of walls, yea, and thoſe poſts which in ſhaking will jog to and fro euery way. Moreouer, walls made of brick or earth take leſſe harme when they be ſhaken in an earthquake. And great difference there is in the very kinde and manner of earthquakes, for the motion is diuers: the ſafeſt is, when houſes as they rocke keep a trembling and warbling noiſe: alſo when the earth ſeemeth to ſwell vp in riſing, and again to ſettle down and ſink with an alternatiue motion. Harmleſſe it is alſo when houſes run on end together by a contrary ſtroke, and butt or jur one againſt another; for the one mouing withſtandeth the other. The bending downward in maner of wauing, and a certain rolling like to ſurging billowes is it that is ſo dangerous, and doth all the miſchiefe: or when the whole motion beareth and forceth it ſelfe to one ſide. Theſe quakings or tremblings of the earth giue ouer when the winde is once vented out: but if they continue ſtill, then they ceaſe not vntill forty daies end, yea and many times it is longer ere they ſtay, for ſome of them haue laſted the ſpace of a yeare or two. L M

CHAP.

Chap. LXXXIII.

¶ *Monſtrous Earthquakes ſeene neuer but once.*

A THere hapned once (which I found in the bookes of the Tuſcanes learning) within the teritorie of Modena, whiles *L. Martius* and *S. Iulius* were Conſuls, a great ſtrange wonder of the earth; for two hils encountred together, charging as it were, and with violence aſſaulting one another, yea and retyring againe with a moſt mighty noiſe. It fell out in the day time, and between them there iſſued flaming fire and ſmoke mounting vp into the sky; while a great number of Roman Gentlemen (from the highway Æmylia) and a multitude of ſeruants B and paſſengers ſtood and beheld it. With this conflict and running of them together all the villages vpon them were daſhed and broken to pieces: very much cattell that was within died therewith. And this hapned the yeare before the war of our Aſſociates: which I doubt whether it were not more pernicious to the whole land of Italy, than the ciuil wars. It was no leſſe monſtrous a wonder that was knowne alſo in our age, in the very laſt yeare of *Nero* the Emperour (as we haue ſhewed in his acts) when medows and oliue rowes (notwithſtanding the great publique port way lay betweene) paſſed ouerthwart one into anothers place, in the Marrucine territorie, within the lands of *Vectius Marcellus* a gentleman of Rome, Procurator vnder *Nero* in his affaires.

Chap. LXXXIV.

¶ *Wonders of Earthquakes.*

C THere happen together with earthquakes deluges alſo and inundations of the ſea, being infuſed and entring into the earth with the ſame aire and wind, or elſe receiued into the hollow receptacle as it ſetleth down. The greateſt earthquake in mans memory was that which chanced during the empire of *Tiberius Cæſar*, when twelue cities of Aſia were laid leuell in one night. But the earthquakes came thickeſt in the Punick war, when in one yeare were reported to be in Rome 57. In which yeare verily, when the Carthaginians and Romans fought a battell at Thraſymenus lake, neither of both armies tooke notice of a great earthquake. Neither is this a ſimple euill thing, nor the danger conſiſteth only in the very earthquake, and no more: but that which it portendeth is as bad or worſe. Neuer abode the city of Rome any D earthquake, but it gaue warning thereof before hand of ſome ſtrange accident and vnhappie euent following.

Chap. LXXXV.

¶ *In what places the ſeas haue gone backe.*

THe ſame cauſe is to be rendred of ſome new hill or piece of ground not ſeen before; when as the ſaid winde within the earth, able to huffe vp the ground, was not powerful enough to breake forth and make iſſue. For, firme land groweth not only by that which Riuers bring in (as the Iſles Echinades, which were heaped and raiſed vp by the riuer Achelous; and by Nilus the greater part of Egypt, into which, if wee beleeue *Homer*, from the Iſland Pharus E there was a cut by ſea of a day and a nights ſailing) but alſo by the retiring and going backe of the ſea, as the ſame poet hath written of the Circeiæ. The like (by report) hapned both in the bay of Ambracia for ten miles ſpace, and alſo in that of the Athenians, for fiue miles, neere Pireæum: alſo at Epheſus, where ſomtime the ſea beate vpon the temple of *Diana*. And verily, if we giue eare to *Herodotus*, it was all a ſea from aboue Memphis to the Ethyopian hills: and likewiſe from the plaines of Arabia. It was ſea alſo about Ilium, and the flat of Teuthrania; and all that leuell whereas the riuer Mæander now runneth by goodly medowes.

Chap. LXXXVI.

¶ *The reaſon of Iſlands that newly appeare out of the ſea.*

F THere be lands alſo that put forth after another manner, and all at once ſhew on a ſudden in ſome ſea; as if Nature cried quittance with her ſelfe, and made euen, paying one for another, namely by giuing againe that in one place, which thoſe chawnes and gaping gulfes tooke away in another.

Chap. lxxxvij.

¶ *What Iſlands haue ſprung vp, and when.*

THoſe famous Iſlands long ſince, to wit, Delos and Rhodes, are recorded to haue growne out of the ſea: and afterwards others that were leſſe, namely Anaphe beyond Melos, and Nea, betweene Lemnus and Helleſpont. Alone alſo, betweene Lebedus and Teos. Thera likewiſe, and Therasia, among the Cyclades, which ſhewed in the fourth yere of the 135 Olympias. Moreouer, among the ſame Iſles 130 yeres after, Hiera, which is the ſame that Automate. And two furlongs from it, after 110 yeares, Thia, euen in our time, vpon the 8 day before the Ides of Iuly, when *M. Iunius Syllanus* and *L. Balbus* were Conſuls.

Chap. lxxxviij.

¶ *What lands the Seas haue broken in betweene.*

EVen within our kenning, neere to Italy, between the iſles Æoliæ. In like maner neer Creta there was one ſhewed it ſelfe with hot fountaines out of the ſea, for a mile and halfe; and another in the 3 yeare of the 143 Olympias, within the Tuſcan gulf, and this burned with a violent winde. Recorded it is alſo, that when a great multitude of fiſhes floted ebbe about it, thoſe perſons died preſently that did feed thereof. So they ſay that in the Campaine gulfe the Pithecuſæ Iſlands appeared. And ſoon after, the hill Epopos in them (at what time as ſuddenly there burſt forth a flaming fire out of it) was laid leuell with the plain champion. Within the ſame alſo there was a town ſwallowed vp by the ſea: and in one earthquake there appeared a ſtanding poole; but in another, by the fall and tumbling downe of certain hills, grew the Iſland Prochyta. For after this maner alſo Nature hath made Iſlands; thus ſhe diſ-ioyned Sicily from Italy, Cyprus from Syria, Eubœa from Bæotia, Atalante and Macris from Eubœa, Besbycus from Bithynia, Leucoſtia from the promontorie and cape of the Syrenes.

Chap. LXXXIX.

What Iſlands came to ioyne vnto the Maine.

AGaine, ſhee hath taken Iſlands from the ſea, and ioyned them to the firme land; namely, Antiſſa to Lesbos, Zephyria to Halicarnaſſus, Aethuſa to Myndus, Dromiſcos and Pern to Miletus, and Narthecuſa to the promontorie Parthenius. Hybanda, ſomtime an Iſle of Ionia, is now diſtant from the ſea 200 ſtadia. As for Syrie, Epheſus hath it now in the midland parts far from the ſea. So Magneſia neighbouring to it, hath Deraſitas and Sophonia. As for Epidaurus and Oricum, they are no more Iſlands at this day.

Chap. XC.

¶ *What lands haue been turned wholly into ſea.*

NAture hath altogether taken away certaine lands: in the firſt place, whereas now the ſea Atlanticum is, was ſometime the continent for a mighty ſpace of ground, as *Plato* ſaith. Likewiſe in our Mediterranean ſea, all men may ſee at this day how much hath beene drowned vp, to wit, Acarnania by the inward gulfe of Ambracia, Achaia within that of Corinth, Europ and Aſia within Propontis and Pontus. Ouer and beſides, the ſea hath broken through Leucas, Antirrhium, Helleſpont, and the two Boſphori.

Chap. XCI.

What lands haue ſwallowed vp themſelues.

AND now to paſſe ouer armes of the ſea and lakes; the very earth hath deuoured and buried her ſelfe: to wit, that moſt high hill Cybotus, with the towne Curites; Sipylus in Magneſia: and in the ſame place before time the moſt noble city called Tantalus; the territories of Galanis and Gamale in Phœnice, together with the very cities. Phogium alſo, a paſſing high hill in Ethiopia, as if the very ſtronds and continent were not to be truſted, but they alſo muſt worke hurt and miſchiefe.

CHAP.

20030
copy 1

A

Chap. XCII.

¶ *What Cities haue been drowned with the ſea.*

THe ſea Pontus hath ouerwhelmed Pyrrha and Antyſſa about Mæotis, Elice and Bura in the gulfe of Corinth; whereof the marks and tokens are to be ſeene in the Deep. Out of the Iſland Cea more than 30 miles of ground was loſt ſuddenly at once, with many men. In Sicily alſo the ſea came in and bare away halfe the city Thindaris, and all that Italy nurſeth betweene it and Sicily. The like it did in Bæotia and Eleuſina.

Chap. XCIII.

B ¶ *Of the ſtrange wonders of the land.*

FOr let vs ſpeake no more of Earthquakes, and whatſoeuer elſe of that kind, as of graues and ſepulchres of cities buried, and extant to be ſeen; but diſcourſe we rather of the wonders, than the miſchiefes wrought by Nature in the earth. And ſurely the ſtory of cœleſtiall things was not more hard to be declared: the wealth is ſuch of mettals and mines, in ſuch varietie, ſo rich, ſo fruitfull, riſing ſtill one vnder another for ſo many ages, notwithſtanding daily there is ſo much waſted and conſumed throughout the world, with fires, ruines, ſhipwrecks, wars, and frauduient practiſes: yea and ſo much ſpent in ryot and ſuperfluous vanities, that it is infinite: yet ſee how many ſorts of jemmes there be ſtill, ſo painted and ſet out with colors? C in precious ſtones what varieties of ſundry colours, and how beſpotted are they: and amongſt them behold the brightneſſe and white hue of ſome, excluding all elſe but onely light! The vertue and power of medicinable fountaines: the wonderfull burning ſo many hundred yeres together of fire iſſuing forth in ſo many places: the deadly dampes and exhalations in ſome places, either ſent out of pits when they are ſunke, or elſe from the very natiue ſeat and poſition of the ground; preſent death in one place to the birds and foules of the aire only (as at Soracte, in a quarter neere the city:) in other, to all other liuing creatures ſaue only man: yea and ſometimes to men alſo, as in the territories of Sinueſſa and Puteoli. Which damp holes breathing out a deadly aire ſome call *Charoneæ Scrobes*, i. *Charons* ditches. Likewiſe in the Hirpines D land, that of Amſanctus, a caue neere vnto the temple of *Nephites*, wherinto as many as enter dy preſently. After the like manner at Hierapolis in Aſia there is another ſuch, hurting all that come to it, except the prieſt of *Cybele*, the great mother of the gods. In other places there be alſo caues and holes of a propheticall power; by the exhalation of which men are intoxicate and as it were drunken, and ſo foretell things to come, as at Delphi that moſt renowned Oracle. In all which things what other reaſon can any mortall man make, than the diuine power of Nature, diffuſed and ſpred through all, which breaketh forth at times in ſundry ſorts.

Chap. XCIV.

E ¶ *Of certaine Lands that alwaies quake.*

SOme parts of the earth there be that ſhake and tremble vnder mens feet as they go: namely in the territorie of the Gabians not far from Rome, there be almoſt two hundred acres of ground which tremble as horſemen ride ouer them. And the like is in the territory of Reate.

Chap. XCV.

¶ *Of Iſlands euer floting and ſwimming.*

F CErtaine Iſles are alwaies wauing and nuer ſtand ſtill, as in the countrey about Cæcubum, Reate aboue named, Mutina, and Statonia. Alſo in the lake Vadimonis, and neer the waters Cutyliæ, there is a ſhadowie darke groue which is neuer ſeen in one place a day and night together. Moreouer in Lydia, the Iſles Calanucæ are not only driuen to & fro by winds, but alſo many be ſhoued and thruſt with long poles which way a man will: a thing that ſaued

many a mans life in the war against *Mithridates*. There be other little ones also in the Riuer Nymphæus, called Saltuares or Dancers, because in any consort of Musitians singing they stir and moue at the stroke of the feet, keeping time and measure. In the great lake of Italy, Tarquiniensis, two Islands carry about with them groues and woods: one while they are in fashion three square, another while round, when they close one to the other by the drift of winds, but neuer foure square.

Chap. XCVI.

¶ *In what lands it neuer raineth. Also many strange wonders and miracles of the earth, and other Elements heaped together.*

Paphos hath in it a famous temple of Venice, vpon a certain floure and altar whereof it neuer raineth. Likewise in Nea a towne of Troas a man shall neuer see it raine about the Image of *Minerua*. In the same also the beasts killed in sacrifice, if they be left there neuer putrifie. Neere to Harpasa a towne in Asia stands a rocke of stone of a strange and wonderfull nature, lay one finger to it and it will stir, but thrust at it with your whole body, it moueth not at all. Within the demy Island of the Tauri, and city Parasinum, there is a kinde of earth that healeth all wounds: but about Assos in Troas there growes a stone, wherewith bodies are consumed, and therefore is called Sarcophagus. Two hills there be neere the riuer Indus: the nature of the one is to hold fast all manner of iron, and of the other not to abide it: wherefore if a mans shooe sole be clouted with hob nailes, in the one of them a man cannot plucke away his foot, and in the other he can take no footing at all. Noted it is, that in Locri and Crotone was neuer pestilence knowne, nor any danger by earthquake. And in Lycia euer after an earthquake it hath been faire for forty daies. In the territorie of Arda if corne be sowed it neuer comes vp. At the altars Murtiæ in the Veientian field, likewise in Tusculanum and the wood Cyminia, there be certaine places, wherein whatsoeuer is pitched into the ground, can neuer be plucked vp againe. In the Crustumine countrey all the hay there growing is hurtfull in the same place: but being once without, it is good and wholesome.

Chap. XCVII.

¶ *What is the reason of the reciprocall ebbe and flow of the seas; and where it is that they keepe no order, and are without reason.*

Of the nature of waters much hath bin said: but the sea tide that it should flow and ebbe againe is most maruellous of all other: the maner thereof verily is diuers, but the cause is in the Sun and Moon. Between two risings of the Moone they flow twice, and twice go backe, and alwaies in the space of 24 houres. And first as he riseth aloft together with the world the tides swell, and anon again, as it goeth from the height of the Meridian line, and enclineth Westward, they slake: again, as she moueth from the West vnder our horizon, and approcheth to the point contrarie to the Meridian, they flow, and then they are receiued backe into the sea vntill she rise again: and neuer keepeth the tyde the same houre that it did the day before; for it waiteth and attendeth vpon the planet, which greedily draweth with it the seas, and euer riseth to day in some other place than it did yesterday. Howbeit the tides keepe iust the same time between, and hold alwaies six houres apiece: I meane not of euery day and night, or place indifferently, but only the equinoctial. For in regard of houres the tides of the sea are vnequall, forasmuch as by day and night the tydes are more or lesse one time than another: in the equinoctial only they are euen and alike in all places. A very great argument this is, full of light, to conuince that grosse and blockish conceit of them who are of opinion, that the planets being vnder the earth lose their power, and that their vertue beginneth when they are aboue only: for they shew their effects as well vnder as aboue the earth, as wel as the earth, which worketh in all parts. And plaine it is, that the Moone performeth her operations as well vnder the earth, as when we see her visibly aloft: neither is her course any other beneath, than aboue our horizon. But yet the difference and alteration of the Moone is manifold, and first euery seuen daies: for whiles she is new the tides be but small vntill the first quarter:

for

20030
copy 1

A for as ſhe groweth bigger, they flow more, but in the full they ſwell and boile moſt of all. From that time they begin again to be more milde; and in the firſt daies of the wain to the ſeuenth, the tides are equall: and againe when ſhe is diuided on the other ſide, and but halfe Moon, they increaſe greater. And in the Coniunction or the change, they are equall to the tides of the full. And euidently it appeareth, that when ſhe is Northerly, and retired higher & farther from the earth, the tides are more gentle, than when ſhe is gone Southerly; for then ſhe worketh neerer hand, and putteth forth her full power. Euery eight yere alſo, & after the hundreth reuolution of the Moone, the ſeas returne to the beginning of their motions, and to the like encreaſe and growth: by reaſon that ſhe augmenteth all things by the yerely courſe of the Sun: foraſmuch as in the two equinoctials they euer ſwel moſt, yet more in that of the Autumne, than the Spring:
B but nothing to ſpeak of in Mid-winter, & leſſe at Mid-ſummer. And yet theſe things fall not out iuſt in theſe very points and inſtants of the times which I haue named, but ſome few daies after: like as neither in the full nor in the change, but afterward: ne yet preſently ſo ſoon as the heauen either ſheweth vs the Moon in her riſing, or hideth her from vs at her ſetting, or as ſhee declineth from us in the middle climat, but later almoſt by two equinoctial hours. Foraſmuch as the effect of all influences and operations in the heauen reach not ſo ſoon vnto the earth, as the eieſight pierceth vp to the heauen: as it appeareth by lightnings, thunders, & thunderbolts. Moreouer, all tides in the main Ocean, ouerſpread, couer, and ouerflow much more within the land, than in other ſeas beſides: either becauſe the whole and vniuerſall element is more courageous than in a part: or for that the open greatneſſe and largeneſſe thereof, feeleth more effectu-
C ally the power of the Planet, working forcibly as it doth far and neere at liberty, than when the ſame is pent and reſtrained within thoſe ſtreights. Which is the cauſe that neither lakes nor little riuers ebbe and flow in like manner. *Pythias* of Maſſiles, writeth, That aboue Brittain the tide floweth in height 80 cubits. But the more inward and Mediterranean narrow ſeas are ſhut vp within the lands, as in an hauen. Howbeit in ſome places a more ſpacious liberty there is that yeeldeth to the power and command of the Moon; for we haue many examples and experiments of them that in a calm ſea without wind and ſaile, by a ſtrange water onely, haue tided from Italy to Vtica in three daies. But theſe tides and quick motions of the ſea are found to be about the ſhores, more than in the deep maine ſea. For euen ſo in our bodies the extreme and vtmoſt parts haue a greater feeling of the beating of arteries, that is to ſay, the vitall ſpirits.
D Yet notwithſtanding in many firths and armes of the ſea, by reaſon of the vnlike riſings of the planets in euery coaſt, the tides are diuers, and diſagreeing in time, but not in reaſon and cauſe, as namely in the Syrtes. And yet ſome there be that haue a peculiar nature by themſelues, as the Firth Taurominitanum, which ebbeth and floweth oftner than twice: and that either in Euboea, called likewiſe Euripus, which hath ſeuen tides to and fro in a day and a night. And the ſame tide three daies in a moneth ſtandeth ſtil, namely in the 7, 8, and 9 daies of the moons age. At Gades, the fountaine next vnto the chappell of *Hercules*, is incloſed about like a well; the which at ſometimes riſeth and falleth as the Ocean doth: at others againe it doth both, at contrary ſeaſons. In the ſame place there is another ſpring that keepeth order and time with the motions of the Ocean. On the banke of Betis there is a towne, the wells whereof as the tide
E floweth, do ebbe; and as it ebbeth, do flow: in the mid times betweene, they ſtirre not. Of the ſame qualitie there is one pit in the towne Hiſpalis; all the reſt be as others are. And the ſea Pontus euermore floweth and runneth out into Propontis, but the ſea neuer retireth backe againe within Pontus.

Chap. XCVIII.

¶ *Marueils of the Sea.*

F ALl ſeas are purged and ſcoured in the full Moone; and ſome beſides at certaine times. About Meſſala and Nylæ, there is voided vpon the ſhore certaine dregges and filthineſſe like to beaſts dung: whereupon aroſe the fable, That the Sunnes oxen were there kept in ſtall. Hereunto addeth *Ariſtotle* (for I would not omit willingly any thing that I know) that no liuing creature dieth but in the reflux and ebbe of the ſea. This is obſerued much in the Ocean of France, but found onely in man by experience, true.

CHAP.

Chap. XCIX. ¶ *What power the Moone hath ouer things on Earth and in the Sea.* G

BY which it is truly gueſſed and collected, that not in vaine the planet of the Moone is ſuppoſed to be a Spirit: for this is it that ſatisfieth the earth to her content: ſhee it is that in her approch and comming toward, filleth bodies ful; and in her retire and going away, emptieth them again. And hereupon it is, that with her growth all ſhell-fiſh wax & encreaſe: and thoſe creatures which haue no bloud, them moſt of all do feele her ſpirit. Alſo, the bloud in men doth increaſe or diminiſh with her light more or leſſe: yea the leaues of trees and the graſſe for fodder (as ſhall be ſaid in conuenient place) do feele the influence of her, which euermore the ſame pierceth, and entreth effectually into all things.

H

Chap. C.

¶ *Of the power of the Sun, and why the Sea is ſalt.*

THus by the feruent heate of the Sun all moiſture is dried vp: for wee haue been taught, that this Planet is Maſculine, frying and ſucking vp the humidity of all things. Thus the broad and ſpacious ſea hath the taſte of ſalt ſodden into it: or elſe it is, becauſe when the ſweet and thin ſubſtance thereof is ſucked out from it, which the firie power of the Sun moſt eaſily draweth vp, all the tarter and more groſſe parts thereof remaine behinde: and hereupon it is, that the deep water toward the bottom is ſweeter and leſſe brackiſh than that aboue in the top. And ſurely, this is a better and truer reaſon of that vnpleaſant ſmacke and taſte that it I hath, than that the ſea ſhould be a ſweat iſſuing out of the earth continually: or, becauſe ouermuch of the dry terrene element is mingled in it without any vapour: or elſe becauſe the nature of the earth infecteth the waters, as it were, with ſome ſtrong medicine. We finde among rare examples and experiments, that there happened a prodigious token to *Denis* tyrant of Sicily, when he was expelled and depoſed from that mightie ſtate of his, and this it was; the ſea water within one day in the hauen grew to be freſh and ſweet.

Chap. CI.

¶ *In like manner of the Moones Nature*

K

ON the contrary, they ſay that the Moone is a planet Fœminine, tender & nightly, diſſolueth humors, draweth the ſame, but carieth them not away. And this appeareth euidently by this proofe, that the carkaſſes of wilde beaſts ſlain, ſhe putrifieth by her influence, if ſhe ſhine vpon them. When men alſo are found aſleepe, the dull nummedneſſe thereby gathered, ſhe draweth vp into the head: ſhe thaweth yce, and with a moiſtening breath proceeding from her, enlargeth and openeth all things. Thus you ſee how Natures turn is ſerued and ſupplyed, and is alwaies ſufficient; whiles ſome ſtars thicken and knit the elements, others againe reſolue the ſame. But as the Sun is fed by the ſalt ſeas, ſo the Moone is nouriſhed by the freſh riuer waters.

L

Chap. CII.

¶ *Where the Sea is deepeſt.*

FAbianus ſaith, that the ſea where is deepeſt, exceedeth not fifteen furlongs. Others againe do report, that in Pontus the ſea is of an vnmeaſurable depth, ouer againſt the Nation of the Coraxians, the place they call *Bathei Ponti*, whereof the bottome could neuer bee ſounded.

Chap. CIII.

¶ *The wonders of Waters, Fountaines and Riuers.*

M

OF all wonders this paſſeth, that certain freſh waters hard by the ſea, iſſue & ſpring forth as out of pipes: for the nature of the waters alſo ceaſeth not from ſtrange and miraculous properties. Freſh waters run aloft the ſea, as being no doubt the lighter: and therefore

20030
copy 1

A fore the ſea water (which naturally is heauier) vpholdeth and beareth vp whatſoeuer is brought in. Yea and amongſt freſh waters, ſome there be that flote and glide ouer others. As for example, in the lake Fucinus, the riuer that runneth into it: in Larius, Addua; in Verbanus, Ticinus; in Benacus, Mincius; in Seuinus, Ollius; in Lemanus lake, the riuer Rhodanus. As for this riuer beyond the Alpes, and the former in Italy, for many a mile as they paſſe, carry forth their owne waters from thence where they abode as ſtrangers, and none other; and the ſame no larger than they brought in with them. This is reported likewiſe of Orontes, a riuer in Syria, and of many others. Some riuers again there be, which vpon an hatred to the ſea, run euen vnder the bottom thereof; as Arethuſa, a fountaine in Syracuſa: wherein this is obſerued, that whatſoeuer is caſt
B into it, commeth vp againe at the riuer Alpheus, which running through Olimpia, falleth into the ſea ſhore of Peloponneſus. There go vnder the ground, and ſhew aboue the ground againe, Lycus in Aſia, Eraſinus in Argolica, Tygris in Meſopotamia. And at Athens what things ſoeuer are drowned in the fountain of Æſculapius, be caſt vp againe in Phalericus. Alſo in the Atinate plaines, the riuer that is buried vnder the earth, twentie miles off appeareth againe. So doth Timavus in the territory of Aquileia. In Aſphaltites (a lake in Iury which ingenders *Bittumen*) nothing will ſinke nor can be drowned, no more than in Arethuſa in the greater Armenia: and the ſame verily, notwithſtanding it be full of Nitre, breedeth and feedeth fiſh. In the Salentines countrey, neere the towne Manduria, there is a lake brim full: lade out of it as much water as you will, it decreaſeth not; ne yet augmenteth, poure in neuer ſo much to it. In a riuer of the Ciconians, and in the lake Velinus in the Picene territory, if wood be throwne in, it is
C couered ouer with a ſtony barke. Alſo in Surius, a riuer of Colchis, the like is to be ſeen: inſomuch, as ye ſhall haue very often the bark that ouergrowes it, as hard as any ſtone. Likewiſe in the riuer Silarus beyond Surrentum, not twigs onely that are dipped therein, but leaues alſo grow to be ſtones; and yet the vater thereof otherwiſe is good and wholeſome to be drunk. In the very paſſage and iſſue of Reatine meere, there growes a rocke of ſtone bigger and bigger by the daſhing of the water. Moreouer in the red ſea there be oliue trees and other ſhrubs, that grow vp green. There be alſo very many ſprings, which haue a wonderfull nature, for their boiling heat: yea, and that vpon the very mountains of the Alpes; and in the ſea between Italy and Ænaria: as in the Firth Baianus, and the riuer Liris, and many others. For in diuers and ſundry places ye may draw freſh water out of the ſea, namely about the iſlands Chelidoniæ and Ara-
D dus: yea and in the Ocean about Gades. In the hot waters of the Padouans there grow greene herbes: in thoſe of the Piſanes there breed frogs: and at Vetulonij in Hetruria, not far from the ſea, fiſhes alſo are bread. In the territory Caſinas there is a riuer called Scatebra, which is cold, and in Summer time more abounding and fuller of water than in winter: in it, as alſo in Stymphalis of Arcadia, there breed & come forth of it little water-mice, or ſmall Limpins. In Dodone, the fountain of *Iupiter* being exceeding chill and cold, ſo as it quencheth and putteth out light torches dipped therein, yet if you hold the ſame neere vnto it when they are extinct and put out, it ſetteth them on fire againe. The ſame ſpring at noon-tide euermore giueth ouer to boile, and wants water, for which cauſe they call it *Anapauomenos*: anon it begins to riſe vntill it be midnight, and then it hath great abundance: and from that time againe it faints by little
E and little. In Illyricum there is a cold ſpring, ouer which, if ye ſpread any clothes, they catch a fire and burne. The fountaine of *Iupiter Hammon* in the day time is cold, all night it is ſeething hot. In the Troglodites countrey there is a fountaine of the Sunne, called the ſweet Spring, about noon it is exceeding cold, anon by little and little it growes to be warm, but at midnight it paſſeth and is offenſiue for heate and bitternes. The head of the Po, at noon in Summer giueth ouer, as it were, and intermits to boile, and is then euer drie. In the Iſland Tenedus there is a ſpring, which after the Sommer Sunſteed euermore from the third houre of the night vnto the ſixt, doth ouerflow, And in the iſle Delos, the fountain Inopus, falleth and riſes after the ſame ſort that Nilus doth, and together with it. Ouer againſt the riuer Timavus, there is a little Iſland within the ſea, hauing hot wels, which ebbe and flow as the tide of the ſea doth, and iuſt
F therwith. In the territory of the Pitinates beyond Apenninus, the riuer Nouanus at euery midſummertime ſwelles and runnes ouer the bankes, but in mid-winter is cleane dry. In the Faliſcane countrie, the water of the riuer Clitumnus makes the oxen and kine white that drinke of it. And in Bæotia, the riuer Melas maketh ſheepe blacke: Cephyſſus running out of the ſame lake, cauſeth them to be white: and Penius again giues them a black colour: but Xanthus neere

vnto

vnto Ilium, coloureth them reddiſh; and hereupon the riuer tooke that name. In the land of Pontus there is a riuer that watereth the plaines of Aſtace, vpon which thoſe mares that feed, giue blacke milke for the food and ſuſtenance of that nation. In the Reatine territorie there is a fountaine called Neminia: which, according to the ſpringing and iſſuing forth out of this or that place, ſignifyeth the change in the price of corne and victuals. In the hauen of Brindis there is a Well, that yeeldeth vnto ſailers and ſea-fering-men, water, which will neuer corrupt. The water of Linceſtis, called Acidula [*i.* Soure] maketh men drunken no leſſe than wine. Semblably, in Paphlagonia, and in the territory of Cales. Alſo in the Iſle Andros there is a fountaine neere the temple of Father *Bacchus*, which vpon the Nones of Ianuarie, alwaies runneth with water that taſteth like wine, as *Mulianus* verily beleeueth, who was a man that had beene thrice Conſull: The name of the ſpring is Dios Tecnoſia. Neere vnto Nonacris in Arcadia, there is the riuer Styx, differing from the other Styx neither in ſmell nor colour: drinke of it once, and it is preſent death. Alſo in Beroſus (an hill of the Tauri) there be three fountaines, the water whereof whoſoeuer drinketh, is ſure to die of it, remedileſſe, and yet without paine. In the Countrey of Spaine called Carrinenſis, two Springs there bee that runne neere together, the one reiecteth, the other ſwalloweth vp all things. In the ſame countrey there is another water, which ſheweth all fiſhes within it of a golden colour, but if they be once out of that water, they be like to other fiſhes. In the Cannenſian territory, neere to the lake Larius, there is a large and broad Well, which euery houre continually, ſwelleth and falleth downe againe. In the Iſland Sydonia before Lesbos, an hot fountaine there is that runneth onely in the Spring. The lake Sinnaus in Aſia, is infected with the wormewood growing about it, and there of it taſteth. At Colophon in the vault or caue of *Apollo Clarius*, there is a gutter or trench ſtanding full of water: they that drinke of it, ſhall propheſie and foretell ſtrange things like Oracles, but they liue the ſhorter time for it. Riuers running backward, euen our age hath ſeen, in the later yeres of Prince *Nero*, as we haue related in the acts of his life. Now, that all Springs are colder in Summer than Winter, who knoweth not? as alſo theſe wonderous workes of Nature, That braſſe and lead in the maſſe or lumpe ſinke downe and are drowned, but if they be driuen out into thin plates, they flote and ſwim aloft: and let the weight be all one, yet ſome things ſettle to the bottome, others againe glide aboue. Moreouer, that heauie burdens and lodes be ſtirred and remoued with more eaſe in water. Likewiſe, that the ſtone Thyrreus, be it neuer ſo big, doth ſwim whole and intire: breake it once into pieces, and it ſinketh. As alſo, that bodies newly dead, fall downe to the bottome of the warer, but if they be ſwollen once, they riſe vp againe. Ouer and beſides, that empty veſſels are not ſo eaſily drawne forth of the water, as thoſe that be full: that raine water for ſalt pits is better and more profitable than all other: and that ſalt cannot be made, vnleſſe freſh water be mingled withall: that ſea-water is longer before it congeale, but ſooner made hot and ſet a ſeething. That in Winter the ſea is hoter, and in Autumne more brackiſh and ſalt. And that all ſeas are made calme and ſtill with oile: and therefore the Diuers vnder the water doe ſpirt and ſprinkle it abroad with their mouthes becauſe it dulceth and allaieth the vnpleaſant nature thereof, and carrieth a light with it. That no ſnowes fall where the ſea is deep. And, whereas all water runneth downeward by nature, yet Springs leape vp; euen at the very foot of Ætna, which burneth of a light fire ſo farre forth, as that for fiftie, yea, and an hundred miles, the waulming round bals and flakes of fire caſt out ſand and aſhes.

Chap. cliii.

¶ *The maruailes of fire and water iointly together, and of Maltha.*

NOw let vs relate ſome ſtrange wonders of fire alſo, which is the fourth element of Nature. But firſt, out of waters. In a citie of Comagene, named Samoſatis, there is a pond, yeelding forth a kinde of ſlimie mud (called Maltha) which will burne cleare. When it meeteth with any thing ſolide and hard, it ſticketh to it like glew: alſo, if it be touched, it followeth them that flee from it. By this meanes the townesmen defended their walls, when *Lucullus* gaue the aſſault, and his ſouldiers fried and burned in their owne armours. Caſt water vpon it, and yet it will burne. Experience hath taught, That earth onely will quench it.

A

Chap. CV. ¶ *Of Naphtha.*

OF the like nature is Naphtha: for ſo is it called about Babylonia, and in the Auſtacenes countrey in Parthia, and it runneth in manner of liquid Bitumen. Great affinitie there is betweene the fire and it; for fire is ready to leap vnto it immediatly, if it be any thing neere it. Thus (they ſay) *Media* burnt her husbands concubine, by reaſon that her guirland annointed therewith, was caught by the fire, after ſhe approched neere to the altars, with purpoſe to ſacrifice.

B

Chap. CVI. ¶ *Of places continually burning.*

BVt amongſt the wonderfull mountaines, the hill Ætna burneth alwaies in the nights: and for ſo long continuance of time yeeldeth ſufficient matter to maintaine thoſe fires: in winter it is full of ſnow, and couereth the aſhes caſt vp, with froſts. Neither in it alone doth Nature tyranize and ſhew her cruelty, threatning as ſhe doth a general conſuming of the whole earth by fire. For in Phoſelis the hil Chimæra likewiſe burneth, and that with a continuall fire night and day. *Cteſias* of Gnidos writeth, that the fire therof is inflamed and ſet a burning with water, but quenched with earth. In the ſame Lycia the mountaines Hephæſtij, being once touched and kindled with a flaming torch, do ſo burne out, that the very ſtones of the riuers, yea,
C and the ſand in waters, are on fire withall; and the ſame fire is maintained with raine. They report alſo, that if a man make a furrow with a ſtaffe that is ſet on fire by them, there follow gutters as it were of fire. In the Bactrians countrey, the top of the hill Cophantus burneth euery night. Amongſt the Medians alſo, and the Cæſtian nation, the ſame mountaines burneth: but principally in the very confines of Perſis. At Suſis verily, in a place called the white tower, out of fifteene chimnies or tunnels the fire iſſueth, and the greateſt of them, euen in the day time carrieth fire. There is a plaine about Babylonia, in manner of a fiſh poole, which for the quantity of an acre of ground burneth likewiſe. In like ſort neere the mountaine Heſperius in Æthyopia, the fields in the night time do glitter and ſhine like ſtars. The like is to be ſeene in the territorie of the Megapolitanes, although the field there within-forth be pleaſant, and not
D burning the boughes and leaues of the thicke groue aboue it. And neere vnto a warme Spring, the hollow burning furnace called *Crater Nymphæi* alwaies portendeth ſome fearefull misfortunes to the Apolloniates, the neighbours thereby, as *Theoponpus* hath reported. It increaſeth with ſhowers of raine, and caſteth out Bitumen to be compared with that fountaine or water of Styx that is not to be taſted, otherwiſe weaker than all Bitumen beſides. But who would maruell at theſe things? in the mids of the ſea, Hiera one of the Ætolian Iſlands neere to Italy burned together with the ſea for certaine daies together, during the time of the allies war, vntill a ſolemne embaſſage of the Senat made expiation therefore. But that which burneth with the greateſt fire of all other, is a certaine hill of the Æthyopians Thœet Ochema, and ſendeth out moſt parching flames in the hotteſt Sun-ſhine daies. Lo in how many places with ſundry fires
E Nature burneth the earth.

Chap. CVII.

¶ *Wonders of fires by themſelues.*

MOreouer, ſince the Nature of this onely element of fire is to be ſo fruitfull, to breed it ſelfe, & to grow infinitely of the leaſt ſparks; what may be thought will be the end of ſo many funerall fires of the earth? what a nature is that which feedeth the moſt greedy voracitie in the whole world without loſſe of it ſelfe? Put thereto the infinit number of ſtars, the
F mighty great Sun; moreouer, the fires in mens bodies, & thoſe that are inbred in ſome ſtones; the attrition alſo of certain woods one againſt another; yea, and thoſe within clouds, the verie original of lightnings. Surely, it exceedeth all miracles, that any one day ſhould paſſe, & not al the world be ſet on a light burning fire, ſince that the hollow firy glaſſes alſo ſet oppoſit againſt the Sun beams, ſooner ſet things a burning than any other fire. What ſhould I ſpeake of innumerable

merable others,which be indeed little,but yet naturally issuing out in great abundance? In the Promontorie Nymphæum there commeth forth a flaming fire out of a rock,which is set a burning with rain. The like is to be seene also at the waters called Scantiæ. But this verily is but feeble when it passeth and remoueth,neither indureth it long in any other matter. An ash there is growing ouer his fiery fountain,and couering it,which notwithstanding is alwaies green. In the territorie of Mutina there riseth vp fire also,vpon certaine set holy-daies vnto *Vulcan*. It is found written, That if a cole of fire fall down vpon the arable fields vnder Aricia, the very soile presently is on fire. In the Sabines territorie,as also in the Sidicines, stones if they be anointed or greased,will be set on a light fire. In a towne of the Salantines called Egnatia, if fire be laid vpon a certaine hallowed stone there,it will immediatly flame out. Vpon the alter of *Iuno Lacinia* standing as it doth in the open aire,the ashes lie vnmoueable and stir not, blow what stormy winds that will on euery side. Ouer and besides, there be fires seene suddenly to arise, both in waters and also about the bodies of men. *Valerius Antias* reporteth, That the lake Thrasymenus once burned all ouer: also that *Serv. Tullius* in his childehood, as he lay asleepe, had a light fire shone out of his head: likewise,as *L. Martius* made an oration in open audience to the army,after the two *Scipios*,were slain in Spain,and exhorted his soldiers to reuenge their death, his head was on a flaming fire in the same sort. More of this argument, and in better order,will we write soone hereafter. For now we exhibit and shew the maruells of all things hudled and intermingled together. But in the mean while,my mind being passed beyond the interpretation of Nature,hasteneth to leade as it were by the hand the minds also of the readers, throughout the whole world.

Chap. CVIII.

¶ *The measure of the whole earth in length and breadth.*

THis our part of the earth whereof I speak, floting as it were within the Ocean (as hath bin said) lieth out in length most from the East to the West, that is to say from India to *Hercules* pillars consecrated at Gades: and as mine Author *Artemidorus* thinketh, it containeth 85 hundred,& 78 miles. But according to *Isidorus*,98 hundred, and 18. *M. Artemidorus* addeth moreouer,from Gades within the circuit of the sacred Promontorie, to the Cape Artabrum, where the front and head of Spain beareth out farthest in length 891 miles. This measure runneth two waies. From the riuer Ganges and the mouth thereof,whereas he discharged himself into the East Ocean,through India and Parthyene vnto Myriandrum a city of Syria, scituate vpon the gulfe or Firth of Isa,52 hundred & 15 miles. From thence taking the next voiage to the Island Cyprus,to Patara in Lycia,Rhodes and Astypatæa (Islands lying in the Carpathian sea) to Tænarus in Laconia,Lilybæum in Sicilie,Calaris in Sardinia,34 hundred & 50 miles. Then to Gades 14 hundred and 50 miles. Which measures being put al together,make in the whole from the said sea,85 hundred 78 miles. The other way,which is more certain,lieth most open and plain by land,to wit,from Ganges to the riuer Euphrates 50 hundred miles and 21. From thence to Mazaca in Cappadocia 244 miles, & so forward through Phrygia and Caria, to Ephesus,400 miles,98. From Ephesus through the Ægean sea to Delos 200 miles. Then to Isthmus 212 miles. From thence partly by land,and partly by the Laconian sea and the gulfe of Corinth,to Patræ in Peloponnesus 202 miles and an halfe: so to Leucas 86 miles & a halfe, and as much to Corcyra. Then to Acroceraunia 132 miles and a halfe: to Brundusium 86 miles and a halfe: so to Rome 3 hundred miles and 60. Then to the Alpes as far as the village Cincomagus 518 miles. Through France to the Pyrenæan hils, vnto Illiberis 556 miles, to the Ocean and the sea coast of Spaine 332 miles. Then the cut ouer to Gades seven miles and a halfe. Which measure by *Artemidorus* his account,maketh in all 86 hundred 85 miles. Now the bredth of the earth,from the Meridian or South-point,to the North,is collected to be lesse almost by the one halfe,namely,54 hundred and 62 miles. Whereby it appeareth plainly,how much of the one side heate of fire,and on the other side frozen water hath stolne away. For I am not of minde that the earth goeth no farther than so,for then it should not haue the forme of a globe; but that the places on either side be vnhabitable,and therefore not found out and discouered. This measure runneth from the shore of the Æthyopian Ocean,which now is habited, vnto Meroe, 550 miles. From thence to Alexandria 1200 and 40 miles. So, to Rhodes 583 miles;

20030
copy 1

A miles; to Gnidus, 84 miles and a halfe; to Cos, 25 miles; to Samus, 100 miles; to Chius, 84 miles; to Mitylene, 65 miles; to Tenedos, 28 miles; to the cape Sigæum, 12 miles and a halfe; to the mouth of Pontus, 312 miles and a halfe; to Carambis the promontorie, 350 miles; to the mouth of Mæotis, 312 miles and a halfe; to the mouth of Tanais, 265 miles: which voiage may be cut ſhorter (with the vantage of ſailing directly) by 89 miles. From the mouth of Tanais, the moſt curious Authors haue ſet downe no meaſure. *Artemidorus* was of opinion, that all beyond was vnfound and not diſcouered; confeſſing, that about Tanais the Sarmatian Nations do inhabit, who lie to the North pole. *Iſidorus* hath added hereto twelue hundred miles, as far as to Thule: which is a iudgement of his grounded vpon bare gueſſe and coniecture. I take it,
B that the borders of the Sarmatians are knowne to haue no leſſe ſpace of ground than this laſt mentioned commeth vnto. And otherwiſe, how much muſt it be, that would containe ſuch an innumerable company of people ſhifting their ſeats euer and anon, as they doe. Whereby I gueſſe, that the ouer-meaſure of the clime inhabitable is much greater. For I know certainely, tha t Germany hath diſcouered mightie great Iſlands not long ſince. And thus much of the length and breadth of the earth, which I thought worth the writing. Now the vniuerſall compaſſe and circuit thereof, *Eratoſthenes* (a great Clerke verily for all kinde of literature, & in this knowledge aboue all others doubtleſſe moſt cunning, and whom I ſee of all men approued and allowed) hath ſet downe to be 252000 ſtadia. Which meaſure, by the Romanes account and reckoning, amounteth to 300 hundred and 15 hundred miles. A wonderous bold attempt of his! but yet ſo exquiſitly calculated and contriued by him, that a ſhame it were not to beleeue
C him. *Hipparchus*, a wonderful man both for conuincing him, and all his other diligence beſides, addeth moreouer little leſſe than 25000 ſtadia.

Chap. CIX.

¶ *The Harmonicall meaſure, and Circumference of the World.*

Dionyſidorus in another kind would be beleeued: (for I will not beguile you of the greateſt example of Grecian vanitie.) This man was a Melian, famous for his skill in Geometrie: he dyed very aged in his owne countrey: his neere kinſ-women (who by right were his
D heires in remainder) ſolemnized his funerals, & accompanied him to his graue. Theſe women (as they came ſome few daies after to his ſepulchre for to performe ſome ſolemne obſequies thereto belonging) by report, found in his monument an Epiſtle of this *Dionyſidorus*, written in his owne name, To them aboue, that is to ſay, To the liuing: and to this effect, namely, That he had made a ſtep from his ſepulchre to the bottome and centre of the earth, and that it was thither 42000 ſtadia. Neither wanted there Geometricians, who made this interpretation, that he ſignified that this Epiſtle was ſent from the middle centre of the earth, to which place downward from the vppermoſt aloft, the way was longeſt; and the ſame was iuſt halfe the diametre of the round globe: whereupon followed this computation, That they pronounced the circuit to be 255000 ſtadia. Now the Harmonicall proportion, which forceth this vniuerſali-
E tie and nature of the World to agree vnto it ſelfe, addeth vnto this meaſure 7000 ſtadia, and ſo maketh the earth to be the 96000 part of the whole world.

F

THE THIRD BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme, or Preface.

HItherto haue we written of the position and wonders of the Earth, Waters, and Starres: also we haue treated in generall termes, of the proportion and measure of the whole world. Now it followeth, to discourse of the parts thereof: albeit this also be iudged an infinite piece of worke, nor lightly can be handled without some reprehension: and yet in no kinde of enterprise pardon is more due; since it is no maruell at all, if he who is borne a mortall man, knoweth not all things belonging to man. And therefore I will not follow one Author more than another, but euery one as I shall thinke him most true in the description of each part. For asmuch as this hath been a thing common in manner to them all, namely, to learn or describe the situations of those places most exactly, where themselues were either borne, or which they had discouered and seene: and therefore neither will I blame nor reproue any man. The bare names of places shall be simply set downe in this my Geographie, and that with as great breuitie as I can: the excellency, as also the causes and occasions thereof, shall be deferred to their seuerall and particular treatises: for now the question is as touching the whole earth in generalitie, which mine intent is to represent vnto your eies: and therefore I would haue things thus to be taken, as if the names of countries were put downe naked, and void of renowne and fame, and such onely as they were in the beginning, before any acts there done; and as if they had indeed an indument of names, but respective onely to the World and vniuersall Nature of all.

Now the whole globe of the earth is diuided into three parts, Europe, Asia, and Africa. The beginning we take from the West and the Firth of Gades, euen where as the Atlanticke Ocean breaking in, is spred into the Inland and Mediterranean seas. Make your entrance there, I meane at the Streights of Gibralter, and then Africa is on the right hand, Europe on the left, and Asia before you iust betweene. The bounds confining these, are the riuers Tanais and Nilus. The mouth of the Ocean at Gades (whereof I spake before) lyeth out in length 15 miles, and stretcheth forth in breadth but fiue, from a village in Spaine called Mellaria, to the promontorie of Africke, called the VVhite, *as* Turannius Graccula *born thereby, doth write.* T. Liuius, *and* Nepos Cornelius *haue reported, that the breadth thereof where it is narrowest, is seuen miles ouer, but ten miles where it is broadest. From so small a mouth (a wonder to consider) spreadeth the sea so huge and so vast as we see; and withall, so exceeding deepe, as the maruell is no lesse in that regard. For why? in the verie mouth thereof, are to be seen many barres and shallow shelues of white sands (so ebbe is the water) to the great terrour of shippes and sailers passing that way. And therefore many haue called those Streights of Gibralter, The entrie of the Mediterranean Sea. Of both sides of this gullet, neere vnto it, are two mountaines set as frontiers and rampiers to keepe all in: namely, Abila for Africke, Calpe for Europe, the vtmost end of* Hercules *Labours. For which cause, the inhabitants of those parts call them, the two pillars of that God; and doe verily beleeue, that by certaine draines and ditches digged within the Continent, the maine Ocean, before excluded, made way and was let in, to make the Mediteranean seas, where before was firme land: and so by that meanes the very face of the whole earth is cleane altered.*

A

Chap. I.

¶ *Of Europe.*

AND firſt, as touching Europe, the nource of that people which is the conqueror of all nations; and beſides, of all lands by many degrees moſt beautifull: which may for right good cauſe, haue made not the third portion of the earth, but the one halfe (diuiding the whole globe of the earth into two parts:) to wit, from the riuer Tanais vnto the Streights of Gades. The Ocean then, at this ſpace aboue-ſaid, entreth into the Atlanticke ſea, and with a greedie current drowneth thoſe
B lands which dread his comming like a tyrant; but where he meeteth with any that are like to reſiſt, thoſe he paſſeth iuſt by, and with his winding turns and reaches he eateth and holloweth the ſhore continually to gaine ground, making many noukes and creekes euery where: but in Europe moſt of all, wherein foure eſpeciall great gulfes are to be ſeene.

Of which, the firſt, from Calpe the vtmoſt promontorie (as is aboue ſaid) of Spain, windeth and turneth with an exceeding great compaſſe, to Locri, and as far as the promontorie Brutium. Within it lieth the firſt land of all others, Spaine; that part I meane, which in regard of vs at Rome, is the farther off, and is named alſo Bœtica. And anon from the Firth Virgitanus, the hither part, otherwiſe called Tarraconenſis, as far as to the hils Pyrenæi. That farther part of larger Spaine is diuided into two prouinces in the length thereof: for on the North ſide of Bœ-
C tica, lyeth Luſitania afront, diuided from it by the riuer Ana.

This riuer beginneth in the territorie Laminitanus of the hither Spain, one-while ſpreading out it ſelfe into broad pooles or meeres, otherwhiles gathering into narrow brooks: or altogether hidden vnder the ground, and taking pleaſure to riſe vp oftentimes in many places, falleth into the Spaniſh Atlantick Ocean. But the part named Tarraconenſis, lying faſt vpon Pyrenæus, & ſhooting along all the ſide thereof, and withal, ſtretching out it ſelfe ouerthwart & croſſe from the Iberian ſea to the Gauls Ocean, is ſeparated from Bœtica & Luſitania, by the mountaine Salarius, and the cliffes of the Oretanes, Carpetanes, and Aſturians.

Bœtica, ſo called of the riuer Bœtis, that cutteth in the mids, out-goeth all other prouinces
D for rich furniture, and a certaine plentifull trimneſſe and peculiar beautie by it ſelfe. Therein are held foure ſolemne Iudiciall great aſſizes and Parliaments, according to foure Counties or ſhires; to wit, the Gaditane, Cordubian, Aſtigitane, and Hiſpalenſis. Townes in it are all in number 175; whereof there are colonies eight; free Boroughes, eight; townes indued with the antient franchiſes of Latium 29: with freedome ſix; Confederate, foure; Tributarie paying cuſtome, 120. Of which, thoſe that be worth the naming, and are more currant in the Latine tongue, be theſe vnder written: to wit, on the riuer Ana ſide and the Ocean coaſt, the citie Oſſonoba, ſurnamed alſo Luſturia. There run between, Luxia and Vrium, two riuers. The hils Ariani, the riuer Bœtis: the ſhore Corenſe with a winding creek. Ouer againſt which, lyeth Gades, to be ſpoken of among the Ilands. The cape or head of *Iuno*; the hauen Beſippo. Townes, Belon,
E and Mellaria. The Streights or Firth out of the Atlanticke ſea. Carteia, called Terteſſos by the Greekes; and the mountaine Calpe. Then, within the firm land, the towne Barbeſula, with the riuer. *Item.* the towne Salbula, Suel-Malacha vpon the riuer of our Confederates. Next to theſe, Menoba with a riuer: Sexi-firmum, ſurnamed Iulium: Selaubina, Abdera, and Murgis the frontier towne of Bœtica. All that whole coaſt, *M. Agrippa* thought to haue had their beginning and diſcent from the Carthaginians. From Ana, there lyeth againſt the Atlanticke Ocean, the region of the Baſtuli and the Turduli.

M. Varro ſaith, that there entered into all parts of Spain, the Herians, Perſians, Phœnicians, Celtes, and Carthaginians or Africans: for *Luſus*, the companion of Father *Liber* or *Liba* (which ſignifieth the frantick furie of thoſe that raged with him) gaue the name to Luſitania; and
F *Pan* was the gouernour of it all. But thoſe things which are reported of *Hercules* and *Pyrene*, or of *Saturne*, I thinke to be as vaine and fabulous tales as any other. As for Bœtis, in the Tarraonenſian prouince, riſing, not as ſome haue ſaid, at the towne Menteſa, but in the chaſe or forreſt Tugrenſis, which the riuer Tader watereth, as it doth the Carthaginian pale alſo at Ilorcum, ſhunneth the funerall fire and ſepulchre of *Scipio*: and turning into the Weſt, maketh toward

the Atlantick Ocean,adopting the prouince and giuing it his owne name , is at firſt but ſmall, G
howbeit receiueth many other riuers into it,from which it taketh away both their name and
their waters. And firſt being entred from Oſſigitania into Bœtica,running gently with a plea-
ſant channel,hath many townes both on the left hand & the right,ſeated vpon it. The moſt fa-
mous and populous between it & the ſea coaſt in the Mediterranean part thereof, are Segeda,
ſurnamed Augurina: Iulia,which is alſo called Findentia: Virgao,otherwiſe Alba, Ebura,other-
wiſe Cereolis: Illiberi,which is alſo Liberini: Ilipua,named likewiſe Laus. Artigi or Iulienſes:
Veſci the ſame that Faventia: Singilia, Hegua, Arialdunũ, Agla the leſſe, Bæbro, Caſtra Vina-
ria, Epiſibrum, Hipponoua, Illurco, Oſca, Eſcua, Succubo, Nuditanum, Tucci the old, all which
belong to Baſtitania, lying toward the ſea. But within the countie or iuriſdiction of Corduba,
about the very riuer ſtandeth the towne Oſſigi,which is ſurnamed Laconicum: Illiturgi called H
alſo Forum Iulium. Ipaſturgi the ſame that Triumphale, Sitia: & 14 miles within the country
Obulco,which is named Pontificenſe. And anon(you ſhall ſee) Ripepora,a town of the confe-
derats, Sacili, Martialum, Onoba. And on the right hand Corduba,ſurnamed Colonia Patritia:
and then beginneth Bœtis to be nauigable,& not before. As you go lower,you ſhal find towns
Carbulo, Decuma,the riuer Singulis, falling into the ſame ſide of Bœtis. The townes of the
county Hiſpalenſis be theſe, Celtica, Axatiara, Arruci, Menoba, Ilipa,ſurnamed Italica. And on
the left hand, Hiſpalis a colony,ſurnamed likewiſe Romulenſis. But right forward oppoſit to
it,the town Oſſet,which hath a name beſides, Iulia Conſtantia: Vergentum,which alſo is the
ſame that Iulij Genitor, Hippo Caurafiarum,the riuer Menoba, which alſo entreth into Bœ-
tis on the right ſide. But within the waſhes & downs of Bœtis there is the town Nebriſſa ſur- I
named Veneria & Colobona: alſo colonies, *viz*. Aſta,which is called Regia: & in the mid-land
part, Aſido,which is the ſame that Cæſariana. The riuer Singulus breaking into Bœtis in that
order as I haue ſaid,runneth hard by the Colony Aſtigitania,ſurnamed alſo Auguſta Firma,&
ſo forward it is nauigable. The reſt of the Colonies belonging to this Countie are free, & en-
ioy immunitie of tribute,namely, Tucci,which is ſurnamed Auguſta Gemella: Itucci,the ſame
that Virtus Iulia, At tubi all one with Claretas Iulia[*i*. exceIlencie of *Iulius*.] Vrſo, which is
Genua Vrbanorum: & among theſe, Munda,which together with *Pompeies* ſon,was taken. Free
towns, Aſtigi the old,& Oſtippo: tributarie, Callet, Calucula, Caſtra Gemina, Ilipula the leſſe
Merucra, Sacrana, Obulcula, Oningis. As a man commeth from the coaſt,neere to the riuer Me-
noba,which alſo will beare a ſhip,there dwel not far off the Alontigicili, & Aloſtigi. But all K
that region which without the forenamed,reacheth from Bœtis to the riuer Ana,is called Be-
turia : diuided into two parts,& as many ſorts of people: to wit,the Celtici,who meet with Lu-
ſitania, and are within the diuiſion or county Hiſpalenſis: and the Turduli,who inhabit faſt vp-
on Luſitania and Tarraconenſis: and they owe ſeruice to the County-court of Corduba: as for
the Celtici,manifeſt it is, That they came from the Celtiberians out of Luſitania,as appeareth
by their religion,tongue,& names of towns,which in Bætica are diſtinguiſhed by their additi-
ons or ſurnames,to wit, Seria,which is called Fama Iulia : Vcultuniacum, which now is Curi-
ga: Laconimurgi, Conſtantia Iulia, Terreſibus is now Fortunales,& Callenſibus, Emanici. Be-
ſides all theſe,in Celtica Acinippo, Arunda, Arunci, Turobrica, Laſtigi, Alpeſa, Sæpona, Se-
rippo. The other Beturia,which we ſaid contained the Turduli,& belonged to the countie of L
Corduba,hath towns of no baſe account, Arſa, Mellaria and Mirobrica: and regions or quarters
Ofrutigi,and Siſapone. Within the Countie of Gades there is of Romane citizens a town cal-
led Regina : of Latines there are Læpia, Vlia, Cariſa ſurnamed Aurelia, Vrgia, which is like-
wiſe named Caſtrum Iulium: alſo, Cæſaris Salutarienſis. But tributaries there be theſe, Beſaro,
Beſippo, Berbeſula, Lacippo, Beſippo, Callet, Cappagum, Oleaſtro, Itucci, Brana, Lacibi, Sa-
guntia, Andoriſippo. The whole length of it, *M. Agrippa* hath ſet down 463 miles,& the bredth
257. But for that the bounds reached forward as far as to Carthage, which cauſe breedeth of-
tentimes errors in the taking of the meaſures, whiles in one place the limits of the prouinces
were changed,and in another the paces in iournying were either more or leſſe; alſo, conſidering
the ſeas in ſo long continuance of time haue incroched here vpon the land,and the banks again M
gotten there of the ſea,and beare farther in ; alſo, for that the reaches of the riuers haue either
turned crooked or gone ſtreight & direct; ouer and beſides, for that ſome haue begun to take
their meaſure from this place,others from that,and gon diuers waies: it is by theſe means come
to paſſe,that no twain accord together in one ſong,as touching their meaſure & Geographie.

A

Chap. II.

¶ *The length and breadth of Bætica.*

THe length of Bœtica at this day from the bound of the town Caſtulo vnto Gades, is 475 miles: and from Murgi the maritine coaſt or lands end, more by 22 miles. The bredth from the edge or border of Carteia, is 224 miles. And verily, who would beleeue, that *Agrippa*, a man ſo diligent, and in this worke principally, ſo curious, did erre, when he purpoſed to ſet out a map of the whole world openly to be ſeene of the whole city, and namely, when *Auguſtus Cæſar* of happie memorie, ioined with him? For he it was that finiſhed the Porch or gallerie begun by *Agrippa's* ſiſter, according to his will, appointment, and direction, which contained the
B ſaid pourtraict.

Chap. III.

¶ *The hither or higher Spaine.*

THe old forme of the hither Spaine is ſomwhat changed, like as of many other prouinces: conſidering that *Pompey* the great in his triumphant trophies which he erected in Pyrenæus, reſtifieth, That 846 townes between the Alps and the marches of the farther or lower Spain, were ſubdued by him and brought to obedience. Now, is the whole prouince diuided into 7 counties, the Carthaginian, the Tarraconian, Cæſar Auguſtani, Clunienſis, Aſturia, Lu-
C cenſis, & Bracarum. There are beſides Iſlands, ſetting aſide which, without once naming them, and excepting the cities that are annexed to others, the bare prouince containeth 294 townes. In which there be 12 colonies, townes of Roman citizens thirteen, of old Latines ſeuenteen, of allies within the league, one; tributarie, 136. The firſt in the very frontiers thereof, be the Baſtulians: behind them in ſuch order as ſhall be ſaid; namely, thoſe Inlanders that inhabit within-forth, the Menteſanes, Oretanes, and the Carpetanes vpon the riuer Tagus. Neere to them, the Vaccæans, Vectones, Celtiberians, and Arrebaci. The townes next to the marches, Vrci, and Barea laid to Bœtica: the countrey Mauritania, then Deitania: after that Conteſtania, and new Carthage, a colonie. From the promontorie whereof called *Saturnes* cape, the cut ouer the ſea
D to Cæſaria a citie in Mauritania, is of 187 miles: In the reſidue of that coaſt is the riuer Tader: the free colonie Illici, of which, a firth or arme of the ſea tooke the name Illicitanus. To it owe ſeruice and are annexed the Icoſitanes. Soon after, Lucentum a towne of the Latines. Dranium a tributarie, the riuer Sucro, which was ſometime the frontier towne of Conteſtania. The region Edetania, which retireth inward to the Celtiberians, hauing a goodly pleaſant poole bordering along the front of it. Valentia, a colonie lying three miles from the ſea. The riuer Turium: and iuſt as far from the ſea, Saguntum, a towne of Roman citizens, renowned for their fidelitie. The riuer Idubeda, and the region of the Ilergaones. The riuer Hebre, yeelding ſuch riches of traffieke and commerce, by reaſon that it is nauigable: which beginneth in the Cantabrians countrey, not far from the towne Inliobrica, and holdeth on his courſe 430 miles:
E and for 260 of them, euen from the towne Varia, carrieth veſſels of merchandiſe: in regard of which riuer, the Greekes named all Spaine Iberia: the region Coſſetania, the riuer Subi, the colonie Tarraco, built by the *Scipioes*, like as Carthage by the Africans. The countrey of the Illergetes, the towne Subur, the riuer Rubricatum, and from thence the Lacetanes and Indigetes. After them in this order following: within-forth at the foot of Pyrenæus, the Auſetanes, Itanes, & Lacetanes: and along Pyrenæus the Cerretanes, and then the Vaſcones. In the edge or marches thereof, the co'o'y Barcino, ſurnamed Fauentia. Towns of Roman citizens, Bætulo, Illuro, the riuer Larnum, Blandæ: the riuer Alba, Emporiæ: two there be of theſe, to wit, of the old inhabitants, and of the Greeks, who were the off-ſpring deſcended from the Phocæans. The riuer Tichus. From whence to Pyrenæa Venus, on the other ſide of the promontorie, are fortie
F miles. Now beſides the forenamed, ſhall be related the principall places of marke as they lie in euery count'e. At Tarracon there plead in court foure and fortie States. The moſt famous and of greateſt name among them, be of Roman citizens the Dertuſanes, and Biſgargitanes: of Latines, the Auſetanes and Cerretanes ſurnamed Iulianes: they alſo who are named Auguſtanes, the Sedetanes, Gerundenſes, Geſſarians, Tearians, the ſame that Iulienſes. Of Tributaries,

taries,the Aquicaldenſes,Onenſes,and Bætulonenſes. Cæſar Auguſta,a free colony, on which G
the riuer Iberus floweth: where the towne before was called Salduba: theſe are of the region
Sedetania,and receiueth 52 States:and among theſe, of Roman citizens the Bellitanes and
Celſenſes:and out of the Colonie,the Calaguritanes ſurnamed alſo Naſcici. The Ilerdians of
the Surdaons Nation,neere vnto whom runneth the riuer Sicoris. The Oſcians of the region
Veſcetania,and the Turiaſonenſes. Of old Latins,the Caſcantenſes,Erganicenſes,Gracchuri-
tans,Leonicenſes,Oſſigerdenſes. Of confederats within the league, the Tarragenſes. Tributa-
ries beſides,the Arcobricenſes,Andologenſes,Arocelitans,Burſaonenſes,Calaguritans ſurna-
med Fibularenſes,Complutenſes,Carenſes,Cincenſes,Gortonenſes,Dammanitanes, Larren-
ſes,Iturienſes,Iſpalenſes,Ilumberitanes,Lacetanes,Vibienſes,Pompelonenſes and Segienſes.
There reſort to Carthage for law 62 ſeuerall States,beſides the Iſlanders. Out of the colonie H
Accitana,the Gemellenſes,alſo Libiſoſona ſurnamed Foroauguſtana : which two are indued
with the franchiſes of Italy:out of the colonie Salarienſis,the Oppidans of old Latium,Caſtu-
lonenſes,whom *Cæſar* calleth *Vænales*. The Setabitanes,who are alſo Auguſtanes, and the Va-
lerrienſes. But of the Tributaries,of greateſt name be the Babanenſes,the Baſcianes,the Con-
ſaburenſes,Dianenſes,Egeleſtanes,Ilorcitani,Laminitani, Menteſami, the ſame that Oritani;
and Mentelani who otherwiſe are Baſtuli:Oretanes who alſo are called Germani,the chiefe of
the Celtiberians,the Segobrigenſes,and the Toletanes of Carpetania,dwelling vpon the riuer
Tagus. Next to them the Viacienſes and Virgilienſes. To the aſſiſes or law-court Clunienſis,
The Varduli bring 14 nations;of which I liſt to name none but the Albanenſes: but the Tur-
modigi foure,among whom are the Segiſamonenſes,Sagiſameiulienſes. To the ſame aſſiſes, I
the Carietes & the Vennenſes do go out of fiue cities,of which the Velienſes are. Thither re-
paire the Pelendones,with 4 ſtates of the Celtiberians,of whom the Numantins were famous:
like as in the 18 cities of the Vaccæans,the Intercatienſes,Pallantini,Lacobricenſes, & Cau-
cenſes:for in the foure ſtates ofthe Cantabrici,only Iuliobrica is named:in the 10 ſtates of the
Autrigones,Tritium,& Vironeſca. To the Areuaci the riuer Areua gaue name. Of them there
be 7 townes;to wit,Saguntia and Vxama,which names be often vſed in other places: beſides
Segouia,and Noua-auguſta,Termes,and Clunia it ſelfe the very vtmoſt bound of Celteberia.
all the reſt lie toward the Ocean,& of the abouenamed the Verduli together with the Canta-
bri. To theſe there are ioined 12 nations of the Aſtures, diuided into the Auguſtans & Tranſ-
montans,hauing a ſtately city Aſturica:among theſe are reckned,Giguri,Peſici,Lanſienſes,& K
Zoclæ. The number of the whole multitude ariſeth to 240000 pols of free men,beſides ſlaues.
The county or iuriſdiction Lucenſis compriſeth 16 towns(beſides the Celticks and Lebuni-
ans)of baſe condition,and hauing barbarous names;howbeit,of free-men to the number wel-
neere of 166000:in like maner 24 cities,which affoord 275000 pols, owe ſeruice to the court
of Bracarum:of whom beſides the Bracarians themſelues,the Vibili,Celerini,Gallæci,Æqui-
ſiliti & Quinquerni,may be named without diſdain and contempt. The length of the hither
Spain,from Pyrenæus to the bound of Caſtulo is 607 miles,& the coaſt therof ſomwhat more
The bredth from Tarracon to the ſhore of Alarſon,307 miles: & from the foot of Pyrenæus,
where,between two ſeas it is pointed with the ſtreights,& ſo opening it ſelfe by little & little
from thence,till it come to touch the farther Spain,it is as much, and addeth ſomewhat more. L
to the bredth:all Spain throughout in manner is full of metall mines,as lead, yron, braſſe, ſil-
uer,and gold:the hither part thereof aboundeth beſides with ſtone glaſſes, or glaſſe ſtones:and
Bœtica particularly with vermilion. There be alſo there quarries of Marble. Vnto all Spaine
throughout,*Veſpaſianus Auguſtus* the Emperour, toſſed with the tempeſts and troubles of the
commonweale,granted the franchiſes of Latium. The mountaines Pyrenæi do confine Spaine
and France one from the other,lying out with their promontories into two contrary ſeas.

Chap. IIII.

¶ *The Prouince Narbonenſis.*

M

That part of Gallia which is waſhed and beaten vpon with the Mediteranean ſea, is called
the prouince Narbonenſis,named afore-time Braccata, diuided from Italy by the riuer
Varus and the Alpes,moſt friendly mountaines to the Romane Empire: and from the
other parts of Gaule, on the North ſide,by the hills Gebenna & Iura. For tillage of the ground

for

20030
copy 1

A for reputation of men, regard of ciuilitie and manners, and for wealth, worthy to be ſet behinde no other prouinces whatſoeuer: and in one word, to be counted Italy, more truely than a prouince: in the edge or marches thereof lyeth the countrey of the Sardaons; & within, the region of the Conſuarones. The riuers be Tecum and Vernodubrum: the townes, Illiberis (a poore relique and ſimple ſhew of a citie to that it was in old time) & Ruſcio, inhabited by the Latines. The riuer Atax ſpringing out of Pyrenæus, runneth through the lake Rubrenſis, & floteth ouer it. *Narbo Martius* a colonie inhabited by the Legionaries of the tenth legion, twelue miles diſtant from the ſea. Rivers, Araris and Liria. Townes in the other parts, ſcattering here and there by reaſon of pooles and meeres lying before them: namely, Agatha, in times paſt belonging to
B the Maſſilians, and the region of Volſcæ Tectoſages. Alſo, where Rhoda of the Rhodians was, whereof Rhodanus tooke name, the moſt fruitfull riuer by far of all Gallia, running ſwiftly out of the Alps through the lake Lemanus, & carrying with it the dead and ſlow riuer Araris; and Iſara running as faſt as it ſelfe, together with Druentia. The two ſmal mouths or paſſages therof are called Lybica: of which, the one is Hiſpanienſum, the other Metapinum: a third there is beſides, and the ſame moſt wide and large, named Maſſalioticum. There be that write, how the towne Heraclea likewiſe ſtood vpon the mouth of Rhodanus. Beyond the ditch out of Rhodanus, which was the work of *C. Marius*, & bearing his name, there was a notable poole or meere. Moreouer the town Aſtromela, and the maritime tract of the Auætici: and aboue it, the ſtonie plains, carrying the memoriall of *Hercules* his battels. The region of the Anatilians, and within-forth, of the Deſuviates and Cauians. Againe, from the ſea; Tricorum, and inward, the region of
C the Tricollivocantians, Segouellaunes, and anon of the Allobroges: but in the marches, Maſſilia of Greeke Phocæans: within the league. The promontorie Citharista, Zaopartus, and the region of the Camatullici. After them, the Suelteri; and aboue them, Verucines: But in the coaſt along ſtill, Athenopolis vnder the Maſſilians, Forum Iulij a Colonie of the ninth legion ſouldiers, which alſo is called Parenſis and Claſſica: in it is the riuer Argenteus: the region of the Oxubij and Ligaunians; aboue whom, are the Suetri, Quarietes, and Adunicates: but in the borders, a Latine towne Antipolis. The region of the Deciates, the riuer Varus guſhing out of an hil of the Alpes, called Acema. In the middle part therof the Colonies, Arelate of the ſixth legion ſouldiers, Bliteræ of the ſeuenth, and Arauſia of thoſe belonging to the ſecond. In the territorie of the Cauians, Valentia and Vienna of the Allobroges. Latine towns, Aquæ Sextiæ
D of the Salyans, and Auenio of the Cavians, Apta Iulia of the Vulgientians, Alebecerriorum of the Apollinares, Alba of the Heluans, Anguſta of the Tricoſtines; Anatilia, Aeria, Bormanni, Comacina, Cabellio, Carcaſum, of the Volſcane Tectoſages: Ceſſero, Carpentoracte, of the Menines: the Cenicenſes, Cambolecti, who are named beſides Atlantici, Forom Voconij, Glanum, Livij, Lutevani, who are the ſame that Foro-neronienſes. Nemauſum of the Arecomici, Piſcenæ, Ruteni, Sanugenſes, and Toloſani, of the Tectoſages: The neighbor borderers vpon Aquitane, Taſco-dumetari, Canonienſes, Vmbranici. Two capitall towns of the confederat ſtate of the Vocontians, Vaſco and Lucus Auguſti. But baſe towns of no importance nineteene, as 24 more annexed to the Nemauſiens, and vnder their Seignorie. To this charter or inſtrument inrolled, *Galba* the Emperor added of the Alpine inhabitants, the Auantici and Eproduntij;
E whoſe town is named Dima. *Agrippa* ſaith, that the length of this prouince Narbonenſis is 270 miles, and the breadth 248.

Chap. V.

¶ *Italy, Tiberis, Rome, Campania.*

NExt to them is Italy, and the firſt of all, the Ligurians: then Hetruria, Vmbria, Latium, where be the mouthes of Tiberis and Rome the head citie of the whole earth, 16 miles diſtant from the ſea: after it is the maritime countrey of the Volſcians, and Campania: then Picentium, Lucanum, and Brutium, the furtheſt point in the South, vnto which from the
F crooked mountaines of the Alpes, like in manner vnto the Moone croiſſant, with ſome parts higher, other lower, Italie ſhooteth out in length to the ſeas: from it, is the ſea coaſt of Græcia, and ſoone after, the Salentines, Pediculi, Apuli, Peligni, Ferentani, Marrucini, Veſtines, Sabines, Picentes, Gaules, Vmbrians, Thuſcanes, Venetians, Carnians, Iapides, Iſtrians, and Liburnians.

Neither

Neither am I ignorant, that it might be thought and that iuſtly, a point of an vnthankefull mind and idle withall, if briefely in this ſort, and as it were by the way, that land ſhould be ſpoken of which is the nource of all lands. She alſo is the mother, choſen by the powerfull grace of the gods, to make euen heauen it ſelfe more glorious; to gather into one the ſcattered empires, to ſoften and make ciuill the rude faſhions of other countries; and whereas the languages of ſo many nations were repugnant, wilde, & ſauage, to draw them together by commerce of ſpeech, conference, and parley; to indue man with humanitie; and briefely, that of all nations in the world, there ſhould be one onely countrey. But here, what ſhould I do? ſo noble are all the places that a man ſhal come vnto, ſo excellent is euery thing, and each ſtate ſo famous and renowned, that I am fully poſſeſſed with them all, and to ſeeke what to ſay. Rome citie, the only faire face therein, worthy to ſtand vpon ſo ſtately a necke and pair of ſhoulders, what worke would it aske thinke you, to bee ſet out as it ought? the very tract of Campaine by it ſelfe, ſo pleaſant and goodly, ſo rich and happie, in what ſort ſhould it be deſcribed? So as it is plaine and manifeſt, that in this one place there is the workmanſhip of Nature wherein ſhe ioieth and taketh delight. Now beſides all this, the whole temperature of the aire is euermore ſo vitall, healthy, and wholeſome, the fields ſo fertile, the hills ſo open to the Sun, the forreſts ſo harmleſſe, the groues ſo coole and ſhadie, the woods of all ſorts ſo bounteous and fruitfull, the mountaines yeelding ſo many breathing blaſts of winde; the corne, the vines, the oliues ſo plentifull; the ſheep ſo inriched with fleeces of the beſt wooll, the bulls and oxen ſo fat and well fed in the necke; ſo many lakes and pooles, ſuch ſtore of riuers and ſprings watering it throughout; ſo many ſeas and hauens, that it is the very boſom lying open and ready to receiue the commerce of all lands from all parts; and yet it ſelfe full willingly deſireth to lie far into the ſea to helpe all mankinde. Neither do I ſpeake now of the natures, wits, and faſhions of the men; ne yet of the nations abroad ſubdued with their eloquent tongue, and ſtrong hand. Euen the Greekes (a nation of all other moſt giuen to praiſe themſelues beyond meaſure) haue giuen their iudgement of her, in that they called ſome ſmall part thereof, Great Greece. But in good faith, that which we did in the mention of the heauen, namely, to touch ſome knowne planets and a few ſtars, the ſame muſt we likewiſe do in this one part: only I would pray the Readers to remember and carry this away, That I haſten to rehearſe euery particular thing through the whole round globe of the earth.

Well then, to begin, Italy is faſhioned like for all the world to an Oke leafe, and much larger in length than breadth: to the left ſide bending with the top, and ending in the figure and faſhion of an Amazonian ſhield; and where that tract of Calabria lyeth which is called Cocinthos, it putteth forth into thoſe two promontories or capes like the moones two hornes; the one, Leucopetra on the right hand; the other Lacinium on the left. In length it reacheth from the foot of the Alps, through Oſtia or Prætoria Auguſta, directly to the citie of Rome, and ſo forward to Capua, with a direct courſe leading to Rhegium a towne ſcituate vpon the ſhoulder thereof: from which beginneth the bending as it were of the necke; and beareth 1000 and 20 miles. And this meaſure would grow to be far more, if it went as farre as Lacinium, but that ſuch an obliquitie and winding might ſeem to decline and beare out too much vnto one ſide. The breadth thereof is diuerſly taken, namely, 410 miles between the two ſeas, the higher and the lower, and the riuers Varus and Arſia. The mids of which breadth (and that is much about the citie of Rome) from the mouth of the riuer Aternus running into the Adriaticke ſea, vnto the mouthes of Tiberis, 136 miles, and ſomewhat leſſe: from Novum Caſtrum by the Adriaticke ſea, to Alſium, and ſo to the Tuſcane ſea: and in no place exceedeth it in breadth 300 miles. But the full compaſſe of the whole from Varus to Arſia, is 20049 miles. Diſtant it is by ſea from the lands round about, to wit, from Iſtria and Liburnia in ſome places 100 miles; from Epirus and Illyricum 50 miles; from Africk leſſe than 200, as *Varro* affirmeth; from Sardinia, an hundred and 20 miles; from Sicilie, a mile and a halfe: from Corcyra leſſe than 70; from Iſſa 50. It goeth along the ſeas, to the Meridionall line verily of the heauen; but if a man examine it exactly indeed, it lyeth betweene the Sun riſing in mid-winter, and the point of the Noone-ſtead.

Now will we deſcribe the compaſſe and circuit thereof, and reckon the cities; wherin I muſt needs proteſt by way of Preface, that I will follow for mine Authour *Auguſtus* the Emperour of famous memorie, and the deſcription by him made of all Italy, which be diuided into 11 Regions

20030
copy 1

A Regionsor Cantons. As for the maritime townes, I will ſet them downe in that order, as they ſtand, according to their vicinity one to another. But foraſmuch as in ſo running a ſpeech and haſtie pen, the reſt cannot poſſibly be ſo orderly deſcribed: therfore in the inland part thereof, I will follow him as he hath digeſted them by the letters of the Alphabet: but mentioning withall, the colonies or chiefe cities by name, which he hath deliuered in that number. Neither is it an eaſie matter to know throughly their poſitions and foundations, conſidering the Ingaune Ligurians (to ſay nothing of all the reſt) were indowed with lands thirtie times, and changed their ſeats. To begin with the riuer Varus therfore, there offereth to our eie, firſt the towne Nicæa, built by the Maſſilians: the riuer Po; the Alpes; the people within the Alpes of many
B names, but of moſt marke Capillati, with long haire: the towne Vediantiorum, the Citie Cemelion, or, a towne belonging to the State of the Vediantians, called Cemelion: the port of *Hercules* and *Monœchus*, and ſo the Ligurian coaſt. Of the Ligurians, the moſt renowned beyond the Alpes, are the Sallij, Deceates, and Oxubij: on this ſide, the Veneni, and deſcended from the Caturiges, the Vagienni, Statyelli, Vibelli, Magelli, Euburiates, Caſmonates, Veliates, and thoſe, whoſe townes we will declare in the next coaſt. The riuer Rutuba, the towne Albium Intemelium, the riuer Merula, the towne Albium Ingaunum, the port or hauen towne Vadum Sabatium, the riuer Porcifera, the towne Genua, the riuer Feritor, the Port Delphini, Tigulia: within, Segeſta Tiguliorum: the riuer Macra which limiteth Liguria. Now on the back ſide behind all theſe townes aboue named, is Apenine, the higheſt mountain of all Italy, reaching from the Alpes with a continuall ridge of hils, to the ſtreights of Cicilie.
C From the other ſide thereof to Padus, the richeſt riuer in all Italy, all the countrey ſhining with goodly faire townes, to wit, Liberna, Dertona a Colonie, Iria, Barderates, Induſtria, Pollentia, Carrea, which alſo is named Polentia, Foro Fuluij the ſame that Valentinum, Auguſta, of the Vagienni: Alba, Pompei Aſta, and Aquæ Statyellorum. And this is the ninth Canton after the Geographie of *Auguſtus*. This coaſt or tract of Liguria containeth betweene the riuers Varus and Macra 211 miles. To it is adioined the 7 wherin is Hetruria from the riuer Macra: and it oftentimes changed the name. In old time the Pelaſgians chaſed the Vmbrians from thence: and by them the Lydians did the like, of whoſe king, named they were Tyrrheni: but ſoon after, of their ceremonies in ſacrificing, in the Greeks language *Thuſci*. The firſt towne of Hetruria is Luna, famous for the hauen; then the Colonie Luca, lying from the ſea: and neerer vnto it
D is Piſæ, between the riuer Auſer and Arnus, which took the beginning from *Pelops* and the Piſians, or Atintanians a Greeke nation. Vada Volateranea, the riuer Cecinna. Populonium of the Tuſcanes in times paſt, ſcituate only vpon this coaſt. After theſe the riuer Prille, and anon after Vmbro, nauigable, and of it tooke name: ſo forward the tract of Vmbria, and the port towne Telamon: Coſſa Volſcientium, a Colonie planted there by the people of Rome, Grauiſcæ, Caſtrum Novum, Pyrgi, the riuer Cæretanus, and Cære it ſelf, ſtanding foure miles within, called Agylla by the Pelaſgians who built it: Alſium and Frugenæ. The riuer Tiberis, diſtant from Macra 284 miles. Within-forth are theſe Colonies, Faliſca deſcended from Argi, as *Cato* ſaith, and for diſtinction is called Hetruſcorum. Lucus Feroniæ, Ruſſellana, Seneníis and Sutriua. As for the reſt, theſe they be, Aretini the old, Aretini Fidentes, Aretini Iuſlienſes, Amitinenſes, A-
E quenſes ſurnamed Taurini: Vlerani, Cortonenſes, Capenates, Cluſines the old, Cluſines the new, Fluentini, faſt vpon the riuer Arnus that runs before them, Feſulæ, Ferentinum, Feſcennia, Hortanum, Herbanum, Nepet, Nouempagi [*i.* the nine villages] the Shire-wiek called Prefecture Claudia, or Foro Clodij: Piſtorucin, Peruſia, Suanenſes, Saturnini, who beforetime were called Aurinini, Sudertani, Statones, Tarquinienſes, Tuſcanienſes, Vetulonienſes, Veientani, Veſentini, Volaterrani ſurnamed Hetruſci and Volſinienſes. In the ſame part lie the territories Cruſtuminus and Cæletranus, bearing the names of the old townes. Tiberis, beforenamed Tybris, and before that Albula, from the middeſt well neere of Apennine, as it lies in length, runs along the marches of the Aretines: ſmall and ſhallow at the firſt, and not able to beare a veſſell without being gathered together, as it were, by fiſh-pooles into a head, and ſo let goe at ſluces:
F as Tinia and Glanis which run into him, the which are at the ſame paſſe, and require 9 daies for collection of waters, and ſo are kept in for running out: in caſe they haue no helpe of rain at al. But Tiberis by reaſon of the rough, ſtony, and rugged channell, for all that deuiſe, hold, on no long courſe together, but only for troughes, to ſpeake more truly, than boats: & thus it doth for a hundred and fifty miles, not far from Tifernum, Peruſia and Otriculum: diuiding as it paſſeth

Hetruria

Hetruria from the Vmbrians and Sabines:and ſo forth vntill anon,within thirteen miles of the citie[Rome]it parts the Veientian countrey from the Cruſtumine: and ſoone after the Fidenate and Latine territories from the Labicane. But beſides Tinia and Glanis, he is augmented with two and forty riuers,and eſpecially with Nar and Anio:which riuer being alſo it ſelfe nauigable,encloſes Latium behind:and neuertheleſſe ſo many waters and fountaines are brought thereby into the citie,whereby it is able to receiue any ſhips, be they neuer ſo great,from the Italian ſea; and is the kindeſt marchant to conueigh all commodities growing and ariſing in any place of the whole world: it is the onely riuer of all others,to ſpeake of, and more villages ſtand vpon it and ſee it,than al other riuers in what land ſoeuer. No riuer hath leſſe liberty than it,as hauing the ſides therof encloſed on both hands,& yet he is no quarreller,nor much harm doth he,albeit he hath many and thoſe ſuddain ſwellings, and in no place more than in the very citie of Rome do his waters ouerflow:yet is he taken to be a prophet rather, and a Counſellor to giue warning,yea,and in ſmelling,more religious and breeding ſcruple,to ſpeake a truth, than otherwiſe cruell and doing any great harme. Old Latium from Tiberis to Circeios, was obſerued to be in length 50 miles. So ſmall roots at the firſt took this Empire. The inhabitants thereof changed often,and held it,ſome one time,ſome another; to wit,the Aborigenes,Pelaſgi,Arcadians,Sicilians,Auruncanes,and Rutilians. And beyond Circeios,the Volſcians,Oſſians,Auſonians, from whence the name of Latium did reach ſoone after, as farre as to the riuer Liris. In the beginning of it ſtands Oſtia, a Colonie,brought thither and planted by a Roman king:the towne Laurentum,the groue of *Iupiter Indiges*, The riuer Numicius, and Ardea, built by *Danaë* the mother of *Perſeus*. Then the Colonie Antium, ſometimes Aphrodiſium: Aſtura, the riuer and the Iſland. The riuer Nymphæus,Claſtra Romana Circeij,in times paſt an Iſland, yea and that verily enuironed with a mighty ſea(if we beleeue *Homer*)but now with a plain. A wonder it is what we are able to deliuer concerning this thing to the knowledge of men. *Theophraſtus*,who of ſtrangers was the firſt that writ(any thing diligently) ſomewhat of the Romans (for *Theopompus*,before whom no man made mention at all, ſaid only,That the citie was woon by the Gaules: and *Clitarchus* next after him, ſpake of nothing elſe but an embaſſage ſent vnto *Alexander*) this *Theophraſtus*, I ſay,vpon a better ground and more certaintie now than bare heareſay, hath ſet downe the meaſure of the Iſland Circeij to be eightie Stadia; in that booke which he wrot to *Nicodorus* the chiefe Magiſtrate of the Athenians,who liued in the 460 yeere after the foundation of Rome citie. Whatſoeuer land therefore aboue tenne miles compaſſe lies neere about it,hath beene annexed to the Iſland. But after that,a yeere,another ſtrange and wonderfull thing fell out in Italy: for not far from Circeij, there is a meere called Pomptina, which *Mutianus*, a man who had beene thrice Conſull, reporteth to haue been a place wherein ſtood 23 cities. Then there is the riuer Vfens,vpon which ſtandeth the towne Tarracina, called in the Volſcian tongue Anxur,& where ſometime was the citie Amycle,deſtroied by ſerpents. After it is there the place of a caue or peak, the lake Fundanus,& the hauen Cajeta. The town Formiæ named alſo Hormiæ,the ancient ſeat(as men thought) of the Læſtrigones. Beyond it was the towne Pyræ,the Colonie Minturne, diuided aſunder by the riuer Liris,called Clanius. The vtmoſt frontier towne in this part of Latium laid to the other,is Sinueſſa, which as ſome haue ſaid,was wont to be called Sinope. Thence comes to ſhew it ſelfe that pleaſant and plentifull countrey Campania. From this vale begin the hills full of vineyards,and famous for drunkenneſſe,proceeding of ſtrong wine and the liquor of the grape, commended ſo highly in all countries:and(as they were wont to ſay in old time)there was the exceeding ſtrife between father *Liber* and dame *Ceres*. From hence the Setine and Cecubine countries ſpread forth: and to them ioine the Falerne and Caline. Then ariſe the mountaines,Maſſici, Gaurani and Surrentine. There the Laborium Champaine fields lie along vnder their feet,and the good wheat harueſt to make fine frumentie for dainties at the table. The ſea-coaſts here are watered with hot fountaines,and among other commodities throughout all the ſea, they beare the name for the rich purple ſhell fiſh, and other excellent fiſhes. In no place is there better or more kind oyle preſſed out of the Oliue. And in this delightſome pleaſure of mankind, the Oſcians,Grecians, Vmbrians, Tuſcanes, and Campanes haue ſtriued who could yeeld beſt. In the skirt and edge thereof is the riuer Sauo,Vulturnum the town and riuer both,Liturnum,and Cumo inhabited by Chalcidians,Miſenum,the hauen Bajæ, Baule,the pooles Lucrinus and Auernus,neer vnto which was ſomtime the town Cimmerium. Then Puteoli,called alſo the Colonie Dicæarchia:

G H I K L M

After

20030
copy 1

A After that,the plaines Phlegræi, and the meere or fenne Acheruſia neere to Cumes. And vpon the very ſtrond by the ſea ſide Naples,a citie alſo of the Chalcidians,the ſame that Parthenope ſo called of the tombe of a Sirene or Meeremaid: Herculanium, Pompeij: and where not farre off the mountaine Veſuvius ouerlooketh, and the riuer Sernus runneth vnder the territory of Nuceria,and within nine miles of the ſea,Nuceria it ſelfe. Surrentum with the promontory of *Minerua*. the ſeat ſometime of the Meermaids. From the cape Circeij lies the ſea open for ſaile 78 miles. This is counted the firſt region of Italy,next Tibris,according to the deſcription of *Auguſtus*. Within it are theſe Colonies, Capua,ſo called of the Champane country, Aquinum, Sueſſa, Venafrum, Sora, Teanum,named withall Sidicinum and Nola: the Townes be, Abellinum, Aricia, Alba Longa, Acerrani, Allifani, Atinates, Aletrinates, Anagnini, Atellani, Aſulani, Arpinates, Auximates, Auellani, Alfaterni; and they who of the Latine, Hernick, and Albicane territories,are ſurnamed accordingly: Bouillæ, Calatiæ, Caſinum, Calenum, Capitulum, Cernetum, Cernetani, who be called alſo Mariani. Corani deſcended from Dardanus the Trojane. Cubulterini, Caſtrimonienſes, Cingulani. Fabienſes, and in the mount Albane, Foro populienſes. Out of the Falarne territory, Fruſinates, Ferentinates, Freginates, Faraterni the old, Fabraterni the new, Ficolenſes, Fricolenſes, Foro-Appi, Forentani; Gabini, Interramnates, Succaſani, called alſo Lirinates, Ilionenſes, Lauinij, Norbani, Nementani, Preneſtini, whoſe citie was in times paſt named Stephanus, Priuernates, Setini, Signini, Sueſſulani, Telini, Trebutini ſurnamed Balinienſes, Tribani, Tuſculani, Verulani, Veliterni, Vlubrenſes, Vluernates: and aboue alſo Rome her ſelf: the * other name whereof to vtter, is counted in the ſecret miſteries of ceremonies an impious and vnlawfull thing: which after that it was aboliſhed, and ſo faithfully obſerued to right good purpoſe and for the ſafetie thereof, *Valerius Soranus* blurted out, and ſoone after abid the ſmart for it. I think it not amiſſe nor impertinent, to inſert there in this very place an example of the ancient religion inſtituted eſpecially for this Silence: for the goddeſſe *Angerona*, whoſe holiday is ſolemnly kept with ſacrifices the 12 day before the Kalends of Ianuary, is repreſented by an Image hauing her mouth faſt ſealed and tied vp. This citie of Rome had 3 gates when *Romulus* left it, or rather foure (if we beleeue the moſt men that write thereof) The wals thereof, when the two *Veſpacians*, Emperors and Cenſors both, to wit, the Father and *Titus* his ſon, took the meaſure, which was in the yere after the foundation of it 828, were in circuit * 13 miles and almoſt a quarter. It containeth within it, ſeuen Mountaines, and is diuided in 14 regions, and 265 croſſe ſtreets or carfours, called Compita Larium. The meaſure of the ſame equall ſpace of ground, running from the gilden piller Milliarium, erected at the head or top of the Rom. Forum, to euery gate which are at this day 37 in number, ſo ye reckon once the 12 gates alwaies open, and ouerpaſſe 7 of the old, which are no more extant, maketh 30 miles 3 quarters and better, by a ſtraight line: but if the meaſure be taken from the ſame Milliarium before-ſaid, through the ſuburbs to the vtmoſt ends of the houſes, and take withall the Caſtra Prætoria, and the pourpriſe of all the ſtreets, it comes to ſomewhat aboue 70 miles: whereunto if a man put the height of the houſes, hee may conceiue verily by it, a worthy eſtimate of the excellency thereof, and confeſſe that the ſtatelineſſe of no citie in the world could be comparable to it. Encloſed it is and fenced on the Eaſt-ide with the bank or rampier of *Tarquinius* the Proud; a wonderfull piece of worke as any other, and as excellent as the beſt: for he raiſed it full as high as the wals, in that ſide where the aduenue to it was moſt open and plaine. In other parts, defended it was and fortified with exceeding high wals, or elſe ſteepe and craggy hils, but only whereas there are buildings lye out abroad, and make as it were many petty cities. In that firſt region of Italy there were beſides, firſt for Latium theſe faire townes of marke, Satricum, Pometia, Scaptia, Pitulum, Politorium, Tellene, Tifata, Cæmina, Ficana, Cruſtumerium, Ameriola, Medullia, Corniculum, Saturnia, where now Rome ſtandeth. Antipolis, which now is Ianiculum, in one part of Rome: Antemnæ, Camerium, Collatiæ: Amiternum, Norbe, Sulmo: and with theſe, the States that were wont to receiue a dole of fleſh in mount Albane, to wit, Albenſes, Albani, Aeſolani, Acienſes, Abolani, Bubetani, Bolani, Caſuetani, Coriolani, Fidenates, Foretij, Hortenſes, Latinenſes, Longulani, Manates, Marales, Mutucumenſes, Munienſes, Numinienſes Olliculani, Octulani, Pedani, Polluſtini, Querquetulani, Sicani, Siſolenſes, Tolerienſes, Tutienſes, Vimitellarij, Velienſes, Venetulani, Vicellenſes. Thus yee ſee, how of the old Latium, there be 53 States periſhed and cleane gone, without any token left behinde. Moreouer, in the Campaine countrey, the towne Stabiæ continued vnto the time that *Cn. Pompeius* and *L. Carbo* were

* Valentia.

* Some reade 30.

were Conſuls, euen vntill the laſt day of Aprill; vpon which day, *L. Silla* a lieutenant in the Allies war, deſtroyed it vtterly: which now at this day is turned into graunges and ferme-houſes. There is decaied alſo there and come to finall ruine, Taurania. There be alſo ſome little relikes left of Caſilinum, lying at the point of the laſt gaſpe. Moreouer *Antias* writes, that Apiolæa towne of the Latines, was woon by *L. Tarquinius* the King, with the Pillage whereof he began to found the Capitoll. From Surrentum, to the riuer Silarus, the Picentine countrey lay for the ſpace of 30 miles, reowmed for the Tuſcanes goodly temple built by *Iaſon* in the honor of *Iuno Argiva*. Within it ſtood the townes Salernum, and Picentia. At Silarus, the third region of Italy, beginnes together with the Lucane and Brutian countries: and there alſo the inhabitants changed not a few times. For held and poſſeſſed it was by the Pelaſgi, Oenotri, Italy, Morgetes, Sicilians, people all for the moſt part of great Greece: and laſt of all by the Lucanes deſcended from the Samnites, who had to their leader and gouernour, *Lucius*. In which ſtandeth the town Pæſtum, called by the Greeks Poſidonia: the Firth or creeke Pæſtanus, the town Helia, now Velia. The promontory Palinurum, from which creeke retired within-forth, there is a dire & cut by water to the columne regia, 100 miles ouer. Next vnto this, the riuer Melphes runneth: alſo there ſtandeth the towne Buxentum, in Greeke, Pyxus, and hard by is the riuer Laus: a towne there was likewiſe of the ſame name. And from thence beginneth the ſea coaſt of Brutium, where is to be ſeen the towne Blanda, the riuer Batum, the hauen Parthenius belonging to the Phocæans: the Firth Vibonenſis, the groue Clampetia, The towne Temſa, called of the Greeks Temeſe: and Terina held by the Crotonians, and the mighty arme of the ſea, called the gulfe Terinæus: the towne Conſentia. Within-forth in a demy Iſland, the riuer Acheron, whereof the townesmen are called Acherontium. Hippo, which now we call Viboualentia; the Port of *Hercules*, the riuer Metaurus, the towne Taurentum, the hauen of Oreſtes, and Medua: the towne Scylleum, the riuer Cratais, mother (as they ſay) to Scylla. Then after it, the columne Rhegia: the Sicilian ſtreights or narrow ſeas, and two capes one ouer-againſt the other; namely, Cænis from Italy ſide, and Pelorum from Sicily, hauing a mile and a halfe betweene them: from whence to Rhegium is 12 miles and a halfe: and ſo forward to a wood in the Apennine, called Sila; and the promontorie or cliffe called Leucopetra, 12 miles off. From which, Locri (carrying the name alſo of the promontorie Zephyrium) is from Silarus diſtant 303 miles. Here is determined the firſt gulfe of Europe, wherin be named theſe ſeas. Firſt, Atlanticum (from which the Ocean ſea breaketh in) called of ſome Magnum: the paſſage whereas it entreth, is of the Greeks called Porthmos; of vs, Fretum Gaditanum, *i.* [The ſtreights of Gebralter] when it is once entred the Spaniſh ſea, ſo farre as it beateth vpon the coaſts of Spaine: Of others, Ibericum, or Balearicum: and anon it taketh the name of Gallicum, or the French ſea, right before the prouince Narbonenſis: and after that, Ligufticum: from whence all the way to the Iſland Sicilie, it is called Tuſcum; which ſome of the Grecians terme Notium, others Tyrrhenum, put moſt of our countrimen Inferum, *i.* [The nether ſea.] Beyond Sicily as farre as to the Salentines. *Polybius* calleth it Auſonium: but *Eratoſthenes* nameth all the ſea Sardonum, that is between the mouth of the Ocean and Sardinia: and from thence to Sicilie, Tyrrhenum; and from it as far as to Creta, Siculum: from which it is hight Creticum. The Iſlands diſcouered along theſe ſeas, were theſe: The firſt of all, thoſe which the Greeks named Pityuſæ, of the Pine ſhrub or plant; but now, Ebuſus: they are both a State confederate, and a narrow arme of the ſea runneth between them; they are 42 miles ouer. From Dianeum, they lie 70 ſtadia: and ſo many are there betweene Dianeum and Carthage, by the maine land: and as much diſtance from Pityuſæ into the maine Ocean, lie the two Baleare Iſlands; and toward Sucro, Colubraria. Theſe Baleares in their warre-ſeruice vſe much the ſling; and the Greeks name them Gymneſiæ. The bigger of them is an hundred miles in length, and in circuit 380. Townes it hath of Romane citizens, Palma and Pollentia: of Latines, Cinium and Cunici: as for Bochri, it was a towne confederate. From it, the leſſer is thirtie miles off, taking in length 60 miles, and in compaſſe 150. Cities in it, be Iamno, Saniſera, and Mago. From the bigger 12 miles into the ſea, lieth the Iſle Capraria, which lies in wait for all ſhipwrack: & ouer-againſt the city Palma, Menariæ, and Tiquadra, and little Annibalis. The ſoile of Ebuſus chaſeth ſerpents away, but that of Colubraria breeds them: and therefore dangerous it is for all that come into it, vnleſſe they bring with them ſome of the Ebuſian earth. The Greeks call this Iſland, Ophiuſa. Neither doth Ebuſus breed any Conies; which are ſo common in the Baleares, that they eate vp their corne.

There

20030
copy 1

A There be as it were 20 more little ones among the ſhelues of the ſea. Now in the maritime coaſt of Gallia in the very mouth of Rhodanus, there is Metina; and ſoone after, that which is called Blaſcon; and the three Stœchades, called ſo of their neighbors the Maſſilians, for the order and ranke wherein they ſtand; and they giue them euery one a ſeuerall name, to wit, Prote, Meſe (which alſo is called Pomponiana) and the third, Hypea. After them, are Sturium, Phœnice, Phila, Lero, and Lerina oueragainſt Antipolis; wherein alſo is a token or memoriall of the towne Vergaonum.

Chap. VI.

B

¶ *Of Corſica.*

IN the Ligurian ſea is Corſica the Iſland, which the Greekes called Cyrnos, but nearer it is to the Tuſcan ſea; it lyeth out from the North into the South, and containeth in length an hundred and fiftie miles: in breadth for the moſt part it beareth fiftie: in circuit 322: diſtant it is from the Waſhes or Downes of Volaterræ 62 miles. Cities it hath 35: and theſe colonies, to wit, Mariana, planted there by *C. Marius*: Aleria, by Dictatour *Sylla*. On this ſide of it is Oglaſa; but within 60 miles of Corſica, there is Planaria, ſo called of the forme thereof, ſo flat it is and leuell with the ſea; and therefore deceiueth many a ſhip that runneth agrouud vpon it. Bigger than it are Vrgo and Capraria, which the Greekes called Ægilos. In like manner Ægilium & Dianium, the ſame that Artemiſia, both lying ouer-againſt the coaſt Coſanum. Other
C ſmall ones alſo, as Mænaria, Columbrarie, Venaria, Ilua, with the yron mines, in circuit a hundred miles (ten miles from Populonia) called of the Greeks, Æthalia: from it is Planaſia 39 miles off. After them, beyond the mouthes of Tybre in the Antian creeke, is Aſtura, and anon Palmaria, Sinonia, and iuſt againſt Formiæ, Pontiæ. But in the Puteolan gulfe, Pantadaria and Prochyta, ſo called, not of *Æneas* his nource, but becauſe it was broken off by the guſhing betweene of the ſea from Ænaria. Ænaria it ſelfe tooke that name of *Æneas* his ſhips that lay in rode there, called by *Homer* Inarime, of the Greeks Pithecuſa, not for the number of Alps there, as ſome haue thought, but of the worke houſes and furnaces of potters that made earthen veſſels, as tunnes and ſuch like, to furniſh Italy with. Betweene Pauſilypus and Naples, Megaris;
D and ſoon after, eight miles from Surrentum, Capræe, renowned for the caſtle there of Prince *Tyberius*; and it beareth in compaſſe foure hundred miles. Anon you ſhall ſee Leucothea: but without your kenning lyeth Sardinia faſt vpon the Africke ſea, but leſſe than nine miles from the coaſt of Corſica: and ſtill thoſe ſtreights are made more narrow by reaſon of ſmall Iſlands, named Cuniculariæ. Likewiſe Phintonis and Foſſæ, whereof the very ſea it ſelfe is named Taphros.

Chap. VII.

¶ *Of Sardinia.*

E SArdinia on the Eaſt ſide beareth 188 miles, on the Weſt, 170, Southward, 74, and Northward 122: ſo that in all, it taketh vp the compaſſe of 560 miles. It is from the Cape of Caraleis to Africke 200 miles: from Gades it is diſtant 1400 miles. It hath two Iſlands on that ſide where the Promontorie Gorditanum ſtandeth, which be called *Hercules* Iſlands: of Sulſenſes cape ſide, Enoſis; of Caralitanum, Ficaria: ſome ſet not far from it the Iſlands Belerides, and Collodes: and another which they call Heras Lutra, *i. Iunoes* lauer, or Hieraca. The States of greateſt name therein, be the Ilienſes, Balari, and Corſi: and of the foure townes, the chiefe are inhabited by the Sulcitanes, Valentines, Neapolitans, Boſenſes, and Caralitani who are Roman infranchiſed citizens, and Norenſes. One colonie there is in it and no more, which is called, Ad Turrim Libyſonis. This iſland Sardinia, *Timæus* called (of the faſhion of a ſhooe or ſlipper) Sandaliotis: but *Myrſylus*, for the reſemblance of a foots-ſtep, Ichnuſa. Ouer-againſt
F the creek Pæſtanum, there is Leucaſia, called ſo of a Mere-maid or Sirene there buried: againſt Veſtia, there lie Pontia and Iſſia, both iointly called by one name Oenotides; a good preſumption and argument that Italie was poſſeſſed by the Oenotrians. And againſt Vibo, other little ones, called Ithaceſiæ, the watch townes of *Vlyſſes*.

Chap. VIII.

¶ *of Sicilie.*

BVt Sicilie excelleth all other of theſe Iſlands, named by *Thucydides* Sicania; by many, Trinacria, or Triquetra of the triangle forme. It is in circuit (as *Agrippa* ſaith) 198 miles. In time paſt it grew to the Brutians countrey, but ſoone after by the guſhing of the ſea between, it was plucked from it, and left a Firth of 12 miles in length, and one & a half in bredth, neere vnto the columne Rhegium. Vpon this occaſion of opening and cleauing in twaine, the Greekes gaue name to the town Rhegium, ſcituat in the edge of Italy. In this narrow ſea there is a rocke called Scylla, and likewiſe another named Carybdis: the ſea is full of whirle-pits, and both thoſe rocks are notorious for their rage and miſchiefe. The vtmoſt Cape or fore-land of this Iſland Triquetra (as we haue ſaid) is called Pilorus, bending againſt Scylla toward Italy. As for Pachynum, it lieth toward Græcia, and from it is Peloponneſus diſtant 144 miles. Lilibæum butteth vpon Africke, and between it and the cape of *Mercury* there be 180 miles; and from the ſaid Lilybæum to the cape of Caraleis in Sardinia 120. Now theſe points & promontories lye aſunder one from the other in this diſtance. By land from Pelorus to Pachynum, 166 miles: from thence to Lilibæum 200 miles: ſo forward to Pelorum 170 In it, of colonies, towns, and cities, there be 72. From Pelorum ſide, which looketh toward the Ionian ſea, yee haue the towne Meſſana, inhabited by enfranchiſed Roman citizens, and they be called Mamertini. Alſo thecape Drepanum, the colony Taurominium, called before-time Naxos: the riuer Aſines, the mountaine Ætna, miraculous for the fires there in the night ſeaſon; the hole or open chinke in the top of it is in compaſſe two miles and a halfe; the imbers and ſparkling aſhes thereof, fly hot as far as to Taurominium and Catana: but the cracking noiſe therof may be heard as far as to Maron, and the hils Gemellis. In this iſland there be alſo the three rocks of the Cyclops, the port of *Vlyſſes*, the colonie Catanæ, the riuers Symethum and Terias: within the Iſle by the plains and champian fields, Læſtrigonij. The towns are theſe, Leontini, and Megaris: and in it is the riuer Pantagies: alſo the colonie Syracuſæ, together with the fountain Arethuſa. Albeit there be other ſprings alſo in the territory of Syracuſa, that yeeld water for drinke, to wit, Temenitis, Archidemia, Magæa, Cyane, and Milichre. Moreouer, the hauen Nauſtathmos, the riuer Elorum, the promontorie Pachynum: and on this front of Sicily, the riuer Hirminium, the towne Camarina, the riuer Helas, and town Acragas, which our countreymen haue named Agrigentum. The colony Thermæ: riuers, Atys and Hypſa, the town Selinus: and next to it the cape Lilybæum, Drepana, the hill Eryx. Townes there be, Panhormum, Solus, Hymetta with the riuer, Cephalœdis, Aluntium, Agathirium, Tyndaris a colony, the town Myſæ, and whence we began Pelorus: within-forth, of Latin condition and Burgeoſie, the Centuripines, Netines, and Segeſtines. Tributaries, Aſſarines, Ætnenſes, Agyrines, Aceſtæi, and Acrenſes: Bidini, Citarij, Caciritani, Drepanitani, Ergetini, Eceſtienſes, Erycini, Eutellini, Etini, Euguini, Gelani, Galatani, Haleſines, Ennenſes, Hyblenſes, Herbitenſes, Herbeſſenſes, Herbulonſes, Halicyenſes, Hadranitani, Imacarenſes, Ichanenſes, Ietenſes, Mutuſtratini, Magelini, Murgentini, Mutyenſes, Menanini, Naxij, Nocœni, Pelini, Paropini, Phinthienſes, Semellitani, Stherrini, Selinuntij, Symetij, Talarenſes, Tiſſinenſes, Triocalini, Tiracienſes, Zanchei belonging to the Meſſenians in the ſtreights of Sicilie. Iſlands there be bending to Africk, Gaulos, Melita, from Camerina 84 miles, and from Lilybeum 113: Coſyra, Hieroneſus, Cæne, Galata, Lopaduſa, Æthuſa which others haue written Æguſa, Bucina, and 75 miles from Solus, Oſteodes: and againſt the Paropini, Vſtica. But on this ſide Sicilie ouer-againſt the riuer Metaurus, 12 miles wel-neare from Italy, 7 others called Æolæ. Theſe very ſame iſlands belonged ſometimes to the Liparæans, and of the Greeks were called Hephæſtiades, and of our men Vulcaniæ, likewiſe Æoliæ, becauſe *Æolus* reigned there in the time that Illium flouriſhed, and about the Troian war.

Chap. IX.

¶ *Of Lipara.*

LIpara with a towne of Romane citizens, called ſo of king *Liparus*, who ſucceeded *Æolus*, but before time Melogonis or Meligunis, is 12 miles from Italy, and is it ſelfe ſomewhat leſſe in circuit. Between this and Sicily there is another, ſometime named Theraſia, now Hiera,

20030
copy 1

A Hiera,becauſe it is conſecrated to *Vulcan*, wherein there is a little hill that belcheth and caſts vp flames of fire in the night. A third there is alſo, named Strongile,a mile from Lipara, lying toward the Sunne riſing(wherein *Aeolus* reigned) and differeth from Lipara onely in this,that it ſendeth forth more cleere flames of fire: by the ſmoke thereof,the people of that countrey will tell(by report)three daies before hand what windes will blow:whereupon it is commonly thought that the windes were obedient to *Aeolus*. A fourth there is beſides,named Didyme, leſſe than Lipara:and a fift, Ericuſa: a ſixt, Phænicuſa, left to feed the reſt that are next to it: the laſt and leaſt is Euonymus. And thus much concerning the firſt gulfe that diuides Europe

Chap. X.

B ¶ *Of Locri, the frontier towne of Italy.*

AT Locres beginneth the front or forepart of Italy, called Magna Græcia, retiring it ſelfe into three creekes of the Auſonian ſea, becauſe the Auſones firſt inhabited thereby. It extendes 82 miles,as *Varro* teſtifieth. But the greater number of writers haue made but 72. In that coaſt there be riuers without number. But thoſe things which are worth the writing of neere vnto Locres,be theſe,Sagra the riuer, and the reliques of the towne Caulon: Myſtia the caſtle Conſilium,Cerinthus,which ſome think to be the vtmoſt promontory of Italy,bearing fartheſt into the ſea. Then follow the creeke or gulfe Scylacenſu,and that which was called by the Athenians when they built it,Scylletium. Which place another creeke Tirenæus,meeting
C with,makes a demie Iſland: in which there is a port towne called Caſtra Anibilis: and in no place is Italy narrower,being but twenty miles broad. And therfore *Dioniſius* the elder would haue there cut it off quite from the reſt, and laid it to Sicilie. Riuers nauigable there be theſe, Cæcinos,Crotalus, Semirus,Arocha,Targines. Within forth is the towne Petilia,the mountaine Alibanus,and promontory Lacinium: before the coaſt whereof there is an Iſland tenne miles from the land, called Dioſcoron,and another Calypſus, which *Homer* is ſuppoſed to haue called Ogygia. Moreouer,Tyris,Eranuſa,Meloeſſa. And this is ſeuentie miles from Caulon,as *Agrippa* hath recorded.

Chap. XI.

D ¶ *The ſecond Sea of Europe.*

FRom the promontory Lacinium beginneth the ſecond ſea of Europe: it takes a great winding and compaſſe with it, and endeth at Acroceraunium, a promontory of Epirus, from which it is ſeuentie miles diſtant. In which there ſheweth it ſelfe the towne Croto,and the riuer Næthus. The towne Thurium betweene the two riuers,Arathis and Sybaris,where there was a towne of the ſame name. Likewiſe between Siris and Aciris there ſtands Heraclea ſomtime called Siris. Riuers,Acalandrum,Maſuentum: the town Metapontum,in which the third region of Italy taketh an end. The Inlanders be of the Brutians,the Apruſtans only: but of Lucanes,Thoatinates,Bantines,Eburines,Grumentines,Potentines,Sontines,Sirines,Sergilanes
E Vrſentines,Volcentanes,vnto whom the Numeſtranes are ioined. Beſides all theſe, *Cato* writes, That Thebes of the Lucanes,is cleane deſtroyed and gone. And *Theopompus* ſaith,That Pandoſia was a citie of the Lucanes,wherein *Alexander* king of the Epirotes was ſlaine. Knit hereunto is the ſecond region or tract of Italy, containing within it the Hirpines, Calabria, Apulia, & the Salentines within an arme of the ſea,in compaſſe 250 miles,which is called Tarentinus of a town of the Laconians,ſcituate in the inmoſt nouke,or creek hereof: and to it was annexed and lay the maritine Colonie which there was. And diſtant it is from the promontory Lacinium 1 :6 miles,putting forth Calabria like a demy Iſland againſt it. The Greeks called it Meſſapia of their captaines name,and before-time,Peucetia of *Peucetius*, the brother of *Oenotrus*. In the Salentine country between the two promontories,there is a 100 miles diſtance. The bredth
F of this demie Iſland,to wit, from Tarentum to Brindis (if you goe by land) is two and thirtie miles,but far ſhorter if you ſaile from the Hauen or Bay Saſina. The townes in the Continent from Tarentum,be Varia,ſurnamed Apula,Ceſſapia and Aletium. But in the coaſt of the Senones, Gallipolis,now Auxa, 62 miles from Tarentum. Two and thirtie miles off is the promontorie which they call Acra Iapygia, and here Italy runneth fartheſt into the ſea. Then

is there the town Basta, and Hydruntum in the space of nineteen miles, to make a partition betweene the Ionian and Adriaticke seas, through which is the shorteſt cut into Greece ouer against the towne Apollonia, where the narrow sea running between, is not aboue fiftie miles ouer. This space between, *Pyrrhus* king of Epirus, was the first, that intending to haue a passage ouer on foot, thought to make bridges there: after him *M. Varro*, at what time as in the Pyrates warre he was Admirall of *Pompeies* fleet. But both of them were let and stopped with one care or other besides. Next to Hydrus there is Soletum, a citie not inhabited: then, Fratuertium: the hauen Tarentinus, the garrison towne Lupia, Balesium. Cælium, Brundusium fifteene miles from Hydrus, as much renowmed as any towne of Italy for the hauen, for the surer sailing, although it be the longer, and the citie of Illyricum Dyrragium is ready to receiue the ships: the passage ouer is 220 miles. Vpon Brundutium bordereth the territory of the Pædiculi. Nine young men there were of them, and as many maids, descended from the Illyrians, who begat betweene them thirteen nations. The townes of these Pædiculi, be Rhudia, Egnatia, Barion, beforetime Iapyx of *Dedalus* his sonne, who also gaue the name to Iapygia. Riuers, Pactius, and Ausidus issuing out of the Hirpine mountaines, and running by Canusium. Then followes Apulia of the Daunians, surnamed so of their leader, father in law to *Diomedes*. In which is the towne Salapia, famous for the loue of an harlot that *Annibal* cast a fancie vnto; then, Sipontum and Vria: also the riuer Cerbalus, where the Daunians take their end: the port Agasus, the cape of the mountaine Garganus, from Salentine or Iapygium 234 miles, fetching a compasse about Garganus: the hauen Garnæ, the lake Pantanus. The riuer Frento, full of Baies and Hauens, and Teanum of the Apulians. In like manner also, Larinum, Aliturnia, and the riuer Tifernus. Then commeth in the region Frentana. So there be three kindes of nations, Teani, of their leader, from the Greekes: the Lucanes subdued by *Calchas*, which quarters now the Atinates hold and occupie. Colonies of the Daunians besides the abouenamed, Luceria, and Venusia: townes, Canusium, Arpi, sometime Argos Hippium, builded by *Diomides*, but soon after called Argyrippa. There *Diomedes* vanquished and destroied the whole generation of the Monadians and Dardians, together with two cities, which grew to a merry iest by way of a by-word, Apina and Trica. The rest be more inward in the second region, to wit, one Colonie of the Hirpines called Beneuentum, changed into a more luckie name, wheras in times past it was cleaped Maleuentum: the Æculanes, Aquilonians, and Abellinates, surnamed Protropi: the Campsanes, Caudines, and Ligurians, surnamed Cornelians: as also Bebianes, Vescellanes, Deculanes, and Aletrines: Abellinates surnamed Marsi, the Atranes, Ænanes, Afellanes, Attinates, & Arpanes: the Borcanes, the Collatines, Corinenses; and famous for the ouerthrow of the Romanes there, the Cannians: the Dirines, the Metintanes, the Genusines, the Hardonians and Hyrines: the Latinates surnamed Frentanes, the matrnates, and out of Garganus the Mateolanes, the Neritines, and Natines, the Rubustines, the Syluines and Strapellines, the Turmentines, the Vibinates, Venusines, and Vlurtines. Now the Inlanders of the Calabrians, the Ægirines, Apanestines and Argentines. The Butuntines and Brumbestines, the Decians, the Norbanes, the Palions, Sturnines, and Tutines. Also of Salentine midlanders, the Aletines, Basterbines, Neretines, Valentines, and Veretines.

Chap. xii.

¶ *The fourth Canton or region of Italy.*

NOw followeth the fourth region, euen of the most hardie and valiant nations of all Italy. In the coast of the Frentanes, next to Tifernus, is the riuer Tirinium, full of good hauens and harbours. The towns there, be Histonium, Buca, and Ortona, with the riuer Aternus. More within the countrey, are the Anxanes surnamed Frentanes: the Carentines, both higher and lower, the Lanuenses: of Marrucines, the Teatines: of Pelignians, the Corsinienses, Super-Æquani and Sulmonenses: of Marcians, the Anxantines and Atinates, the Fucentes, Lucentes, and Maruvij: of Albenses, Alba vpon the lake Fucinus: of Æquiculanes, the Cliternines and Carseolanes: of Vestines, the Augulanes, Pinnenses, Peleuinates, vnto whom are ioined the Aufinates on this side the mountaines: of Samnites, whom the Greekes called Sabellians and Saunites, The Colonie Bouianum, the old; and another surnamed Vndecumanorum, namely, inhabited by those of the eleuenth legion: the Ausidenates, Esernines, Fagisulani, Ficolenses, Sepinates,

20030
copy 1

A nates, Treuentinates: of the Sabines, the Amiternines, Curenſes, Forum Decij, Forum Nouum, the Fidenates, Interamnates, Nurſines, Nomentanes, Reatines, Trebulanes, ſyrnamed Mutuſcæi, as alſo Suffenates, the Tiburtes, and Tarinates. In this quarter of the Æquiculæ there be periſhed and gone the Comines, Tadianes, Acedikes, and Alfaterni. *Gellianus* writeth, that Acippe, a towne of the Marſians, built by *Marſyas* a captaine of the Lydians, was drowned and ſwallowed vp by the lake Fucinus. Alſo *Valerian* reporteth, that a towne of the Vidicines in Picenum was vtterly ruined by the Romans. The Sabines as ſome haue thought were for their religion and deuout worſhipping of the gods called Sevini: they dwell hard by the Veline lakes vpon moiſt and dewie hils. The riuer Nar draineth them dry with his hot waters of brimſtone: which riuer running from thence toward Tyberis filleth it, and gliding from the hill Fiſcellus, neere the groues of Vacuna and Reate, is hidden in the ſame. But from another ſide,
B the riuer Anio, beginning in the mountain of the Trebanes, bringeth with it into Tiberis three lakes of great name for their delectable pleaſantnes, which gaue the name to Sublaquenſu. In the Reatine territorie is the lake Cutiliæ, wherein floteth an Iſland; and this lake, as *M. Varro* ſaith, is in the very midſt and centre of Italy. Beneath the Sabines lieth Latium; on the ſide Picenum; behinde, Vmbria; and the hills of the Apennine on either hand, do incloſe as with a rampier, the Sabines.

Chap. xiii.

¶ *The fifth Region.*

C THe fift region is Picene, a Nation in times paſt moſt populous, 360000 of the Picentes were reduced vnder the protection of the people of Rome. They are deſcended from the Sabines, vpon a vow that they made to hold and ſolemniſe a ſacred ſpring. They dwelt by the riuer Aternus, where now is the rerritorie Adrianus, and the Colonie Adria, ſeuen miles from the ſea. There runneth the riuer Vomanum, and there lieth the Prætutiane and Palmenſis territorie: alſo Caſtrum novum, the riuer Batinum, Truentum with the riuer, the onely relique of the Liburnians remaining in Italy. More riuers there be, to wit, Alpulates, Suinum, and Heluinum, at which the Prætutian country endeth, and the Picentian beginneth. The towne Cupra, a caſtle of the Firmanes, and aboue it the colony Aſcuum, of all Picenum the moſt renow-
D ned. Within ſtandeth Nouana. In the edge or marches without are Cluana, Potentia, and Numana, built by the Sicilians. Next to thoſe is the colony Ancona, with the promontory Cumerum lying hard vnto it, in the very elbow of the edge thereof as it bendeth, being from Garganus 183 miles. Within-forth do inhabit the Auximates, Beregranes, Cingulanes, Cuprenſes ſyrnamed the Mountainers, Falariens, Pauſulanes, Pleninenſes, Ricinenſes, Septempedani, Tollentinates, Triacenſes, the city Saluia, and the Tollentines.

Chap. xiiii.

¶ *The ſixth Region.*

E TO theſe adioyneth the ſixt region, comprehending Vmbria and the French pale about Ariminum. At Ancona begin the French marches, by the name of Togata Gallia. The Sicilians and Liburnians poſſeſſed moſt part of that tract, and principally the territories, Palmenſis, Prætutianus, and Adrianus. Them the Vmbrians expelled: theſe againe Hetruria draue out: and laſtly the Gaules diſſeiſed it. The people of Vmbria are ſuppoſed of all Italy to be of greateſt antiquity, as whom men thinke to be of the Greeks named Ombri, for that in the generall deluge of the countrey by raine they only remained aliue. The Tuſcanes are knowne to haue by war forced and woon 300 townes of theirs. At this day in the frontier of it there are the riuer Æſus, and Senogallia; the riuer Metaurus, and the colonie Fanum Fortunæ. Piſaurum alſo with the riuer. In the parts within, Hiſpellum and Tuder. In the reſt, the Amerines, Attidi-
F ates, Aſirinates, Arnates, and Æſinates, Camertes, Caſventillanes, and Carſulanes, Dolates, ſirnamed Salentines, Fulginates, Foro-flaminienſes, Foro-Iulienſes, named alſo Concubienſes, Foro-Bremitiani, Foro-Sempronienſes, Iguini, Interamnates, ſyrnamed Nartes, Meuanates, Meuainienſes, and Matilicates, Narnienſes, whoſe towne before-time was called Nequinum. Nucerines, ſyrnamed Fauonienſes, and Camelani. The Otriculanes, and Oſtranes.

The Pitualnes, with the addition of Piſuerts, as alſo others ſirnamed Mergentines, and the Peleſtines, Sentinates, Sarſinates, Spoletines, Suarranes, Seſtinates, and Suillates, Sadinates, Trebiates, Tuficanes, Tifernates, named withal Tribertines, as alſo other of them diſtinguiſhed by the name of Metaurenſes. The Veſionicates, the Vrbinates, as well they that be ſirnamed Metaurenſes, as others Hortenſes, the Vettionenſes, Vindenates, and Viuentanes. In this tract are extinct the Felignates, and they who poſſeſſed Cluſiolum aboue Interamna: alſo the Sarranates, with the towns Acerræ, called beſides Vafriæ, and Turceolum, the ſame that Vetriolum. Semblably the Solinates, Suriates, Fallienates, Apiennates. There are gon alſo and cleane loſt the Arienates with Crinouolum, alſo the Vſidicanes and Plangenſes, the Piſinates, and Cæleſtines. As for Amera aboue written, *Cato* hath left in record, that it was built 964 yeres before the war againſt *Perſeus*. G H

Chap. XV.

¶ *The eighth Region.*

THe eight region is bounded with Ariminum, Padus, and Apennine. In the borders therof is the riuer Cruſtuminum, the colony Ariminum, with the riuers Ariminum and Apruſa. Then the riuer Rubico, the vtmoſt limit ſomtime of Italy After it Sapis the riuer, Vitis, and Anemo, Rauenna a towne of the Sabines, with the riuer Bedeſes, 102 miles from Ancona. And not far from the Vmbrians ſea, Butrium. Within-forth are theſe colonies, Bononie, vſually called Felſina when it was the head city of Hetruria, Brixillum, Mutina, Parma, Placentia. I Towns, Cæſena, Claterni, Forum Clodij, Liuij, and Popilij, pertaining to the Truentines: alſo [Forum] the Cornelij, Laccini, Fauentini, Fidentini, Oteſini, Padinates, Regienſes a Lepido, Solonates: alſo the forreſts Galliani, ſirnamed Aquinates, Tanetani, Veliates ſirnamed Vecteri, Regiates and Vmbranates. In this tract the Boij are conſumed, who had 112 tribes or Kindreds, as *Cato* ſaith. Likewiſe the Senones, they that tooke Rome.

Chap. XVI.

¶ *Of the riuer Padus.*

PAdus, iſſuing out of the boſome of the mountaine Veſulus, bearing vp his head aloft into a mighty height, runs from a maruellous ſpring worth the ſeeing, in the marches of the Ligurian Vagienni, and hiding it ſelfe within a narrow trench as it were vnder the ground and riſing vp again in the territorie of the Forovibians, is inferiour to no other riuers for excellencie. Of the Greeks it was called Eridanus, and is much ſpoken of and well knowne, for the puniſhment of *Phaeton*. It ſwelleth about the riſing of the Dog ſtar, by reaſon the ſnow is then thawed: more vnruly and rough vnto the fields thereby, than to the veſſels vpon it, howbeit it ſtealeth and carieth away nothing as his owne; but when he hath left the fields, his bountie is more ſeen by their plenty and fruitfulneſſe: from his head he holdeth on his courſe 90 miles wanting twain aboue 300. In which his paſſage he taketh in vnto him not only the nauigable riuers of the Apennine and the Alps, but huge main lakes alſo that diſcharge themſelues into him: ſo as in all he carieth with him into the Adriaticke ſea to the number of 30 riuers. The chiefe and moſt notorious of them all are theſe, ſent out of the ſide of Apennine; Tanarus, Trebia, Placentine, Tarus, Nicea, Gabellus, Scultenna, Rhenus. But running out of the Alpes, Stura, Morgus, Duriæ twaine, Seſſites, Ticinus, Lambrus, Addua, Olius, and Mincius. And there is not a riuer againe that in ſo little a way groweth to a greater ſtreame: for ouercharged it is and troubled with the quantitie of water, and therefore worketh it ſelfe a deepe channell heauie and hurtfull to the earth vnder it, although it be deriued and drawne into other riuers and goles, betweene Rauenna and Atium, for an hundred and twenty miles; yet becauſe hee belcheth and caſteth them out from him in ſo great aboundance, he is ſaid to make 7 ſeas. Drawn he is to Rauenna by a narrow channel, where he is called Baduſa, and in times paſt Meſſanicus. M But the next mouth that he maketh carieth the bigneſſe of an hauen, which is named Vatreni: at the which *Claudius Cæſar* as hee came triumphant out of Britaine entred into Adria with that huge Veſſell more like a mighty great houſe than a Ship. This mouth of it was beforetime called Eridanum: of others, Spineticum, of the city Spinæ neere by, built by *Diomedes*,

(as

20030
copy 1

A (as ſome thinke) with the treaſures of Delphie. There the riuer Vatrenus from out of the territory of Forum Cornelij, encreaſeth Padus. The next moneth that it hath, is Capraſiæ, then Sagis, and ſo forth Volane, which before-time was called Olane. All thoſe riuers and trenches aforeſaid, the Tuſcanes began to make firſt out of Sagis, carrying the forceable ſtreame of the riuer acroſſe into the Atrian meeres, which are called the ſeuen ſeas, and made the famous hauen of Atria a towne of the Tuſcanes; of which the Adriaticke ſea tooke the name afore-time, which now is called Adriaticum. From thence are the full mouthes there of Carponaria and the Foſſes Phyliſtinæ which others call Tartarus, but all ſpring out of the ouerflowing of the Foſſe Phyliſtina, holpen with Atheſis comming out of the Tridentine Alpes, and Togiſonus out of the territory of the Padouans: Part of them made alſo the next port Brundulum: like as the two Medoaci and the Foſſe Clodia. make Edron. With theſe Padus mingleth it ſelfe,
B and by theſe he runneth ouer, and as it is ſaid by moſt writers, like as in Ægypt Nilus maketh that which they call Delta, ſo it ſhapeth a triangle figure between the Alpes and the ſea coaſt, two miles in compaſſe. A ſhame it is to runne to the Greekes for to borrow of them the Etymologie and reaſon of any thing in Italy: howbeit *Metrodorus Scepſius* ſaith, That forasmuch as about the ſpring and head of this riuer there grow many pitch trees, called in French Padus, therefore it tooke the name Padus. Alſo, that in the Ligurian language, the riuer it ſelfe is called Bodincus, which is as much to ſay, as bottomleſſe. And to approue this reaſon and argument, there is a towne thereby called Induſtria, but by an old name Bodincomacum, where in very deed, beginneth the greateſt deapth thereof.

C

Chap. XVII.

¶ *Italy beyond Padus, the eleuenth Region.*

NExt to it, is the region called Tranſpadana, and the eleuenth in number: all whole in the mid-land part of Italy, into which the ſeas bring in all things with fruitfull channel. The townes therein, be Vibi-Forum, and Seguſta. The colonies at the foot of the Alpes, Auguſta of the Taurines, an ancient deſcent from the Ligurians: from whence Padus is nauigable. Then, Auguſta Prætoria, of the Salaſſi, neer vnto the two-fold gullets or paſſages of the Alpes, to wit, Graija and Peninæ: for men ſay, that the Carthagineans came through the one, and *Hercules* in at the other, named Graijæ. There ſtandeth the towne Eporedia, built by the people of
D Rome, by direction and commandement out of the bookes of *Sibylla*. Now the Gauls in their tongue call good horſe-breakers Eporedicæ. Alſo, Vercella of the Lybici, deſcended from the Sallij: Nouaria, from the Vertacomacores: which euen at this very day is a village of the Vocontij, and not as *Cato* thinketh, of the Ligurians: of whom, the Leui and Marici built Ticinum, not far from Padus: like as the Boij comming ouer the Alpes, founded Laus Pompeia; and the Inſubrians, Millaine. That Comus and Bergomus, yea and Licini-Forum, with other nations thereabout, were of the Orobian race, *Cato* hath reported: but the firſt beginning and originall of that nation of Orobians, he confeſſeth that he knoweth not. Which notwithſtanding *Cornelius Alexander* ſheweth to haue deſcended from the Greekes; and this he gueſſeth by the interpretation of their name, which ſignifieth, Men liuing in mountaines. In this tract, Barra a
E towne of the Orobians is cleane deſtroyed; from whence, *Cato* ſaith, the Bergomates took their beginning; bewraying euen by their name, that they were ſeated more highly than happily. There are cleane gone and conſumed alſo the Caturiges, baniſhed perſons of the Inſubrians: likewiſe Spina, before-named. In like ſort, Melpum, a towne of ſpeciall importance for wealth; which (as *Nepos Cornelius* hath written) was by the Inſubrians, Doians, and Senones, raſed on that very day, on which *Camillus* forced Veij.

Chap. XVIII.

¶ *Venice, the tenth Region.*

F

NOw followeth the tenth region of Italy, Venice, lying faſt vpon the Adriaticke ſea: the riuer whereof Silis, commeth forth of the mountaines Tauriſani: wherein alſo is the Towne Altinum, the riuer Liquentia iſſuing from the mountaines Opitergeni; a hauen of the ſame name: the colonie Concordia. Riuers and hauens, to wit, Romatinum, Tilauentum,

the

the greater and the leſſe: Anaſſum, whereunto Varranus runneth downe: Alſa, Natiſo, with Turrus, running faſt by Aquileia, a colony ſcituate 12 miles from the ſea. This is the region of the Carni, ioyning vnto that of the Iapides: the riuer Timavus, and the caſtle Pucinum, ſo famous for good wine. The vale and Firth Tergeſtinus, taking name of the Colonie Tergeſte, 23 miles from Aquileia: beyond which ſix miles, is the riuer Formio, 189 miles from Rauenna the ancient bound or limit of Italy enlarged: but at this day of Iſtria, which was ſo named of the riuer Iſter, flowing out of the riuer Danubius into Adria: and ouer againſt the ſame Iſter, the gullet or mouth of Padus alſo entreth thither: by the contrary ruſhing ſtreames of which two riuers, the ſea between both beginneth to be more milde, as many Authors haue reported, but vntruly: and *Cornelius Nepos* alſo, although he dwelt iuſt by Padus; for there is no riuer that runneth out of Danubius into the Adriaticke ſea. Deceiued (I ſuppoſe) they were becauſe the ſhip Argos went downe a riuer into the Adriaticke ſea, not far from Tergeſte; but what riuer it was, is yet vnknowne. They that will ſeeme to be more curious than their fellowes, ſay, That it was carried vpon mens ſhoulders ouer the Alpes: and that it was ſet into Iſter, and ſo into Saus, and then Nauportus (which vpon that occaſion tooke his name) which ariſeth betweene Æmona and the Alpes. G H

CHAP. XIX.

¶ *Iſtria.*

ISTria runneth out like a demie Iſland. Some haue deliuered in writing, that it is 40 miles broad, and 122 miles about. The like they ſay of Liburnia adioyning vnto it, and of the hollow gulfe Flanaticus. But others ſay, that the compaſſe of Liburnia is 180 miles. And ſome there be againe, who haue ſet out Iapidia, as far as to the ſaid creeke Flanaticus, behind Iſtria 130 miles: and ſo haue made Liburnia in circuit 150 miles. *Tuditanus*, who ſubdued the Iſtrians, vpon his owne ſtatue there ſet this inſcription; That from Aquileia to the riuer Titius, were 200 ſtadia. The townes in Iſtria of Romane citizens, be Ægida and Parentium. A Colony there is beſides, Pola, now called Pietas Iulia; built in old time by the Colchians. It is from Tergeſte 100 miles. Soone after, ye ſee the towne Neſactium, and the riuer Arſia, the vtmoſt bound now of Italy. From Ancona to Pola there is a cut ouer the ſea of 120 miles. In the midland part of this tenth region, are theſe Colonies; Cremona, and Brixia, in the Cenomanes countrie: but in the Venetians countrie, Ateſte. Alſo the townes, Acelum, Patauium, Opitergium, Belunum, Vicetia: Mantua of the Tuſcanes is only left beyond Padus. That the Venetians were the off-ſpring of the Trojanes, *Cato* hath ſet downe in writing: alſo, that the Cenomanes neere vnto Maſſiles, dwell in the Volcians countrie. Fertines, Tridentines, and Barnenſes, are townes of Rhetia. As for Verona, it is of Rhetians, and Euganeans; but Iulienſes be of the Carnians. Then follow theſe, whom we need to vſe no curioſitie in naming; Alutruenſes, Aſſeriates, Flamonienſes, Vannienſes, & others ſurnamed Gulici: Foro Iulienſes ſurnamed Tranſpadani: Forelani, Venidates, Querqueni, Tauriſani, Togienſes, Varuani. In this tract there be periſhed in the borders, Itaminum, Pellaon, Palſicium. Of the Venetians, Atina, and Cælina: of the Carnians, Segeſte and Ocra: and of the Tauriſſi, Noreia. Alſo from Aquileia 12 miles, there was a towne quite deſtroyed by *M. Claudius Marcellus*, euen maugre the Senate, as *L. Piſo* hath recorded. In this region there be alſo ten notable lakes and riuers, either iſſuing forth of them as their children, or elſe fed and maintained by them, if ſo be they ſend them out againe, when they haue once receiued them: as Larius doth Æna, Verbanus Ticinus, Benacus Mincius, Sebinus Oſſius, Eupilius Lamber, al inhabiting and ſeated in Padus. The Alpes reach in length ten miles from the vpper ſea to the lower, as *Cælius* ſaith: *Timogenes*, two and twenty: but *Cornelius Nepos* draweth them out in breadth an hundred miles: *T. Liuius* ſaith, three thouſand ſtadia: both of them take meaſure in diuers places: for ſometime they exceed a hundred miles, where they diſioyne Germany from Italy, and in other parts they are ſo thin, that they make not full out threeſcore and ten miles; and that by the prouidence as it were of Nature. The breadth of Italy from Varus vnder the foot of them, through the ſhallowes or plaſhes of Sabatia, the Taurines, Comus, Brixia, Verona, Vicetia, Opitergium, Aquileia, Tergeſte, Pola, and Ariſtia, maketh ſeuen hundred and two miles. I K L M

CHAP.

20030

Chap. xx.

¶ *Of the Alpes, and Alpine Nations.*

MAny nations inhabit the Alps, but thoſe of ſpeciall name from Pola to the tract of Tergeſtis, are theſe, the Secuſſes, Subocrines, Catili, Menocaleni: and neere to the Carnians thoſe who in times paſt were called Tauriſci, but now Norici. Vpon theſe there do confine the Rhetians and Vindelici, all diuided into many States. Men thinke that the Rheti are the Tuſcans progenie, driuen out by the Gaules, with their leader *Rhætus*. But leauing theſe Rhœtians, turning our breaſt and viſage to Italy, wee meet with the Euganean nations of the
B Alpes, who inioyed the liberty and franchiſes of the Latines, and whoſe townes *Cato* reckoneth to the number of 34. Of them, the Triumpilines, both people and lands were ſold. After them the Camuni and many ſuch were annexed to the next townſhips, and did ſeruice as homagers to them. The Lepontians and the Salaſſians, the ſame *Cato* thinketh to be of the Taurick race. But all others in manner ſuppoſe verily that the Lepontians were a reſidue left behinde of *Hercules* his traine and company; grounding vpon the interpretation of the Greek name, as hauing their bodies ſeaged with the Alpine ſnowes as they paſſed through: that the Graij likewiſe were of the ſame retinue, planted in the very paſſage, and inhabiting the Alps Graiæ: alſo that the Euganei were nobleſt of birth, whereupon they took their name. The head city of them is Stonos. Of thoſe Rhœtians the Vennonetes and Sarunetes, inhabit neere the heads of the river Rhenus. And of the Lepontians, thoſe who are called Viberi, dwel by the Spring of Rhoda-
C nus, in the ſame quarter of the Alpes. There be alſo inhabitants within the Alps, endowed with the liberty of Latium, namely, the Octodurenſes, and their neighbor borderers the Centrones, as alſo the Cottian States. The Caturiges, and thoſe from them deſcended, to wit, the Vagienni, Ligures, and ſuch as be called the Mountainers: and many kindes of the Capillati, confining vpon the Ligurian ſea. It ſeemeth not amiſſe in this place to ſet down an inſcription out of a triumphant Trophie erected in the Alps, which runneth in this forme: *Vnto the Emperour* Cæſar, *ſon of* Auguſtus *of famous memorie, Arch-Biſhop, Generall fourc times, and inueſted in the ſacred authoritie of the Tribunes: the Senate and people of Rome. For that by his conduct and happie fortune, all the Alpine nations which reached from the vpper ſea to the nether, were reduced and brought vn-*
D *der the Empire of the people of Rome. The Alpine nations ſubdued, are theſe, Triumpilini, Camuni, Vennonetes, Iſarci, Breuni, Naunes & Focunales. Of the Vindelici foure nations, to wit, the Conſuanetes, Virucinates, Licates, and Catenates. The Abiſontes, Suanetes, Calucones, Brixentes, and Lepontij. Viberi, Nantuates, Seduni, Veragri, Salaci, Acitauones, Medulli, Vceni, Caturiges, Brigiani, Sogiontij, Ebroduntij, Nemaloni, Edenates, Eſubiani, Veamini, Gallitæ, Triulatti, Ectini, Vergunium, Eguituri, Nementuri, Oratelli, Neruſi-velauni, Suetri. Now there were not reckoned among theſe the twelue Cottian States which were not vp in any hoſtility, ne yet thoſe which were aſſigned to the freetownes to enioy the burgeoiſie of Rome, by vertue of the law Pompeia.* Behold this is that Italy conſecrated to the gods, theſe are her nations, and theſe be the townes of her ſeuerall States. And more than all this, that Italy, which when *L. Æmylius Paulus* and *Caius Attilius Regulus* were Conſuls, vpon newes brought of a ſudden riſing
E and tumult of the Gauls, alone by it ſelfe, without any forrein aids, and euen them, without any nations beyond Padus, armed 80000 horſemen and 700000 foot. In plenty of all mettal mines it giueth place to no land whatſoeuer. But forbidden it is to dig any by an old act of the Senat, giuing expreſſe order to make ſpare of Italy.

Chap. xxi.

¶ *Illyricum.*

THe Nation of the Liburnians ioineth vnto Arſia, euen as farre as the riuer Titius. A part
F thereof were the Mentores, Hymani, Encheleæ, Dudini, and thoſe whom *Callimachus* nameth Pucetiæ. Now, the whole in generall is called by one name, Illyricum. The names of the nations are few of them either worthy or eaſie to be ſpoken. As for the iudiciall court of Aſſiſes at Scordona, the Iapides and foureteene States beſides of the Liburians reſort vnto. Of which it grieueth me not to name the Lacinians, Stulpinians, Burniſtes and Albonenſes. And in that Court theſe Nations following haue the libertie of Italians, to wit, the Alutæ and

Flanates,

Flanates, of whom the ſea or gulfe beareth the name: Lopſi, Varubarini, and the Aſſeſiates that are exempt from all tributes; alſo of Iſlands, the Fulſinates and Curiolæ. Moreouer, along the borders and maritime coaſts, beyond Neſactum, theſe townes; Aluona, Flauona, Tarſatica, Senia, Lopſica, Ortopula, Vegium, Argyruntum, Corinium, the city Ænona, the riuer Pauſinus, & Tedanium, at which Iapida doth end. The iſlands lying in that gulfe, together with the townes, beſides thoſe towns aboue noted, Abſirtium, Arba, Tragurium, Iſſa, Pharos beforetime Paros, Crexa, Giſſa, Portunata, Again, within the continent, the colony Iaderon, which is from Pola 160 miles. From thence 30 miles off, the iſland Colentum; and 18, the mouth of the riuer Titius. G

Chap. xxii

¶ *Liburnia.* H

THe end of Liburnia and beginning of Dalmatia is Scordona, which frontier towne is 12 miles from the ſea, ſcituate vpon the ſaid riuer Titius. Then followeth the antient countrie of the Tariotes, and the caſtle Tariota, the Promontory Diomedis, or, as ſome would haue it the demy iſland Hyllis, taking in circuit a hundred miles: alſo Tragurium, inhabited by Roman citizens, well knowne for the marble there: Sicum, into which place, *Claudius* late *Cæſar*, ſent the old ſouldiers: the Colony Salona, 222 miles from Iadera. There repaire to it for law thoſe that are deſcribed into Decuries or tithings 382: to wit, Dalmatians 22, Decunum 239, Ditions, 69, and Mezæi 52, Sardiates: in this tract are Burnum, Mandetrium, and Tribulium, caſtles of name for the battels of the Romanes. There came alſo forth of the iſlands the Iſſæans, Collentines, Separians, and Epetines. Beſides them, certaine caſtles, Piguntiæ and Rataneum, and Narona a colonie pertaining to the third Countie-court, 72 miles from Salona, lying hard to a riuer of the ſame name, and 20 miles from the ſea. *M. Varro* writeth, that 89 States vſed to repaire thither for juſtice. Now, theſe only in a manner be knowne, to wit, Cerauni in 33 Tithings. Daorizi in 17, Deſtitiates in 103, Docleates in 34, Deretines in 14, Deremiſtes in 30, Dindari in 33, Glinditiones in 44, Melcomani in 24, Nareſij in 102, Scirtari in 72, Siculote in 24: and the Vardæi, who ſometime waſted and forraied Italy, in 20 decuries and no more. Beſides theſe, there held and poſſeſſed this tract Oenei, Partheni, Hemaſini, Arthitæ & Armiſtæ. From the riuer Naron a hundred miles, is the colony Epidaurum. Townes of Roman citizens be theſe, Rhizinium, Aſcrinium, Butua, Olchinium, which beforetime was called Colchinium, built by the Colchi. The riuer Drilo, and the towne vpon it, Scodra, inhabited by Roman citizens, eighteen miles from the ſea. Ouer and beſides, many other towns of Greece, yea & ſtrong cities, out of all remembrance. For in that tract were the Labeates, Enderudines, Saſſæi, Grabæi, and thoſe who properly were called Illyrij, the Taulantij and Pyræi. The Promontorie Nymphæum in the coaſt thereof, keepeth ſtill the name: alſo Lyſſum a towne of Romane citizens, a hundred miles from Epidaurum. I K

C xxiii.

¶ *Macedonie.* L

FRom Liſſum is the prouince of Macedonie: the nations there, be the Partheni, and on their backe ſide the Daſſaretes. Two mountaines of Candauia 79 miles from Dyrrhachium: but in the borders thereof, Denda, a towne of Roman citizens: alſo the Colonie Epidamnum, which for that vnluckie names ſake was by the Romans called Dyrrhachium. The riuer Aous, named of ſome Æas. Apollonia, ſometime a Colonie of the Corinthians, ſcituate within the countrey, ſeuen miles from the ſea, in the marches wherof is the famous Nymphæum. The borderers inhabiting thereby, are the Amantes and Buliones. But in the very edge therof, the town Oricum built by the Colchi. Then beginneth Epirus, the mountaines Acroceraunia, at which we haue bounded this ſea of Europe: as for Oricum, it is from Salentinum (a promontorie of Italy) 85 miles. M

Chap. xxiiii ¶ *Noricum.*

BEhind the Carni and Iapides, whereas the great riuer Iſter runneth, the Norici ioine to the Rhæti. Their towns be Virunum, Celeia, Teurnia, Aguntum, Viana, Æmona, Claudia, Flavium,

20030
copy 1

A vium, Tolvenſe. Vpon the Norici there lie faſt the Lake Peiſo, the deſerts of the Boij. Howbeit, now by the colonie of the late Emperor *Claudius* of famous memorie, Salaria and the towne Scarabantia Iulia, they be inhabited and peopled.

Chap. XXV.

¶ *Pannonia.*

THence beginneth Pannonia ſo fruitfull in Maſt: wheras the hils of the Alps, waxing more
B mild and ciuil, turning through the midſt of Illyricum from the North to the South, ſettle lower by an eaſie deſcent both on the right hand and the left. That part which regardeth the Adriatick ſea, is called Dalmatia, and Illyricum aboue-named. Pannonia bendeth toward the North, and is bounded by the riuer Danubius. In it are theſe Colonies, Æmonia, Siſcia. And theſe riuers of ſpeciall name, and nauigable, run into Danubius, Draus with more violence out of the Noricke Alps; and Saus out of the Carnicke Alpes more gently, 115 miles between. As for Draus, it paſſeth through the Serretes, Serrapilles, Iaſians, & Sandrozetes: but Saus through the Colapians and Bruci. And theſe be the chiefe States of that country. Moreouer, the Ariuates, Azali, Amantes, Belgites, Catari, Corneates, Araviſci, Hercuniates, Latouici, Oſeriates, and Varciani. The mount Claudius, in the front whereof are the Scordiſci, and vpon the back, the Tauriſci. The iſland in Saus, Metubarris, the biggeſt of all the riuer iſlands. Beſids, notable good riuers, Calapis running into Saus neere Siſcia, where with a double chan-
C nell it maketh the iſland called Segeſtica: another riuer Bacuntius, running likewiſe into Saus, at the towne Sirmium: where is the State of the Sirmians and Amantines. Fiue & forty miles from thence Taurunum, where Saus is intermingled with Danubius. Higher aboue there run into it Valdanus and Vrpanus, and they ywis be no baſe and obſcure riuers.

Chap. XXVI.

¶ *Mœſia.*

VNto Pannonia ioineth the Prouince called Mœſia, which extendeth along Danubius vnto Pontus. It beginneth at the confluent aboue-named: in it are the Dardanians, Celegeri,
D Triballi, Trimachi, Mœſi, Thranes, and the Scythians bordering vpon Pontus. Faire riuers, out of the Dardanians countrey, Margis, Pingus, and Timachis. Out of Rhodope, Oeſſus: out of Hæmus, Vtus, Eſſamus, and Ieterus. Illyricum where it is broadeſt, taketh vp 325 miles: it lieth out in length from the riuer Arſia to the riuer Drinius, 800 miles. From Drinium to the cape Acroceraunium, 182 miles. *M. Agrippa* hath ſet downe all the whole ſea comprehending Italy and Illyricum, in the compaſſe of 1300 miles. In it are two ſmaller ſeas or gulfs bounded as I haue ſaid: namely, The lower, otherwiſe called the Ionian, in the fore-part: the inner, called Adriaticum, which alſo they name the vpper: in the Auſonian ſea there be no iſlands worth the ſpeaking, but thoſe aboue-named: in the Ionian ſea there are but few, to wit, vpon the Calabrian coaſt before Brunduſium, by the obiect ſite whereof, the hauen is made: and againſt the Apu-
E lian coaſt Diomede, famous for the tombe and monument of *Diomedes*: another alſo of that name, called by ſome Teutria. As for the coaſt of Illyricum, it is peſtered with more than a thouſand, ſuch is the nature of the ſea, full of ſhelues and waſhes, with narrow chanels running between. But before the mouthes of Timavus, there be Iſlands famous for hot waters, which ebbe and flow with the ſea: and neere vnto the territorie of the Iſtrians, Ciſſa, Pullariæ, and thoſe which the Greekes name Abſyrtides, of *Medeas* brother *Abſyrtes* there ſlaine. Neere vnto them, they called the Iſlands Electrides, wherin is ingendred Ambre, which they cal Electrum, a moſt aſſured argument to proue the vanity of the Greeks; for that which of them they meant, was neuer known: againſt Iader, there is Liſſa; and certain other ouer-againſt the Liburnians, called Creteæ: and as many of the Liburnians, Celaduſæ: againſt Surium, there is Brattia,
F commended for neat and goats. Iſſa, inhabited by Roman citizens, and Pharia with the towne. Next to theſe, Corcyra, ſurnamed Melæna, with the towne of the Gnidians, diſtant 22 miles aſunder: between which and Illyricum, is Melita; wherof (as *Callimachus* teſtifieth) the little dogs Melitæi tooke their name: and 12 miles from thence, the three Elaphites. In the Ionian ſea from Oricum 1000 miles, is Saſonis, well knowne for the Pirats harbor there.

THE

THE FOVRTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

From whence first arose all the fabulous lyes, and the excellent Learning of the Greekes.

THe third Sea of Europe beginneth at the mountaines Acroceraunia, and endeth in Hellespont: it containeth besides nineteene smaller gulfes or creekes, 25 thousand miles. Within it, are Epirus, Acarnania, Ætolia, Phocis, Locris, Achaia, Messania, Laconia, Argolis, Megaris, Attica, Bœotia. And againe from another sea the same Phocis and Locris, Doris, Phthiotis, Thessalia, Magnesia, Macedonia, Thracia. All the fabulous veine, and learning of Greece, proceeded out of this quarter. And therefore we will therein stay somewhat the longer. The countrey Epirus, generally so called, beginneth at the mountaines Acroceraunia. In it, are first the Chaones, of whom Chaonia taketh the name: then the Thesprotians, and Antigonenses: the place Aornus, and the aire arising out of it so noisom and pestiferous for birds. The Cestines, and Perrhœbians with their mountaine Pindus; the Cassiopæi, the Dryopes, Selli, Hellopes, and Molossi, among whom is the temple of Iupiter Dodonæus, *so famous for the Oracle there: the mountaine Tomarus, renowned by* Theopompus *for the hundred fountaines about the foot thereof.*

CHAP. I.

¶ *Epirus.*

EPirus it selfe reaching to Magnesia and Macedonia, hath behinde it the Dassaretians aboue named, a free nation, but anon the sauage people of the Dardanians. On the left side of the Dardanians, the Trebellians and nations of Mœsia lye ranged: afront there ioine vnto them, the Medi and Denthelates: vpon whom the Thracians border, who reach as farre as to Pontus. Thus enuironed it is and defenced round, partly with the high hill Rhodope, and anon also with L
Hæmus. In the vtmost coast of Epirus among the Acroceraunia, is the castle Chimæra, vnder which is the spring of the kings water. The townes are, Mæandria and Cestria: the riuer of Thesprotia, Thyamis: the colonie Buthrotium: and the gulfe of Ambracia, aboue all others most famous, receiuing at his mouth the wide sea; 39 miles in length, and 15 in breadth. Into it runneth the riuer Acheron, flowing out of Acherusia, a lake of Thesprotia 36 miles from thence: and for the bridge ouer it 1000 foot long, admirable to those that admire and wonder at all things of their owne. In the very gulfe is the towne Ambracia. The riuers of the Molossians, Aphas and Arachtus. The citie Anactoria, and the lake Pandosia. The townes of Acarnania, called before time Curetus, be Heraclea and Echinus: and in the very entrance and mouth thereof, Artium a Colonie of *Augustus*, with the goodly temple of *Apollo*, and the free citie Ni- M
copolis. When ye are gone out of the Ambrecian gulfe into the Ionian sea, yee meet with the Leucadian sea coast, and the promontorie of Leucate. Then the creeke, and Leucadia it selfe, a demie Island, sometime called Neritis, but by the labour of the inhabitants thereby, cut quite from the Continent, but annexed to it again by meanes of the winds blowing together heapes

of

20030
copy 1

A of ſand, which place is called Dioryctus, and is in length almoſt halfe a mile. A town in it there is called Leucas, ſometime Neritum. Then the cities of the Acarnanians, Halyzea, Stratos, Argos ſurnamed Amphilochicum. The riuer Achelous running out of Pindus, & diuiding Acarnania from Ætolia, and by continuall bringing in of earth, annexing the iſland Artemita to the firme and maine land.

Chap. II

¶ *Ætolia.*

B THe Ætolian nations, be the Athamanes, Tymphei, Ephiri, Ænienſes, Perrhœbi, Dolopes, Maraces and Atraces, from whom the riuer Atrax falleth into the Ionian ſea. The Towne Calydon in Ætolia is ſeuen miles and an halfe from the ſea, neere to the riuer Euenus: then followeth Macynia and Molychria, behinde which Chalcis ſtandeth, and the mountaine Taphiaſſus. But in the very edge and borders thereof, the Promontorie Antirrhium, where is the mouth of the Corinthian gulfe, not a mile broad where it runneth in, & diuideth the Ætolians from Peloponneſus. The promontorie that ſhooteth out againſt it, is named Rhion: but vpon that Corinthian gulfe are the townes of Ætolia, Naupactum and Pylene: but in the mid-land parts, Pleucon, Halyſarna. The mountaines of name: in Dodone, Tomarus: in Ambracia, Grania: in Acarnania, Aracynthus: in Ætolia, Acanthon, Panætolium and Macinium.

Chap. III.

C

¶ *Locri.*

NExt to the Ætolians are the Locri, ſurnamed Ozolæ, free States and exempt: the towne Oeanthe: the hauen of *Apollo Phæſtius*: the creeke Criſſæus. Within-forth are theſe towns Argyna, Eupalia, Phæſtum, and Calamiſſus. Beyond them are Citrhæi, the plaines of Phocis, the towne Cirrha, the hauen Chalæon: from which, ſeuen miles within the land, is the free citie Delphi, vnder the hill Pernaſſus, the moſt famous place vpon earth for the Oracle of *Apollo*. The fountaine Caſtalius, the riuer Cephiſſus running before Delphos, which ariſeth in a citie, ſometime called Liloæa. Moreouer, the towne Criſſa, and together with the Bulenſes,
D Anticyra, Naulochum, Pyrrha, Amphiſſa an exempt State, Trichone, Tritea, Ambryſus, the region Drymæa, named Daulis. Then in the inmoſt nouke of the creeke, the very canton and angle of Bœotia is waſhed by the ſea, with theſe townes Siphæ and Thebæ, which are ſurnamed Corſicæ neere to Helicon. The third towne of Bœotia from this ſea is Page, from whence proceedeth and beareth forth the necke or cape of Peloponneſus.

Chap. IV.

¶ *Peloponneſus.*

E PEloponneſus, called beforetime Apia and Pelaſgia, is a demy Iſland, worthie to come behinde no other land for excellency and name; lying betweene two ſeas, Ægeum and Ionium: like vnto the leafe of a plane tree, in regard of the indented creekes and cornered nouks thereof: it beareth a circuit of 563 miles, according to *Iſodorus*. The ſame, if you compriſe the creekes and gulfes, addeth almoſt as much more. The ſtreight where it beginneth to paſſe on and go forward, is called Iſthmos. In which place the ſeas a bouenamed guſhing and breaking from diuers waies, to wit, from the North and the Eaſt, do deuoure all the breadth of it there: vntill by the contrary running in of ſo great ſeas, the ſides on both hands being eaten away, and leauing a ſpace of land betweene, fiue miles ouer, Hellas with a narrow necke doth meet with Peloponneſus. The one ſide thereof is called the Corinthian gulfe, the other, the Saronian. Lecheum of the one hand, and Cenchræa of the other, do bound out and limit the ſaid ſtreights
F where the ſhips are to fetch a great compaſſe about with ſome danger, ſuch veſſels I meane as for their bigneſſe cannot be conueighed ouer vpon wains. For which cauſe, *Demetrius* the king, *Cæſar* the Dictator, prince *Caius*, and *Domitius Nero*, aſſaied to cut through the narrow foreland, and make a channell nauigable with eaſe: but the attempt and enterpriſe was vnhappie, as appeared by the iſſue and end of them all. In the middeſt of this narrow ſtreight which we

haue called Iſthmos, the colonie Corinthus, beforetime called Ephyra, ſcituate hard to a little G
hill, is inhabited, ſome 60 ſtadia from both ſea ſides: which from the top of the high hill and caſtle there, which is named Acrocorinthus, wherein is the fountaine Pirene, hath a proſpect into both thoſe contrarie ſeas. At this Corinthian gulfe there is a paſſage or cut by ſea from Leucas to Patræ of 87 miles. Patræ a Colonie, built vpon the promontorie of Peloponneſus, that ſhooteth fartheſt into the ſea, ouer-againſt Ætolia and the riuer Euenus, of leſſe diſtance, as hath bin ſaid, than fiue miles in the very gullet and enterance, do ſend out the Corinthian gulfe 85 miles in length, euen as far as Iſthmos.

Chap. v.

¶ *Achaia.* H

AChaia, the name of a prouince, beginneth at Iſthmus, aforetime called it was Ægialos, becauſe of the cities, ſcituate ſo orderly vpon the ſtrand. The principal and firſt there is Lecheæ abouenamed, a port towne of the Corinthians. Next to it Oluros, a caſtle of the Pelleneans. The townes Helice, Bura, and (into which the inhabitants retired themſelues, when theſe beforenamed were drowned in the ſea) Sicyon, Ægira, Ægion, and Erineos. Within the country was Cleone and Hyſie. Alſo the hauen Panhormus, & Rhium deſcribed before: from which promontorie fiue miles off ſtandeth Patræ aboue mentioned, & the place called Pheræ. of 9 hils in Achaia, Scioeſſa is moſt knowne, alſo the Spring Cymothoe. Beyond Patræ is the towne Olenum, the colonie Dymæ. Certain faire places called Buprasium and Hirmene: & the I
promontorie Araxum. The creeke of Cyllene, the cape Chelonates: from whence to Cyllene is two miles. The caſtle Phlius. The tract alſo by *Homer* named Arethyrea, and afterwards Aſophis. Then the country of the Elians, who before were called Epei. As for Elis the city it ſelfe, it is vp higher in the mid-land parts, 12 miles from Pylos. Within it ſtandeth the Chappell of *Iupiter Olympius*, which for the fame of the games there, containeth the Greekes and Chaldeans account of yeares. Moreouer, the town ſometime of the Piſeans, before which the riuer Alpheus runneth. But in the borders and coaſt therof the promontorie Ichthys. Vpon the riuer Alpheus, there is paſſage by water in barges to the townes Aulos and Leprion. The promontory Platanestus; all theſe lie Weſtward. But toward the South, the arme of the ſea called Cypariſſius, and the city Cypariſſa, 72 miles in circuit. The townes vpon it, Pylos, Methone, a place and K
forreſt called Delos: the promontorie Acritas: the creeke Aſineus of the towne Aſinum, & Coroneus of Corone; and theſe are limited with Tenarus the promontorie. There alſo is the region Meſſenia with 22 mountains. The riuer Paomiſus. But within, Meſſene it ſelfe, Ithome, Oechalia, Arene, Pteleon, Thryon, Dorion, Zanclum, famous townes all for many occurrents at ſundry times. The compaſſe of this arme of the ſea is 80 miles, the cut ouer-croſſe 30 miles. Then from Tenarus, the Laconian land pertaining to a free people, and an arme of the ſea there in circuit about 206 miles, but 39 miles ouer. The townes Tenarum, Amiclæ. Pheræ, Leuctra, and within-forth Sparta, Theranicum: and where ſtood Cardamyle, Pitane, and Anthane. The place Thyrea, and Gerania. The hill Taygetus: the riuer Eurotas, the creeke Ægylodes, and the towne Pſammathus. The gulfe Gytheates, of a towne thereby (Gytheum) from whence to the L
Iſland Creet, there is a moſt direct and ſure cut: all theſe are incloſed within the promontorie Maleum. The arme of the ſea next following is called Argolicus, and is 50 miles ouer, and 172 miles about. The towns about it Boea, Epidaurus, Limera, named alſo Zarax. Cyphanta, the hauen. Riuers, Inachus, Eraſinus: betweene which ſtandeth Argos ſurnamed Hippium vpon the Lake Lerne, from the ſea two miles, and nine miles farther Mycenæ: alſo where they ſay Tirynthа ſtood, and the place Mantinea. Hills, Artemius, Apeſantus, Aſterion, Parparus, and eleuen others beſides. Fountaines, Niobe, Amymone, Pſammothe. From Scylleum to Iſthmus 177 miles. Towns, Hermione, Trœzen, Coryphaſium and Argos, called of ſome Inachium; of others, Dipſium. The hauen Cenites, the creeke Saronicus, beſet round about in old time with woods of Oake; whereupon it had the name, for ſo old Greece called an Oake. Within it ſtood the M
towne Epidaurum, much reſorted vnto for the temple of *Æſculapius*, the promontorie Spiræum, the hauens Anthedon, and Bucephalus: and likewiſe Cenchreæ which we ſpake of before, being the other limit of Iſthmus, together with the chappell of *Neptune*, famous for the games there repreſented euery fiue yeres. Thus many creekes doth ſcotch and cut Peloponneſus: thus

many

20030
copy 1

A many ſeas I ſay do rore and daſh againſt it. For on the North ſide the Ionian ſea breaketh in: on the Weſt it is beaten vpon with the Sicilian. From the South the Cretian ſea driueth againſt it: Ægeum from the Southeaſt, and Myrtoum on the Northeaſt, which beginning at the Megarian gulfe, waſheth all Attica.

Chap. VI.

¶ *Of Arcadia.*

THe midland parts thereof, Arcadia moſt of all taketh vp, being euery way far remote from the ſea: at the beginning it was named Drymodis, but ſoone after Pelaſgis. The townes in it be Pſophis, Mantinea, Stymphalum, Tegea, Antegonea, Orchomenum, Pheneum, Pala-
B tium, from whence the mount Palatium at Rome tooke the name. Megalepolis, Catina, Bocalium, Carmon, Parrhaſiæ, Thelphuſa, Melanæa, Heræa, Pile, Pellana, Agræ, Epium, Cynætha, Lepreon of Arcadia, Parthenium, Alea, Methydrium, Eneſpe, Maciſtum, Lampe, Clitorium, Cleone: betweene which townes is the tract Nemea, vſually called Berubinadia. Mountains in Arcadia, Pholoe with a towne ſo named. Item, Hyllene, Lyceus, wherein was the chappell of *Iupiter Lycenus*, Mænalus, Artemiſius, Parthenians, Lampeus, and Nonacris: & eight beſides of baſe account. Riuers, Ladon, iſſuing out of the meeres and fens of Pheneus, Erymanthus out of a mountaine of the ſame name, running both downe into Alpheus. The reſt of the cities to be named in Achæa, Aliphiræi, Abeatæ, Pyrgenſes, Pareatæ, Paragenitiæ, Tortuni, Typanæi,
C Thryaſij, Trittenſes. All Achaæa generally throughout, *Domitius Nero* endowed with freedom. Peloponneſus from the promontorie of Malea to the towne Lechæum vpon the Corinthian gulfe, lyeth in bredth 160 miles: but ouer croſſe from Elis to Epidaurum 125 miles: from Olympia to Argos through Arcadia 63 miles. From the ſame place to Phlius is the ſaid meaſure. And all throughout, as if Nature made recompence for the irruptions of the ſeas, it riſeth vp in 76 hills.

Chap. VII.

¶ *Greece and Attica.*

D AT the ſtreights of Iſthmus beginneth Hellas, of our countrymen called Græcia: the firſt tract thereof is Attica, in old time named Acte. It reacheth vnto Iſthmus on that part thereof which is called Megaris of the colony Megara, or againſt Pagæ. Theſe 2 townes as Peloponneſus lieth out in length, are ſeated on either hand, as it were vpon the ſhoulders of Hellas. The Pageans, and more than ſo, the Ægoſthenienſes lie annexed to the Magarenſians, and owe ſeruice to them. In the coaſt thereof is the hauen Schœnus. Townes, Sidus, Cremyon, Scironia rocks for three miles long, Geranea, Megara, and Eleuſin. There were beſides, Oenoa and Probalinthus, which now are not to be ſeen, 52 myles from Iſthmus. Pyræus and Phalera, two hauens ioined to Athens by a wall, within the land fiue miles. A free citie this is, and needeth no more any mans praiſe: ſo noble and famous it is otherwiſe, beyond all meaſure. In At-
E tica be theſe fountains, Cephiſſia, Larine, Callirrhoe, and Enneacreunos. Mountains, Brileſſus, Megialcus, Icarius, Hymettus, & Lyrabetus: alſo the riuer Iliſſos. From Pyræum 42 miles off, is the promontorie Sunium, likewiſe the promontorie Doriſcum. Alſo Potamos and Brauron, townes in times paſt. The village Rhamnus, and the place Marathon, the plain Thriaſtius, the town Melita and Oropus, in the confines or marches of Bœotia. Vnto which belong Anthedon, Oncheſtos, Theſpre a free town Lebadea: and Thebes ſurnamed Bœotia, not inferior in fame and renown to Athens, as being the natiue country, & as men would haue it, of two gods, *Liber* and *Hercules*. Alſo they attribute the birth of the Muſes in the wood Helicon. To this Thebes, is aſſigned the foreſt Cithæron, and the riuer Iſmenus. Moreouer fountains in Bœotia, Oedipodium, Pſammate, Dirce, Epigranea, Arethuſa, Hippocrene, Aganippe, and Gargaphiæ. Moun-
F tains ouer and beſides the forenamed, Mycaleſſus, Adyliſus, Acontius. The reſt of the townes betweene Megara & Thebes, Eleutheræ, Haliartus. Plateæ, Pheræ, Aſpledon, Hyle, Thisbe, Erythræ, Gliſſas, and Copæ. Neere to the riuer Cephiſſus, Lamia, and Anichia: Medeon, Phligone, Grephis, Coronæa, Chæronia. But in the outward borders, beneath Thebes, Ocale, Elæon, Scolos, Scœnos, Peteon, Hyrie, Mycaleſſus, Hyreſeon, Pteleon, Olyros, Tanagia, a free State; and in

the

the very mouth of Euripus,which the Iſland Eubœa maketh by the oppoſite ſite thereof, Aulis,ſo renowned for the large hauen that it hath. The Bœotians in old time were named Hyantes. The Locrians alſo are named withall Epicnemidij, in times paſt Letegetes,through whom the riuer Cephiſſus runneth into the ſea. Townes,Opus(whereof commeth the gulfe Opuntinus)and Cynus. Vpon the ſea coaſt of Phocis,one & no more,to wit Daphnus. Within-forth among the Locrians, Elatea,and vpon the bank of Cephiſſus(as we haue ſaid) Lilea:& toward Delphos,Cnenius and Hiampolis:again, the marches of Locri, wherein ſtand Larymna and Thronium,neere vnto which the riuer Boagrius falleth into the ſea. Townes, Narycion, Alope, Scarphia:after this,the vale called of the people there dwelling, Maliacus Sinus, wherein bee theſe townes, Halcyone,Econia,and Phalara. Then Doris,wherin are Sperchios, Erineon,Boion,Pindus, Cytinum. On the back-ſide of Doris is the mountain Oeta. Then followeth Æmonia that ſo often hath changed name. For one and the ſame hath bin called Pelaſgicum,Argos, and Hellas,Theſſalia alſo,and Dryopis,and euermore tooke name of the kings. In it was borne a king called *Græcus*, of whom Greece bare the name:there alſo was *Hellen* borne, from whence came the Hellenes. Theſe being but one people,*Homer* hath giuen three names vnto,that is to ſay,Myrmidones,Hellenes,and Achæi. Of theſe,they be called Phthiotæ who inhabit Doris. Their towns be Echinus,in the very gullet & entrance of the riuer Sperchius : and the ſtreights of Thermopylæ,ſo named by reaſon of the waters:and foure miles from thence Heraclea, was called Trachin. There is the hill Callidromus:and the famous townes, Hellas, Halos, Lamia, Phthia,and Arne.

Chap. VIII.

¶ *Theſſalie.*

MOreouer in Theſſalie,Orchomenus,called before-time Minyeus; and the towne Almon, or after ſome Elmon; Atrax,Pelinna,and the fountaine Hyperia. Townes,Pheræ,behind which Pierius ſtretcheth forth to Macedonie:Lariſſa,Gomphi,Thebes of Theſſalie,the wood Pteleon,and the creeke Pagaſicus. The towne Pagaſa,the ſame named afterwards Demetrias; Tricca,the Pharſalian plains with a free city; Cranon and Iletia. Mountains of Phthiotis, Nymphæus,moſt faire and ſightly for the naturall arbors and garden workes there:Buzigæus, Donaceſa,Bermius,Daphiſſa,Chimerion,Athamas,Stephane. In Theſſaly there be 34,whereof the moſt famous are,Cerceti,Olympus,Pierus,Oſſa: iuſt againſt which,is Pyndus and Othrys,the ſeat and habitation of the Lapithæ;and thoſe lie toward the Weſt: but Eaſtward, Pelios,all of them bending in manner of a theatre: and before them ſtand raunged wedge-wiſe, 72 cities,Riuers of Theſſalie,Apidanus,Phœnix,Enipeus,Onochomus,Pamiſus : the fountain Meſſeis,the people Bœbeis:and aboue all the reſt the moſt famous riuer Peneus,which ariſing neere Gomphi,runneth for 500 ſtadia in a wooddie dale between Oſſa and Olympus, and halfe that way is nauigable. In this courſe of his,are the places called Tempe, 5 miles in length, and almoſt an acre and a halfe broad,where on both hands the hils ariſe by a gentle aſcent aboue the reach of mans ſight. Within-forth glideth Peneus by,in a freſh green groue, cleare as chryſtall glaſſe ouer the grauelly ſtones;pleaſant to behold for the graſſe vpon the banks,and reſounding again with the melodious conſent of the birds. It taketh in the riuer Eurotus, but entertaineth him not,but as he floweth ouer the top of him like oile(as *Homer* ſaith :) within a while after that he hath carried him a ſmall way,letteth him goe againe and reiecteth him, as refuſing to mingle with his owne ſiluer ſtreams,thoſe pœnall and curſed waters engendred for the infernall Furies of hell.

Chap. IX.

¶ *Magneſia.*

TO Theſſaly,Magneſia is annexed : the fountaine there is Libethra. The townes, Iolchos, Hirmenium,Pyrrha,Methone,Olizon. The promontorie Sepias. Townes moreouer, Caſtana,Sphalatra,and the promontory Ænantium. Towns beſides,Meliboea,Rhiſus,Erymne. The mouth of Peneus. Towns,Homolium,Orthe,Theſpiæ,Phalanna, Thaumacie, Gyrton, Cranon,Acarne,Dotion,Melitæa,Phylace,Potinæ. The length of Epirus,Achaia,Attica and Theſſalie,lying ſtraight out, is by report 480 miles ; the bredth 287.

Chap. X.

¶ *Macedonie.*

MAcedonie, ſo called afterwards (for before-time it was named Emathia) is a kingdome conſiſting of 150 ſeuerall States, renowmed for two kings aboue the reſt, and ennobled ſometime for the Monarchie and Empire of the world. This countrie lying farre in behind Magneſia and Theſſaly toward the nations of Epirus Weſtward, is much troubled and infeſted with the Dardanians. The North parts therof are defended by Pæonia and Pelagonia, B againſt the Triballi. The townes be theſe, Aege, wherein the maner was to interre their kings: Berœa, and Æginium, in that quarter which of the Wood is called Pieria. In the outward borders Heraclea, and the riuer Apilas: more townes, Phina, and Oloros: the riuer Haliacmon. Within-forth are the Haloritæ, the Vallei, Phylacei, Cyrreſtæ, Tyriſſæi: Pella the Colonie: the town Stobi of Romane citizens. Anon, Antigonia, Europus vpon the riuer Axius, and another of the ſame name through which Rhædias runneth: Heordeæ, Scydra, Mieza, Gordiniæ. Soone after in the borders, Ichnæ, and the riuer Axius. To this bound the Dardani: Treres, and Pieres border vpon Macedony. From this riuer, are the nations of Pæonia, Parorei, Heordenſes, Almopij, Pelagones, and Mygdones. The mountaines Rhodope, Scopius, and Orbelus. The reſt is a plaine countrie, wherein Nature ſeemes to ſet out her riches; in the lap whereof are the Arethuſij, Antiochienſes, Idomenenſes, Doberienſes, Trienſes, Allantenſes, Andariſtenſes, C Moryllij, Gareſci, Lynceſtæ, Othrionei, and the free ſtates of the Amantines and Oreſtæ. Colonies, Bulledenſis & Dienſis. Xilopolitæ, Scotuſſæi free; Heraclea, Sintica, Timphei, and Coronæi. In the coaſt of the Macedonian ſea, the towne Calaſtra, and within-forth, Phileros, and Lete: and in the middle bending of the coaſt, Theſſalonica, of free eſtate and condition. To it from Dyrrachium, it is 114 miles, Thermæ. Vpon the gulfe Thermaicus, be theſe townes, Dicæa, Pydna, Derrha, Scione: the promontory Canaſtæum. Townes, Pallene, Pherga. In which region theſe mountaines, Hypſizorus, Epitus, Alchione, Leuomne. Townes, Niſſos, Brygion, Eleon, Mendæ, and in the Iſthmos of Pallene, the Colinie ſometime called Potidæa, and now Caſſandria, Anthemus, Holophyxus the creeke, and Mecyberna. Townes, Phiſcella, Ampelos, Torone, and Singos: the Frith (where *Xerxes* king of the Perſians cut the hill Athos from the D Continent) in length a mile and a halfe. The mountaine it ſelfe ſhooteth out from the plaine into the ſea, 75 miles. The compaſſe of the foot thereof takes 150 miles. A towne there was in the pitch of it, Acroton. Now there be Vranopolis, Palæotrium, Thyſſus, Cleone, Apollonia, the inhabitants whereof be named Macrobij. The towne Caſſera, and a ſecond gullet or creeke of the Iſthmus, Acanthus, Stagira, Sitone, Heraclea, and the region lying vnder Mygdonia, wherein are ſeated farre out from the ſea, Apollonia and Arethuſa, Againe in the coaſt, Poſidium, and a creeke with the towne Cermorus: Amphipolis a free ſtate, and the people Biſaltæ. Then the riuer Strimon, which is the bound of Macedonia, which ſpringeth in Hæmus: of which, this is worthy to be remembred, that it runneth into ſeuen lakes before it keepeth a direct courſe. This is that Macedonie, which ſometime conquered the dominion ouer all the E earth: this ouer-ran Aſia, Armenia, Iberia, Albania, Cappadocia, Syria and Ægypt; yea and paſſed ouer Taurus and Caucaſus: this ruled ouer the Bactrians, Medians, and Perſians, and poſſeſſed all the Eaſt: this hauing the conqueſt of India, raunged after the tracts of Father *Liber* and *Hercules*. This is the very ſame Macedonie, of which in one day *Paulus Æmilius* our Generall, ſacked and ſold 72 cities. See the difference of fortune in two men.

Chap. xi.

¶ *Thracia.*

F NOw followeth Thracia, among the moſt valiant nations of Europe, diuided into 52 regiments of ſouldiers. Of thoſe States in it, the Denſeletes and Medi, whom it grieues me not to name, doe inhabit neere to the riuer Strymon on the right ſide, as farre as to the Biſaltæ aboue-named: on the left, the Digeri, and many townes of the Beſſi, euen to the riuer Neſtus, which inuironeth the bottome of the hill Pangæus, between the Eleti, Diobeſi, and Carbileſi, and ſo forward to the Bryſæ and Capæi. Odomanta a towne of the Odryſians, ſendeth

deth out the riuer Hebrus to the neighbour-borderers, the Carbiletes, Pyrogeris, Drugeri, Cæ- G
nicks, Hypſalts, Beni, Corpilli. Botiæi, and Edons. In the ſame tract the Selletæ, Priautæ, Di-
loncæ, Thyni, Celetæ, the greater vnder Hæmus, the leſſe vnder Rhodope: between whom, run-
neth the riuer Hebrus. The towne ſcituate beneath Rhodope, was before-time named Ponero-
polis; ſoone after by the founder, Philippopolis: but now of the ſite thereof Trimontium. The
aſcent of Hæmus vp to the top, taketh ſix miles: the backe-ſide and hanging thereof downe to
Iſter, the Mœſians, Getes, Aoti, Gaudæ, and Clariæ, and vnder them the Arræi, Sarmata whom
they call Areatæ, and Scythians: and about the ſea coaſt of Pontus, the Moriſenes and Sitho-
nians, from whom the Poet *Orpheus* deſcended, doe inhadite. Thus Iſter boundeth it on the
North: in the Eaſt, Pontus and Propontus: Southward, the ſea Ægæum, in the coaſt whereof
from Strimon, ſtand Apollonia, Oeſtima, Neapolis, and Polis. Within-forth, the Colonie of H
Philip, and 325 miles from Dyrrhachium, Scotuſa, Topiris, and the mouth of the riuer Neſtus.
The hill Pangæus, Heraclea, Olynthos Abdera a free citie, the meere and nation of the Biſons.
There ſtood the town Tinda, terrible for the horſes of *Diomedes* that ſtabled there. Now at this
day, Diceæ, Iſmaron, the place Parthenion, Phaleſina, Maronea called Ortagurea before-time.
* Or 100090. The mountaine Serrium and Zonæ: then, the plaine Doriſcus able to receiue * 10000 men: for
ſo *Xerxes* took a iuſt account of his armie and numbred it. The mouth of Hebrus: the hauen of
Stentor: the free towne Ænea, together with the tombe of *Polydorus*, the region ſometime of
the Cicones. From Doriſcus, the coaſt bendeth crookedly to Macron-Tichos, for 122 miles.
About which place the riuer Melas, whereof the creeke be areth name. Townes, Cypſella, Bi-
ſanthe, and that which is called Macron-Tichos, what way as ſtretching forth the walls along I
from Propontis to the Creeke Melanes betweene two ſeas, it excludes Cherſoneſus as it run-
neth out. For, Thracia of one ſide beginning at the ſea coaſt of Pontus, where the riuer Iſter is
diſcharged & ſwallowed vp, hath in that quarter paſſing faire and beautifull cities, to wit, Iſtro-
polis of the Mileſians, Tomi, and Calatis which before was called Acernetis. It had ſometime
Heraclea and Bizon, which ſunke and was loſt in a gaping chinke of the earth; but now in ſtead
thereof Dionyſopolis, called before Crunos. The riuer Ziras runneth hard by it. All that tract,
the Scythians named beſides Aroteres, poſſeſſed. There townes were, Aphrodiſius, Libiſtos,
Zigere, Borcobe, Eumenia, Parthenopolis, Gerania, where it is reported that the nation of the
Pygmeans kept, whom the barbarous people call Catizi, and they are of beliefe that they were
chaſed away and put to flight by cranes. In the edge thereof next to Dionyſopolis, there is O- K
deſſus of the Mileſians, the riuer Pomiſcus, the towne Tetranaulocos: the mountaine Hæmus
bearing forth with a huge top into Pontus had in the pitch therof the towne Ariſtæum. Now
in the coaſt is Meſembria and Anchialum, where Meſſa was. The region Aſtice. There was the
towne Anthium, now there is Apollonia. The riuers Paniſſa, Rira, Tearus, Oroſines Townes,
Thynnias, Almedeſſos, Deuelton with the poole which now is called Deultum, belonging to
the old ſouldiers. Phinopolis, neere vnto which is Boſphorus. From the mouth of Iſter to the
entrance of Pontus, ſome haue made it 555 miles. *Agrippa* hath ſet to 40 miles more. And from
thence to the wall aboue-named 150: and ſo from it to Cherſoneſus 126. But neere to Boſpho-
rus is the arme of the ſea Gaſthenes. The hauen ſurnamed of old men, and another likewiſe of
women. The promontory Chryſoceras, whereupon ſtandeth the town Bizantium of free eſtate, L
called before-time Lygos. From Dyrrachium it is 711 miles. Thus much lies out the main in
length between the Adriatick ſea and Propontis. Riuers, Bathynias, Pydaras, or Atyras. Towns,
Selymbria, Perinthus, annexed to the Continent 200 paſes broad. Within-forth, Byzia, the
caſtle of Thracian kings, hated of Swallowes, vpon the horrible and curſed fact of *Tereus*. The
region Camica: the colonie Flauiopolus, where before-time the town was called Zela. And 50
miles from Byria the Colony Apros, which is from Philippi 188 miles. But in the borders, the
riuer Erginus, where was the town Gonos. And there you leaue the citie Lyſimachia, alſo now
in Cherſoneſus. For another land paſſage or Iſthmus there is of like ſtreightnes, al one in name,
and of equall breadth with that of Corinth. Likewiſe on both ſides two cities do beautifie and
ſet out the ſtronds, which they take vp not vnlike to the other, to wit, Pactiæ from Propontis M
and Cardia from the gulfe Melane: as for this, it taketh the name of the forme and proportion
of the place made like a heart: and both, afterwards, where incloſed within Lyſimachia 3 miles
* Macron-Tichos. from the * long walls aboueſaid. Cherſoneſus from Propontis ſide, had Tiriſtaſis & Crithotes,
alſo Ciſſa faſt vpon the riuer Ægos: now it hath from the colony Apros 32 miles Reſiſtos, ouer-

againſt

20030
copy 1

A againſt the colony Pariana. And Helleſpontus, diuiding Europe from Aſia, ſeuen ſtadia aſunder (as we haue ſaid) hath foure cities there oppoſite one againſt another, to wit, in Europe, Calippolis and Seſtos; in Aſia, Lampſicum and Abydos. Then, is the promontory of Cherſoneſus Maſtiſia, iuſt contrary to Sigeum, in the crooked front whereof is Cynoſſema: for ſo is *Hecubaes* tombe named, the very rode of the Athenians nauie. The towne and chappell of *Protéſilaus*: and in the very vtmoſt forefront of Cherroneſus, which is called Æolium, the towne Elæus. After it, as a man goeth to the gulfe Melane, the hauens Cælos, Panhormus, and the aboue-named Cardia. The third ſea of Europe, is in this manner bounded and limited. Mountaines of Thraſia ouer and aboue thoſe afore rehearſed, Edonus, Gigemorus, Meritus, and Melamphyllon. Riuers falling into Hebrus, be Bargus, and Suemus. The length of Macedonie,
B Thracia and Helleſpontus, is ſet downe before. Some make it ſeuen hundred and twenty miles. The breadth is three hundred and eighty miles. The ſea Ægium tooke that name of a rocke, betweene Tenedos and Chios, more truly than of an Iſland named Aex, reſembling a goat, and therefore ſo called of the Greekes; which all at once appeareth to riſe out of the mids of the ſea. The ſea-men that faile from out of Achaia to Andros, diſcouer it on the right hand, and to them it preſageth ſome dreadfull and miſchieuous accident. Part of the Ægæan ſea is laid to the Myrtoum, and ſo called it is of a little Iſland, which ſheweth it ſelfe to them that ſet faile from Gereſtus to Macedonie, not farre from Chariſtos in Eubœa. The Romanes comprehend all theſe ſeas in two names: namely, Macedonicum, all that which toucheth Macedonia and Thracia: and Græcienſum where it beateth vpon Greece. As for the Greekes, they diuide euen
C the Ionian ſea into Siculum and Creticum, of the Iſlands. Alſo Icarius they call that between Samos and Mycione. All the other names are giuen by gulfes and creekes, whereof we haue ſpoken. And thus much verily as touching the ſeas and nations contained in this manner within the third ſection or gulfe of Europe.

Chap. XII.

¶ *The Iſlands betweene thoſe lands, among which, Creta, Eubœa, Cyclades, and Sporades: alſo of Helleſpont, Pontus, Mœotis, Dacia, Sarmatia and Scythia.*

D Iſlands ouer againſt Threſpotia, Corcyra: 12 miles from Buthrotus, and the ſame from the cliffes Acroceraunia 50 miles, with a citie of the ſame name, Corcyra of free condition, alſo the towne Caſſiope, and the temple of *Iupiter Caſſiopeus*: it lieth out in length 97 miles. *Homer* called it Scheria and Phæacia: *Callimachus* alſo, Drepane. About it are ſome others: but bending toward Italy, Thoronos: and toward Leucadia the two Paxæ, fiue miles diuided from Corcyra. And not farre from them before Corcyra, Ericuſa, Marate, Elaphuſa, Malthace, Trachiæ, Pytionia, Ptychia, Tarachie. And from Pholachrum a promontory of Corcyra, the rocke into which their goeth a tale, that the ſhip of *Vliſſes* was turned, for the reſemblance it hath of ſuch a thing. Before Leucadia, Sybota. But between it & Achaia there be very many: of which Teleboides the ſame that Taphiæ: but of the inhabitants before Leucadia, they be called Ta-
E phias, Oxie, and Prinoeſſa: and before Ætolia, the Echinades, Ægialia, Cotonis, Thyatira, Geoaris, Dionyſia, Cyrnus, Chalcis, Pinara & Myſtus. Before them in the deep ſea, Cephalenia and Zacynthus, both free ſtates: Ithaca, Dulichium, Same, Crocylea, and Paxos. Cephalenia ſometime called Melæna, is 11 miles off, and 44 miles about. As for Same, it was deſtroied by the Romanes: howbeit, ſtill it hath three townes: between it and Achaia is Zacynthus with a town, a ſtately Iſland, & paſſing fertile. In times paſt it was called Hyrie, and is 22 miles diſtant from the South coaſt of Cephalenia. The famous hill Elatus is there. The Iſle it ſelf is in circuit 25 miles. Twelue miles from it is Ithaca, wherin ſtands the mountain Neritus. And in the whole it takes vp the compaſſe of 25 miles. From it 12 miles off is Araxum a cape of Peloponneſus.
F Before this Iſland in the main ſea there appeare Aſteris and Prote. Before Zacynthus 35 miles full Eaſt, are the two Strophades, called by others Plotæ: and before Cephalenia, Letoia. Before Pylos three Sphagiæ, and as many before Meſſene, called, Oenuſſæ. In the gulfe Aſinæus three Thyrides: in the Laconian gulfe, Teganuſa, Cothon, Cythera with the towne, named beforetime Porphyris. This lies fiue miles from the promontorie Malea, dangerous for ſhips to come about it, by reaſon of the ſtreights there. in the Argolick ſea are Pityuſa, Irine & Ephyre

and

and against the territory Hermonium, Typarenus, Epiropia, Colonis, Aristera: ouer against G
Trœzenium Calauria, halfe a mile from Plateæ: also, Belbina, Lacia and Baucidias. Against Epidaurus, Cecryphalos, and Pytioneſos, ſix miles from the Continent. Next to it is Ægina a free ſtate, 17 miles off, and for 20 miles they ſaile by it. The ſame is diſtant from Pyræum the port of the Athenians, 12 miles, and beforetime was vſually called Oenone. Againſt the promontory Spiræum, there lie onpoſite Eleuſa, Dendros, two Craugiæ, two Cæciæ, Selachuſa, Cenchreis and Aſpis. Alſo in the Megarian gulfe, there be foure Methurides. As for Ægilia, it is 15 miles from Cythera, and the ſame is from Phalaſerna a towne in Creet 25 miles. And Creet it ſelfe, lying of one ſide to the South, and the other to the North, ſtretcheth forth in length Eaſt and Weſt; a famous and noble Iſland for a hundred cities in it. *Doſiades* ſaith it tooke that name of the nymph *Creta* daughter of *Heſperis*: but according to *Anaximander*, of a king of the Curetes. *Philiſtides*, *Mallotes*, *Crates*, haue thought it was called firſt Æria, and afterH
wards Curetis: and ſome haue thought it was named Macaros for the bleſſed temperature of the aire. In bredth it exceedeth in no place 50 miles, and in the middle part broadeſt it is: but in length it is full 270 miles: in circuit 589 miles: and winding it ſelfe into the Creticke ſea, ſo called of it, where it ſtretcheth out fartheſt Eaſtward, it puts forth of it the promontory Sammonium iuſt againſt Rhodos, and Weſtward Criu-Metopon, toward Cyrenæ. The principall townes of marke, be Phalaſerne, Elæa, Cyſamum, Pergamum, Cydon, Minoum, Apteron, Pantomatrium, Amphymalla, Rhythimna, Panhormum, Cyteum, Apollonia, Matium, Heraclea, Miletos, Ampelos, Hyera-pytna, Lebena, Hierapolis. And in the midland parts, Cortyna, Phæſtum, Gnoſſus, Potyrrhenium, Myrina, Lycaſtus, Rhamnus, Lyctus, Dium, Aſum, Pyloros, Rhytion, Clatos, Pharæ. Holopyxos, Laſos, Eleuthernæ, Therapne, Marathuſa, Mytinos. And other I
townes about the number of 60, ſtand yet vpon record. The hils be Cadiſcus, Idæus, Dictæus, and Morycus. The Iſle it ſelfe, from the promontory in it called Criu-Metopon, as *Agrippa* reports, is diſtant from Phycus, a promontory of the Cyrene 225 miles. Likewiſe from Capeſcum point, it is from Malea in Peloponnenſus 80 miles. From the Iſland Carpathus, which lies Weſtward from the cape Sammonia, 60 miles. This Iſland aforeſaid lyeth between it and Rhodos. The reſt about it be theſe: before Peloponneſus two Coricæ, and as many Mylæ: and on the North ſide, when a man hath Creet on the right hand, there appeares Leuce iuſt againſt Cydonia, together with the two Budoræ, againſt Matium, Cia: againſt the promontory Itanum Oniſa and Leuce: againſt Hierapytna, Chryſa, and Caudos. In the ſame coaſt are Ophiuſſa, Butoa, and Rhamnus: and when men haue fetched about and doubled the point Criu-Metopon, K
appeare the Iſles called Muſagores. Before the promontory Sammonium, Phocæ, Platiæ, Sirnides, Naulochos, Armedon and Zephire. But in Hellas, yet ſtill in Ægium, Lichades, Scarphia, Mareſa, Phocaria, and very many more ouer againſt Attica, but towneleſſe, and therefore obſcure and of no reckoning: but againſt Eleuſin, the noble Salamis, and before it Pſytalia: and from Sunium, Helene fiue miles off: and Ceos from thence as many, which our countrimen haue named Cæa: but the Greekes Hydruſſa, cut off and diſmembred from Eubœa. In times paſt it was 500 ſtadia long: but ſoone after, foure parts almoſt, namely thoſe that butted vpon Bœotia, eaten vp by the ſame ſea: ſo as now the towns remaining that it hath, be Iulis and Cartheæa. For Coreſſus and Pæceſſa are periſhed & gone. From hence as *Varro* ſaith, came the fine linnen cloath that women vſe: yea, and Eubœa it ſelfe hath been plucked from Bœotia, and di- L
uided with ſo little an arme running betweene, that a dridge ioineth the one to the other: euident it is to the eie, and well ſeen, by reaſon of two promontories in the South ſide, to wit, Geneſtum, bending toward Attica, and Capharens to Helleſpontus: and one vpon the North-ſide, to wit, Cæneus. In no part thereof doth it extend broader than 40 miles: and no where doth it gather in narrower than 20. But in length from Attica as far as Theſſalie, it lies along Bœotia 150 miles: and containeth in circuit 365. From Helleſpont, on Caphareus ſide, it is 225 miles. In times paſt renowned it was for theſe cities, Pyrrha, Porthmos, Neſos, Cerinthus, Oreum, Dium, Ædepſum, Ocha, Oechalia, now Chalcis, ouer againſt which ſtands Aulis in the main: but now, for Gereſtum, Eretria, Caryſtus, Oritanum, Artemiſium, the fountain Arethuſa, the riuer Lelantum, the hot waters called Hellopiæ, it is of great name: but yet in more requeſt for the M
marble of Caryſtus. In former time it was called commonly Chalchodontis or Macris, as *Dionyſius* and *Ephorus* doe ſay: but Macra, according to *Ariſtides*: and as *Callidemus* would haue it, Chalcis, for the braſſe there firſt found: and as *Menæcmus* ſaith, Abantias: and laſt of all Aſo-

pis,

20030
copy 1

A pis,as the Poets commonly name it. Without in the Myrtoum ſea be many Iſles, but of greateſt marke be Glauconnenſis and Ægilia:and neere to the promontory Gereſtum about Delos certain lying round together,whereupon they tooke their name Cyclades.The firſt and chiefe of them,Andrus with a towne,is from Gereſtum 10 miles,and from Ceum 39. *Myrſilus* ſaith it was called Cauros,and afterwards Antandros. *Callimachus* nameth it Laſia: others Nonagria, Hydruſſa and Epagris: it takes in compaſſe 93 miles. A mile from the ſame Andros, and 15 from Delos,lieth Tenos,with a town fifteen miles in length: which for the plenty of water *Ariſtotle* ſaith was called Hydruſſa, but others name it Ophiuſſa. The reſt be theſe, Myconos with the hill Dimaſtos,15 miles from Delos. Scyros Syphnus, before-time named Heropia and Acis,in circuit 28 miles about: Seriphus 12 miles,Præpeſinthus, Cythnus, and Delos it ſelfe,of all others moſt excellent by far,as being the midſt of all the Cyclades,much frequen-
B ted for the temple of *Apollo*, and for merchandiſe and trafique. Which hauing a long time floted vp and downe,as it is reported,was the only Iſland that neuer felt earthquake vnto the time of *M.Varro*. *Mutianus* hath recorded that it was twice ſhaken. *Ariſtotle* giueth a reaſon of the name in this ſort,becauſe it was diſcouered and appeared on a ſudden. *Ægloſthenes* termeth it Cynthia: others Ortygia,Aſteria,Lagia,Chlamydia,Cynethus,and Pyrpile,for that in it fire was firſt found out.It is but 5 miles about,and riſeth vp by the aſcent of the hil Cinthus.Next it is Rhene,which *Anticlides* called Celaduſſa,and *Helladius* Artemite.Moreouer,Syros,which antient writers haue ſaid to be in circuit 26 miles, and Mutians 160. Oliaros,Paros, with a towne,38 miles from Delos,of great name for the white marble there,which at firſt men called
C Pactia,but afterwards Minois. From it ſeuen miles and a halfe is Naxus (18 miles from Delos) with a towne which they called Strongyle, afterwards Dia, within a while Dionyſias, of the plentifull vines,and others,Sicily the leſſe,and Callipolis. It reacheth in circuit 75 miles, and is halfe as long again as Paros. And thus far verily they obſerue & note for the Cyclades; the reſt that follow for the Sporades. And theſe they be, Helenum, Phocuſſa,Phæcaſia,Schinuſſa,Phalegandros,and 17 miles from Naxos,Icaros:which gaue name to the ſea,lying out as far in length with two towns,for the third is loſt: before-time it was called Dolichum,Macris, and Ichtyoeſſa. It is ſcituate Northeaſt from Delos 50 miles: and from Samos it is diſtant 35 miles. Between Eubœa and Andros there is a frith 12 miles ouer. From it to Gereſtum is 112 miles and a halfe: and then no order forward can be kept: the reſt therefore ſhall be ſet
D downe huddle by heapes. Ios from Naxus 24 miles,venerable for the ſepulchre of *Homer*: it is in length 25 miles,and in former time called Phænice.Odia,Letandros,Gyaros with a town, 12 miles about.It is from Aneros 62 miles. From thence to Syrnus 80 miles.Cynethuſſa,Telos,famous for coſtly ointment.*Callimachus* calls it Agathuſſa. Donyſa,Pathmos, in circuit 30 miles. Coraſiæ,Lebinthus,Leros,Cynara,Sycinus,which before-time was Oenœ, Heratia the ſame that Onus,Caſus otherwiſe Aſtrabe,Cimolus,*alias* Echinuſſa,Delos with a towne,which *Ariſtides* nameth Byblis,*Ariſtotle* Zephyria,*Callimachus* Himallis,*Heraclides* Syphnus and Acytos,and this of all the Iſlands is the roundeſt.After it Machia,Hypere ſometime Patage,or after ſome Platage,now Amorgos,Potyægos. Phyle,Thera; when it firſt appeared it was called Calliſte.From it afterwards was Theraſia plucked: and between thoſe twain ſoone after aroſe
E Automate,the ſame that Hiera: and Thia, which in our daies appeared new out of the water neere Hiera. Ios is from Thera 25 miles. Then follow Lea,Aſcania, Anaphe, Hippuris, Hippuriſſuſa.Aſtipalæa,of free eſtate,in compaſſe 88 miles: it is from Cadiſcus a promontory of Creta,125 miles.From it is Platea,diſtant 60 miles.And from thence Camina,38 miles:then Azibnitha,Laniſe, Tragia, Pharmacuſa, Techidia, Chalcia, Calydna, in which are the townes Coos and Olymna. From which to Carpathus,which gaue the name to the Carpathian ſea is 25 miles, and ſo to Rhodes with a Southerne winde. From Carpathus to Caſos 7 miles: from Caſos to Samonium a promontorie of Crete, 30 miles. Moreouer, in the Euboike Euripe, at the firſt entrance wel-neere of it are the foure Iſlands Petaliæ,and at the end thereof, Atalante, Cyclades,and Sporades: confined and encloſed on the Eaſt with the Icarian ſea coaſts of A-
F ſia: on the Weſt with the Myrtoan coaſts of Attica. Northward with the Ægæan ſea: and South with the Creticke and Carthaginian ſeas; and take vp in length two hundred myles. The gulfe Pegaſicus hath before it, Eutychia, Cicynethus, and Scyrus aboue ſaid: but the vtmoſt of all the Cyclades and Sporades, Gerontia, Scadira, Thermeuſis, Irrheſia, Solinnia, Eudemia, Nea, which is conſecrate vnto *Minerua*. Athos before it hath foure, Peparethus

thus with a town ſomtime called Euonos, 9 miles off, Scyathus 5 miles, and Iulios with a town G
88 miles off. The ſame is from Maſtuſia in Corinthos 75 miles, & is it ſelf in circuit 72 miles. Watered it is with the riuer Iliſſus, from thence to Lemnos 22, and is from Athos 87. in compaſſe it containeth 22 miles and a halfe. Townes it hath, Hephæſtia and Marina, into the Market place wherof the mountain Athos caſteth a ſhadow in the hotteſt ſeaſon of ſommer. Thaſſos a free State is from it fiue miles: in times paſt it was called Æria or Æthria. From thence Abdera in the continent is 20 miles: Athos 62: the Iſle Samo-Thrace as much, being a free priuiledged ſtate, and lying before Hebrus. From Imbrus 32 miles: from Lemnus 22 miles and a halfe: from the coaſt of Thracia 28 miles: in circuit it is 32 miles, and hath the riſing of the hill Saoces for the ſpace of ten miles, and of all the reſt is fulleſt of hauens and harbors. *Callimachus* calleth it by the old name Dardania. Betwixt Cherrhoneſus and Samo-Thrace is H
Halomeſus, about 15 miles from either of them: beyond lieth Gethrone, Lamponia, Alopeconeſus not farre from Cœlos, an hauen of Cherrhoneſus: and ſome other of no name or regard. In this ſea let vs rehearſe alſo the deſart and vnpeopled Iſles, ſuch as we can finde names for, to wit, Deſticos, Larnos, Cyſſicos, Carbruſa, Celathuſa, Scylla, Draconon, Arconeſus, Diethuſa, Scapos, Capheris, Meſate, Æantion, Phateruneſos, Pateria, Calete, Neriphus and Polendus.

The fourth of thoſe great ſeas in Europe, beginning at Helleſpont, endeth in the mouth of Mœotis. But briefly we are to deſcribe the forme of the whole ſea, to the end the parts may be ſooner and more eaſily known. The vaſt and wide Ocean lying before Aſia, and driuen out from Europe in that long coaſt of Cherſoneſus, breaketh into the maine with a ſmall and narrow iſſue, and by a Firth of 7 ſtadia, as hath been ſaid, diuideth Europe from Aſia. The firſt ſtreights I
they call Helleſpontus: this way *Xerxes* the King made a bridge vpon ſhips, and ſo led his armie ouer. From thence there is extended a ſmall Euripus or arme of the ſea for 86 miles ſpace to Priapus a city of Aſia, wheras *Alexander* the great paſſed ouer. From that place the ſea grows wide and broad, and again gathereth into a ſtreight: the largeneſſe thereof is called Propontis, the ſtreights Boſphorus, halfe a mile ouer; and that way *Darius* the father of *Xerxes* made a bridge ouer and tranſported his forces. The whole length of this from Helleſpont is 239 miles. From thence the huge main ſea called Pontus Euxinus, and in times paſt Axenus, takes vp the ſpace between lands far diſſite and remote aſunder, and with a great winding and turning of the ſhores bendeth back into certain horns, and lieth out-ſtretched from them on both K
ſides, reſembling euidently a Scythian bow. In the very mids of this bending it ioineth cloſe to the mouth of the lake Mœotis, and that mouth is called Cimmerius Boſphorus, 2 miles and a halfe broad. But between the two Boſphori, Thracius and Cimmerius, there is a direct ſtrait courſe between, as *Polybius* ſaith, of 500 miles. Now the whole circuit of all this ſea, as *Varro* and all the old writers for the moſt part do witneſſe, is 2150 miles. *Nepos Cornelius* addes thereto 350 miles more. *Artemidorus* maketh it 2919 miles. *Agrippa*, 2360 miles. *Mutianus*, 2865 miles. In like ſort ſome haue determined and defined the meaſure on Europe ſide to be 4078 miles and a halfe: others, 1172 miles. *M. Varro* taketh his meaſure in this manner: from the mouth of Pontus to Apollonia 188 miles and a halfe: to Calatis as much. Then to the mouth of Iſter 125: to Boriſthenes 250: to Cherrhoneſus a towne of the Heracleates, 375 miles. To L
Panticapæus, which ſome call Boſphorus, the vtmoſt coaſt of Europe, 222 miles and a halfe, which in all makes 1336 miles and a halfe. *Agrippa* meaſureth thus: From Byzantium to the riuer Iſter 560 miles: then to Panticapæum 630: from thence the very lake Mœotis taking into it the riuer Tanais, running out of the Rhiphæan hills, is ſuppoſed to beare the compaſſe of 1306 miles, being the fartheſt bound betweene Europe and Aſia. Others again make 11025 miles. But ſurely from his mouth to the mouth of Tanais, and take a ſtreight courſe, it is 375 miles without queſtion. The inhabitants of that coaſt haue beene named in the deſcription and mention of Thrace, as farre as to Iſtropolis: now from thence the mouthes of Iſter. This riuer ariſing among the hills of Abnoba a mountaine of Germanie, ouer againſt Rauricum a towne in Gaule, paſſing many a mile beyond the Alpes, and through innumerable Nations M
vnder the name of Danubius, with a mightie encreaſe of waters, and where hee firſt beginneth to waſh Illyricum, taking the name of Iſter after he hath receiued three ſcore riuers, and the one halfe of them well neere nauigable, rolleth into Pontus with ſix huge ſtreames. The firſt mouth of it is Peuces, ſoone after the Iſland it ſelfe Peuce, of which the next Channell

tooke

20030
copy 1

A tooke name, and is ſwallowed vp of a great miere of 19 miles. Out of the ſame channell and aboue Aſtropolis, a poole is bred of 63 miles compaſſe, which they cal Halmyris. The ſecond mouth is called Naracuſtoma: the third Caloſtoma, neere the Iſland Sarmatica: the fourth Pſeudoſtoma, and the Iſland Conopon Diabaſis. After that, Boreoſtoma, and Spireoſtoma. Each of theſe are ſo great, that by report the ſea for 40 miles length within it is ouer-matched with the ſame, and the freſh water may ſo far be euidently taſted. From it, into the inland parts of the country, the people verily be all Scythians: but diuers other nations there be that inhabit the coaſts next to the ſea: in ſome places the Gete, called of the Romanes Daci: in others Sarmatæ, of the Greekes Sauromatæ; and among them, the Hamaxobij or Aorſi. Elſe-where, the baſtard and degenerate Scythians, who are come from baſe ſlaues, or elſe the Troglodites, and anon the Alani and Rhoxalani. But the higher parts betweene Danubius and the forreſt
B Hercynius, as farre as to the Pannonian wintering harbours of Carnuntum, and the confines there of the Germans, the fielden countrie alſo & plains of Iazege, the Sarmatians poſſeſſe. But the hills and forreſts, the Dakes who were expelled by them, do inhabite as farre as to the riuer Pythyſlus from Marus; or peraduenture it is Duria, diuiding them from the Sueuians & kingdome of Vannians. The parts againſt theſe, the Baſtarnæ doe keepe; and from thence, other Germans. *Agrippa* hath ſet downe that whole tract from Iſter to the Ocean, to mount vnto 2000 miles, and 400 leſſe in bredth, to wit, from the deſarts of Sarmatia to the riuer Viſtula. The name of Scythians euery where continually runs into Sarmatians and Germans. Neither hath that old denomination remained in any others but thoſe, who (as I haue ſaid) liue fartheſt off, and in the edge of theſe nations, vnknowne in manner to all men beſides. But the townes next to
C Iſter are Cremniſcos, and Æpolium: the mountaines Macrocrenij: the noble riuer Tyra, giuing name to the towne, whereas before-time it was called Ophiuſa. Within the ſame there is a ſpatious Iland, inhabited by the Tyragetæ. And it is from Pſeudoſtomum, a mouth of Iſter, 130 miles. Soone after be the Axiacæ, bearing the name after the riuer: beyond whom are the Crobyzi: the riuer Rhode: the creeke Sagaricus, and the hauen Ordeſus. And 120 miles from Tyra, is the great riuer Boryſthenes; alſo a lake and people of that name: yea and a towne 15 miles within from the ſea, called by ancient names Olbropolis, and Miletopolis. Againe, in the ſea ſide, the hauen or harbour of the Achæans: the Iſland of *Achilles*, famous for the tombe of that worthy wight. And from it 135 miles, there is a demy Iſland lying out acroſſe in faſhi-
D on of a ſword, called Dromos Achilleos, vpon occaſion of his exerciſe there of running: the length whereof *Agrippa* hath declared to be 80 miles. All that tract throughout, the Tauriſci, Scythians, and Sarmatians do inhabite. Then the wilde woodland countrie gaue the name vnto the ſea Hylæum, which beates hard vpon it: the inhabitants are called Enæcadloæ. Beyond, is the riuer Panticapes, which diuideth the Nomades and Georgians aſunder: and ſoone after Aceſinus. Some writers doe ſhew, that Panticape together with Boryſthenes, runne together in one confluent beneath Olbia, but they that write more exactly, doe name Hypanis. See how much they erred, who haue deſcribed it in a part of Aſia. It entreth into the ſea with a mighty great ebbe and returne of the water, vntill it be within fiue miles of Mœotis, compaſſing as it goeth a mighty deale of ground, and many nations. Then there is a gulfe or arme of the ſea cal-
E led Corcinites, and a riuer Pacyris. Towns, Naubarum and Carcine. Behind, is the lake Buges, let out into the ſea by a great ditch. And Buges is ſelf from Coretus (an arme or branch of the lake Mœotis) is diſioyned, with a backe part full of crags and rocks. Riuers it receiueth, Buges, Gerrhus, Hypanis, comming all from diuers querters: for Gerrhus parteth the Baſilides and Nomades. Hypanis, through the Nomades and the Hyleans, falleth into Buges by a channell made by mans hand, but in his owne naturall channell into Coretus. The region of Scythia is named Sendica. But in Carcinites, Taurica beginneth: which alſo in times paſt was enuironed all about with the ſea, whereſoeuer now there lie plains and flat fields. But afterwards it mounteth vp with huge hills. Thirtie nations there be in it: and of them 24 be Inlanders. Six townes, Orgocyni, Caraſeni, Aſſyrani, Tractari, Archilachitæ, and Caliordi. The very pitch and creſt
F of the hill, the Scytotauri do hold. Bounded they are Weſtward, with Cherroneſus; Eaſt-ward with the Scythian Satarchi. In the coaſt next to Carcinites are theſe towns, Taphræ, in the very ſtreights of the demy Iſland: then, Heraclea, Cherroneſus, endowed with franchiſes by the Romans. Aforetime it was called Megarice, and is the moſt ciuel & faireſt of all the reſt of that tract, as retaining ſtill the names and faſhions of the Greekes, and is beſides compaſſed with a

wall

wall of fiue miles about. Then, the promontory Parthenium. A citie of the Tauri, Placia. The G
hauen Symbolon: the promontory Criu-metopon, ouer against Charambes a promontorie of
Asia, running through the middle of Euxinus, for the space of 170 miles: which is the cause es-
pecially that maketh the forme abouesaid of a Scythian bow. Neere to it, are many hauens and
lakes of the Tauri. The towne Theodosia, distant from Criu-Metopon 122 miles, and from
Chersonesus 165 miles. Beyond, there haue been towns, Cyte, Cephyrium, Acre, Nympheum,
and Dia. And the strongest of them all by many degrees, standeth yet still in the very entry of
Bosphorus, namely, Pantecapium of the Milesians, from Theodosia 1035 miles: but from
Cimmerum a town scituate beyond the Firth, a mile and a halfe as we haue said. And this is al
the bredth there that diuideth Asia from Europe: which somtime is passeable ouer most-what
on foot, namely, when the Firth is frozen and all on yce. The breadth of Bosphorus Cimmerius
is 12 miles and a halfe. It hath vpon it these townes, Hermisium, Myrmecium; and within it, an H
Island Alopece. But along Mœotis, from the fartheſt narrow land passage, which place is cal-
led Taphræ, vnto the mouth of Bosp horus, it containes 260 miles. On Taphræ side, the Conti-
nent within-forth is inhabited by the Anchetæ, among whom Hypanis springeth: and Neuri,
where Borysthenes hath his head. Moreouer, the Geloni, Thussagetæ, Budini, Basilidæ, and
the Agathyrsi, with blew haire on their heads. Aboue them, the Momades, and the Anthropo-
phagi. On Buges side aboue Mœotis, the Sauromates and Essedones dwell, but along the bor-
ders euen as far as Tanais, the Mœotæ, of whom the lake was so called, and the vtmost on their
backes the Arimaspi. Within a little appeare the Rhiphæan hils, and a countrey called Pre-
rophoros, for the resemblance of certain wings or feathers, occasioned by the continuall fall of
snow. A part of the world thus is condemned by dame Nature, and drowned in deepe and thick I
darkenes, dwelling within no other houses but the workes of frozen cold, and the ycie harbors
of the chilling Northerne wind. Behind those hills and beyond the North pole, there is a bles-
sed and happy people (if we may beleeue it) whom they call Hyperborei, who liue exceeding
long, and many fabulous and strange wonders are reported of them. In this tract are supposed
to be the two points or poles about which the world turns about, and the very ends of the hea-
uens reuolution. For 6 moneths together they haue one entire day; and night as long, when the
Sunne is cleane turned from them: but their day beginneth not at the spring Æquinoctiall (as
the leaud and ignorant common people do imagine) and so continueth to the Autumne: for
once in the yeere, and namely at our mid-sommer when the Sun entreth into Cancer, the Sun
riseth with them: and once likewise it setteth, euen in the mid-winter with vs, when the Sun en- K
treth Capricorne. The countrie is open vpon the Sunne, of a blissefull and pleasant tempera-
ture, void of all noisome wind & hurtfull aire. Their habitations be in woods and groues, where
they worship the gods both by themselues, and in companies and congregations: no discord
know they; no sicknes are they acquainted with. They neuer die, but when they haue liued long
enough: for when the aged men haue made good cheere, and annointed their bodies with sweet
ointments, they leape from off a certain rocke into the sea. This kind of sepulture, of all others
is most happy. Some Writers haue seated them in the first part of the sea coasts in Asia, and
not in Europe, for that indeed some be there resembling the like manners and customes, and
euen so scituate, named Atocori. Some haue set them iust in the mids between both Sunnes to
wit, the setting of it with the Antipodes, and the rising of it with vs: which cannot possibly be, L
considering so vast and huge a sea comming betweene. As for those that haue placed them no
where but in the six moneths day-light, haue written thus much of them, That they sow in the
morning, reape at noone, at sun-setting gather the fruits from the trees, and in the nights lie
close shut vp within caues. Neither may we make doubt of that nation, since that so many Au-
thors doe testifie, That they were wont to send the first fruits of their corne, as far as Delos to
Apollo, whom aboue all others they honour. And virgins they were that had the carriage of this
present; who for certaine yeeres were venerable, and courteously entertained of all nations, vn-
till such time as vpon breach of faithfull hospitalitie, they took vp an order to bestow those sa-
cred oblations in the next marches of their neighbour borderers: and they againe to conueigh
the same to their neighbours that confined vpon them, and so forward as far as to Delos. But M
soone after, this custome was for-let and cleane giuen ouer. The length of Sarmatia, Scythia,
and Taurica, and of all that tract from the riuer Borysthenes, is 980 miles, the breadth 717, as
M. Agrippa hath cast it. But I for my part suppose, that the measure of this part of the earth is
vncertaine,

20030
copy 1

A vncertaine: but after the order which we haue begun, let vs go forward with the reſt behind of all this diuiſion: as for the pety ſeas thereof we haue truly ſhewed them already.

Chap. XIII.

¶ *The Iſlands Pontus.*

HElleſpont hath no Iſlands to be ſpoken of, in Europe. In Pontus are two, a mile and halfe from Europ, and 14 miles from the mouth of the riuer, to wit, Cyaneæ, of others called Symplegades; and by report of fables they ran one into another: the reaſon was, becauſe they being ſeuered by a ſmall ſpace betweene, to them that enter the ſea full vpon them, they ſeemed twaine: but if they turned their eye a little aſide from them, they made a ſhew as
B if they met together. On this ſide Iſter there is one, pertaining to the Apolloniates, 80 miles from Boſphorus Thracius, out of which *M. Lucullus* brought *Apollo Capitolinus*. What are within the mouths of Iſter we haue declared already. Before Boryſthenes is the aboue named Achillea, called Leuce and Macaron. This, our moderne Coſmographers in theſe daies doe ſet 140 miles from Boryſthenes, from Tyra 120: from the Iſland Peuce 50. It is in compaſſe about ten miles. The reſt be in the gulfe Carcinites, namely Cephalonneſos, Rhoſphoduſa, and Macra. I cannot paſſe by the opinion of many writers, before we depart from Pontus, who ſuppoſe all the inland ſeas or Mediterranian ariſe from that head, and not from the ſtreights of Gades: and they lay for their ground an argument not without ſome good probabilitie, becauſe out of Pontus the ſea alwaies floweth, and neuer ebbeth againe.
C But now we are to depart from thence, that other parts of Europ may be ſpoken of: & when we are gone ouer the Riphœan hils, we muſt paſſe along cloſe by the North Ocean, and keepe the left hand vntill we come to Gades. In which tract there are reported to be very many Iſles without name: of which, as *Tymæus* reporteth, there is one before Scythia called Bannomanna, diſtant from Scythia one daies ſailing: into which, in the temperate ſeaſon of the ſpring, Amber is caſt vp to the ſhore by the waues of the ſea. All the other coaſts are no otherwiſe marked and known but by vncertain heare-ſay. The North Ocean from the riuer Paropamiſus, whereas it daſheth vpon Scythia, *Hecatæus* nameth Amarchium, which word in the language of that nation ſignifieth, Frozen. *Philemon* writeth, that the Cymbrians call it Morimaruſa, *i. mortuum*
D *Mare*, the dead ſea, euen as far as to the promontorie of Rubeæ: but all beyond forward, Cronium. *Xenophon Lampſacenus* ſaith, That three daies ſailing from the Scythian coaſt there is the Iſland Baltia, of exceeding greatneſſe. The ſame doth *Pythias* name Baſylia. There be alſo named the Iſles Oonæ, wherein the Inhabitants liue of birds egges and otes. Others alſo, wherin men are born with horſe feet, called thereupon Hippopades. Others againe of the Panoti, who being otherwiſe naked, haue mighty great eares that couer their whole bodies. And now forward we begin at the nation of the Ingevoni, the firſt of all the Germanes in thoſe parts, to diſcouer all vpon more ſure and euident report. There is the exceeding great mountain Sevo, not inferior to the high hills Riphæi, which maketh a mighty huge gulfe, euen as far as the Cimbrians promontory, called Codanus: it is full of Iſlands, of which the goodlieſt of all is Scan-
E dinavia, the bigneſſe whereof is not yet diſcouered. A part only thereof, as much as is knowne, the nation of Heleviones doth inhabit in 500 villages, who call it a ſecond world. And as it is thought, Enigia is no whit leſſe. Some ſay that theſe parts, as far as to the riuer Viſtula, is inhabited by the Sarmatians, Venetians, Scyrians, and Hirrians: alſo that the gulfe of the ſea is called Clylipenus: and that in the mouth or entrance of it is the Iſland Latris. Alſo that not far from it there is another arme of the ſea bounding vpon the Cimbrians. The promontory of the Cimbrians ſhooting far into the ſeas, maketh a demy Iſland, which is called Cartris: from which coaſt 23 Iſlands haue been diſcouered and known by the Roman armies; the nobleſt of them are Burchana, called of our countrey men Fabaria, of the plenty of a pulſe called Beans, growne there of it ſelfe vnſowne. Likewiſe Gleſſaria, ſo called by the ſoldiers, of Amber: but
F of the barbarous people Auſtrania; and beſides them Actania. Along this ſea coaſt, vntil you come to the riuer Scaldis, the German nations do inhabit, but the meaſure of that tract canot eaſily be declared, ſuch vnmeaſurable diſcord and difference there is amongſt Writers. The Greeks and ſome of our owne country haue deliuered the coaſt of Germanie to be 2500 miles about. *Agrippa* again ioyning with it Rhetia and Noricum, ſaith that it is in length 886 miles,

and in bredth 268. And verily of Rhœtia alone, the bredth well-neere is greater, at leaſtwiſe at the time that it was ſubdued, and the people departed out of Germanie: for Germany many yeares after was diſcouered, and yet not all of it known throughly. But if it be lawful to geſſe, there wil not be much wanting in the coaſts & compaſſe, according the opinion of the Greeks; nor in the length ſet down by *Agrippa*.

Chap. XIV.

¶ *Germanie.*

OF Germanes there be fiue kindes: the Vindili, part of whom be the Burgundians, Varini, Carini, and Gurtones. A ſecond ſort, the Ingævones, part of whom be the Cimbri, Teutoni, and people of the Cauchi. The next to them be the Iſtævones, and part of them be the Cimbri. Then the midlanders, the Hermiones, among whom are the Suevi, Hermunduri, Chatti, and Cheruſci. The fift are the Peucini, the Baſternæ, bordering vpon the aboue-named Dacæ. Faire riuers that run into the Ocean, to wit, Guttalus, Viſtillus, or Viſtula, Albis, Viſurgis, Amiſius, Rhenus, Moſa. And within-forth the Hircynium hill, inferiour to none in eſtimation, ſtandeth to gard and incloſe them.

Chap. XV.

¶ *Iſlands in the Gaules Ocean.*

VPon the very Rhene it ſelfe, for 100 miles almoſt in length, lieth the moſt noble Iſland of the Batavi and Cannenufates: as alſo others of the Friſians, Cauchians, Friſiabones, Sturij, and Marſalij, ſpred within Helius and Flevus, for ſo be the mouthes into which Rhenus guſhing, diuideth it ſelfe; and is diſcharged from the North into certain lakes: from the Weſt into the riuer Moſa. But in the middle mouth between, hee beareth a ſmall current and channell, and keepeth his owne name.

Chap. XVI.

¶ *England and Ireland.*

OVer againſt this tract lieth Britannia, betweene the North and Weſt, being an Iſland renowned both in Greeke and Roman records: oppoſite it is vnto Germanie, Gaule, and Spaine, the greateſt parts by far of all Europe, and no ſmall ſea betweene. It was ſometime named Albion, when all the Iſles were called Britanniæ, of which anon we wil ſpeak. This Iſland is from Geſſoriacum, a coaſt towne of Morini, fifty miles, taking the next and ſhorteſt cut. In circuit, as *M. Pitheas* and *Iſidor* report, it containeth 3825 miles. And now for theſe thirtie yeares well-neere, the Romane Captaines grow into farther knowledge thereof, and yet not beyond the forreſt of Caledonia, as neere as it is. *Agrippa* ſuppoſeth that it is in length 800 miles, and in bredth 300. Alſo that Ireland is as broad, but not ſo long by 200 miles. This Iſle is ſeated aboue it, and but a very ſhort cut or paſſage diſtant from it, to wit, 30 miles from the people Silures. Of other Iſlands in this Ocean there is none by report in circuit more than 125 miles. Now there be Orcades 40, diuided aſunder by ſmall ſpaces betweene: Acmodæ 7, and 30 Hæbudes. Alſo betweene Britaine and Hibernia, Mona, Monapia, Ricnea, Vectis, Silimnus, and Andros: but beneath them, Siambis and Axantos: and on the contrary ſide towards the Germane Sea there lie ſcattering the Gleſſariæ, which the later Greeke Writers haue named Electrides, for that Amber was there ingendred or bred. The fartheſt of all knowne or ſpoken of, is Thule, in which there be no nights at all, as we haue declared, about Midſummer, namely when the Sun paſſeth through Cancer: and contrariwiſe no daies in mid-winter: and each of theſe times they ſuppoſe do laſt ſix moneths, all day or all night. *Timæus* the Hiſtoriographer ſaith, that farther within-forth, and ſix daies ſailing from Britain, there lieth the Iſland Mictis, in which white lead grows; and that the Britans do ſaile thither in winter veſſels, couered with leather round about, and wel ſowed. There be that make mention of others beſide, to wit, Scandia, Dumna, Bergos, and Nerigos the biggeſt of all the reſt, from the which men ſaile to Thule. Within one daies ſailing from Thule is the frozen ſea, named of ſome Cronium.

Chap. XVII.

¶ *Gallia.*

ALl Gallia, by one name called Comata, is diuided into three kindes of people, and thoſe ſeuered one from the other by riuers eſpecially: to wit, Belgica, from Scaldis to Sequana: Celtica, from it to Garumna; and this part of Gallia is named Lugdunenſis. From thence to the lying out of the mountaine Pyrenæus, Aquitania, formerly called Aremorica. *Agrippa* hath made this reckoning and computation of all Gaul generally, to wit, lying between Rhene, Pyrenæus, the Ocean, and the hills Gebenna and Iura; whereby hee excludeth Narbonenſis Gallia, that is in length 420 miles, and in bredth 313. Next to Scaldis there inhabited the vtmoſt borderers, the Toxandri, vnder many names: then the Menapij, Morini, and Oromanſici, ioyning vpon the tract or territorie called Geſſoriacus: the Brinnani, Ambiani, Bellonici, and Haſſi. But farther within-forth, the Caſtologi, Atrebatis, and Neruij, free ſtates: the Veromandui, Sueroni, and Sueſſiones, likewiſe free: the Treviri free before-time: the Lingones confederates, the Remi confederats alſo: the Mediomotricæ, the Sequani, the Raurici, & Helvetij. Colonies two, Equeſtris and Rauriaca. Moreouer, of Germane nations in the ſame Prouince that dwell neere Rhene, the Nemetes, Trivochi, and Vangiones: then the Vbij, Colonia, Agrippenſis, Gugerni, Batavi, and thoſe whom we ſpake of in the Iſlands of Rhene.

Chap. XVIII.

C

¶ *Lugdunenſis Gallia.*

LVgdunenſis Gallia containeth the Luxovij, Velocaſſes, Galleti, Veneti, Abricatui, Oſiſmij, and the noble riuer Ligeris: but a more faire and goodly demy-Iſland, running forth into the Ocean, from the very marches of the Oſiſmij, hauing in circuit 625 miles, with the necke thereof 125 miles broad. Beyond it dwell the Nannites. Within-forth, the Hœdni confederats, the Carnuti likewiſe confederats, the Boij, the Senones, the Aulerici, ſyrnamed Eburovices, and the Cenomannes and Meldi, free States. Parrhiſij, Trecaſſes, Andegani, Viducaſſes, Vadicaſſes, Vnelli, Carioſvelites, Drabhudi, Rhedones, Turones, Iteſui, and Secuſiani, free States, in whoſe countrey ſtandeth the Colonie Lugdunum.

Chap. XIX.

¶ *Aquitania.*

TO that prouince of Gaule which is called Aquitania, belong the Ambilatri, Anagnutes, Pictones, the Santones, Bituriges, named alſo Vibiſci Aquitani, whereof the Prouince tooke name, and the Sediboniates. Then ſuch as were enrolled into townes hips from diuers parts, to wit, Begerri, Tarbeli, who came vnder foure enſignes, Cocoſſati vnder 6 enſignes, Venami, Onobriſates, Belendi, and the foreſt Pyrenæus. Beneath them, Moneſi, Oſquidiales, Mountainers, Sibillates, Camponi, Bercorates, Bipedimui, Saſſumini, Vellates, Vornates, Conſoranni, Auſci, Eluſates, Sottiates, Oſquidates in the champion and plaine country, Succaſſes, Latuſates, Baſabocates, Vaſſei, Sennates, Cambolectri, Ageſinales, ioyning to the Pictones. Then the Bituriges free, called alſo Cubi. Next to them, Lemovires, Arverni free, and Gabales. Again, thoſe that confine and border vpon the prouince Narbonenſis, the Ruthenes, Caduni, Autobroges, & the Petrogoti, diuided from the Toloſanes by the riuer Tarme. Seas about the coaſts, vpon Rhene the North Ocean: between it and Sequana the Britan ocean: between it and Pyrenæus, the Gaule Ocean. Iſlands many, to wit of the Veneti, called alſo Veneticæ: and in the gulfe of Aquitane, Vliarus.

Chap. XX.

F

¶ *The hither Prouince of Spaine.*

AT the Promontorie of Pyrenæus beginneth Spain, narrower not only than Gaule, but alſo than it ſelfe (naturally) ſo huge a quantitie is wrought into it, while the Ocean of one coaſt, the Iberian ſea on the other, do cling and preſſe the ſides together. The very hills

of Pyrenæus, which from the Eaſt ſpred all the way to the Southweſt, make Spaine ſhorter on the North ſide than the South. The next marches of this higher prouince is the ſame that the tract of Tarracon, namely from Pyrenæus along the Ocean, the forreſt and mountains of Vaſcones. And firſt in this part you finde theſe townes: namely in the country of the Varduli, Olarſo, Moroſgi, Menoſca, Veſperies, the port towne Amanum, where now is Flaviobriga, and a colony of nine cities. The region of the Cantabri, the tiuer Sada, the port town of Victoria, inhabited by the Iuliobrigenſes. From that place the fountaines of Iberus, 40 miles. The hauen Biendium, the Origeni entermingled with the Cantabri. Their hauens Veſei and Veca: the countrey of the Aſtures, the towne Nœga, in the demy Iſland Peſicus. And then the countie Lucenſis, and ſo from the riuer Navilubio, the Cibarci, Egovarri ſyrnamed Namarini, Iadoni, Arrotiebæ, the promontorie Celticum. Riuers, Florius and Nelo. Celtici ſyrnamed Neriæ: and aboue them the Tamarici, in whoſe demy Iſland are 3 Altars called Seſtianæ, dedicated to *Auguſtus*, Cœpori, and the towne Nœla. The Celtici, ſyrnamed Præſamarci, and Cileni. Of Iſles worth the naming, Corticata and Aunios. From the Cileni, the county town of the Bracæ, Heleni, Gravij, the caſtle Tyde, all diſcended from the Greekes: the Iſlands Cicæ, the faire town Abobrica, the riuer Minius, with a broad mouth 4 miles ouer, the Leuni, Seurbi, Auguſta a town of the Bracæ: and aboue them alſo, Gallæcia, the riuer Limia. Alſo the riuer Durius, one of the greateſt in Spaine, ſpringing in the Pelendones country, & running hard by Numantia, and ſo on, through the Arevaci and Vaccæi, diuiding the Vetones from Aſturia, and the Gallæcians from Luſitania: and there alſo it keepeth off the Turduli from the Bracari. All this region aboue-ſaid from Pyrenæus, is full of mettall mines, to wit, gold, ſiluer, iron, lead, as well blacke as white, *i.* tinne.

Chap. XXI.

¶ *Luſitania.*

AT the riuer Durius begins Luſitania, wherin are Turduli the old, Peſuri, the riuer Vacca, the towne Talabrica, the towne and riuer Minium. Townes, Conimbrica, Oliſippo, Eburo, Britium: from whence there runs out into the ſea with a mighty cape, the promontorie which ſome haue called Artabrum; others, the Great; and many, Oliſſoponenſe, of the towne, making a diuiſion of land, ſea, and aire aboue. In it is the ſide of Spaine determined and bounded, and from the compaſſe of it beginneth the forefront thereof.

Chap. XXII.

¶ *Iſlands in the Ocean.*

ON the one hand is the North and the Gauls Ocean: on the other, the Weſt and the Atlanticke Ocean. The ſhooting forth of the promontorie aforeſaid ſome haue reported to be 60 miles, others 90. From thence to Pyrenæus there be writers not a few, who ſay it is 1250 miles, and that there is a nation of the Atabri, which neuer was, with a manifeſt error. For they haue ſet in this place by exchanging ſome letters, the Artotrebæ, whome wee named before the promontorie Celticum. They haue erred alſo and miſſed in certain famous riuers. From Minius aboue named, as *Varro* ſaith, Æminius is 200 miles diſtant (which ſome men take to be elſewhere, and call it Limæa) named of men in old time Oblivionis, and wherof goeth many a tale. From Durius to Tagus is 200 miles, and comes between. This Tagus is a riuer much renowned for the ſand that yeelds gold. 160 miles from it the promontory Sacrum runs out from the middle front in maner of Spain: and 14 miles *Varro* ſaith it is from it to the mids of Pyrenæus. But from Ana, by which we haue ſeparated Luſitania from Bætica, 226 miles, adding therto from Gades 102 miles. Nations, Celtici, Varduli, and about Tagus, the Vettones. From Ana to Sacrum the Luſitanes. Memorable townes, from Tagus in the coaſt ſide, Oliſippo, of good note for the Mares that conceiue there by the Weſt wind. Salatia, with addition of Vrbs Imperatoria, and Merobrica: the promontory Sacrum, & another called Cæneus: towns, Oſſonoba, Balſa, and Myrtius. The whole prouince is diuided into three counties or iudiciall courts of Aſſiſes, Emeritenſis, Pacenſis, and Scalabitanus. It containeth in all fiue and forty States, wherein be fiue Colonies, one Borough Towne of Romane Citiſens, three enfranchiſed

20030
copy 1

A chiſed with the liberties of old Latium. Stipendiaries or Tributaries 36. Moreouer, the Colonies be thus named; Auguſta Emerita: and vpon the riuer Ana, Metallinenſis, Pacenſis, Norbenſis, named alſo Cæſariana. To it are layed and inrolled Caſtra Iulia and Caſtra Cæcilia. The fift is Scalabis, called Præſidium Iulium. The free borough of Roman citiſes, Olyſſippo, named alſo Felicitas Iulia. Townes of the old Latium liberty, Ebora, which likewiſe was called Liberalitas Iulia: Myrtilis alſo and Salatia, which we haue ſpoken. Of Tributaries, ſuch as I am not loth to name, beſide the aboue ſaid in the additions of Bætica, Auguſtobrigenſes, Ammienſes, Aranditani, Axabricenſes, Balſenſes, Cæſarobricenſes, Caperenſes, Caurenſes, Colarni, Cibilitani, Concordienſes, the ſame that Bonori, Interauſenſes, Lancienſes. Mirobrigenſes, ſyrnamed Celtici, Medubricenſes, the ſame that Plumbarij, Ocelenſes, who alſo are Lancienſes, Turtuli, named Barduli and Tapori. *M. Agrippa* hath written, that Luſitania, toge-
B ther with Aſturia and Gallæcia, is in length 540 miles, and in bredth 526. But all Spain from the two promontories of Pyrenæus, along the ſeas, takes vp in circuit of the whole coaſt, 2900 miles, and by others 2700. Ouer againſt Celtiberia be very many Iſles, called of the Greekes Caſſiterides, for the plenty of lead which they yeeld: and iuſt againſt the promontorie of the Arrotrebæ, ſix named Deorum [*i.* of the gods] which ſome haue called Fortunatæ. But in the very point or cape of Bætica, from the mouth of the firth 75 miles, lieth the Iſland Gades, 12 miles long, as *Polybius* write th, and three miles broad. It is from the maine, where it is neereſt, leſſe than * 700 paces, in other places aboue ſeuen miles. The whole Iſle it ſelfe containes the ſpace of 15 miles in circuit. It hath within it a towne of Roman citiſens named Auguſta, Vrbs
C Iulia Gaditania. On that ſide that regards Spain, within 100 paces lieth another Iſland three miles long and one broad, wherein formerly was the towne Gades. The name of this Iſland, after *Ephorus* and *Thiliſtides*, is Erythia: but according to *Tymæus* and *Silenus*, Aprodiſias: the naturall home-bred inhabitants call it Iunonis The bigger of theſe two Gades, as ſaith *Tymæus*, was by them called Cotinuſa, our countrymen name it Tarteſſos, the Carthaginians * Gadir, which in the Punicke language ſignifieth the * number of ſeuen. Erithia the other was called, becauſe the Tirians, who were the firſt inhabitants, were reported to haue had their firſt beginning out of the red ſea Erythræum. Some thinke that *Geryon* here dwelt, he whoſe droues of cattell *Hercules* had away. Some againe thinke it is another, ouer againſt Luſitania, and there ſometime ſo called.

* I eſſe than 3 quarters of a miles.

* Or Gadiz.

* *Septem*, or as ſome read, *Septum*, *i.* a parke or cloſure.

D

Chap. XXIII.

¶ *The meaſure of all Europe.*

HAuing finiſhed our circuit about Europ, we muſt now yeeld the totall ſumme and complete meaſure of it in the whole, that ſuch as are deſirous of knowledge be not to ſeek in any one thing. *Artemidorus* and *Iſidore* haue ſet downe the length thereof from Tanais to Gades, 84014 miles, *Polybius* hath put down the bredth thereof, from Italy to the Ocean 1150 miles, for as then the largeneſſe thereof was not knowne. Now the very bredth of Italy alone by it ſelfe (as we haue ſhewed) is 1220 miles to the Alps: from whence by Lyons to the Bri-
E taine part of the Morini (which way *Polybius* ſeemeth to take his meaſure) is 1168 miles. But the more certaine meaſure and the longer is directed from the ſaid Alps to the Weſt, and the mouth of the Rhine, through the place called Caſtra Legionum Germaniæ, 1243 miles. Now from henceforward we will deſcribe Africke and Aſia.

THE FIFTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

The description of Africke.

AFricke the Greekes haue called Lybia, euen all that tract from whence the Lybian sea before it beginneth, and endeth in the Ægyptian. No part of the earth receiueth fewer gulfes and armes of the sea, in that long compasse of crooked coasts from the West. The names as well of the Nations as towns there be of all others most hard to be pronounced, vnlesse it be in their owne tongues, and againe they be castles and forts for the most part that they dwell in.

CHAP. I.

¶ *Mauritania.*

AT the beginning, the lands of Mauritania vntill the time of *C. Cæsar*, [i. *Caligula*] sonne of *Germanicus*, were called kingdomes: but by his cruelty diuided it was into two prouinces. The vtmost promontorie of the Ocean is named of the Greeks Ampelusia: the townes therein were Lissa and Cotes, beyond *Hercules* pillars. Now in it is Tingi, sometime built by *Antæus*: and afterward by *Claudius Cæsar* when he made a Colonie of it, it was called Traducta Iulia. It is from Belone a towne in Bætica by the next and neereſt passage ouer sea thirty miles. Fiue and twenty miles from it in the Ocean coast standeth a Colonie erected by *Augustus*, now Iulia Constantia, exempt from the dominion and iurisdiction of the Kings of Zilis, and commanded to go for law and iustice as far as Bætica. And two and thirty miles from it, Lixos, made a Colony by *Claudius Cæsar*; whereof in old time there went many fabulous and loud lying tales. For there stood, they say, the royall pallace of *Antæus*: there was the combat betweene him and *Hercules*: there also were the gardens and hort-yards of the Hesperides. Now there floweth thereinto out of the sea a certain creek or arme thereof, and that by a winding channell, wherein men now take it that there were Dragons seruing in good stead to keep and gard the same. It incloseth an Island within it selfe, which, notwithstanding the Tract thereby be somewhat higher, is onely not ouerflowed by the sea tides. In it there standeth erected an altar of *Hercules*: and setting aside certaine wilde Oliues, nothing else is to be seen of that goodly groue, reported to beare golden Apples. And in good faith lesse may they wonder at the strange lies of Greece, giuen out of these and the riuer Lixus, who would but thinke how of late our countreymen haue deliuered some fables of the same things as monstrous well-neere: to wit, That this a most strong and mighty city, and bigger than great Carthage: moreouer, that it is scituate right against it, aad an infinite way well-neere from Tingi: and other such like, which *Cornelius Nepos* hath been most eager to beleeue. From Lixus forty miles in the midland part of the main stands Babba, another Colony of *Augustus*, called by him Iulia in the field or champian: also a third 75 miles off, called Banasa, but now it hath the addition of Valentia. 35 miles from it is the towne Volubile, iust in the mid way between both seas. But in the coast and borders thereof, fifty miles from Lixus, runneth Subur a goodly plenteous riuer, and nauigable neere to the Colony Banasa. As many miles from it is the towne Sala, standing vpon a riuer

20030
copy 1

A a riuer of the ſame name, neere now vnto the wilderneſſe, much infeſted and annoied with whole heards of Elephants, but much more with the nation of the Autololes, through which lies the way to Atlas the moſt fabulous mountaine of all Africk. For writers haue giuen out, that this hill ariſing out of the very midſt of the ſea ſands, mounteth vp to the skie, all rough, ill fauored, and ouergrowne on that ſide that lieth to the ſhore of the Ocean, vnto which it gaue the name; and yet the ſame is ſhadowie, full of woods, and watered with veines of ſpouting Springs that way which looketh to Africke, with fruitfull trees of all ſorts, ſpringing of the own accord, and bearing one vnder another, in ſuch ſort, that at no time a man can want his pleaſure and delight to his full contentment. Moreouer, that none of the inhabitants there are ſeene all day long: all
B is ſtill and ſilent, like the fearfull horror in deſert wilderneſſe: and as men come neerer and neerer vnto it, a ſecret deuotion ariſeth in their hearts, and beſides this feare and horrour, they are lifted vp aboue the clouds, and euen cloſe to the circle of the Moone. Ouer and beſides, that the ſame hill ſhineth oftentimes with many flaſhes of fires, and is hanted with the wanton laſciuious Ægipanes and Satyres, whereof it is full, that it reſoundeth with noiſe of Haut-boies, pipes, and fifes, and ringeth againe with the ſound of tabers, timbrels, and cymbals. Theſe be the reports of great & famous writers, to ſay nothing of the labors and works both of *Hercules* and *Perſes* there; and to conclude, that the way vnto it is exceeding great, and not certainely knowne. Bookes there were beſides of *Hanno*, a great captain and commander among the Carthaginians, who in the time of the moſt flouriſhing ſtate of Carthage, had a charge and com-
C miſſion to diſcouer and ſuruey the whole compaſſe of Africk. Him, moſt of the Greeks as well as our countreymen following, among ſome other fabulous ſtories, haue written that hee alſo built many cities there; but neither memoriall vpon record, nor any token of them at all is left extant. Whiles *Scipio Æmylianus* warred in Africk, *Polybius* the writer of the Annales, receiued of him a fleet: who hauing ſaled about of purpoſe to ſearch into that part of the world, hath put thus much downe in writing, that from the ſaid mountaine Weſt, toward the forreſt ful of wild beaſts which Africk breedeth, vnto the riuer Anatis, are 485 miles. And from thence to Lixus 205. *Agrippa* ſaith, that Lixus is diſtant from the ſtreights of Gades 112 miles. Then, that there is an arme of the ſea called Saguti. Alſo a towne vpon the promontory, Mutelacha. Riuers, Subur and Sala. Moreouer, that the hauen Rutubis is from Lixus 313 miles. And ſo forward to the Promontorie of the Sun. The port or hauen Riſardir; the Gætulians, Autololes, the riuer
D Coſenus, the nation of the Scelatites and Maſſalians. The riuers Maſatal and Darat, wherein Crocodiles are ingendred. Then forward, that there is a gulfe of 516 miles, incloſed within the promontory or cape of the mountain Barce, running along into the Weſt, which is called Surrentium: after it, the riuer Palſus, beyond which are the Æthiopians Perorſi, & at their back are the Pharuſi. Vpon whom ioine the midlanders, to wit, the Gætulianders. But vpon the coaſt are the Æthyopian Daratites, the riuer Bambotus ful of Crocodiles & Hippopotames [*i.* Waterhorſes.] From which, he ſaith, That there is nothing but mountains all the way as far as to that which we call Theon-Ochema (The gods chariot.) Then, in ſailing nine daies and nights to the promontorie Heſperium, he hath placed the mountain Atlas in mid-way thereof, which by all other writers is ſet downe to be in the vtmoſt marches of Mauritania. The firſt time that the
E Romans warred in Mauritania, was in the time of prince *Claudius* Emperor: at what time as *Ædemon* the freed ſeruant of king *Ptolomæus*, by *C. Cæſar* ſlaine, went about to reuenge his death; for as the barbarous people retired and fled back, certaine it is that the Romans came as far as to the hill Atlas. And not only ſuch Generals as had bin Conſuls, and were of the Senatours degree and calling, who at that time managed and conducted the wars, but knights alſo and gentlemen of Rome, who from that time had gouernment and command there, tooke it for an honor and glory, that they had pierced and entred into Atlas. [* Fiue Romane Colonies, as wee haue ſaid, be in that prouince] and by that common fame and report, there may ſeeme to lie a thorow faire thither. But that is found for the moſt part by daily experience, moſt deceiueable of all things elſe; becauſe perſons of high place and great worth, when they are loath to ſearch
F out narrowly into the truth of matters, ſticke not for ſhame of ignorance, to giue out vntruths; and neuer are men more credulous and apt to beleeue and be deceiued, than when ſome graue perſonage fathereth a lie. And verily I leſſe maruell, that they of gentlemens degree, yea, and thoſe now of Senators calling, haue not come to the certaine knowledge of ſome things there: ſeeing they ſet their whole affection and mind vpon nothing but exceſſe and riot; which how

* It ſeemeth that this clauſe is to be ſet in the beginning of the next chapter.

powerfull

powerfull it is and forcible, is ſeen by this moſt of all, when foreſts are ſought out far and neere G
for Iuory and Citron trees; when all the rocks in Getulia are ſearched for Murices and Purpuræ [ſhell fiſhes that yeeld the purple crimſon colour.] Howbeit, the natural inhabitants of that country do write, That in the ſea coaſt 150 miles from Sala, there is the riuer Aſana, that receiueth ſalt water into it, but hath in it a goodly faire hauen; and not far from it another freſh riuer, which they call Fut: from which to Dyris (for that is the name in their language of Atlas, by a generall conſent) are 200 miles, with a riuer comming betweene, named Vior. And there, the ſpeech ſo goeth, are to be ſeene the certain tokens of a ground ſomtimes inhabited; to wit, the reliques of vine-yards and date tree groues. *Suetonius Paulinus* (a Conſull in our time) who was the firſt Roman leader, that for certaine miles ſpace went ouer Atlas, alſo hath reported verily as touching the height thereof, that with the reſt: and moreouer, that the foot thereof to- H
ward the bottom, ſtand thick and ful of tall woods, with trees therein of an vnknown kinde, but the heigth of them is delectable to ſee to, ſmooth and euen without knots, the leaues & branches like Cypreſſe, and beſides the ſtrong ſmell they yeeld, are couered all ouer with a thinne downe, of which (with ſome help of Art) fine cloath may be made, ſuch as the ſilk-worm doth yeeld. That the top and creſt thereof is couered ouer with deepe ſnow euen in Sommer time. Moreouer, that he reached vp to the pitch of it at the tenth daies end, & went beyond it, as far as a riuer called Niger, through wilderneſſes ful of blacke duſt; where otherwhiles there ſtood out certaine cliffes, and craggie rocks, as they were ſcortched and burnt; and that thoſe places by reaſon of partching heat were not habitable, albeit a man made triall thereof in the winter ſeaſon: furthermore, that the peſants who dwelt in the next foreſts, were peſtred with Elephants, I
wilde beaſts, and ſerpents of all ſorts; and thoſe people were called Canarij; for that they and dogs feed together one with another, and part among them the bowels of wild beaſts. For certaine it is knowne, that a nation of the Æthyopians whom they cal Peroeſi, ioineth vpon them. *Iuba* the father of *Ptolomæus*, who before-time ruled ouer both Mauritanes, a man more memorable and renowned for his ſtudy and loue of good letters, than for his kingdome and royall port, hath written the like concerning Atlas: and he ſaith moreouer, that there is an herb growing there called Euphorbia, of his Phyſitions name that firſt found it: the milkie iuice whereof he praiſeth wondrous much, for to cleare the eies, and to be a preſeruatiue againſt all ſerpents and poiſons whatſoeuer; and thereof hath he written a treatiſe, and made a book by it ſelfe: thus much may ſuffice, if it be not too much, as touching Atlas. K

Chap. II.

¶ *The prouince Tingitania.*

THe length of the Prouince Tingitania taketh 170 miles. The nations therin be theſe: the Mauri, which in times paſt was the principall, and of whom the prouince took name: and thoſe moſt writers haue called Maruſij. Being by war weakened and diminiſhed, they came in the end to a few families only. Next to them were the Maſſæſuli, but in like manner were they conſumed. Now is the prouince inhabited by the Getulians, Bannurri, and the Autololes, the moſt valiant and puiſſant of all the reſt. A member of theſe were ſomtime the Veſuni, but being diuided from them, they became a nation by themſelues, and bounded vpon the L.
Æthiopians. The prouince naturally full of mountains Eaſtward, breedeth Elephants. In the hill alſo Abila, and in thoſe which for their euen and equal height they cal, The 7 brethren: and theſe butt vpon Abila, which looketh ouer into the ſea. From theſe beginneth the coaſt of the Inward ſea. The riuer Timuda nauigable, and a town ſomtime (of that name.) The riuer Laud, which alſo receiueth veſſels. The town Ruſardie, and the hauen. The riuer Malvana nauigable. The towne Siga iuſt againſt Malacha ſcituate in Spaine: the Royall ſeat of *Syphax*, and now the other Mauritania. For a long time they kept the names of KK. ſo as the vtmoſt was called Bogadiana: and likewiſe Bocchi, which now is Cæſarienſes. Next vnto it is the hauen, for the largeneſſe thereof called Magnus, with a towne of Roman citizens. The Riuer Muluca, which is the limit of Bocchi and the Maſſæſuli. Quiza Xenitana, a towne of ſtrangers: Ar- M
ſennaria, a towne of Latines three miles from the Sea: Carcenna, a Colonie of *Auguſtus*, erected for the ſecond Legion: likewiſe another Colonie of his planted with the Pretorian band, Gunugi, and the promontorie of *Apollo*. And a moſt famous towne there Cæſarea, vſually before-time called Iol, the Royall Seat of King *Iuba*: endowed by *Claudius* the Empe-

rour

20030
copy 1

A rour of happie memorie,with the franchiſes and right of a Colonie, at whoſe appointment the old ſouldiers were there beſtowed. A new towne,Tipaſa,with the grant of the liberties of Latium. Likewiſe Icoſium,endowed by *Veſpaſian* the Emperour,with the ſame donations. The colonie of *Auguſtus* Ruſconiæ,and Ruſcurium,by *Claudius* honoured with the free burgeoiſie of the citie. Ruſoezus,a colonie of *Auguſtus*. Salde,a Colonie of the ſame man. Igelgili alſo, and Turca,a towne ſeated vpon the ſea and the riuer Amſaga. Within the land,the Colonie Auguſta,the ſame that Succubar; and likewiſe Tubriſuptus. Cities,Timici,Tigauæ. Riuers, Sardabala and Nabar. The people Macurebi; the riuer Vſar,and the nation of the Nabades. The riuer
B Ampſaga is from Cæſarea 233 miles. The length of Mauritania both the one and the other together,is 839 miles; the breadth 467.

Chap. III.

¶ *Numidia.*

NExt to Ampſaga is Numidia,renowned for the name of *Maſaniſſa*; called of the Greekes the land Metagonitis. The Numidian Nomades,ſo named of changing their paſture,who carry their cottages or ſheds(and thoſe are all their dwelling houſes) about with them vpon waines. Their townes be Cullu and Ruſicade, from which 48 miles off within the Midland parts,is the colonie Cirta,ſurnamed of the Cirtanes: another alſo within and a free bo-
C rough town,named Bulla Regia. But in the vtmoſt coaſt,Tacatua,Hippo Regius, and the riuer Armua. The towne Trabacha,of Roman citizens: the riuer Tuſca, which boundeth Numidia. and beſides the Numidian marble,and great breed of wilde beaſts, nothing is there elſe worth the noting.

Chap. IV.

¶ *Africa.*

FRom Tuſca forward,you haue the region Zeugitana, and the countrey properly called Africa. Three promontories; firſt the White; then anon that of *Apollo* ouer-againſt Sardinia: and a third of *Mercurie* oppoſite to Sicilie, which running into the ſea make two creekes:
D the one Hipponenſis,next to the towne which they call Hippo raſed; the Greeks name it Diarrhyton,for the little brooks and rils that water the grounds: vpon this,there bordereth Theudalis,an exempt towne from tribute,but ſomewhat farther from the ſea ſide; then the promontory of *Apollo*. And in the other creek,Vtica,a towne of Roman citizens,ennobled for the death of *Cato*; and the riuer Bagrada. A place called Caſtra Cornelia: and the colony Carthago, among the reliques and ruines of great Carthage,and the colony Maxulla: towns, Carpi, Miſna,and the free borough Clupea vpon the promontorie of *Mercurie*. *Item*,free townes,Curubis, and Neapolis. Soone after ye ſhall meet with another diſtinction of Africke indeed. Libyphœnices are they called,who inhabit Byzacium; for ſo is that region named; containing in circuit 250 miles,exceeding fertile and plenteous, where the ground ſowne yeeldeth again to
E the husband-man 100 fold increaſe. In it are free townes,Leptis, Adrumetum, Ruſpina and Thapſus: then Thenæ,Macomades,Tacape,Sabrata,reaching to the leſſe Syrtis: to which,the length of Numidia and Africa from Amphaga,is 580 miles: the breadth,c. ...ch thereof as is knowne,200. Now this part which wee haue called Africke, is diuided into prouinces twaine,the old and the new; ſeparated one from the other by a foſſe or ditch brought as farre as to Thenæ, within the Africane gulfe, which towne is 217 miles from Carthage: and that trench *Scipio Africanus* the ſecond,cauſed to be made,& bare halfe the charges together with the KK. The third gulfe is parted into twaine,curſed and horrible places both,for the ebbing and flowing of the ſea,and the ſhelues betweene the two Syrtes. From Carthage to the nearer of them,which is the leſſe,is 300 miles by the account of *Polybius*: who ſaith alſo,that the ſaid
F Syrte is for 100 miles forward dangerous, and 300 about. By land alſo thither, the way is paſſeable by obſeruation of the Stars,at one time of the yeare onely. and that lyeth through deſert ſands and places full of ſerpents. And then you meet with Forreſts repleniſhed with numbers of wilde beaſts. And within-forth Wildernesſes of Elephants: and ſoone after,waſte deſerts euen beyond the Garamantes,who from the Augilæ are diſtant twelue daies iourney.

Aboue

Aboue them was the nation of the Psylli: and aboue them the lake of *Diomedes* enuironed with G
desarts. Those Augylæ themselues are seated well neere in the middle way from Æthyopia, which bendeth Westward, and the countrie lying between the two Syrtes, with equall distance between of both sides: but the shore betweene the two Syrtes of 250 miles. There standeth the citie Ocensus, the riuer Cinyps and the countrie. Townes, Neapolis, Taphra, Abrotonum, the other Leptis, called also the great. Then the greater Syrtis, in compasse 625 miles, and in direct passage 313. Next to it, there inhabit the people Cisipades. In the inmost gulfe was the coast of the Lotophagi, whom some haue called Alachroas, as far as to the alters of Phylæna, and of sand are they. Next to them. not farre from the Continent, the vast and wide Meere admitteth into it the riuer Triton, and taketh the name of him: but *Callimachus* calleth it Pallantias, and saith it is on this side the lesser Syrtes; but many place it between both Cyrtes. The H
promontory that encloses the bigger, is named Boryon. Beyond it is the prouince Cyrenaica. From the riuer Ampsaga to this bound, Africk contains 26 States, who are subiect to the Romane Empire: among which are six colonies besides the aboue-named, Vthina and Tuburbis. Townes endowed with Franchises of Roman citizens 15. Of which those in the midland parts, worthy to be named, are Azuritanum, Abutucence, Aborienſe, Canopicum, Chilmanense, Simittuense, Thunusidense, Tuburnicense, Tynidrumense, Tribigense, Vcitana twain, the greater and the lesse, and Vagiense. One towne enioying the liberties of Latium, Vsalitanum. One tributary or pensionary towne neere Castra Cornelia, paieth custome and duties to Rome. Free townes 30, of which there are to be named within-forth, Arolitanum, Acharitanum, Auinense, Abziritanum, Canopitanum, Melzitanum, Madaurense, Salaphitanum, Tusdritanum, Tiricen- I
se, Tiphicense, Tunicense, Theudense, Tagestense, Tigense, Vlusibritanum, another Vagense, Vigense and Zamense. The rest may well be called not only cities, but also for the most part, Nations, namely the Natadontes, Capsitani, Misulani, Sabarbares, Massili, Misiues, Vamacures, Ethini, Massini, Marcubij, and Gætulia all and whole, euen to the riuer Nigris, which parteth Affricke and Æthiopia.

Chap. V.

¶ *Cyrene.*

THe region Cyrenaica, called also Pentapolitana, is famous and renowned for the Oracle of *Hammon*, which is from Cyrenæ 400 miles, for the fountaine of the Sunne, and princi- K
pally for 5 cities, Berenice, Arsinoe, Ptolemais, Apollonia, and Cyrene it selfe. Berenice standeth vpon the vtmost winding and nouke of Syrtis, called sometim the city of the aboue-named Hesperides, according to the wandering tales of Greece. And before the towne, not far off, is the riuer Lethon, the sacred groue where the hort-yards of these Hesperides are reported to be. From Leptis it is 385 miles. From it stands Arsinoe, vsually named Teuchira, 43 miles: and from thence 22 miles, Ptolemais, called in old time Barce. And then 250 miles off the promontory Phycus runs out along the Creticke sea, distant from Tænarus a cape of Laconia, 350 miles: but from Creet it selfe 125 miles. And after it Cyrene, 11 miles from the sea. From Phycus to Apollonia is 24 miles: to Cherronesus 88: and so forth to Catabathnus 216 miles. The inhabitants there bordering, be the Marmaridæ, stretching out in length almost from Pa- L
rætonium to the greater Syrtis. After them the Araraucele: and so in the very coast and side of Syrtis, The Nasamones, whom before-time the Greekes called Mesammones by reason of the place, for that they were seated in the middest betweene the two quicke sands. The Cyrenaick countrie, for the space of 15 miles from the sea side, is fruitfull for trees: and for the same compasse within the land, but for corne onely: but then for 30 miles in bredth, and 250 in length, for the gum Laser and nothing else. After the Masamones, the Hasbitæ and Masæ do liue. Beyond them the Hammanientes, eleuen daies iournie from the greater Syrtes to the West, and euen they also euery way are compassed about with sands: howbeit they find without much ado pits almost in cubits deepe, for that the waters there of Mauritania doe ouerflow. Houses they
make themselues of salt, hewed out of their owne hils in maner of stone. From these to the Tro- M
glodites, in the Southwest coast is foure daies iournie, with whom they chaffer and traffick only for a certaine precious stone or gem, which we call a Carbuncle, brought out of Æthyopia. There comes betweene, the countrie Phazania, lying toward the wilderneſſe aboueſaid of Affrick, aboue the lesse Syrtis: where we subdued the nation of the Phazanij, together with the ci-

ties

20030
copy 1

A ties Alele and Cillaba. In like manner Dydamum ouer-againſt Sabrata. Next to whom there is a mountain, reaching a great way from the Eaſt into the Weſt, called by our men Ater, naturally as it were burnt, & like as if it were ſcorched, and ſet on fire with the reflection of the Sun. Beyond that mountain are the deſarts: alſo Matelgæ a town of the Garamants, & likewiſe Debris, which caſteth forth a ſpring of waters ſeething vp from noon to midnight exceeding hot: and for as many houres again into midday moſt chilling cold; alſo the moſt goodly towne Garama, the chiefe head of the Garamantes. All which places the Romanes haue conquered by force of armes, and ouer them *Cornelius Balbus* triumphed, the onely man of forreiners that was honoured with the triumphant chariot, and endowed beſides with the freedome of Romane
B citizens. For why, being borne at Gades, he and his vncle both, *Balbus* the elder, were made free denizons of Rome. And this is maruell that our writers haue recorded, that beſides the towns abouenamed by him conquered, himſelfe in his triumph caried the titles and pourtraictes not of Cydamus and Garama only, but alſo of all other nations and cities, which were ranged in a Roll, and went in this order, The towne Tabidium, the nation Niteris, the towne Negligemela, the Nation Bubeium, the town Vel, the nation Enipi, the town Thuben, the hill named Niger. The towns Nitibrum and Rapſa, the nation Diſcera, the town Debris, the riuer Nathabur, the towne Tapſagum, the nation Nannagi, the towne Boin, the towne Pege, the riuer Daſibari. And again forward, theſe townes lying one to another together, Baracum, Buluba, Alaſi, Balſa, Galla, Maxala, and Zizama. The hill Gyri, wherein *Titus* hath reported that precious ſtones were engendred. Hitherto the way to the Garamants, was intricat and vnpaſſable, by rea-
C ſon of the robbers and theeues of that countrey, who vſed to dig certain pits in the way (which to them that know the quarters of the counttey, is no hard matter to doe) and then couer them lightly ouer with ſand. But in the laſt war which the Romans maintained againſt the Oenſes, vnder the conduct and fortunate auſpices of *Veſpaſian* the Emperor, there was found a ſhort and neere way of foure daies iourney; & this way is called *Præter caput Saxi* (beſides the rocks head) The frontier towne of Cyrenaica is called Catabathmos, which is a towne and a vaile all on a ſudden falling with a ſteepe deſcent. To this bound, from the leſſe Syrtis, Cyrenaica Africa lieth in length 1060 miles, and in bredth, for ſo much as is knowne, 800.

Chap. VI.

D ¶ *Lybya Mareotis.*

THe countrey following is named Mareotis Libya, and boundeth vpon Ægypt, inhabited by the Marmaridæ, Adyrmachidæ, and ſo forward with the Mareotæ. The meaſure of it from Catabathmos to Paretonium, is 86 miles. In that tract there lyeth in the way betweene the village Apis, a place renowned for the religious rites of Ægypt. From it to Parætonium are 12 miles. From thence to Alexandria 200 miles: the bredth thereof is 169 miles. *Eratoſthenes* hath deliuered in writing, that from Cyrenæ to Alexandria by land is 525 miles. *Agrippa* ſaith, that the length of all Africk from the Atlanticke ſea, together with the inferiour part of Ægypt containeth 3040 miles. *Polybius* and *Eratoſthenes*, reputed to haue bin moſt exact and curious in this kinde, ſet downe, from the Ocean to great Carthage 1600 miles. From thence
E to Canopicum the neereſt mouth of Nilus, they make 1630 miles. *Iſidore* reckoneth from Tingi to Canopus 3599 miles. And *Artemidorus* forty leſſe than *Iſiodorus*.

Chap. VII.

¶ *Iſlands about Africke, and ouer againſt Africke.*

THeſe ſeas haue not very many Iſlands within them. The faireſt of them all is Meninx, 35 miles long, and 25 broad, called by *Eratoſthenes* Lotophagitis. Two towns it hath, Meninx on Africke ſide, and Thoar on the other: it ſelfe is ſcituate from the right hand promonto-
F rie of the leſſe Syrtis *200 paces. A hundred miles from it againſt the left hand is Cercina, with a free towne of the ſame name, in length it is 25 miles, and halfe as much in bredth where it is moſt; but toward the end not aboue fiue miles ouer. To it there lieth a pretty little one toward Carthage called Cercinitis, & ioineth by a bridge vnto it: from theſe almoſt 50 miles, lies Lopaduſa ſix miles long. Then, Gaulos and Galata: the earth whereof killeth the Scorpion, a fell

*Or 1500 paces, i. a mile and a half.

crea-

creature,and noiſome to Africke. Men ſay alſo that they wil die in Clupea,ouer againſt which G
lieth Corſyra,with a towne. But againſt the gulfe of Carthage be the two Æginori,rocks more like than Iſlands,lying moſt between Sicily and Sardinia. There be that write how theſe ſomtime were inhabited,but afterwards ſunke downe and were couered.

Chap. VIII.

¶ *The Æthyopians.*

BVt within the inner compaſſe and hollow of Africke toward the South, & aboue the Gætulians,where the deſarts come between,the firſt people that inhabit thoſe parts,be the Libij Ægyptij,and then the Leucæthiopes. Aboue them are the Æthyopian nations, to wit, the Nigritæ,of whom the riuer tooke name: the Gymetes,Pharuſi, and thoſe which now reach H
to the Ocean,whom we ſpake of in the marches of Mauritania, namely, the Perorſi. From all theſe,it is nothing but a wilderneſſe Eaſtward,till you come to the Garamantes,Augylæ, and Troglodites,according to the moſt true opinion of them,who place 2 Æthyopiaes aboue the deſarts of Africk; and eſpecially of *Homer*,who ſaith,that the Æthyopians are diuided 2 waies, namely,Eaſt and Weſt. The riuer Nyger is of the ſame nature that Nilus. It bringeth forth Reed and Papyr,breedeth the ſame liuing creatures,and riſeth or ſwelleth at the ſame ſeaſons. It ſpringeth betweene the Tareleia Æthyopians,and the Oecalicæ. The towne Mavin belonging to this people,ſome haue ſet vpon the wilderneſſe; as alſo,neere vnto them, the Atlantes, the Ægipanes,halfe wilde beaſts,the Blemmyi,the Gamphaſants,Satyres, & Himantopodes. Thoſe Atlantes if we will beleeue it,degenerate from the rites and manners of all other men. I
For neither call they one another by any name,and they look wiſtly vpon the Sun,riſing,& ſetting,with moſt dreadful curſes,as being pernicious to them & their fields; neither dream they in their ſleep as other men. The Troglodites dig hollow caues, and theſe ſerue them for dwelling houſes: they feed vpon the fleſh of ſerpents. They make a gnaſhing noiſe,rather than vtter any voice,ſo little vſe haue they of ſpeech one to another. The Garamants liue out of wedlock and conuerſe with their women in common. The Augylæ do no worſhip to any but to the diuels beneath. The Gamphaſantes bee all naked,and know no Wars, and ſort themſelues with no forrainer. The Blemmyi,by report haue no heads,but mouth and eies both in their breſt: the Satyres beſides their ſhape only,haue no properties nor faſhions of men. The Ægipanes are ſhaped,as you ſee them commonly painted. The Himantopodes be ſome of them limber legged K
and tender,who naturally go creeping on the ground. The Pharuſi,ſometime Perſæ,are ſaid to haue bin the companions of *Hercules*,as he went to the Heſperides. More of Africke worth the noting,I haue not to ſay.

Chap. IX.

¶ *Of Aſia.*

VNto it ioineth Aſia,which from the mouth of Canopus vnto the mouth of Pontus, after *Timoſthenes* 2639 miles. From the coaſt of Pontus to that of Mæotis, *Eratoſthenes* ſaith,is L
1545 miles. The whole,together with Egypt vnto Tanais,by *Artemidorus* and *Iſidorus*,taketh 8800 miles. Many ſeas there be in it,taking their names of the borderers; and therefore they ſhall be declared together with them. The next country to Africk inhabited,is Ægypt,lying far within-forth to the South,ſo far as the Æthyopians,who border vpon their backs. The nether part thereof the riuer Nilus,diuided on the right hand and the left, by his claſping doth bound and limit,with the mouth of Canopus from Africke,with the Peluſiake from Aſia, and carrieth a ſpace between of 170 miles. Whereupon,conſidering that Nilus doth ſo part it ſelf, ſome haue reckoned Ægypt among the Iſlands,ſo as it maketh a triangular figure of the land. And here it is that many haue called Ægypt by the name of the Greeke letter Delta, Δ. The meaſure of it from the channell where it is but one,and from whence it beginneth firſt to part M
into skirts and ſides,vnto the mouth of Canopus,is 146 miles; and to the Peluſiak 256: the vpmoſt part therof bounding on Æthyopia,is called Thebais. Diuided it is into townes hips with ſeueral iuriſdictions,which they cal Nomos; to wit,Ombites, Phatuites, Apollopolites, Hermonhites, Thinites,Phanturites,Captites,Tentyrites,Dioſpalites,Antæopolites,Aphroditopolites,

20030
copy 1

A lites,and Lycopolites. The country about Peluſium,theſe town-ſhips with their ſeueral iuriſdictions,Pharbœtites,Bubaſtites,Sethroites,& Tanites.The reſt haue theſe following,the Arabicke, the Hammoniacke which extendeth to the Oracle of *Iupiter Hammon*, Oxyrinchites, Leontopolites,Atarrabites,Cynopolytes,Hermopolites:Xoites, Mendeſins, Sebennites, Capaſtites,Latapolites,Heliopolites,Proſopites,Panopolites, Buſirites,Onuphites,Sorites,Ptenethu,Pthemphu,Naucratites,Nitrites,Gynæcopolites,Menelaites,in the country of Alexandria. In like manner of Libya Mareotis. Heracleopolites is in the Iſland of Nilus,fiftie miles long,wherein alſo is that which they call *Hercules* his town. Two Arſinoites there be they,and Memphites reach as farre as two the head of Delta.Vpon it there do bound out of Affrica the two Ouafitæ.There be that change ſome names of theſe,and ſet down for them other iuriſdictions,to wit,Heroopolites,and Crocodilopolites. Between Arſinoites and Memphites there
B was a lake 250 miles about,or as *Mutianus* ſaith,450, fifty paces deep,[*i.* 150 foot,]& the ſame made by mans hand,called the Lake Mæridis, of a king who made it.72 miles from thence is Memphis,the caſtle in old time of the Ægyptian kings. From which to the Oracle of *Hammon* is twelue daies iournie, & ſo to the diuiſion of Nilus,which is called Delta,fifteen miles.The riuer Nilus riſing from vnknowne ſprings,paſſeth thorow deſarts and hot burning countries: and going thus a mighty way in length,is known by fame onely,without armes,without wars, which haue diſcouered and found out all other lands.It hath his beginning,ſo far forth as *Iuba* was able to ſearch and find out,in a hil of the lower Mauritania,not far from the Ocean,where a lake preſently is ſeen to ſtand with water,which they call Nilides.In it are found theſe fiſhes
C called Alabetæ,Coracini,Siluri,and the Crocodile.Vpon this argument & preſumption Nilus is thought to ſpring from hence,for that the pourtract of this ſource is conſecrated by the ſaid prince at Cæſaria,in Iſeum,and is there at this day ſeene.Moreouer,obſerued it is,that as the Snow or rain do ſatisfie the countrie in Mauritania,ſo Nilus doth encreaſe.When it is run out of this lake,it ſcorneth to run through the ſandy and ouergrown places, and hides himſelf for certaine daies iourny. And then ſoone after out of a greater lake, it breaketh forth in the country of the Maſſæſyli,with Mauritania Cæſarienſes,and lookes about viewing mens company,carrying the ſame arguments ſtill of liuing creatures bred within it.Then once again being receiued within the ſands,it is hidden a ſecond time for twenty daies iourny,in the deſarts as farre as to the next Æthiopes:and ſo ſoone as hee hath once againe eſpied a man, forth hee
D ſtartes(as it ſhould ſeem)out of that ſpring,which they called Nigris.And then diuiding Affrick from Æthiopia, being acquainted, if not preſently with people,yet with the frequent company of wild and ſauage beaſts,and making ſhade of woods as he goes he cuts through the middeſt of the Æthiopians:there ſurnamed Aſtapus,which in the language of thoſe nations ſignifieth a water flowing out of darkeneſſe. Thus daſheth he vpon ſuch an infinite number of Iſlands,and ſome of them ſo mighty great,that albeit he bare a ſwift ſtreame,yet is he not able to paſſe beyond them in leſſe ſpace than 5 daies.About the goodlieſt and faireſt of them Meroe,the chanell going on the left hand is called Aſtabores, that is, the branch of a water comming forth of darkeneſſe:but that on the right hand Aſtuſapes,which is as much as, lying hid, to the former ſignification.And neuer taketh the name of Nilus, before his waters meet again
E & accord all whole together.And euen ſo was he aforetime named Siris,for many miles ſpace: and of *Homer* altogether Ægyptis:and of others, Triton: here and there,and euer and anon hitting vpon Iſlands,and ſtirred as it were with ſo many prouocations:and at the laſt encloſed and ſhut within mountaines, and in no place he caries a rougher and ſwifter ſtream,whiles the water that he beareth,haſtens to a place of the Æthiopians called Catadupi,where in the laſt fall among the rockes that ſtand in his way, he is ſuppoſed not to runne, but to ruſh downe with a mighty noiſe. But afterwards he becomes more milde and gentle, as the courſe of his ſtreame is broken,and his violence tamed and abated,yea,and partly wearied with his long way: and ſo though with many mouths of his,he diſchargeth himſelfe into the Ægyptian ſea.Howbeit at certaine ſet daies he ſwelleth to a great height:and when he hath trauelled all ouer Ægypt,hee
F ouerfloweth the land,to the great fertility and plenty thereof. Many and diuers cauſes of this riſing and increaſe of his, men haue giuen:but thoſe which carry the moſt probabilitie, are either the rebounding of the water,driuen back by the winds Eteſiæ,at that time blowing againſt it,and driuing the ſea withall vpon the mouths of Nilus:or elſe the Summer rain in Æthiopia by reaſon that the ſame Eteſiæ bring clouds thither from other parts of the world.*Timæus* the

Mathematician,alledged an hidden reaſon therof,to wit,that the head and ſource of Nilus is named Phyala,and the riuer it ſelfe is hidden,as it were drowned within certain ſecret trenches within the ground, breathing forth vapors out of reeking rockes,where it thus lieth in ſecret. But ſo ſoone as the ſunne during thoſe daies,commeth neere, drawne vp it is by force of heate, and ſo all the while he hangeth aloft,ouerfloweth:and then againe for feare he ſhould be wholly deuoured and conſumed,putteth in his head againe and lieth hid. And this happeneth from the riſing of the dog ſtarre Sicinus,in the Sunnes entrance into Leo,while the planet ſtandeth plumbe ouer the fountaine aforeſaid:for as much as in that climate there are no ſhadows to be ſeene. Many againe were of a different opinion,that a riuer floweth more abundantly,when the Sunne is departed toward the North pole,which happeneth in Cancer and Leo: and therefore at that time is not ſo eaſily dried:but when he is returned once againe back toward Capricorn and the South pole,it is drunke vp,and therefore floweth more ſparely. But if according to *Timæus* a man would thinke it poſſible that the water ſhould be drawne vp,the want of ſhadowes during thoſe daies,and in thoſe quarters,continueth ſtill without end. For the riuer begins to riſe and ſwell at the next change of the Moone after the Sun-ſteed,by little and little gently,ſo long as he paſſes through the ſigne Cancer,but moſt abundantly when he is in Leo. And when he is entred Virgo,he falleth and ſettleth low again,in the ſame meaſure as he roſe before. And is cleane brought within his bankes in Libia,which is, as *Herodotus* thinketh, by the hundreth day. All the whiles it riſeth, it hath been thought vnlawfull for kings or gouernours to ſaile or paſſe in any veſſell vpon it,and they make conſcrence ſo to do. How high it riſeth,is known by markes and meaſures taken of certaine pits. The ordinary height of it is ſixteen cubits. Vnder that gage the waters ouerflow not all. Aboue that ſtint there are a let and hinderance, by reaſon that the later it is ere they be fallen,and downe again. By theſe,the ſeed time is much of it ſpent,for that the earth is too wet. By the other there is none at all,by reaſon that the ground is dry and thirſty. The prouince taketh good keep and reckoning of both,the one as well as the other;For when it is no higher than 12 cubits,it findeth extream famine:yea, and at 13 it feeleth hunger ſtill,14 cubits comforts their hearts, 15 bids them take no care, but 16 affoordeth them plenty and delicious dainties. The greateſt floud that euer was knowne vntill thiſe daies was 18 cubits,in the time of Prince *Claudius* Emperor:and the leaſt,in the Pharſalian warre, againſt the death of *Pompey*: as if the very riuer by that prodigious token lothed to ſee the ſame. When at any time the waters ſeeme to ſtand and couer the ground ſtill,they are let out at certaine ſluces,or floud-gates drawne vp and ſet open. And ſo ſoon as any part of the land is freed from the water,ſtraight waies it is ſowed. This is the only riuer of all others that breatheth out no wind from it. The Seignory & dominion of Ægypt beginneth at Syene, the frontier rowne of Æthiopia. For that is the name of a demy Iſland 100 miles in compaſſe, wherein are the Ceraſtæ vpon the ſide of Arabia:and ouer againſt it the 4 Iſlands Philæ, 600 miles from the partition of Nilus,where it began to be called Delta,as wee haue ſaid. This ſpace of ground hath *Artemidorus* deliuered,and withall, that within it were 250 townes. *Iuba* ſeteth down 400 miles. *Ariſtocreon* ſaith,that from Elephantis to the ſea is 750 miles. This Elephantis being an Iſland,is inhabited beneath the loweſt cataract or fal of water 3 miles,and aboue Syene 16:and it is the vtmoſt point that the Ægyptians ſaile vnto,& is from Alexandria 586 miles. See how far the Authors aboue written, haue erred and gone out of the way: there meet the Æthiopian ſhips,for they are made to fold vp together, and carry them vpon their ſhoulders, ſo often as they come to thoſe cataracts or downefals afore-ſaid. Ægypt ouer and aboue all other their boaſt and glory of antiquitie,brags that in the raigne of king *Amaſis*, there were inhabited in it and peopled twenty thouſand cities. And euen at this day full it is of them,ſuch as they be,and of baſe account. Howbeit, that of *Apollo* is much renowmed, as alſo neere vnto it another of Leucathea,and* Dioſpolis the great,the very ſame that Thebes,famous for the 100 gates in it. Alſo, Captos, a great mart towne next to Nilus, much frequented for merchandiſe and commodities out of India and Arabia. Moreouer the towne of *Venus*,and another of *Iupiter*,& Tentyris,beneath which ſtandeth Abydus, the royall ſeate of *Memnon*,and Oſiris renowmed for the temple there, ſeuen miles and an halfe diſtant from the riuer,toward Lybia. Then Ptolemais,Panopolis,and another yet of *Venus*. Alſo in the Lybian coaſt, Lycon,where the hils doe bound Thebais. Soone after,theſe townes of *Mercurie*, Alabaſton, Canum, and that of *Hercules* ſpoken of before. After theſe, Arſinoe, and the aboue-ſaid Memphis, betweene which

* The citie of Iupiter.

and

20030
copy 1

A and the dioceſſe Arſinoetis, in the Lybian coaſt, the towers called Pyramides, the Labyrinth built vp in the lake of Mœris without any iot of timber to it, and the town Crialon. One more beſides, ſtanding within-forth and bounding vpon Arabia, called the towne of the Sunne, of great account and importance.

Chap. X.

¶ *Alexandria.*

BVt right worthy of praiſe is Alexandria, ſtanding vpon the coaſt of the Egyptian ſea, built by *Alexander* the Great on Africke ſide, 12 miles from the mouth of Canopus, neere to the lake Mareotis; which was before-time called * Arapotes. *Danochares* the Architect (a * Rachoberis
B man renowned for his ſingular wit many waies!) aid the modell and platforme therof by a ſubtil and witty deuiſe; for hauing taken vp a circuit of 15 miles for the city, he made it round like to a Macedonian cloke, ful in the skirts, bearing out into angles and corners, as wel on the right hand as the left, ſo as it ſeemed to lie in folds and plaits; and yet euen then he ſet out one fifth part of all this plot for the kings palace. The lake Marcotis from the South ſide, meeteth with an arme of the riuer Nilus, brought from out of the mouth of the ſaid riuer called Canopicus: for the more commodious trafficke and commerce out of the firme ground and inland Continent. This lake containeth within it ſundry Iſlands, and (according to *Claudius Cæſar*) it is thirty miles ouer. Others ſay, that it lieth in length 40 Schœni, and ſo, whereas euery Schœne is 30 ſtadia, it commeth by that account to be 150 miles long, and as many broad. Ouer and beſides,
C there be many goodly faire towns of great importance, ſtanding vpon the riuer Nilus where he runneth, and thoſe eſpecially which haue giuen name to the mouthes of the riuer, and yet not to all thoſe neither (for there be 11 of them in all, ouer and beſides foure more, which they themſelues call baſtard mouthes) but to 7 of the principall: to wit, vpon that of Canopus, next vnto Alexandria; then Bolbitinum, and ſo foorth to Sebenniticum, Phatuiticum, Mendeſicum, Taniticum, and laſt of all Peluſiacum. Other cities there be beſides, to wit, Buros, Pharbœtos, Leontopolis, Achribris, Iſis towne, Buſiris, Cynophis, Aphrodites, Sais, Naucratis, of which ſome thinke the mouth Naucraticum tooke the name, which they be that cal Heracleoticum, preferring it before Canopicum, next vnto which it ſtandeth.

D

Chap. XI.

¶ *Arabia [the Deſart or Petræa.]*

BEing once paſt that arme of the riuer Nilus, which entereth into the ſea at Peluſium, you come into Arabia, confining vpon the red ſea; and that other Arabia, ſo rich & odoriferous, and therefore renowned with the ſyrname of Happie. As for this deſart Arabia, poſſeſſed it is by the Catabanes, Esbonites, and Screnite Arabians: all barren and fruitleſſe, ſaue whereas it meeteth with the confines of Syria, and ſetting aſide the mountaine Caſius, nothing memorable. This region confronteth the Arabians Canchlei on the Eaſt-ſide, and the Cedræi Southward, and they both confine together afterwards vpon the Nabathæes. Moreouer, 2 Baies there
E bee, the one called the gulfe of Heroopolis, and the other of Elani; both in the red ſea on the coaſt of Egypt, 150 miles diſtant, betweene two townes, Elana, and Gaza, which is in our (Mediteranean) ſea. *Agrippa* counteth from Peluſium to Arſinoe, a towne ſcituate vpon the red ſea, an hundred and fiue and twenty miles. See how ſmall a way lyeth betweene two Climates ſo different in Nature.

Chap. XII.

¶ *Syria, Paleſtine, Phœnice.*

F VPon the coaſt of the ſaid Arabia, confineth Syria; a Region in times paſt, the chiefe and moſt renowned vpon earth; and the ſame diſtinguiſhed by ſundry names. For where it confineth vpon the Arabians, called it was Paleſtina, Iurie, Cœle-Syria, and afterward, Phœnice. But go farther within the firme land, Damaſcene. Turne more ſtill Southwards, it is named Babylonia. And the ſame, between the riuers Euphrates and Tygris, carrieth the name

of Meſopotamia. Beyond the mountaine Taurus, it is Sophene; but on this ſide the hill, they call Comagene. The countrey beyond Armenia, is Adiabenæ, named before-time Aſſyria: but the marches of Syria, which confront Cilicia, is knowne by the name of Antiochia. The whole length of Syria, from the frontiers of Cilicia to Arabia, containeth 470 miles: the bredth between Seleucia Pieria, to Zeugina, a towne ſeated vpon Euphrates, taketh 175 miles. They that make a more ſubtill and particular diuiſion, would haue Phœnice to be enuironed with Syria. And firſt, as you come from Arabia, is the ſea-coaſt of Syria, which compriſeth in it Idumæa & Iudæa; then you enter into Phœnicia, and ſo into Syria again, when you are paſt Phœnicia. And within-forth farther into the country, Phœnice is incloſed with Syria Damaſcena. All that ſea yet, which beateth vpon that coaſt, beareth the name of the Phœnician ſea. As for the nation it ſelfe of the Phœnicians, haue been highly reputed for their Science and learning, and namely, for the firſt inuention of letters, for their knowledge in Aſtrologie, nauigation, and martial skill. Being paſt Peluſium, you come to a city called Chabriæ Caſtra to the mountain Caſius, and the temple of *Iupiter Caſius*: alſo the tombe of *Pompeius Magnus*; and laſt of all to the city Oſtracium. To conclude, from Peluſium to the frontiers of Arabia the Deſart [alongſt the coaſt of Syria] are 65 miles.

Chap. XIII.

¶ *Idumæa, Syria, Paleſtina, Samaria.*

SOon after beginneth Idumæa & Paleſtina, euen from the riſing vp of the lake Sirbon, which ſome haue reported to carry a circuit of 150 miles. *Herodotus* ſaith, it is hard vnder the foot of the hill Caſius: but at this day it is but a ſmall lake. As for the towns there, they be Rhinocolura, and more within the land, Rhaphæa: alſo Gaza a port towne, and farther within, Anthedon, and the mountain Angoris. From thence you deſcend to the coaſt of Samaria, the free citie Aſcalon, and Azotus; the two Iamnes, whereof the one is well within the land; and ſo forward to Ioppe, a towne in Phœnicia, which by report, is more antient than the deluge. Scituate it is vpon an hill, with a rocke before it, wherein are to be ſeen the tokens and reliques of Lady *Andromedaes* priſon where ſhe was bound. Within a chappell there, the Siren *Decreto*, whereof the Poets tell ſuch tales, is worſhipped. Being paſt Ioppe, you meet with Apollonia: the towne of Strato, called alſo Cæſarea, founded by K. *Herod:* it beareth now the name of Prima Flauia, a colony there planted and endowed with priuiledges by *Veſpaſian* the Emperor. The bounds of Paleſtina be 180 miles from the confines of Arabia: and there entreth Phœnice. Within-forth in the countrey, are the townes of Samaria, and Neapolis, which before-time was named Mamortha (or Maxbota.) Alſo Sabaſte vpon the mountain, and Gamala, which yet ſtandeth higher than it.

Chap. XIIII.

¶ *Iurie and Galilæa.*

ABoue Idumæa and Samaria, Iudæa ſpreadeth out far in length and breadth. That part of it which ioineth to Syria, is called Galilæ: but that which is next to Syria and Egypt, is named Peræa, [*i*. beyond Iordan.] Full of rough mountaines diſperſed here and there: and ſeuered it is from other parts of Iury, by the riuer Iordan. As for the reſt of Iudæa, it is diuided into ten gouernments or territories, called Toparchies, in this order following: to wit, that of Hiericho, a vaile richly planted with Date trees: Emmaus, well watered with fountaines: Lydda, Ioppica, Accrabatena, Gophnitica, Thamnitica, Betholene, Tephenæ, and Orine, wherein ſtood Ieruſalem, the goodlieſt citie of all the Eaſt parts, and not of Iury onely. In it alſo is the principalitie Herodium, with a famous towne of that name.

Chap. XV.

¶ *Iordane the Riuer.*

THe riuer Iordan ſpringeth from the fountaine Paneades, which gaue the Syrname to the citie Cæſarea, whereof we will ſpeake more. A pleaſant riuer it is, and as the ſite of the countrey will permit and giue leaue, winding and turning in and out, ſeeking as it were for loue

20030
copy 1

A loue and fauour, and applying it ſelfe to pleaſe the neighbor inhabitants. Full againſt his will, as it were, he paſſeth to the lake of Sodom, Aſphaltites, that ill-fauored and curſed lake: and in the end falleth into it, and is ſwallowed vp of it, where amongſt thoſe peſtilent and deadly waters, he loſeth his owne that are ſo good and wholeſome. And therefore to keep himſelfe out of it as long as he poſſibly could, vpon the firſt opportunity of any vallies, hee maketh a lake, which many call Geneſara, which is 16 miles long, and 6 broad. The ſame lake is enuironed with diuers faire and beautifull townes; to wit, on the Eaſt ſide, with Iulias and Hippo; on the South, with Tarichea, of which name, the lake by ſome is called Tarichion; and on the Weſt, with Tiberias, an healthfull place for the baines there of hot waters.

B

Chap. XVI.

¶ *Aſphaltites.*

ASphaltites, or the lake of Sodom, breedeth and bringeth forth nothing but Bitumen; and thereupon it tooke the name. No liuing body of any creature doth it receiue into it: buls and camels ſwim and flote aloft vpon it. And hereupon ariſeth that opinion which goeth of it, That nothing there wil go downe and ſink to the bottome. This lake in length exceedeth 100 miles, 25 miles ouer it is at the broadeſt place, and ſix at the narroweſt. On the Eaſt, the Arabian Nomades confront it; and on the South ſide, Machærus regardeth it: in time paſt, the ſecond fortreſſe of Iudæa, and principall next to Ieruſalem. On the ſame coaſt, there is a fountain of hot waters, wholeſome and medicinable, named Callirhoe, and good againſt many diſeaſes.
C The very name that it carrieth, importeth no leſſe praiſe and commendation.

Chap. XVII.

¶ *The people Eſſeni.*

ALong the Weſt coaſt inhabit the Eſſeni. A nation this is, liuing alone and ſolitarie, and of all others throughout the world moſt admirable and wonderfull. Women they ſee none: carnal luſt they know not; they handle no mony, they lead their life by themſelues, and keepe company onely with Date trees. Yet neuertheleſſe, the countrey is euermore well peopled, for that daily numbers of ſtrangers reſort thither in great frequencie from other
D parts: and namely, ſuch as be weary of this miſerable life, are by the ſurging waues of frowning fortune driuen hither, to ſort with them in their manner of liuing. Thus for many thouſand yeares [a thing incredible, and yet moſt true] a people hath continued without any ſupply of new breed and generation. So mightily increaſe they euermore, by the weariſome eſtate & repentance of other men. Beneath them ſtood ſometime Engadda, for fertilitie of ſoile and plenty of Date-tree groues, accounted the next city in all Iudæa, to Ieruſalem. Now, they ſay, it ſerueth for a place only to inter their dead: beyond it, there is a caſtle or fortreſſe ſcituat on a rock, and the ſame not far from the lake of Sodom Aſphaltites. And thus much as touching Iudæa.

E

Chap. XVIII.

¶ *Decapolis.* [i. *Cœle-Syria.*]

THere ioyneth to it on Syria ſide, the region Decapolis, ſo called of the number of townes and cities in it. Wherein, all men obſerue not the ſame, nor make like account: howbeit moſt men ſpeake of Damaſcus and Opotos, watered with the riuer Chryſorrhoa. Alſo, Philadelphia, renowned for the fruitfull territory about it. Moreouer, of Scythopolis, taking name of the Scythians there planted: and before-time Myſa, ſo named of Prince or Father *Bacchus*, by reaſon that his nource there was buried. Alſo Gadara, ſcituate on the riuer Hieromiax, running euen before it. Beſides, the aboue-named Hippos Dios. Likewiſe Pella, enriched with the good fountains: and laſt of all, Galaza and Canatha. There lie betweene and about theſe
F cities, certaine Royalties called Triarchies, containing euery one of them as much as an whole countrey: and reduced they be as it were into ſeuerall countries; namely, Trachonitis Panias, wherein ſtandeth Cæſarea, with the fountain aboue-ſaid, Abila, Arca, Ampeloeſſa, and Gabe-

Chap. XIX.

¶ *Tyre and Sidon.*

REturne now we muſt to the ſea-coaſt of Phœnice. A riuer runneth there called Crocodilon, whereupon ſtood a towne in times paſt bearing the name. Alſo there remain in thoſe parts the bare reliques ſtill of cities, to wit, Dorum, Sycaminum, the cape or promontory Carmelum; and a towne vpon the hill ſo named; but in old time called Ecbatana. Neere ther to Getta and Iebba; the riuer Pagida or Pelus, carrying chryſtall glaſſe with his ſands vpon the ſhore. This riuer commeth out of the meere Ceudeuia, from the foot of mount Carmel. Neere vnto it is the city Ptolemais, erected in forme of a colony, by *Claudius Cæſar*; in ancient time called Are. The towne Ecdippa, and the cape Album. Then followes the noble citie Tyrus, in old time an Iſland, lying almoſt 3 quarters of a mile within the deepe ſea: but now, by the great trauell and deuiſes wrought by *Alexander* the Great at the ſiege thereof, ioyned to the firme ground: renowmed, for that out of it haue beene three other cities of ancient name, to wit, Leptis, Vtica, and that great Carthage, which ſo long ſtroue with the Empire of Rome for the monarchy and dominion of al the whole world: yea, and Gades, diuided as it were from the reſt of the earth, were peopled from hence. But now at this day all the reputation and glory thereof, ſtands vpon the die of purple & crimſon colors. The compaſſe of it is 19 miles, ſo ye compriſe Palætyrus within it. The very towne it ſelfe alone, taketh vp 22 ſtadia. Neere vnto it are theſe townes, Luhydra, Sarepta, and Ornython: alſo Sydon, where the faire and cleer glaſſes be made, and which is the mother of the great citie Thebes in Bœotia.

Chap. XX.

¶ *The mount Libanon.*

BEhind it, beginneth the mount Libanus, and for 1500 ſtadia reacheth as farre as to Smyrna, whereas Cœle-Syria takes the name. Another promontory there is as big ouer-againſt it, called Antilibanus, with a vallie lying betweene, which in old time ioyned to the other Libanus with a wall. Being paſt this hill, the region Decapolis ſheweth it ſelfe to you within-forth, called Decapolis; and the aboue-named Tetrachies or Realmes with it, and the whole largeneſſe that Paleſtine hath. But in that coaſt and tract ſtill along the foot of the mount Libanus, there is the riuer Magoras: alſo the colonie Berytus, called Fœlix Iulia. The towne Leontos; the riuer Lycos: alſo Palæbyblos, [*i.* Byblos the old.] Then ye come vpon the riuer Adonis, and ſo to theſe townes, Byblos [the new,] Botrys, Gigarta, Trieris, Calamos, and Tripolis, vnder the Tyrians, Sydonians, and Aradians. Then meet you with Orthoſia, and the riuer Eleutheros. Alſo theſe townes, Simyra, Marathos; and ouer-againſt, Aradus, a towne of ſeuen ſtadia: and an Iſland leſſe than a quarter of a mile from the Continent. When you are once paſt the countrie, where the ſaid mountaines doe end, and the plaines lying betweene, then beginneth the mount Bargylis: and there, as Phœnice endeth, ſo begins Syria againe. In which countrie are Carne, Balanea, Paltos, and Gabale: alſo the Promontorie, whereupon ſtandeth the free city Laodicea, together with Dioſpolis, Heraclea, Charadrus, and Poſidium.

Chap. XXI.

¶ *Syria, Antiochena.*

GO forward in this tract, and you ſhall come to the cape of Syria Atiochena: within-forth is ſeated the noble and free citie it ſelfe Antiochena, ſurnamed Epidaphne: through the mids whereof runneth the riuer Orontes. But vpon the very cape, is the free citie Seleucia, named alſo Pieria.

Chap. XXII.

¶ *The mount Caſius.*

ABoue the citie Seleucia, there is another mountaine named Caſius, as well as that other, which confronterh Arabia. This hill is of that heigth, that if a man be vpon the top of it in the darke night ſeaſon, at the reliefe of the fourth watch, he may behold the Sunne ariſing

20030
copy 1

A ſing. So that with a little turning of his face and body, hee may at one time ſee both day and night. To get vp by the ordinary high-way to the very pitch of it, a man might fetch a compas of 19 miles; but climbe directly vpright it is but 4 miles. In the borders of this country runs the riuer Orontes, which ariſeth between Libanus and Antilibanus, neere to Heliopolis. Then the towne Rhoſos appeares: and behind it, the ſtreight paſſages and gullets betwixt the mountaines Rhotij and Taurus, which are called Portæ Syriæ. In this tract or coaſt ſtands the town Myriandros, the hill Avanus (where is the towne Bomilæ, which ſeparateth Cilicia from the Syrians.

Chap. XXIII.

B ¶ *Cœle-Syria, [or high Syria.]*

IT remaineth now to ſpeake of the townes and cities in the midland parts within the firme land: and to begin with Cœle Syria, it hath in it Apamia, ſeparated from the Nazerines tetrarchy by the riuer Marſia: likewiſe Bambyce, otherwiſe called Hierapolis; but of the Syrians, Magog. There is honored the monſtrous idoll of the Meermaid, Atargatis, called of the Greeks Decreto. Alſo Chalcis, with this addition, Vpon Belus: from which the region Chalcidene, moſt fertile of all Syria, taketh name. Then haue you the quarter Cyrrhiſtica, with Cirrhus, Gazatæ, Gindarenes, and Gabenes. Moreouer, two Tetrarchies, called Granucomatæ. Moreouer, the Hemiſenes, Hylates, the Ituræans country (and principally thoſe of them who are named Betarrani) and the Mariammitanes. The Tetrarchie or Principalitie named Mam-
C miſea, the city Paradiſus, Pagræ, Pinarites, and two Seleuciæ, beſides the aboue named, one called, Vpon Euphrates; and the other, Vpon Belus: and laſt of all, the Carditenſes. The reſt of Syria hath theſe States (beſides thoſe which ſhall be ſpoken of with the riuer Euphrates) the Arethuſians, Beræenſes, and Epiphanenſes: and Eaſtward, the Laodicenes, namely thoſe who are entituled, Vpon Libanus: the Leucadians and Lariſſæans: beſides 17 Tetrarchies reduced into the forme of realmes, but their names are barbarous.

Chap. XXIV.

¶ *Euphrates.*

D AND here me-thinks is the fitteſt and meeteſt place to ſpeake of Euphrates. The ſource of it, by report of them that ſaw it laſt and neereſt, is in Caranitis, a ſtate vnder the gouernment of Armenia the greater: and thoſe are *Domitius* and *Corbulo*, who ſay, that it ſpringeth in the mountaine Aba. But *Licinius Mutianus* affirmeth, that it iſſueth from vnder the foot of the mountaine which they call Capotes, 12 miles higher into the countrey than is Simyra: and that in the beginning it was called Pyxirates. It runs firſt directly to Derxene, and ſo forth to Ana alſo, excluding the regions Armeniæ, the greater as wel as the leſſe, from Cappadocia. The Daſtuſæ from Simyra are 75 miles: from thence it is nauigable to Pæſtona, 50 miles: from it to Melitene in Cappadocia, 74 miles. So forward to Elegia in Armenia, ten miles; where
E he receiueth theſe riuers, Lycus, Arſania, and Arſanus. Neere to Elegia he meeteth afront with the hil Taurus: yet ſtayeth he not there, but preuaileth a pierceth thorow it, although it beare a bredth there of 12 miles. At this entry where he breaketh thorow the hill they cal him Omiras, and ſo ſoon as he hath made way and cut thorow it he is named Euphrates. Being paſt this mountaine, he is full of rocks and very violent: howbeit he paſſeth through the country of the Mœri, where he carieth a ſtream of 3 Schœnes bredth, where he parts Arabia on the left hand, from Comagene on the right. And neuertheleſſe, euen there wheras he conquereth and getteth the vpper hand of Taurus, he can abide a bridge to be made ouer him. At Claudiopolis in Cappadocia he courſeth Weſtward: and now the mountain Taurus, though reſiſted and ouercome at firſt, impeacheth and hindereth him of his way, and notwithſtanding (I ſay) he was ouermatched and diſmembred one piece from another, he gets the better of him another way, breaking
F his courſe now, and driuing him perforce into the South. Thus Nature ſeems to match the forces of theſe two champions equally in this maner, That as Euphrates goes on ſtil without ſtay as far as he will, ſo Taurus will not ſuffer him yet to run what way he wil. Now when theſe Cataracts and downfalls of the riuer are once paſt, it is nauigable againe, and forty miles from that

place

place ſtandeth Samoſata the head city of Comagena. Now hath Arabia beſide the townes a- G
foreſaid, Edeſſa, ſomtime called Antiochea, Callirrhoe, taking name of the fountain: and Carræ, ſo famous and renowned for the defeature there of *Craſſus* and his army. Hereunto ioineth the gouernment and territorie of Meſopotamia, which alſo taketh the firſt beginning from the Aſſyrians, in which ſtand the townes Anthemuſa and Nicephorium. Hauing paſſed this country, ye ſtraitway enter vpon the Arabians called Rhetavi, whoſe capitall city is Singara. Now to returne to Samoſatæ, from it in the coaſt of Syria, the riuer Marſyas runneth into Euphrates. As Gingla limiteth Comagene, ſo the land of the Meri beginneth there. The towns Epiphania and Antiochia haue the riuer running cloſe to them, and hereupon they haue this addition in their names, Standing vpon Euphrates. Zenyma likewiſe, 72 miles from the Samoſatæ, is innobled for the paſſage ouer Euphrates: for ioined it is to Apamia, right againſt, by a H
bridge, which *Seleucus* the founder of both cauſed to be made. The people that ioine hard to Meſopotamia be called Rhoali. As for the townes of Syria which be vpon this riuer, are Europum, Thapſicum in times paſt, at this preſent Amphipolis; and laſt of all the Arabian Scænitæ. Thus paſſeth Euphrates, as far as to the land Vra, where turning his courſe to the Eaſt, hee leaueth behinde him the Deſarts of Palmyra in Syria, which reach to the city Petra, and to the country of Arabia Fœlix.

Chap. XXV.

¶ *Palmyra.*

THe noble city Palmyra is paſſing well ſeated, as well for the riches of the ſoile, as for a- I
boundance of waters, which imbeliſh and ſet out the country on euery ſide. As rich and long as it is, the territory all about is inuironed and incloſed with bars of ſand. And as if Nature had a deſire to exempt it from all other lands to liue apart in peace, ſhee hath ſet it iuſt in the middeſt and confines, between two puiſſant and mighty empires, to wit, the Romans and Parthians: for there is not ſo ſoone any war proclaimed between thoſe two States and Monarchies, but at firſt they haue on both ſides a regard of it as a neutre. It is from Seleucia of the Parthians, namely that vpon Tigris, 537 miles: and from the next port or coaſt of Syria, 252: and from Damaſco 27 neerer.

Chap. XXVI. K

¶ *Hierapolis.*

BEneath the deſarts and wilderneſſe of Palmyra lieth the countrey Stelendena, wherein are the cities named at this day Hierapolis, Berœa, and Chalcis. Beyond Palmyra alſo, Hemeſa taketh vp ſome part of thoſe ſaid deſarts: and likewiſe Elutium, neerer to Petra by one halfe than is Damaſcus. And next to Afura ſtandeth Philiſcum, a towne of the Parthians vpon Euphrates: from which by water it is a iourney of ten daies to Seleucia, and from thence as many likewiſe to Babylon: for Euphrates, 83 miles from Zeugma, about the village Maſſice, diuideth it ſelfe into two armes. On the left ſide he paſſeth into Meſopotamia, euen thorow Seleucia, and about it entreth into the riuer Tygris, which runneth hard by: but on the right L
hand he carieth a current in his chanell toward Babylon, the chiefe city ſomtime of Chaldæa, and paſſing through the midſt thereof, as alſo of another called Otris, he parts aſunder into ſundry lakes and meeres. And there an end of Euphrates. He riſeth and falleth at certain times after the order of Nilus: yet ſome little difference there is betweene them in the manner, for he ouerfloweth Meſopotamia when the Sun is in the 20 degree of Cancer, and begins againe to diminiſh and ſlake when the Sun is paſt Leo, and newly entred into Virgo: ſo as in the 29 degree of Virgo he is downe again, and come to his ordinary courſe.

Chap. XXVII. M

¶ *Cilicia, and the nations adioyning, to wit, Iſauricæ, Homonades, Piſidia, Lycaonia, Pamphylia, the mountaine Taurus, and Lycia.*

BVt time it is to returne now to the coaſts of Syria, and to Cilicia that confronts it. Where in the firſt place we meet with the riuer Diaphanes, the mountain Crocodilus, the ſtreights and

20030
copy 1

A and paſſages of the mount Amanus: more riuers alſo, to wit, Andricon, Pinarus, and Lycus, as alſo the gulfe Iſſicus. The towne Iſſa ſtandeth vpon it, then come we to Alexandria to the Riuer Chlorus, the free towne Ægę, the riuer Pyramus, and the ſtreights in the entrance to Cilicia. Beyond them we encounter the townes Mallos & Magarſos: as for Tarſos it is more within the countrey. From this towne we enter vpon the plaines of Aleij, and ſo forward to theſe townes, Caſſipolis, and Mopſum, which is free, and ſtandeth vpon the riuer Pyramus; Thynos, Zephyrium, and Anchialæ. On forward you ſhal haue the riuers Saros and Sydnus, which runs through: Tarſus a free city far from the ſea: then are ye in the country Celeuderitis, together with the capitall towne thereof. And anon ye ſhall ſet foot in a place called Nymphæum, and
B Solœ Cilicij now Pompeiopolis, Adana, Cibira, Pinara, Pedalie, Halix, Arſinoe, Tabæ, & Doron: and neere the ſea ſide you ſhall finde a towne, an harbour, and a caue, named all Corycos. Soon after, the riuer Calycadnus. The cape Sarpedon, the townes Olme and Mylæ, the Cape and towne both of *Venus*, the very next harbor from whence men paſſe into the Iſle Cypres. But in the maine land you ſhall finde theſe townes, Myanda, Anemurium, Coraceſium: and the riuer Melas, the antient bound that limiteth Cilicia. Farther within-forth are to be ſpoken of, the Anazarbenes, at this day Cæſar Auguſtani; Caſtabla, Epiphania, before-time Eniandos, Eleuſa, and Iconium: Seleucia vpon the riuer Calicadmus, ſirnamed alſo Trachiotis, a city remoued backward from the ſea, where it was called Hormia. Furthermore, within the country, the riuers Liparis, Bombos, and Paradiſus. Laſt of all, the mountaine Iubarus. All Coſmographers haue ioyned Pamphylia to Cilicia, and neuer regarded the Nation of Iſaurica, being a
C country by it ſelfe, hauing within it theſe towns, Iſaura, Clibanus, Lalaſſis. And it ſhoots down to the ſea ſide, full vpon the frontiers of the country Anemurium aboue-ſaid. In like ſort, as many as haue ſet forth maps and deſcriptions of the world, had no knowledge at all of the Nation Homonades confining vpon it, notwithſtanding they haue a good towne within it, called Homona. Indeed the other fortreſſes, *viz.* 44, lie hidden cloſe among the hollow vallies & hils of that country. There inhabit the mountainers ouer their heads, the Piſidians, ſomtime called Sobymi, whoſe chiefe colony is Cæſaria, the ſame that Antiochia. Their townes be Oroanda and Sagaleſſos. This nation is incloſed as it were within Lycaonia, lying within the iuriſdiction of the leſſe Aſia, and euen ſo together with it, the Philomelians, Timbrians, Leucolithi, Pelteni, and Hyrienſes reſort thither for law and iuſtice. There is a gouernment or Tetrarchy alſo,
D out of the quarter of Lycaonia, on that ſide that bordereth vpon Galatia; vnto which belong 14 States or cities, the chiefe whereof is called Iconium. As for the nations of Lyconia, thoſe of any note be, Tembaſa vpon Taurus, Sinda in the confines of Galatia, and Cappadocia. But on the ſide thereof aboue Pamphilia, ye meet with Myliæ, diſcended in old time from Thrace, who haue for their head city Aricanda. As for Pamphilia, it was in antient time called Mopſopia. The Pamphylian ſea ioineth to the Cilician. The townes ſcituate vpon that coaſt, be Side, Aſpendus on the hill, Plantaniſtus, and Perga. Alſo the cape Leucolla, the mount Sardemiſus, the riuer Eurymedon, running hard by Aſpendum. Moreouer, Cataractes the riuer, neere vnto which ſtand Lyrneſſus and Olbia; and the vtmoſt towne of all that coaſt Phaſelis. Faſt vpon it lieth the Lycian ſea, and the nation of the Lycians, where the ſea makes a huge great gulfe.
E The mountaine Taurus likewiſe, confining vpon the Levant ſea, doth limit Lycia and Cilicia, with the promontorie Chelidonium. This Taurus is a mighty mountain, and determineth as a iudge an infinite number of nations. So ſoone as he is riſen from the coaſt of the Eaſt Indian ſea hee parteth in twaine, and taking the right hand paſſeth Northward, and on the left hand Southward, ſomwhat bending into the Weſt: yea, and diuiding Aſia through the middeſt, and (but that he meeteth with the ſeas) ready to ſtop and dam vp the whole earth beſides. He retireth back therefore, as being curbed, toward the North, fetching a great circuit, and ſo making his way, as if Nature of purpoſe oppoſed the ſeas eftſoones againſt him to bar him of his paſſage; of one ſide the Phœnician ſea, of another the great ſea of Pontus; the Caſpian & Hyrcanian ſeas likewiſe; and full againſt him the lake Mœotis. And notwithſtanding all theſe bars,
F within which he is pent, twined, and wreſted, yet maketh he means to haue the maſtery, and get from them all: and ſo winding byas he paſſeth on, vntill he encounter the Riphæan hils, which are of his owne kinde: and euer as he goeth is entituled with a number of new names. For he is called Imaus where he firſt beginneth: a little forward, Emodus, Paropamiſus, Circius, Canibades, Parphariades, Choatras, Oreges, Oroandes, Niphates, and then Taurus. Neuertheleſſe

where

where he is higheſt, and as it were ouer-reacheth himſelfe, there they name him Caucaſus : G
where he ſtretcheth forth his armes like as if he would now and then be doing with the ſeas, he changeth is name to Sarpedon, Coraceſius, and Cragus : and then once again he takes his former name Taurus, euen where he opens and makes paſſage as it were to let in the world. And yet for all theſe waies and ouertures he claimeth his owne ſtil, and theſe paſſages are called by the names of gates, in one place Armeniæ, in another Caſpiæ, and ſometimes Ciliciæ. Ouer and beſides, when he is broken into parcels, and eſcaped far from the ſea, he taketh many names from diuers and ſundry nations on euery ſide: for on the right hand he is termed Hyrcanus, and Caſpius: on the left, Pariedrus, Moſchicus, Amazonicus, Coraxicus, and Scythicus: and generally throughout all Greece, Ceraunius.

To returne then to Lycia, being paſt the foreſaid cape there, Chelidonium, ye come to the H
towne Simena, the hill Chimæra, which caſteth flames of fire euery night, the city Hephæſtium, where the mountains about it likewiſe oftentimes are known to burne. Somtimes the city Olympus ſtood there, but now nothing to be ſeene but mountaines, and amongſt them theſe townes, Gage, Corydalla, and Rhodiopolis. On the ſea coaſt, the city Lymira vpon a riuer, to which Aricandus runneth : alſo the mountaine Maſſyrites, the cities Andriara and Myra. Alſo theſe townes, Apyre, and Antiphellos, which ſomtime was called Habeſſus ; and more within-forth in a corner, Phellus. Then come ye to Pyrrha, and ſo to Xanthus, 15 miles from the ſea, and to a riuer likewiſe of that name. Soon after ye meet with Patara, before-time named Sataros, and Sydinia ſeated vpon an hill, and ſo to the promontorie Ciagus. Beyond which ye ſhall enter vpon a gulfe as big as the former, vpon which ſtandeth Pinara and Telmeſſus, the vtmoſt I
bound in the marches of Lycia. In antient time Lycia had in it 60 townes, but now not aboue 36. Of which the principall and of greateſt note, beſides the aboue named, be Canæ, Candiba, where is the famous wood Oenium, Podalia, Choma, vpon the riuer Adeſa, Cyane, Aſcandalis, Amelas, Noſcopium, Tlos, and Telanorus. As for the midland parts of the maine, you ſhall finde Chabalia, with three townes thereto belonging, Oenonda, Balbura, and Bubon.

When you are beyond Telmeſſus you meet with the Aſiaticke ſea, otherwiſe called Carpathium, and this coaſt is properly called Aſia. *Agrippa* hath diuided it in two parts, whereof the one by his deſcription confronteth vpon Phrygia and Lycaonia Eaſtward : but on the Weſt ſide it is limited with the Ægean ſea. Southward it bounds vpon Egypt, and in the North vpon Paphlagonia : the length thereof by his computation is 470 miles, the bredth 300. As for the other he ſaith, That Eaſtward it confineth vpon Armenia the leſſe : Weſtward vpon Phrygia, Lycaonia, and Pamphylia : on the North it butteth vpon the prouince or realm of Pontus, and on the South ſide is incloſed with the Pamphylian ſea. He addeth moreouer, that it containeth 575 miles in length, and 325 in bredth. The next coaſt bordering thereupon is Caria : and when you are paſt it, Ionia, and beyond that, Æolis. As for Caria it incloſeth Doris in the mids, enuironing it round on euery ſide, as far as to the ſea. In it is the Cape Pedalium, alſo the riuer Glaucus, charged with the riuer of Telmeſſus. The townes of any reſpect be Dædala and Crya, peopled only with baniſhed perſons. Therein you finde the riuer Axoum, and the towne Calydua. K

L

Chap. XXVIII.

¶ *The riuer Indus.*

THe riuer Indus, ariſing from the mountaines of the Cybirates, receiueth into it 60 other running riuers, maintained with ſprings, of other ſmall riuers and brookes fed with land flouds, aboue 100. Vpon it ſtandeth the free towne Caunos, and a little off, Pyrnos. Soon after ye meet with the port Creſſa, ouer againſt which is diſcouered the Iſland Rhodus, within the kenning of twenty miles. Being paſt that hauen, you ſhall enter vpon the plaine Loryma, vpon which are ſeated the townes Tyſanuſa, Tarydion, Larymna. Then meet you with the M
gulfe Thymnias, and the cape Aphrodiſias : and on the other ſide of it the towne Hyda, and another gulf Schœnus. Then followes the country Bubaſſus, wherein ſtood in antient time, the towne Acanthus, otherwiſe called Dulopolis. Alſo vpon the cape there, the free city Gnidos, Triopia, then Peguſa, called likewiſe Stadia. Beyond which you enter into the Countrey of

Doris,

20030
copy 1

A Doris. But before we paſſe farther, meet it were to ſpeake of thoſe cities and States which are in the midland countrie; and which lie behind, and namely of one, named Cibiratica. The towne it ſelfe is in Phrygia, and to it reſort for law and iuſtice 25 cities.

Chap. XXIX.

¶ *Laodicia, Apamia, Ionia, Epheſus.*

THe principall citie in thoſe quarters (of the Cibirites) is Laodicia. Seated it is vpon the riuer Lycus: and yet there run hard to the ſides thereof two other riuers, Aſopus, and Ca-
B per. This citie in times paſt was called Dioſpolis, & afterwards Rhoas. The other nations belonging to that iuriſdiction of the Cibirates, worth the naming, by the Hydrelites, Themiſones, and Hierapolites. Another countie court or towne of reſort there is, which taketh the name of Synnada: and to it repaire for iuſtice, the Licaonians, Appians, Encarpenes, Dorylæi, Midæi, Iulienſes, and other ſtates of no great reckoning, fifteene. A third Seignorie or Shire there is that goes to Apamia, which in old time was called Celænæ, and afterwards Ciboron: ſcituate it is at the foot of the hill Signia, enuironed with three riuers, Marſias, Obrima, and Orga, falling all into the great riuer Mæander. As for the riuer Marſias (which a little from his ſpring was hid vnder the ground, whereas *Marſyas* the muſitian ſtroue with *Apollo* in playing vpon the flute) ſheweth himſelfe again in Aulocrenæ, for ſo is the vallie called, ten miles from
C Apamia, as men trauell the high way to Phrygia. Vnder this iuriſdiction, we ſhould do well to name the Metropolites, Dionyſopolites, Euphorbenes, Acmoneſes, Peltenes, and Silbians. There are beſides to the number of 60 ſmall towns of no account. But within the gulfe of Doris there ſtand Leucopolis, Amaxites, Eleus, and Euthenæ. Moreouer, other townes of Caria, Pitaium, Eutaniæ, and Halicarnaſſus. And to this citie were annexed, as ſubiect and homages by *Alexander* the great, ſix other townes, namely, Theangela, Sibde, Medmoſſa, Euranium, Pedaſium, and Telneſſum: which townes are inhabited betweene the two gulfes, Ceramicus, and Iaſius. From thence yee come to Myndus, and where ſometime ſtood Palæmindus, Neapolis, Nariandus, Carianda, the free citie Termera, Bergyla, and the town Iaſus which gaue the name to the gulfe Iaſius. But Caria is moſt renowned & glorious for the places of name within it in
D the firme land: for therein are theſe cities, to wit, Mylaſa free, and Antiochia, now ſtanding where ſometime were the townes, Seminethos, and Cranaos: and enuironed now it is about with the riuers Mæander, and Moſſinus. In the ſame tract ſtood ſometime Mæandropolis alſo. There is beſides, the citie Eumenia, vpon the riuer Cludrus: the riuer Glaucus: the towne Lyſias and Orthaſia. The tract or marches of Berecinthus, Nyſa, Trallais, which alſo is named Euanthia, Seleucia, and Antiochia; which is ſcituate vpon the riuer Eudone that runneth hard by it, and Thebanis which paſſes quite through it. Some there be who report, that the dwarfes called Pigmæi, ſometime there dwelt. In which region beſides, were theſe townes, Thydonos, Pyrrha, Eurome, Heraclea, Amyzon, and the free citie Alabanda, whereof that ſhierewicke or iuriſdiction tooke name. Alſo the free towne Stratonicea, Hynidos, Ceramus, Trœzene, and
E Phorontis. Yea there be nations farther remote, that reſort thither to pleade and haue iuſtice in that court: namely, the Othroniens, Halydiens, or Hyppines, Xyſtianes, Hydiſſenſes, Apolloniates, Ttapezopolites, and of free condition the Aphrodſians. Ouer and beſides theſe, there are Coſſinus, & Harpaſa, ſcituate vpon the riuer Harpaſus, which alſo ran vnder Trallicon, when ſuch a towne there was. As for the country of Lydia, watered it is in many places with the recourſe of Mæanders ſtreame, winding and turning in and out, as his manner is: and it reacheth aboue Ionia: confining vpon Phrygia in the Eaſt, vpon Miſia in the North, and in the South ſide encloſing all the countrie of Caria. This Lydia was ſometimes named Mœnia. The capitall citie of this region, is Sardis, ſeated vpon the ſide of the mountaine Tmolus, called beforetime Timolus, a hill well planted with vineyards. Moreouer, renowmed is this country for the
F riuer Pactolus iſſuing forth of this mountaine; which riuer is called likewiſe Chryſorrhoa: as alſo for the fountain Tarnes The city aboueſaid, was commonly by the Mœonias called Hyde, famous for the meer or lake of Gyges. Al that iuriſdiction is at this day called Sardinia. Thither reſort beſides the abouenamed, the Caduenes, deſcended from the Macedonians; the Lorenes, Philadelphenes, yea and the very Mœnians, ſuch as inhabite vpon the riuer Cogamus at the foot of Tmolus; and the Tripolitanes who together with the Antoniopolites, dwel vpon

the

the riuer Mæander. Furthermore, the Apollonos-Hieritæ, Myſotmolites, and others of ſmall reputation. G

Ionia beginneth at the gulfe Iaſius, and all the coaſt thereof is very full of creekes and reaches. The firſt gulfe or creeke therein is Baſilicus; and ouer it the cape Poſideum, and the town called ſomtime, the Oracle of Branchidæ, but at this day, of Apollo Didymæus, 20 ſtadia from the ſea ſide. Beyond which 180 ſtadia, ſtandeth Milletus, the head citie of Ionia, named in time paſt Lelegeis, Pityuſa, and Anactoria. From which, as from a mother citie, are deſcended more than eighty others, all built along the ſea coaſt by the Milleſians. Neither is this city to be defrauded of her due honour, for bringing forth that noble citizen *Cadmus*, who deuiſed and taught firſt to write in Proſe. Concerning the riuer Mæander, it iſſueth out of a lake at the foot of the mountain Aulocrene: and paſſing vnder many townes, and filled ſtill with as many riuers running into it, it fetcheth ſuch windings to and fro, that oftentimes it is taken for to run back againe from whence it came. The firſt countrie that it paſſeth through, is Apamia: and from thence it proceedeth to Eumenitica, and ſo forward through the plaines Bergylletici. Laſt of all, hee commeth gently into Caria, and when hee hath watered and ouerflowed all that land with a moſt fat and fruitful mud that he leaueth behind him, about ten ſtadia from Miletus, he diſchargeth himſelfe into the ſea. Neer to that riuer, is the hill Latmus: the citie Heraclea, ſurnamed Caryca, of a hill of that name: alſo Myus, which as the report goeth, was the firſt citie founded by the Ionians after their arriuall from Athens, Naulochum, and Pyrene. Alſo vpon the ſea coaſt, the towne called Trogilia, and the riuer Geſſus. Moreouer, this quarter all the Ionians reſort vnto in their deuotion, and therefore named it is Panionia. Neere vnto it was built a priueledged place for all fugitiues, as appeareth by the name Phygela: as alſo the town Marathe ſium ſtood there ſometime: and aboue it, the renowmed citie Magneſia, ſurnamed, Vpon Mæander; of the foundation of that other Magneſia in Theſſalie. From Epheſus it is 15 miles; and from Trallais thither, it is three miles farther. Beforetime, called it was Theſſaloce, & Androlitia: and being otherwiſe ſituate vpon the ſtrond, it tooke away with it other Iſlands called Deraſides, and ioine them to the firme land from out of the ſea. More within the maine ſtandeth Thyatira (in old time called Pelopia and Euhippa) vpon the riuer Lycus. But vpon the ſea coaſt, yee haue Manteium, and Epheſus, founded in times paſt by the Amazones. But many names it had gone through before; for in time of the Troiane war, Alopes it was called: ſoone after, Ortygia, and Morges: yea, and it took name Smyrne, with addition of Trachæa, [*i.* rough] Samornium, and Ptelea. Mounted it is vpon the hill Pione, and hath the riuer Cayſtrus vnder it, which commeth out of the Cilbian hills, and bringeth downe with it many other riuers, and principally is maintained and enriched with the lake Pegaſeum, which diſchargeth it ſelfe by reaſon of the riuer Phyrites that runneth into it. With theſe riuers he bringeth downe a good quantitie of mud, whereby he increaſeth the land: for now already a good way within the land, is the Iſland Syrie, ioined to the continent. A fountain there is within the citie, called Callipia; and two riuers (height both Selinus) comming from diuers parts, enuiron the temple of *Diana*. After you haue been at Epheſus, you come to another Manteium, inhabited by the Colophonians: and within, the country Colophon it ſelfe, with the riuer Haleſus vnder it. Then meet you with the noble temple of *Apollo Clarius*, and Lebedos. And in this quarter ſomtime was to be ſeen the towne Notium. The promontory alſo Coryceon is in this coaſt: and the mountaine Mimas, which reaches out 250 miles, and endeth at length in the plaines within the continent that ioyne vnto it. This is the place, wherein *Alexander* the Great commanded a trench ſeuen miles long and an halfe to be cut through the plain, for to ioyne two gulfes in one, and to bring Erythree and Mimas together for to be enuironed round therewith. Neere this city Erythree were ſometimes the townes, Pteleon, Helos, and Dorion: now, there is the riuer Aleon, and the cape Corineum: vpon the mount Mimas, Clazomene, Partheniæ, and Hippi called Chytophoria, hauing beene ſometime Iſlands: the ſame, *Alexander* cauſed to be vnited to the firme land for the ſpace of two ſtadia. There haue periſhed within-forth and beene drowned, Daphnus, Hermeſia, and Sipylum, called before-time Tantalis, notwithſtanding it had beene the chiefe citie of Mœonia, ſituate in that place, where now is the meere or lake Sale. And for that cauſe Archæopolis ſucceeded in that preeminence, and after it Colpe, and in ſtead thereof Lebade. As you returne from thence toward the ſea ſide, about twelue miles off, you come vpon the citie Smyrna, built by an Amazonite, but repaired and fortified by *Alexander* the Great. Ituate H I K L M

20030
copy 1

A tuat it is pleaſantly vpon the riuer Melis,which hath his head and ſource not far off. The moſt renowned hils in Aſia for the moſt part, ſpred themſelues at large in this tract, to wit, Maſtuſia, on the back ſide of Smyrna; and Termetis,that meets cloſe to the foot of Olympus. This hil Olympus endeth at the mountain Tmolus; Tmolus at Cadmus; and Cadmus at Taurus. When you are paſt Smyrna,you come into certain plains,occaſioned by the riuer Hermus,and therefore adopted in his name. This riuer hath his beginning neer to Doryleus a city of Phrygia,and takes into it many other cities,& principally Phryge, which giues name to the whole nation,and diuides Phrygia and Caria aſunder. Moreouer Lyllus & Crios,which alſo are big and great by reaſon of other riuers of Phrygia,Myſia,and Lydia, which enter into them. In the very mouth of this riuer ſtood ſomtime the towne Temnos; but now in the very vtmoſt nouke
B of the gulfe certain ſtony rocks called Myrmeces. Alſo the towne Leuce vpon the cape ſo called: ſomtime an Iſland it was: and laſt of all Phocæa, which limiteth and boundeth Ionia. But to returne to Smyrna; the moſt part of Æolia,whereof we will ſpeake anon,repaires commonly thither to their Parliament and Aſſiſes. Likewiſe the Macedonians,ſyrnamed Hircani, as alſo the Magnetes from Sipylum. But vnto Epheſus,which is another principal and famous city of Aſia,reſort thoſe that dwell farther off,to wit,the Cæſarians,Metropolites,Cylbianes, the Myſo-Macedonians,as well the higher as the lower,the Maſtaurians,Brullites,Hyppepœnians,and Dios-Hieriteæ.

Chap. XXX.

C ¶ *Æolis, Troas, and Pergamus.*

AEolis,in old time Myſia,confronts vpon Ionia: ſo doth Troas,which bounds on the coaſt of Helleſpontus. Being then paſt Phocæa,you meet with the port Aſcanius, & the place where ſometime Lariſſa ſtood: and now Cyme, and Myrina which loueth to be called Sebaſtopolis. Within the firme land,Ægæ,Attalia,Poſidea, Neon-tichos, and Temnos. But vpon the coaſt, the riuer Titanus, and a city taking name thereof. The time was when a man might haue ſeen there the city Grynia: but now there is but an hauen and the bare ground, by reaſon that the Iſland is taken into it, and ioyned thereto. The towne Elæa is not farre from thence,and the riuer Caicus comming out of Myſia. Moreouer,the towne Pytane,and the Ri-
D uer Canaius. Other townes there were in old time,but they are loſt and periſhed, namely, Canæ,Lyſimachia,Atarnæa, Carenæ, Ciſthene, Cilla, Cocillum, Thebæ, Aſtyre, Chryſa, Palæſtepſis, Gergithos,and Neandros. Yet at this day are to be ſeen the city Perperene,& beyond it the tract and territory Heracleotes,the towne Coryphas,the riuer Gryliooſolius, the quarter called Aphrodiſias,before-time Politice. Orgas the country,and Scepſis the new. The riuer Evenus,vpon the banke whereof ſtood once Lyrmeſſos,and Miletos,but now they are gon. In this tract is the mountain Ida. Moreouer,in the ſea coaſt, Adramytteos, ſomtime called Pedaſus,where the Parliament and Terme is holden, and whereof the gulfe is named Adramitteos. Other riuers be there beſides,to wit, Aſtron, Cormalos, Eryannos, Alabaſtros, and Hieros out of Ida. Within-forth be Gargara,a towne and hill both. And then again toward the ſea ſide,
E Antandros, before-time called Edonis: then, Cymeris, and Aſſos, which alſo is Apollonia. Long ſince alſo there was a towne called Palamedium. After all theſe,you come vpon the cape Leolon,the middle frontier between Æolus and Troas. And there had bin in antient time the city Polymedia,and Cryſſa,with another Laryſſa alſo. As for the Temple Smintheum it remaineth ſtill. But farther within,the towne Colone that was, is now decayed and gon,and the traffique and negotiation in all affaires turned from thence to Adramytteum. Now as touching the territorie of the Apolloniates,after you be paſt the riuer Rhyndicus, you finde theſe States; the Ereſians,Miletopolites,Pœmanenes, Macedonians, Aſchilacæ, Polychnæi, Pionites,Cilices,and Mandagandenes. In Myſia, the Abrettines, and thoſe called Helleſpontij;
F beſides thoſe of baſe account and eſtimation. The firſt city you encounter in Troas,is Amaxitus: then Cebrenia and Troas it ſelfe, named alſo Antigonia, now Alexandria, and is entituled a Roman Colony. Beyond Troas ſtandeth the towne Nee: there runneth alſo Scamander, a riuer nauigable; and Sigæum, a Towne ſometime, vpon the cape ſo called. At length you come to the hauen of the Greeks, into which Xanthus and Somoeis runne ioyntly together, as

alſo Palæ-Scamander, but firſt it maketh a lake. The reſt that *Homer* ſo much ſpeaks of, namely Rhæſius, Heptaporus, Careſus, and Rhodius, there is no mention or token remaining of them: as for the riuer Granicus, it runneth from diuers parts into the chanel of Propontis. Yet there is at this day a little city called Scamandria: and one mile and a halfe from the port or ſea, the free city Ilium, that enioyeth many immunties and liberties; of which towne goeth all that great name. Without this gulfe lieth the coaſt Rhœtea, inhabited with theſe townes vpon it, namely, Rhœteum, Dardanium, and Arisbe. There ſtood ſometimes alſo Acheleum, a towne neere vnto the tombe of *Achilles*; founded firſt by the Mityleneans, and afterwards re-edified by the Athenians, vpon the Bay Sigæum, vnder which his fleet rode at anchor. There alſo was Acantium, built by the Rhodians, in another coine or canton of that coaſt, where *Aiax* was interred, a place thirty ſtadia diſtant from Sigæum, and the very Bay wherein his fleet alſo lay at harbour. Aboue Æolis and one part of Troas, within the Continent and firme land there is the towne called Teuthrania, which the Myſians in old time held. And there ſpringeth Caicus the riuer aboue ſaid. A large countrey this is of it ſelfe, and eſpecially when it was vnited to Myſia, and all ſo called: containing in it Pioniæ, Andera, Cale, Stabulum, Coniſium, Tegium, Balcea, Tiare, Teuthrane, Sarnaca, Haliſerne, Lycide, Parthenium, Thymbrum, Oxiopum, Lygdanum, Apollonia, and Pergamus the goodlieſt city of them all by many degrees: through it paſſeth the riuer Selinus, and Cætius runneth hard vnder it, iſſuing out of the mountain Pindaſus. And not far from thence is Elea, which as we ſaid ſtandeth vpon the ſtrond. And verily all that tract and iuriſdiction is of that city named Perganena. To the Parliament and judiciall Aſſiſes there reſort the Thyatyrenes, Mygdones, Moſſines, Bregmenteni, Hieracomitæ, Perpereni, Tyareni, Hierapolenſes, Harmatapolites, Attalenſes, Pantaenſes, Apollonidenſes, and other pety cities of no name and account. As for Dardanium, a pretty towne it is, threeſcore and ten ſtadia from Rhœteum. Eighteene miles from thence is the cape Trapeza, where the ſea beginneth to ruſh roughly into the ſtreight Helleſpont. *Eratoſthenes* mine Authour ſaith, That the cities of the Solymi, Leleges, Bebrices, Colycantij and Trepſedores ſomtime flouriſhed, but now are vtterly periſhed. *Iſidorus* reporteth as much of the Arymeos and Capretæ, the very place where Apamia was built by *Seleucus*, betweene Cilicia, Cappadocia, Cataonia, and Armenia: and for that he had vanquiſhed moſt fierce and cruell nations, at the firſt he named it Damea.

Chap. XXXI.

¶ *The Iſlands lying before little Aſia, and in the Pamphylian ſea. Alſo Rhodus, Samus, and Chios.*

THe firſt Iſland of Aſia is iuſt againſt the mouth or channell of Nilus, called Canopicus of *Canopus*, (as men ſay) the Pilot of K. *Menelaus*. The ſecond is Pharus, which is ioined to Alexandria by a bridge: in old time it was a daies ſailing from Ægypt to it: and now by fires from a watch-tower ſailers are directed in the night along the coaſt of Egypt. *Cæſar* Dictator erected therein a colony. And in truth it ſerueth in right good ſtead as a Lanthorne: for the hauens about Alexandria be very dangerous and deceitfull, by reaſon of the barres and ſhelues in the ſea: and there are but three chanels and no more, by which a man may paſſe ſafely to Alexandria, to wit, Tegamum, Poſideum, and Taurus. Next to that Iſle, in the Phœnician ſea before Ioppa, lies Paria, an Iſle of no great compaſſe, for it is all one town. This is the place, folke ſay, where lady *Andromeda* was expoſed and caſt out to a monſter. Moreouer, Aredos, the Iſle before named, between which and the Continent there is a fountaine, as *Mutianus* writeth, in the ſea where it is fifty cubits deep, out of which freſh water is drawne and conueighed from the very bottome of the ſea, through pipes made of leather. As for the Pamphylian ſea, it hath ſome ſmal Iſlands of little or no reckoning. In the Cicilian ſea there is Cyprus, one of the fiue greateſt in thoſe parts, and it lieth Eaſt and Weſt full againſt Cilicia and Syria. The Seate it was in times paſt, whereunto nine Kingdomes did homage, and of which they held. *Timoſthenes* ſaith, That it contained in circuit foure hundred and nineteene miles and an halfe: but *Iſidorus* is of opinion, that it is but three hundred ſeuenty fiue miles about. The ful length thereof

20030
copy 1

A thereof betweene the two capes, Dinaretas and Acamas, which is Southward, *Artemidorus* reporteth to be a hundred and ſixtie miles and a halfe: and *Timoſthenes* two hundred; who ſaith beſides, that ſometime it was called Acamantis: according to *Philonides*, Ceraſtis: after *Xenagoras*, Aſpelia, Amathuſia, and Macatia: *Aſtynomus* calleth it Cryptos and Colinia. Townes there be in it fifteene, Paphos, and Palepaphos (that is, Paphos the new, and Paphos the old,) Curias, Citium, Corineum, Salamis, Amathus, Lepathos, Solœ, Tamaſeus, Epidarum, Chytri, Arſinoe, Carpaſium, and Golgi. There were in it beſides, Cinirya, Marium and Idalium: but now are they come to nothing. And from the cape Anemurium in Cilicia, it is fifty miles diſtant. All that ſea which lieth betweene it and Cilicia, they call Aulon Cilicium, that is to ſay, The plaine of Cilicia. In this tract is the Iſland Elæuſa: and foure others beſides, euen before the cape, named Clides, ouer-againſt Syria. Likewiſe one more, named
B Stiria, at the other cape or point of Cilicia. Moreouer, againſt Neampaphos, [*i.* new Paphos] the Iſle Hierocepia. Againſt Salamis, Salaminæ. Moreouer in the Lycian ſea there be Iſles, Illyris, Telendos, Attelebuſſa, and three Cypriæ, all barren and fruitleſſe: beſides Dionyſia, before-time called Caretha. Moreouer, againſt the promontory of Taurus, and the Chelidoniæ, hurtfull and dangerous to ſaylers: and beſides them as many more, together with the towne Leucola, called Pactiæ, namely, Laſia, Nymphous, Macris, Megiſta, in which the citie that ſtood is gone. Beſides theſe, many others there were, but of no importance. But ouer-againſt the cape Chimera, Dolichiſte, Chirogilium, Crambuſſa, Rhoge, Enagora of eight miles. Againſt Dædalion, two: againſt Cryeon, three: Stongyle, moreouer, againſt
C Sidynia, which king *Antiochus* founded: and toward the riuer Glaucus; Laguſa, Macris, Didymæ, Helbo, Scope, Aſpis, and Telandria: howbeit, the towne in it is ſunke and gone: laſt of all the Iſle Rhoduſſa, next to the harborough or hauen Caunus. But the faireſt of all is the Iſle Rhodes, a free ſtate, and ſubiect to none: It containeth in compaſſe an hundred and thirtie miles, or if we rather giue credit to *Iſidorus*, an hundred and three. Three great townes there be in it well peopled, Lindus, Camirus, and Ialyſus, now called Rhodes. By the account of *Iſidorus* it is from Alexandria in Ægypt, fiue hundred ſeuenty and eight miles: but according to *Eratoſthenes* fiue hundred ſixty and nine: after *Mutianus* fiue hundred, and from Cyprus foure hundred and ſixteene. Many names hath it been knowne by in times paſt, to wit, Ophyuſa, Aſteria, Æthræa, Trinacria, Corymbia, Pœeſſa, Atabyria of king *Atabyris*: and finally, Macaria,
D and Oloeſſa. Many other Iſlands be ſubiect vnto it, and namely Carpathus (which gaue name to the ſea Carpathium) Caſos, Achme in times paſt: and Niſeros, diſtant from Gnidos twelue miles and an halfe, which heretofore had beene called Porphyris. And in the ſame raunge, Syme, betweene Rhodes and Gnidus, and is in circuit ſix and thirtie miles and a halfe. Enriched this Iſland is with eight commodious hauens. Ouer and beſides theſe, there lie about Rhodes, Cyclopis, Teganon, Cordyluſa, foure vnder the name of Diabete: Hymos, Chalcis, wherein ſtandeth a good towne: Seutluſa, Narthecuſa, Dimaſtos, and Progne. Being paſt Gnidos, yee ſhall diſcouer Ciferuſſa, Therionarce, Calydne beautified with three townes, to wit, Notium, Niſyrus, Mendeterus: with Arconeſus the Iſle, wherein ſtandeth the towne Ceramus. Vpon the coaſt of Caria, the Iſlands, twenty in number, called Argiæ: beſides, Hye-
E tuſſa, Lepſia, and Leros. But the goodlieſt & moſt principall of all others in that coaſt is Cos, which lieth from Halicarnaſſus fifteene miles; and in compaſſe about, it beareth an hundred miles: as men thinke, Merope it was called: as *Staphylus* ſaith, Cos: but according to *Dionyſius*, Meropis: and afterwards Nymphæa. This Iſle is fortified with the mount Prion: and as ſome thinke, Niſyris the Iſland, named before-time Porphyris, was of old vnited to this, and afterwards diſmembred from it. Beyond this Iſland yee may diſcouer Carianda, with a towne in it: and not farre from Halicarnaſſus, Pidoſus. Moreouer, in the gulfe Ceramicus, Priaponneſus, Hipponeſus, Pſyra, Mya, Lampſemandus, Paſſala, Cruſa, Pyrrhe, Sepiuſſa, Melano. And within a little of the maine, another called Cinedopolis, by occaſion of certain Catamites and ſhamefull baggages that king *Alexander* the Great left there. The coaſt of Ionia
F hath in the ſea the Iſlands Ægeæ and Corſeæ, beſides Icaros, ſpoken of before. Alſo Lade, before-time called Latæ: and among ſome other little ones of no worth, the two Camelides neer to Miletus. Moreouer, Mycalum, Trogyliæ, Trepſilion, Argennon, Sardalion: & the free Iſland Samos, which in circuit hath foureſcore and ſeuen miles, or as *Iſidorus* thinkes, a hundred. *Ariſtotle* writeth, how at the firſt it was called Parrhania, afterwards Dryuſa, and then Anthemuſa.

Aristocritus giueth it moreouer other names, to wit, Melamphyllus, yea, and Cypariſſia: others terme it Partheno-aruſa, and Stephane. Riuers in it be Imbraſus, Cheſius, and Ibettes: fountaines of freſh water, Gigarto, and Leucothea: but no other hils, ſaue only Cercetius. There lie adioyning to it other Iſlands beſides, namely, Rhypara, Nymphæa, and Achillea. Foureſcore and thirteene miles from it, you may diſcouer Chios, a free ſtate, with a town in it, which is an Iſland as renowned euery way as Samos: *Ephorus* by the ancient name calleth it Æthalia: *Metrodorus* and *Cheobulus*, Chia, of a certaine lady Nymph, whoſe name was *Chio*: others ſuppoſed it was ſo called of Chion, *i.* Snow: and ſome would haue it to be Macris and Pityuſa. An hill there is in it called Pellenæas, where the good marble is digged, called Chium. The ancient Geographers haue written, That it is a hundred twenty and fiue miles about; and *Iſidorus* addeth nine more. Scituate it is betweene Samos and Lesbos, full oppoſite vnto the cape Erythræ. Neere vnto it lie Thalluſa (which ſome write Dapnuſa,) Oenuſſa, Elaphites, Euryanaſſa, Arginuſſa with a towne. Now are all theſe about Epheſus, as alſo the Iſles of *Piſiſtratus*, ſo called: and thoſe which are named Anthinæ, to wit, Myonneſus, and Diareuſa. In both theſe the townes that were, be loſt through water. Furthermore, the Iſland Poroſelenæ with a towne in it, Cerciæ, Halone, Commone, Illetia, Lepria, and Rheſpheria, Procuſæ, Bolbulæ, Phanæ, Priapos, Syce, Melane, Ænare, Siduſa, Pela, Drymuſa, Anydros, Scopelos, Sycuſſa, Marathuſſa, Pſile, Perirheuſa, and many others of no reckoning. But among the Iſles of name, is that of Teos, lying farther in the deepe ſea, which hath a towne in it: and lieth from Chios foureſcore and one miles, and as much from the Bay Erythræ. Neere vnto Smyrna are the Iſlands Periſterides, Catieria, Alopece, Elæuſſa, Bachina, Pyſtira, Crommyonneſus, and Megale. And iuſt before Troas, the Iſles Aſcaniæ, and three Plateæ. Then the Lamiæ, and two Plitaniæ. Moreouer, the Iſlands Plate, Scopelos, Getone, Artheidon, Celæ, Laguſſæ, and Didymæ. But the moſt ſtately of all others in this ſea, is Lesbos, which lies from Chios threeſcore and fiue miles. Named it was in times paſt, Hemerte, Laſia, Pelaſgia, Ægira, Æthiope and Macaria: within it were eight townes of name; whereof one, namely Pyrrha, is ſwallowed vp of the ſea: and another, to wit, Arisbe, ouerthrown by an earthquake. As for the Iſle Methymna was peopled from Antiſſa, which was vnited to it, and wherein were eight townes, and is about ſeuen and thirtie miles from * Aſia the leſſe. As for the townes Agamede and Hiera which were in it, gone they be now and vtterly periſhed. Yet there remaine Ereſos, Pyrrha, and Mitylenæ, which hath continued for fiue hundred yeeres, mighty and puiſſant. *Iſidorus* ſaith, That this Iſland is in circuit about a hundred ſeuenty and three miles: but the old Geographers, a hundred ninety and fiue. In it are theſe mountaines, Lepethymus, Ordymnus, Mariſtus, Creon, and Olympus. Eight miles and a halfe it is from the Continent, where it lieth neereſt. About this Iſland Lesbos, there lie neere at hand other little ones, namely, Saudalion, and the fiue Leucæ. Of which Cydonea is one, wherein is a fountaine of hot water. As for Argenuſſæ, from thence to Ægæ is reckoned foure miles. There are beſides in this coaſt Phelluſa, & Pedua. Now without Helleſpont, ouer-againſt the bay and cape Sigeum, lieth the Iſle Tenedus, called ſometimes Leucophrys, Phænice, and Lyrneſſos. From Lesbos it is ſix and fifty miles, and from Sigæum twelue miles and a halfe.

* Natolia

Chap. XXXII.

¶ *Helleſpontus, Myſia, Phrygia, Gallatia, Bithynia, Boſphorus.*

Archipelago.

LEt vs now leaue the Iſles in the ſea Ægeum, and come to Helleſpont, now called the ſtreights of Callipolis: whereinto the maine ſea guſhes with a mighty force and violence, with his gulfes and whirlepooles, digging before him a way, vntil he haue limited and diuided Aſia from Europe. The promontory firſt appearing there, we named Trapeza. From which tenne miles off, ſtandeth the towne Abidum, where the ſtreights are but ſeuen ſtadia ouer. Beyond it is Percote the towne: and Lampſacum, called before-time Pityuſa. Moreouer, the Colonie Parium, which *Homer* named Adraſtia. Moreouer, the towne Priapos, the riuer Æſepus and the cape Zelia. Then come ye to Propontus, for ſo is the place called where the ſea begins to enlarge it ſelfe. Into this channell runneth the riuer Granicum, which maketh the hauen Artace, where once ſtood a towne. Beyond it there is an Iſland, which *Alexander* the Great ioined to the Continent [by two bridges, according to *Strabo*] in which ſtandeth the towne Cyzicum,

20030
copy 1

A zicum, founded by the Mileſians, called heretofore Arconneſos, Dolionis, & Dindymis, neere the top whereof is the mountaine Dindymus. When ye are beyond Cizycum, you meet with theſe townes beſides, Placia, Ariacos, Scylacum, & behind them, the hill Olympus, called ſometime Mæſius. Alſo the city Olympena. The riuers Horiſius and Rhyndacus, named heretofore Lycus. This riuer taketh his beginning in the mariſh or meere Artynia, neere to Miletopolis. It receiueth into it Mareſtos, and many others, and parteth Aſia from Bithynia. This region in antient time was called Cronia: after, Theſſalis: then Malianda, and Strymonis. All this nation of theſe quarters, *Homer* named Halizones, for that they be enuironed with the ſea. Therein ſtood in old time a mighty great city named Attuſa. At this day it hath 15 cities, amongſt
B which is Gordiu-come, now called Iuliopolis: and in the very coaſt vpon the ſea, Daſcylos. Go further on and ye meet with the riuer Gebes: and within the main, the towne Helgas, the ſame that Germanicopolis, knowne alſo by another name, Booſcœte, as alſo Apamea, now called Myrtea of the Colophonians. Being paſt it, you come to the riuer Etheleum, the antient limit of Troas, where Myſia beginneth. Afterwards you enter into the gulfe of Bryllion, whereinto runneth the riuer Aſcanium, vpon which ſtandeth the towne Bryllion, and beyond it you ſhall ſee the riuers Helas and Cios, together with a town of that name. A mart town this was, whereto reſorted the Phrygians that border neere to it, for to traffique and furniſh themſelues with merchandiſe: built verily it was by the Mileſians: but the place whereon it ſtood was called Aſcania of Phrygia. And therefore me-thinks we cannot do better than euen here to ſpeake of
C that country. Phrygia then ſpreadeth out aboue Troas and the nations before-named, from the cape Lectus vnto the riuer Etheleus. It confronteth on the North ſide vpon part of Galatia, Southward it boundeth hard to Lycaonia, Piſidia, and Mygdonia. And on the Eaſt part it reacheth to Cappadocia. The townes of greateſt name, beſides thoſe before rehearſed, be Ancyra, Andria, Celænæ, Coloſſæ, Carina, Cotiaion, Ceranæ, Iconium, and Midaion. Certain Authors I haue, who write, that out of Europe there come to inhabit theſe parts, the Myſi, Bryges, and Thyni, of whom are deſcended and likewiſe named, the Myſians, Phrygians, and Bithynians.

And euen here I think it good to write alſo of Galatia, which lying higher than Phrygia, yet poſſeſſeth a greater part of the plaine countrey thereof, yea and the capitall place of it, ſome-
D time called Gordium. They that inhabited and held that quarter of Phrygia were Gaules, called Toliſtobogi, Voturi, and Ambitui: but they that occupied the countreys of Mæonia and Paphlagonia were named Trochmi. This region confronteth Cappadocia on the North and Eaſt ſide, and the moſt fruitfull part thereof the Tectoſages and Teutobodiaci kept in their poſſeſſion. And ſo much for the principall nations of this countrey. As for the States, Tetrarchies, and regiments, there be in all 195. The townes are theſe: of the Tectoſages, Ancyra: of the Trochmi, Tavium: of the Toliſtobogians, Peſinus. Beſides theſe, there be States of good account, Attalenſes, Araſenſes, Comenſes, Dioſhieronitæ, Lyſtreni, Neapolitani, Oeandenſes, Seleucenſes, Sebaſteni, Timmoniacenſes, and Tebaſeni. This Galatia extendeth euen as far as to Gabalia and Milyæ in Pamphylia, which are ſcituate about Baris: alſo Cyllanticum and
E Oroadicum, the marches of Piſidia, likewiſe Obigene, part of Lycaonia. Riuers there be in it, beſide thoſe before named, Sangarium and Gallus, of which riuer, the gelded prieſts of dame *Cybelæ*, mother of the gods, were named Galli. Now it reſteth to ſpeake of the towns vpon the ſea coaſt. Yet I cannot ouerpaſſe Pruſa neere to Cios, which lieth farre within the countrey of Bithynia, which *Anniball* founded at the foot of the hill Olympus: from Pruſa to Nicæa are counted 25 miles: in which way lieth the lake Aſcanius betweene. Then come vou to Nicæa in the very vtmoſt part of the gulf Aſcanium, which before was called Olbia: alſo to another Pruſa, built vnder the mountaine Hippius. Once there were in this coaſt Pythopolis, Parthenopolis, and Coryphanta. And now there be vpon the ſea ſide theſe riuers, Æſius, Bryazon, Plataneus, Areus, Siros, Gendos, named alſo Chryſorrhoas. The promontory alſo, vpon which
F ſtood the towne Megaricum. Then the gulfe or arme of the ſea which was called Craſpedites, for that that towne before named ſtood as it were in a fold, plait, or nouke thereof. Sometimes alſo there was the towne Aſtacum, whereupon the Creeke tooke the name of Aſtacenus. Moreouer, in antient time, the Towne Libyſſa, by report, was planted there: But now there remaineth nothing elſe to be ſeen but the tombe of *Anniball*. But in the inmoſt part of the Gulfe, where it endeth, there ſtandeth the goodly faire City of Bithynia called Nico-

media. The cape Leucatas, which incloſeth the gulfe Aſtarenus, is from Nicomedia 42 miles and halfe. Being paſt this gulfe, the ſea begins to ſtreighten again, and the land to meet neer together; and theſe ſtreights reach as far as Boſphorus in Thracia. Vpon theſe ſtreights ſtands the free city Chalcedon, 72 miles and a halfe from Nicomedia. Before-time it was called Proceraſtis: then Compuſa: afterwards, the city of the Blind, for that they who founded it, being in a place but 7 ſtadia from Bizantium, where was a ſeat in all reſpects more commodious and fit for a city, were ſo blind as not to chuſe it for the plot of Chalcedon. But within the firme land of Bithynia is the colony Apamena: and there inhabit alſo the Agrippenſes, Iuliopolites, and they of Bithynium. Moreouer, for riuers ye haue Syrium, Lapſias, Pharmicas, Alces, Crynis, Lylæus, Scopius, Hieras, which parteth Bithynia from Galatia. Beyond Chalcedon ſtood Chryſopolis: then Nicopolis, of which the gulfe ſtill retaines the name, wherein is the hauen of Amycus: the cape Naulocum, Eſtia, wherein is the temple of *Neptune*: and the Boſphorus, a ſtreight halfe a mile ouer, which now once again parteth Aſia and Europe. From Chalcedon it is 12 miles and an halfe. There beginneth the ſea to open wider, where it is 8 miles & a quarter ouer, in that place where ſtood once the towne Philopolis. All the maritime coaſts are inhabited by the Thyni, but the inland parts by the Bithynians. Lo here an end of Aſia, and of 282 nations, which are reckoned from the limits and gulf of Lycia, vnto the ſtreights of Conſtantinople. The ſpace of the ſtreights of Helleſpont and Propontis together, vntill you come to Boſphorus in Thracia containeth in length 188 miles, as we haue before ſaid. From Chalcedon to Sigeum, by the computation of *Iſidor*, are 372 miles and a halfe. Iſlands lying in Propontis before Cyzicum, are theſe, Elaphonneſus, from whence commeth the Cyzicen marble; and the ſame Iſle was called Neuris, and Proconneſus. Then follow Ophyuſa, Acanthus, Phœbe, Scopelos, Porphyrione, and Halone with a towne. Moreouer, Delphacia and Polydora, alſo Artacæon, with the towne. Furthermore, ouer againſt Nicomedia is Demonneſos: likewiſe beyond Heraclea, iuſt againſt Bithynia, is Thynias, which the Barbarians call Bithynia. Ouer and beſides, Antiochia: and againſt the foſſe or riuer Rhyndacus, Besbicos, 18 miles about. Laſt of all, Elæa, two Rhoduſſæ, Erebinthus, Magale, Chalcitis, and Pityodes.

THE SIXTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

Chap. I.

¶ *Pontus Euxinus.*

THe ſea called Pontus Euxinus, and named by the Greeks in old time, Axenos, for the hard vſage that paſſengers found at the hands of thoſe ſauage Nations vpon the coaſts thereof, is ſpred alſo betwixt Europ and Aſia, vpon a very ſpite and ſpeciall enuy of Nature, as it ſeems, to the earth, and a wilfull deſire to maintaine the ſea ſtill in his greatneſſe, and to fulfill his greedy and endleſſe appetite. For ſhee was not contented to haue inuironed the whole earth, with the main Ocean, yea and taken from it a great part thereof, with exceeding rage ouerflowing the ſame, and laying all empty and naked: it ſufficed not, I ſay, to haue broken through the mountaines, and ſo to ruſh in, and after the ſea had diſmembred * Caſpe from Affricke, to haue

* Mouth of Gibraltar.

20030
copy 1

A haue ſwallowed vp much more by far than is left behind to be ſeen: no nor to haue let Proponti ſguſh through Helleſpont, and ſo to encroach again vpon the earth and gaine more ground: vnleſſe from the ſtreights of Boſphorus alſo he enlarge himſelfe into another huge and vaſt ſea, and yet is neuer content, vntill the lake Mœotis alſo with his ſtreight, meet with him as he thus ſpreadeth abroad and floweth at liberty, and ſo ioine together and part as it were, their ſtolne good betweene them. And verily that all this is happened maugre the earth, and that it made all reſiſtance that it could, appeareth euidently by ſo many ſtreights and narrow paſſages lying between theſe two elements of ſo contrary nature (conſidering that in Helleſpont, the ſpace is not aboue 875 paces from land to land; and at the two Boſphori the ſea is ſo paſſeable, that oxen or kine may ſwim at eaſe from the one ſide to the other: and hereupon they both
B tooke their name:) the which vicinitie ſerueth very wel to entertaine and nouriſh amity among nations, ſeparated by nature one from another; and in this diſunion as it were, appeareth yet a brothely fellowſhip and vnitie. For the cocks may be heard to crow, and the dogs to bark, from the one ſide to the other; yea and men out of theſe two worlds may parly one to another with audible voice, and haue commerce of ſpeech together, if the weather be calme, and that the windes doe not carry away the ſound thereof.

Well, the meaſure ſome haue taken of the ſea, from Boſphorus Thracius to the lake of Mœotis, and haue accounted it to be 1438 miles and a halfe. But *Eratoſthenes* reckoneth it leſſe by one hundred. *Agrippa* ſaith, that from Chalcedon to Phacis, is a thouſand miles, and ſo to Boſphorus Cimmerius 360 miles. As for vs we will ſet downe ſummarily and in generall, the diſtances of places, according to the moderne knowledge of our nation in theſe daies, foraſmuch
C as our armies haue warred in the very ſtreight and mouth of this Cimmerian ſtreight.

Being paſſed then from the ſtreight of Boſphorus Thracius, we meet with the riuer Rhebas, which ſome haue called Rhœſus; and beyond it Pſillis another riuer; then come we to the port of Calpas, and Sangarius one of the principall riuers of Aſia; it ariſeth in Phrygia, it receiueth other huge riuers into it, and among the reſt Tembrogius and Gallus. The ſame Sangarius was called alſo Coralius. After this riuer, begin the gulfes Mariandini, vpon which is to be ſeen the towne Heraclea, ſcituate vpon the riuer Lycus. It is from the mouth of Pontus 200 miles. Beyond it is the port Acone, curſed for the venomous herbe and poiſonous Aconitum, which taketh name thereof. Alſo the hole or caue Acheruſia. Riuers alſo there be, Pedopiles, Callichorum and Sonantes. One towne, Tium, eight and thirty miles from Heraclea: and laſt of all, the
D riuer Bilis.

Chap. II.

¶ *The nation of the Paphlagonians and Cappadocians.*

BEyond this riuer Bilis, is the countrey Paphlagonia, which ſome haue named Pylemerina, and it is incloſed with Galatia behinde it. The firſt towne ye meet in it, is Maſtya, built by the Mileſians: and next to it, is Cromna. In this quarter the Heneti inhabit, as *Cornelius Nepos* ſaith. Moreouer, from thence the Venetians in Italy, who beare their name, are deſcended as he would haue vs beleeue. Neere to the ſaid towne Cromna, is another called Seſamum in
E times paſt, and now Amaſtris. Alſo the mountaine Cytorus, 64 miles from Tium. When you are gone paſt this mountain, you ſhall come to Cimolus and Stephane, two townes, and likewiſe to the riuer Parthenius; and ſo forward to the cape and promontory Corambis, which reacheth forth a mighty way into the ſea: and it is from the mouth of the ſea Pontus 315 miles, or as others rather thinke, 350. As far alſo it is from the ſtreight Cimmerius, or as ſome would rather haue it, 312 miles and a halfe. A towne there was alſo in times paſt of that name; and another likewiſe beyond it called Arminum: but now, there is to be ſeen the colony Sinope, 164 miles from Citorum. Being paſt it, you fall vpon the riuer Varetum, the people of Cappadocia, the townes Gazima and Gazelum, and the riuer Halyto, which iſſuing out of the foot of the hill Taurus, paſſeth through Cataonia and Cappadocia. Then meet you with theſe towns
F following, Gangre, Cariſſa, and the free city Amiſum, which is from Sinope 130 miles. As you trauell farther, you ſhall ſee a gulfe carrying the name of the ſaid towne, where the ſea runneth ſo far within the land, that it ſeems to make Aſia well-neare an Iſland: for from thence vnto the gulf Iſſicus in Cilicia is not aboue 200 miles through the continent. In al which tract, there be

no

no more than three nations which iustly and by good right, may be called Greekes, to wit, the Dorians, Ionians, and Æolians; for all the rest are reputed barbarous. Vnto Amisum, there ioined the towne Eupatoria, founded by K. *Mithridates*; and after that he was vanquished, both together tooke the name of Pompeiopolis. G

Chap. III.

¶ *Cappadocia.*

IN Cappadocia, there is a city well within the land, called Archelais, scituate vpon the riuer Halys: which *Claudius Cæsar* the Emperor erected as a colony, and peopled it with Romane souldiers. There is besides a towne which the riuer Sarus runneth vnder: also Neo-cæsarea, H which Lycus passeth by: and Amasia with the riuer Iris running vnder it, within the countrey Gazacena. Moreouer, in the quarter called Colopena, there stand Sebastia & Sebastopolis, little towns indeed, howbeit comparable with those aboue said. In the other part of Cappadocia there is the city Melita, built by queene *Semiramis*, not far from Euphrates: also, Dio-Cæsarea, Tyana, Castabala, Magnopolis, Zela, and vnder the mountaine Argæus, Mazaca, which now is named Cæsarea. That part of Cappadocia which lieth before Armenia the greater, is called Melitene: that which bordereth vpon Comagene, Cataonia: vpon Phrygia, Garsauritis: vpon Sargaurasana, Cammaneum; and finally vpon Galatia, Morimene. And there the riuer Cappadox separateth the one from the other. Of this riuer the Cappadocians took name, whereas beforetime they were called Leucosyri: as for the lesse Armenia, the riuer Lycus diuideth it from I Neo-Cæsarea beforesaid. Within the country there runneth also the great riuer Ceraunus. But on the coast side, when you are past the city Amysum, you meet with the town Lycastum, and the riuer Chadisia; and once past them, you enter into the countrey Themiscyra. In this quarter also you may see the riuer Iris, bringing down with it another riuer Lycus that runneth into it. And in the midland parts there is the city Zela, ennobled for the ouerthrow of *Triarius*, whom *C. Cæsar* defeated with his whole army. But in the coast againe you shall encounter the riuer Thermodon, which issueth from before a castle named Phanarœa, and passeth beside the foot of the mountaine Amazonius. In which place there stood somtime a towne of that name, and other fiue, namely, Phamizonium, Themiscyra, Sotira, Amasia, Comana, at this present called Manteium. K

Chap. IV.

¶ *The people of the region Themiscyrene.*

MOreouer, in Pontus ye haue the nations of the Genetæ & the Chalybes, together with a town of Cotyi. People besides called Tibareni, and Mossyni, who brand and marke their body with hot fearing yrons. Also the nation of the Macrocephali, with the towne Cerasus, and the port Cordulæ. Beyond which you come to a people named Bechires, and Buzeri, and to the riuer Melas. And so forward to the quarter of the Macrones, Sideni, & so to the riuer Sydenum, vpon which is scituat the town Polemonium, distant from Amisum 220 miles: L where ye shall finde the riuers Iasonius and Melanthius; and a towne 80 miles from Amisum, called Pharnacea; the castle and riuer of Tripolis. Item, Philocalia, and Liuiopolis without a riuer: and lastly the imperiall & free city Trapezus, enuironed with a high mountain, 100 miles from Pharnacea. And being past Trapezus, you enter into the country of the Armenochalybes, and Armenia the greater; which are 30 miles asunder. But vpon the coast you shall see the riuer Pyxites that runneth euen before Trapezus; and beyond it the country of the Sanni Heniochi. Moreouer, the riuer Absarus, in the mouth whereof there is a castle likewise so named, from Trapezus 150 miles. Behind the mountains of that quarter, you meet with the region Iberia; but in the coast therof the Heniochi, Ampreutæ and Lazi. The riuers Campseonysis, Nogrus, Bathys. When ye are once past them, you come into the countrey of the Colchians, M where stands the town Matium, with the riuer Heracleum passing vnder it, & a Promontorie of that name, & last of all, the most renowned riuer of all Pontus, called Phasis: this riuer riseth from out of the Moschian mountains, & for 38 miles and an halfe, is nauigable, & beareth any great vessels whatsoeuer. And then for a great way it carrieth smaller bottoms, & hath ouer it

20030
copy 1

A 120 bridges. Beautified it was ſometimes with many faire townes vpon the bankes thereof on both ſides, and the principall of them all, were Tyritaum, Cygnus, and the city Phaſis ſcituate in the very mouth thereof, as it falleth into the ſea. But the goodlieſt city planted vpon this riuer, and moſt famous of all the reſt was Æa, fifteene miles diſtant from the ſea: where Hippos and Cyanos, two mighty great riuers, comming from diuers parts, enter both into the riuer Phaſis. But now there is no count made of any but of Surium onely, which taketh name of the riuer Surium which runneth to it. And thus far we ſaid that Phaſis was capable of great ſhips. Among other riuers which it receiues, for number and greatneſſe admirable, is the riuer Glaucus. In the foſſe and mouth of this riuer Phaſis, where hee is diſcharged into the ſea, there be ſome little Iſlands of no reckoning. And there, from Bſarus it is 75 miles. Being paſt Phaſis you meet with another riuer called Charien: vpon which bordereth the nation of the Salæ, na-
B med in old time Phthirophagi and Suani, where you ſhall meet with the riuer Cobus, which iſſueth out of Caucaſus, and runneth through the country of the Suani aboue-ſaid. Then you come to another riuer Rhoas, and ſo forward to the region Eerectice: to the riuers Sigania, Terſos, Atelpos, Chryſorrhoas, and the people Abſilæ: the caſtle Sebaſtopolis, an hundred miles from Phaſis, the nation of the Sanigores, the towne Cygnus, the riuer and towne both called Pityus. And laſt of all ye arriue vpon the country of the Heniochæ, where be nations entituled with many and ſundry names.

Chap. V.

C ¶ *The region of Colchis, the Achæi, and other nations in that tract.*

NExt followeth the region of Colchis, which is likewiſe in Pontus: wherin the mountain Caucaſus windes and turnes toward the Rhiphæan hils, as hath been ſaid before, and that mountaine of the one ſide bendeth downe toward Euxinus, Pontus, and Mæotis; and of the other, enclineth to the Caſpian and Hircane ſeas. When ye are deſcended to the maritime coaſts, ye ſhall find many barbarous and ſauage nations there inhabiting, to wit, the Melanchlæni, and the Choruxi, where ſometimes ſtood Dioſcurias a city of the Cholchians, neere vnto the riuer Anthemus, which now lieth waſt and diſpeopled, notwithſtanding it was ſo renowned in times paſt, that by the report of *Timoſthenes*, there repaired thither and inhabited therein
D 300 nations of diuers languages. And euen afterwards our Romanes were forced to prouide themſelues of 130 interpreters, when they would negotiate and traffick with the people in and about Dioſcurias. Some there be that think how it was firſt founded by *Amphitus* and *Telchius*, who had the charge of the chariots of *Caſtor* and *Pollux*: for certain it is, that the fierce and wild nation of the Heniochi, are from them deſcended. Being paſt Dioſcurias, you come vp the towne Heraclium, which from Sebaſtopolis is 80 miles diſtant: and ſo forward to the Achæi, Mardi and Cercetæ: and after them to the Serri, and Cephalotomi. For within that tract ſtood the moſt rich and wealthy town Pitius, which by the Heniochians was ranſacked and ſpoiled. On the backe part thereof inhabit the Epagerites [a nation of the Sarmatians] euen vpon the mountaine Caucaſus: and on the other ſide of that hill, the Sauromatæ (the country is at this day called Tartaria the great.) Hither retired and fled king *Mithridates* in the time of *Claudius*
E *Cæſar* the Emperor: who made report, that the Thali dwell thereby, and confine Eaſt-ward vpon the very opening of the Caſpian ſea: which by his report remaineth dry, whenſoeuer the ſea doth ebbe. But now to turne vnto the coaſt neer vnto the Cercetæ, you meet with the riuer Icaruſa, with a towne and riuer called Hierum, 136 miles from Heracleum. Then come yee to the cape Cronea, in the very ridge and high pitch whereof the Toretæ inhabit. But beneath it you may ſee the citie Sindica, 67 miles ſcituate from Hierum: and laſt of all, you arriue vpon the riuer Sceaceriges.

Chap. VI.

F ¶ *Mæotis, and the ſtreights thereof called Boſphorus Cimmerius.*

FRom the ſaid riuer to the very entrance of the Cimmerian Boſphorus are counted 88 miles and a halfe. But the length of the very demy Iſland, which extendeth and ſtretcheth out between Pontus and Mæotis, is not aboue 87 miles and a halfe, and the breadth in no place

leſſe

leſſe than two acres of land. This the paiſants of that country do call Eione. The very coaſts of G
this ſtreight Boſphorus, both of Aſia ſide and Europa, boweth and windeth like a curb to Mœotis. As touching the townes here planted, in the very firſt entry thereof ſtandeth Hermonaſſa, and then Cepi, founded by the Mileſians. Being paſt Cepi you come ſoone after to Stratilia, Phanagoria, and Apaturos, in manner vnpeopled and void: and laſt of all, in the very vtmoſt point of the mouth where it falleth into the ſea, you arriue at the towne Cimmerius, named before-time Cerberian.

Chap. VII.

¶ *Nations about Mœotis.*

BEing paſſed Cimmerium, yon come to the very broad lake Mœotis, whereof we ſpake be- H
fore in the Geography of Europe. Vpon the coaſt wherof, beyond Cimmerium on the ſide of Aſia, inhabite the Mœotici, Vati, Serbi, Archi, Zingi, and Pſeſij. After this, you come to the great riuer Tanais, which runneth into Mœotis with two armes or branches: and on the ſides of it dwell the Sarmations, an off-ſpring deſcended in old time (as men ſay) from the Medians: but ſo multiplied now, that they themſelues are diuided and diſperſed into many nations. And firſt of all are the Sauromatæ, ſurnamed Gynæcocratumeni; *i.* (as one would ſay) ſubiect to women: from whence the Amazones are prouided and furniſhed of men to ſerue their turne in ſtead of husbands, Next to them, are the Euaſæ, Cottæ, Cicimeni, Meſſeniani, Coſtobocci, Choatræ, Zigæ; Dandari, Thuſſageræ, and Turcæ, euen as far as the wildernesſes, I
forreſts chaſes, and rough vallies. But beyond them are the Arnuphæi, who confine vpon the mountaine Rhiphæi. As for as the riuer Tanais, the Scythians call it Silys: and Mœotis, they name Temerinda, that is to ſay, the mother of the ſea, or rather, the ſeas end. In ancient time there ſtood a great towne vpon the very mouth of Tanais, where it falleth into the ſea. As for the neighbour borders of this ſea, inhabited they were ſometime by the Lares: afterwards, by the Clazomenij, and Mœones: and in proceſſe of time, by the Panticapenſes. Some Authours write, that about Mœotis toward the higher mountaine Ceraunij, theſe nations following doe inhabit, to wit, firſt vpon the very coaſt and ſea ſide, the Napææ: and aboue them, the Eſſedones, ioyning vpon the Colchy, and the high mountain [Corax.] After them, the Carmaces, the Oranes, Anticæ, Mazacæ, Aſcantici, Acapeates, Agagammatæ, Phycari, Rhimoſoli, and K
Aſcomarci. Moreouer, vpon the hill Caucaſus, the Icatales, Imaduches, Ranes, Anelaks, Tydians, Charaſtaſci, and Aſuciandes. Moreouer, along the riuer Lagous, iſſuing out of the mountaines Cathei, and into which Opharus runneth, theſe nations enſuing do dwell, to wit, the Caucadians, and the Opharites: beyond whom runneth the riuers Menotharus, and Imitues, out of the mountaines Ciſſij, which paſſeth through the Agedi, Carnapes, Gardei, Acciſi, Gabri, and Gregari: and about the ſource or ſpring of this riuer Imitues, the people Imitui and Aparrheni. Others ſay, that the Suites, Auchetes, Saternei, and Aſampates, inuaded and conquered theſe parts; and that the Tanaites and Nepheonites, were by them put to the edge of the ſword, and not one perſon of them ſpared. Some write, that the riuer Opharius runneth through the Canteci, and the Sapæi: and that the riuer Tanais trauerſed ſometime through the L
Phatareans, Herticei, Spondolici, Synthietæ, Amaſſi, Iſſi, Catareti, Tagori, Catoni, Neripi, Agandei, Mandarei, Saturchei, and Spalei.

Chap. VIII.

¶ *Cappadocia.*

HItherto haue wee treated and gone through the nations and inhabitants of the coaſts vpon the Mediterranian ſea. Now are wee to ſpeake of the people inhabiting the very midland parts of the maine within: wherein I proteſt, and deny not, but that I will deliuer many things otherwiſe than the ancient Geographers haue ſet downe: foraſmuch as I haue M
made diligent ſearch into the ſtate of thoſe regions, as wel by enquiry of *Domitius Corbulo* (who lately went with an army through thoſe quarters (as of diuers kings and princes, who made repaire to Rome with ſutes and ſupplications, but eſpecially of thoſe kings ſons that were left as hoſtages in Rome. And firſt to begin with the nation of the Cappadocians. This is a country

that

20030
copy 1

A that of all others which bound vpon Pontus,reacheth fartheſt within the firm land; for on the left hand it paſſeth by both Armenias,the greater and the leſſe,& Comagene:and on the right all thoſe nations in Aſia before-named,confining many others; and ſtill preuailing with great might,growing on and climing Eaſtward vp to the mountain Taurus,it paſſeth beyond Lycaonia,Piſidia,and Cilicia:and with that quarter which is called Cataonia, pierceth aboue the tract of Antiochia,and reacheth as far as to the region Cyrrheſtica, which lyeth well within that country. And therefore the length of Aſia there,may containe 1250 miles, & the breadth 640.

Chap. IX.

B ¶ *Armenia the greater and the leſſe.*

THe greater Armenia,beginning at the mountains Pariedri,is diuided from Cappadocia by the riuer Euphrates,as hath bin ſaid before: & where the riuer Euphrates beginneth to turne his courſe from Meſopotamia,by the riuer Tigris as renowned as the other, both theſe riuers is it furniſhed withal,which is the cauſe that it taketh the name of Meſopotamia, as being ſcituate between them both. The main land which lyeth between, is poſſeſſed by the mountains of Arabia called Orei:howbeit,it extendeth vntil it confine vpon Adiabene. Being paſt it once,it is hemmed in with mountains that incounter it ouerthwart,which cauſe it to inlarge it ſelfe into a bredth on the left hand,as far as to the riuer Cyrus:and then it turneth euer croſſe,vntill it meet with the riuer Araxes: but it carrieth his length into the leſſe Armenia, C confining ſtil vpon the riuer Abſarus,which falleth into the Ponticke ſea:and the mountaines Pariedri (from which the ſaid riuer iſſueth) which diuide it from the leſſe Armenia. As for the riuer Cyrus,it ſpringeth in the mountains Heniochij,which ſome called Coraxici. But Araxes iſſueth out of the ſame mountain from whence Euphrates commeth,and there is not aboue ſix miles ſpace between them both. This riuer Araxes is augmented with the riuer Muſis;and then himſelfe loſeth alſo his name,and as moſt haue thought,is carried by the riuer Cyrus into the Caſpian ſea:as for the townes of name in the leſſe Armenia,they be theſe,Cæſarea, Aſia,and Nicopolis. In the greater yee haue Arſamole, faſt vpon the riuer Euphrates: likewiſe Carcathiocerta,ſcituate vpon Tigris. In the higher country,is the city Tigranocerta, built in D the plain beneath,neere to Araxes,Artaxata. *Aufidius* ſaith,that both the Armeniæ containe in all 500 miles. *Clandius Cæſar* reporteth, that in length from Daſcuſa to the confines of the Caſpian ſea,it taketh 1300 miles,and in bredth halfe ſo much,to wit, from Tigranocerta to Iberia. This is wel knowne,that diuided it is into certain regiments, which they call Strategians;and yet ſome of them in old time,were as large each of them as realmes and kingdomes: and to the number they were of 120,but ſuch barbarous names they had,that they cannot well be ſet downe in writing. Encloſed it is Eaſtward with the mountains, but neither the hils Ceraunij,nor yet the region Adiabene,do preſently and immediatly confine thereupon: for the country of the Sopheni lyeth between:then you come to the mountaines aforeſaid, and being paſt them,you enter into the countrey of the Adiabenes. But on that coaſt where the plaines E lie and the flat vallies,the next neighbors to Armenia,be the Menobardi and Moſcheni. As for Adiabene,enuironed it is partly with the riuer Tigris,and partly compaſſed with an vnacceſſible ſteep mountaines. On the left hand,it confineth vpon the Medians, and hath a proſpect to the Caſpian ſea,the which commeth out of the Ocean (as we ſhall ſhew in meet and conuenient place) and is incloſed wholly within the mountains of Caucaſus. As for the nations there inhabiting along the marches and confines of Armenia,now wil we ſpeake of them.

Chap. X.

¶ *Albania,and Iberia.*

F ALl the plaine country between Armenia and the riuer Cyrus,the Albanois of Aſia do inhabit. Being paſt it,you enter anon into the Iberians region, who are ſeparated from the Albanois aforeſaid by the riuer Alazon,which runneth downe from the Caucaſian hills into Cyrus. The townes of importance,in Albania,is Cabalaca;in Iberia, Harmaſtis, neere to the riuer Neoris: beyond which,is the region Thaſie,and Triare, as farre as vnto the mountaines

tains Partedori. And when you are past them, you enter into the desarts of Cholchis: and on the G
side of them which lyeth toward the Ceraunij, the Armenochalybes do inhabit: and so forward you come into the tract and marches of the Moschi, which extend to the riuer Iberus, that runneth into Cyrus. Beneath them, inhabit the Sacassani, and beyond them the Macronians, who reach euen to the riuer Absarus. Thus you see how the plaines and the hanging of the hills in these parts are inhabited. Againe, from the marches and frontiers of Albania, all the forefront of the hils is taken vp and possessed by the sauage people of the Sylui; and beneath them, of the Lubienes, and so forward by the Didurians, and Sodij.

Chap. XI.

¶ *The gates and passages of the mountaine Caucasus.* H

WHen ye are beyond the Sodij, you come to the Streights of the hill Caucasus, which many haue erroniously called Caspiæ Portæ. And certes, Nature hath performed a mightie piece of worke, in cleauing asunder at one instant those mountaines, where the gates were barred vp as it were with iron portculleises, whiles vnder the mids therof, the riuer Dyriodorus runneth: and on this side of it, standeth a strong fort and castle called Cumania, scituate vpon a rock, able to impeach an army neuer so puissant & innumerable that would passe thereby; in such sort, as in this place by means of these bar-gates, one part of the world is excluded from the other: and namely most of all they seeme to be set opposite as a rampart against Harmastis a towne of Iberia. But being passed these said gates, you come to the mountains Gordyei, where the Valli and Suarni, barbarous and sauage nations, are imployed onely I
in the mines of gold. Beyond them as far as to the Ponticke sea, you enter into the countrey of the Heniochi, wherof be many sorts, and soon after to the Achei. And thus much as touching this tract of the sea Ponticke, and of the most renowned gulfes of all others. Some haue set downe in writing, that between Pontus and the Caspian sea, it is not aboue 375 miles. *Cornelius Nepos* saith it is but 150. See into what great streights betweene both seas Asia is driuen again, and as it were thronged. *Claudius Cæsar* hath reported, that from Cimmerius Bosphorus to the Caspian sea, it is 150 miles, and that *Seleucus Nicator* purposed if he had liued, to cut the land through from the one side to the other: but in this purpose of his, himselfe was cut short and slain by *Ptolomæus Ceraunus*. To conclude, it is in manner held for certain, that from those K
gates of Caucasus vnto the Pontick sea, it is 200 miles, and no lesse.

Chap. XII.

¶ *The Iflands in the Ponticke sea.*

IN the Pontick sea lye the Islands Planctæ, otherwise Cyaneæ or Symplegades. Then Apollonia, named also Thynnias, for distinction sake from that other so named in Europe: it is from the continent one mile, and is in circuit three. Iust ouer-against Pharnacea, is the Isle Chalceritis, which the Greeks called Aria, consecrated as it were to *Mars*; wherein they say the foules that are, vsed to fight and flutter with their wings against all other birds that come L
thither.

Chap. XIII.

The Regions and people confining vpon the Scythian Ocean.

HAuing thus sufficiently discourssed of all the countries within the firme land of Asia, let vs now determine to passe ouer the Rhiphæan hills, and discouer the coasts of the Ocean which lie on the right hand of those hills. Wherein we haue to consider, that Asia is dashed and beaten vpon by this maine sea on three parts: to wit, on the North side, and there it is M
called Scythicus: on the East, where they call it Eous: and last from the South, and there they name it Indicus. And according to the sundry gulfes and creekes that it maketh, and the inhabitants by whom it passeth, many names it taketh. Howbeit, a great part of Asia toward the North, lieth desart, and hath in it much wildernesse vnhabitable, by reason of the exreme cold of that frozen climat, so subiect to the Pole Artick. But being once past the vtmost quarter of the

20030
copy 1

A the North-point,and came to the North-Eaſt where the Sun ariſeth at midſommer,then you come to the Scythians. Beyond whom, and the very point of the North-pole and the winde from thence,ſome haue placed the Hyperborei; of whom we haue ſpoken at large in the treatiſe of Europe. On this ſide the Hyperborei,the firſt cape or promontory that you meet with-all in the countrie Celtica, is named Lytarmis:and then you come vnto the riuer Carambucis, where by the forcible influence of the ſtarres,the high mountains Rhiphæa,as being wearied, begin to ſettle and abaſe themſelues lower. At the fall and deſcent of which mountains,I haue heard ſay, that certain people named Arnupheæ inhabited: a nation not much vnlike in their maner of life to the Hyperboreans. They haue their habitations in forreſts;their feeding is vp-
B on berries of trees:ſhorne they be all and ſhauen, for both men and women count it a ſhame to haue haire on their heads:otherwiſe they are ciuill enough in their conuerſation and behauior: and therefore, by report, they are held for a ſacred people and inuiolable, in ſo much as thoſe cruell nations and inhumane that border vpon them,will offer them no abuſe; neither do they reſpect them only,but alſo in regard and honour of them,they forbeare thoſe alſo that flie vnto them as to a place of franchiſe and priuiledge. Goe beyond them once, you come among the *Scythians indeed,the Cimmerij,Cicianthi,Georgi,and the nation of the Amazons,& theſe confront the Caſpian or Hircan ſea:for it breaks forth of the deep Scithian Ocean,toward the back parts of Aſia,and takes diuers names of the inhabitants coaſting vpon it, but eſpecially aboue all other of the Caſpians & Hircaneans. *Clitarchus* is of this opinion,that this ſea is full
C as great and large as Pontus Euxinus. And *Eratoſthenes* ſets downe the very meaſure and pourpriſe thereof:namely,from Eaſt to South along the coaſt of Caduſia and Albania,5400 ſtadia: from thence by the Aratiaticks,Amarbi,and Hircanij,to the mouth of the riuer Zoum, 4800 ſtadia:from it to the mouth of Iaxartes where it falleth into the ſea, 2400 ſtadia: which being put together amount in all to 1575 miles. *Artemidorus* counteth leſſe by 25 miles. *Agrippa* in bounding out and limiting the circuit of the Caſpian ſea,& the regions coaſting vpon it,together with them Armenia both the greater and the leſſe,namely, Eaſtward with the Ocean of the Seres,Weſtward with the mountains of Caucaſus;on the South ſide with the hill Taurus,and finally on the North with the Scithian Ocean,hath written,That the whole precinct and compaſſe of theſe parts may contain in length[ſo far as is known & diſcouered of thoſe countries]
D 590 miles,and 290 in breadth. Yet for all this,there want not others who ſay, That the whole circuit of that ſea,and begin at the very mouth and firth thereof,ariſeth to 2500 miles. As for this mouth aforeſaid where it breakes into the ſea it is very narrow,but exceeding long:howbeit when it begins once to enlarge it ſelfe and grow wide,it turns and fetcheth a compaſſe with horned points like to a quarter moone,and after the maner of a Scithian bow,as *M. Varro* ſaith, it windes along from his mouth toward the lake Mœotis. The firſt gulfe that it makes is called Scythicus; for the Scithians inhabit on both ſides, and by meanes of the narrow ſtreight between haue commerce and trafficke one with another:for of the one ſide are the Nomades and Sauromatæ,compriſing vnder them many other nations of diuers names:and on the other, the Abzoæ,who haue no fewer ſtates vnder them. At the very entry of this ſea on the right hand,the
E Vdines, a people of the Scithians, dwell vpon the very point of this mouth:and then along the coaſt,the Albanois,a nation deſcended (as men ſay) from *Iaſon*;where the ſea lying before them is called Albanum. This nation is ſpread alſo vpon the mountaines of Caucaſus, and ſo along downe the hills as far as to the riuer Cyrus,which confines the marches between Armenia and Iberia,as hath bin ſaid. Aboue the Maritime coaſts of Albania & the Vdines country,the Sarmatians,called Vtidorſi,and Aroteres,are planted:and behinde them,the Amazones,whom we haue already ſhewed;who alſo are women Sauromatians. The riuers of Albani which fall into the ſea,are Caſſios and Albanos: and then Cambices,which hath his head in the Caucaſian mountains:and ſoon after Cyrus,which ariſes out of the hills Corax,as before is ſaid. Moreouer *Agrippa* writes,that this whole coaſt of Albanie(fortified with thoſe high and inacceſſable mountains of Caucaſus)contains 425 miles. Now when you are paſt the riuer Cyrus,the Caſ-
F pian ſea begins to take that name, for that the Caſpians doe inhabit the coaſts thereof. And here the errour of many is to be laid open and corrected,euen of thoſe alſo who were in the laſt voyage with *Corbulo* in Armenia with the Romane armie: for they tooke it, that thoſe gates of Caucaſus whereof we ſpake before,were the Caſpian gates, and ſo called them: and the verie mappes and deſcriptions which are painted and ſent from thence, beare that name and title.

* At this day, the Moſchouites,white & blackRuſians, Georgians, Amazonians,& the leſſe Tartatia.

Likewise the menacing commandements, and threatning commissions sent out by *Nero* the Emperour for to gaine and conquer those gates, which through Iberia lead into Sarmatia, made mention of the gates Caspiæ there, which had in a manner no passage at all to the Caspian sea, by reason that the mountaine Caucasus empeached it. Howbeit in very truth, there be other gates so called, which joine vpon the Caspian nations, which wee had neuer knowne from the other, but by relation of those that accompanied *Alexander* the Great in his voyage and expedition to those parts. For the realme and kingdome of the Persians, which at this day wee take that the Parthians hold, lyeth aloft betweene the Persian and Hircane seas vpon the mountaines of Caucasus, in the very hanging and descent thereof, on both sides confining vpon Armenia the greater: and on that part which lieth to Comagene, confronteth and joineth (as we haue said) vpon Sepheniæ: and vpon it againe bordereth Adiabene, where the realme of the Assyrians doth begin: whereof Arbelitis, which boundeth next vpon Syria, taketh vp a good part: which is the countrie wherein *Alexander* the Great discomfited and vanquished *Darius*. All this tract, the Macedonians who entered with *Alexander*, surnamed Mygdonia, for the resemblance of that in Greece from which they came. Townes of name there be in it, Alexandria, and Antiochia, which they call Nisibis: and from Artaxata it is 750 miles. There was also another citie called Ninus, or Niniue, seated vpon the riuer Tygris, which regarded the West, which in times past was highly renowned. But on the other side, where it lieth toward the Caspian sea, lieth the region Atropatene, separated by the riuer Araxes, from Otene in Armenia: wherein is the citie Gazæ, 450 miles from Artaxata: and as many from Ecbatana in Media, whereon some part the Atropatenes doe hold.

Chap. XIIII.

¶ *Media, and the gates Caspiæ.*

AS for Ecbatana the head citie of Media, *Seleucus* the king founded it: and it is from Seleucia the great 750 miles, and from the Caspian gates 20. The other great towns of importance in Media, be Phausia, Agamzua, and Apamia, named also Rhaphane. And as for the streights there, called the Caspian gates, the same reason is there of that name, as of the other by Caucasus; by reason that the mountaine is clouen and broken through, and hath so narrow a lane, that hardly a waine or cart is able to passe by it; and that for the length of 8 miles: all done by the picke-axe and mans hand. The rockes and cliffes that hang ouer on the one side and the other, be like as if they were scorched and half burnt: so dry and thirsty is all that tract, and without fresh water for 38 miles space: for all the liquor and moisture issuing out of those craggie rockes, runneth through it, which letteth the passage, and causeth folke to auoid that way. Besides, such a number of serpants doe there haunt, that no man dare passe that way but in winter onely.

Chap. XV.

¶ *Nations about the Hircane sea.*

VNto Adiabene, joyneth the countrie of the Carduchy, so called in times past, and now Cordueni, by which the riuer Tigris runneth: and vpon them the Pratitæ do confine, called also Paredoni: who keepe the hold of the Caspian gates aforesaid. On the other side of whom, you shall meet with the deserts of Parthia, and the mountaine Cithenus: but being passed that once, you come streight into the most pleasant and beautiful tract of the same Parthia, called Choara; and there stand two cities of the Parthians, built sometimes as forts opposite against the Medians: namely, Calliope & Issatis, scituate in times past vpon another rocke. As for the capitall citie of al Partia, Hecatompylos, it is from the Caspian gates aboue-said 133 miles. Thus you see how the kingdome of the Parthians also is limited & separat by these mountaines and streights. When a man is once gotten forth of these gates, presently he enters vpon the Caspians countrie, which reacheth as far as to the sea side, and gaue the name as well to it as to the gates afore-named. Howbeit al the region vpon the left hand is ful of mountains from whence backward to the riuer Cyrus, are by report 220 miles, but from that riuer if you would go higher vp to those gates, you shal find it 700 miles. And in very truth from this place began *Alexander* to make the account and reckoning of his iournies, in that voyage of his to India,

20030
copy 1

A India, ſaying, that from thoſe gates to the entrance of India, it was 15680 ſtadia: from thence to the city Bacha, which they call Zariaſpa 3700, and ſo to the riuer Iaxartes 5 miles.

Chap. XVI.

¶ *Other Nations alſo.*

FRom the Caſpians country Eaſtward, lieth the region called Zapanortene, & in it the land Daricum, the moſt fertile tract of all thoſe parts. Then come you to the Tapyrians, Anariaci, Stauri and Hircani, at whoſe coaſts the ſame ſea begins to take the name Hircanum, euen from the riuer Syderis. About it are other riuers, to wit, Mazeras and Stratos, all iſſuing
B out of Caucaſus. Out of the realme of Hircania, you enter into the country Margiana, ſo commendable for the warme Sun-ſhine weather there, and the only place in all that quarter which yeeldeth vines. Enuironed it is on euery ſide with goodly pleaſant hils to the eie, for the compaſſe of 1500 ſtadia. Fortified it is beſides, and affordeth hard acceſſe vnto it by reaſon of the ſandy and barren deſarts for the ſpace of 120 miles. And ſcituat it is euen against the tract of Parthia, wherein *Alexander* the Great ſometime had built Alexandria, which beeing raſed and deſtroied by the Barbarians, *Antiochus* the ſon of *Seleucus* re-edified in the ſame place vpon the riuer Margus, which runs through it, together with another riuer Zodale, and it was called Syriana [or rather Seleucia.] Howbeit, he deſired rather that it ſhould be named Antiochia. This
C citie containeth in circuit 70 ſtadia: and into it, *Orodes* after that he had defeated *Craſſus* & his hoaſt, brought all the Romans whom he had taken priſoners. Being paſt the high country Margiana, you come to the region of Mardi, a fierce & ſauage people, ſubiect vnto none, they inhabit the mountain Caucaſus, and reach as far as to the Bactrians. Beyond that tract are theſe nations, the Ochanes, Chomares, Berdrigei, Hermatotrophi, Bomarci, Commani, Marucæi, Mandrueni and Iatij. The riuers alſo Mandrus and Gridinus. Beyond inhabit the Choraſmij, Gandari, Attaſini, Paricani, Sarangæ, Parraſini, Maratiani, Naſotiani, Aorſi, Gelæ, whom the Greeks called Caduſij, and the Matiani. Moreouer, in it ſtood the great towne Heraclea, built by *Alexander* the Great, which afterwards was ſubuerted and ouerthrowne: but when it was repaired again by *Antiochus*, he named it Achais. Beneath in the country, the Derbines do inhabit, thorough whoſe marches in the very midſt runneth the riuer Oxus, which hath his beginning out
D of a lake called Oxus. Beyond them are the Syrmatæ, Oxij, Tagæ, Heniochi, Bateni, Saraparæ, and Bactrians, with their towne Zariaſpe, called afterwards Bactrum, of the riuer Bactra. This nation inhabiteth the back parts of the hill Paropamiſus, ouer against the ſource & ſpring of the riuer Indus, & is inuironed with the riuer Ochus. Beyond the Bactrians are the Sogdianes, & Panda the principal city of that country. In the very vtmoſt marches of their territory ſtandeth the town Alexandria built by *Alexander* the Great, wherin are to be ſeen the altars and columnes, erected by *Hercules*, prince *Bacchus*, *Cyrus*, *Semiramis*, and *Alexander*: ſuppoſed and taken to be the very end of all their voiages in that part of the world, reſting within the riuer Iaxartes, which the Scythians call Silys. For *Alexander* and his ſoldiers thought it had bin Tanais. Howbeit, captain *Demonax*, who ſerued vnder the kings *Seleucus* and *Antiochus*, paſſed ouer that
E riuer with an army; and at the end of his voiage ſet vp altars vnto *Apollo Didymæus*. And the *Demonax* we follow, eſpecially in this deſcription and Geographie of ours.

Chap. XVII.

¶ *The Scythian Nation.*

BEyond the realm Sogdiana, inhabit the Nations of the Scythians. The Perſians were wont to call them in general Sacas, of a people adioyning vnto them, ſo named. In old time they were known by the name of Arameans. And on the other ſide, the Scythians for their part vſed to term the Perſians, Chorſari: and the hil Caucaſus, they called Graucaſus, that is to ſay,
F white with ſnow. The principal nations of Scythia, be the Saræ, Maſſagetæ, Dahæ, Eſſedones, Ariacæ, Rhymnici, Peſici, Amordi, Hiſti, Edones, Camæ, Camacæ, Euchatæ, Cotieri, Antariani, Pialæ, Arimaſpi beforetime called Cacidiri, Aſæi & Oetei. As for the Napæans & Apellæans who ſometime dwelt there, they be vtterly extinct and gone. The riuers there of name be Mandagræus and Caſpaſius. And ſurely there is not a region wherein Geographers doe varie

and disagree more thau in this: and as I take it, this commeth of the infinit number of those G
nations, wandring to & fro, and abiding neuer in one place. *Alexander* the Great and *M. Varro* make report, that the water of the Scythian sea is fresh in taste, & potable. And in truth *Pompey* the great had such water brought vnto him from thence to drink, when he waged war thereby against *Mithridates*: by reason no doubt of the great riuers that fall into it, which ouercome the saltnesse of the water. *Varro* saith moreouer, That during this expedition and iourny of *Pompeius*, it was for certain knowne, that it is but seuen daies iourney from out of India to the Bactrians countrey, euen as far as to the riuer Icarus which runneth into Oxus: and that the merchandise of India, transported by the Caspian sea, and so to the riuer Cyrus, may be brought in fiue daies by land as far as to Phasis in Pontus. Many Islands there lie all ouer that sea: but one aboue the rest, and most renowned, is Tazata; for thither all the shipping from out of the Cas- H
pian sea and the Scythian Ocean, do bend their course & there arriue; for that all the sea coasts do affront the Leuant, and turn into the East. The frontiers of Scythia from the first cape thereof is vnhabitable by reason of the snow that lies continually: neither are the next regions thereto frequented and tilled, for the barbarous crueltie of those nations that border vpon it: such as the Anthropophagi, who liue of mans flesh, and haunt those parts. Hereupon it commeth, that you shall find nothing there but huge desart forests, with a number of wild beasts, lying in wait for men as sauage as themselues. When you are past this region, you enter againe amongst the Scythians, where you shal find likewise a wildernes ful of wild beasts, euen as far as to the promontory & mountain called Tabis, which regardeth the sea. In such sort as one moitie in manner of that coast, all along which looketh toward the East, lieth wast, and is not inhabited. The I
first people of any knowledge and acquaintance be the Seres, famous for the fine silk that their woods do yeeld. They kemb from the leaues of their trees the hoary downe thereof, and when it is steeped in water, they card and spin it, yea, and after their manner make therof a sey or web, whereupon the dames here with vs haue a double labour both of vndoing, and also of weauing again this kind of yearn. See what ado there is about it, what labour and toile it costeth, & how far fet it is; and all for this, that our ladies and wiues when they go abroad in the street may cast a lustre from them, and shine again in their silks and veluets. As for the Seres, a mild and gentle kind of people they are by nature: howbeit, in this one point they resemble the bruit and wild beasts, for that they cannot away in the commerce with other nations, with the fellowship and society of men, but shun and auoid their company, notwithstanding they desire to* traf- K
ficke with them. The first riuer known among them is Psitaras: the next to it Carabi: the third Lanos: and then you come to a cape of that name. Beyond it is the gulfe Chryse, the riuer Attanos, and another bay or creeke called Attanos. By it lyeth the region of the Attaci, a kind of people, secluded from all noisome wind & aire, keeping vpon hils, exposed to the pleasant sunshine, where they inioy the same temperature of aire that the Hiperboreans liue in. Of this country and people, *Amonetus* hath written a seuerall booke of purpose: like as *Herateus* hath compiled such another treatise of the Hyperboreans. Beyond the Attaci or Attacores, the Thyrians and Tocharians do inhabit; yea, and the Casirians, who now by this time belong to the Indians, & are a part of them. But they within-forth that lie toward the Scithians, feed of mans flesh. As for the Nomades of India, they likewise wander to & fro, and keep no resting place. L
Some write, that they confine vpon the very Ciconians and Brysanians on the North side. But there (as all Geographers do agree) the mountains Emodi arise and shoot vp: and there entereth the country of the East Indians, and extendeth not only to that sea, but also to the Southerne, which we haue named the Indian sea. And this part of the Orientall Indians, which lieth directly streight forth, as far as to that place where India beginneth to twine and bend toward the Indian sea, containeth 1875 miles. And all that tract which windeth and turneth along the South, taketh 2475 miles (as *Eratosthenes* hath collected & set downe) euen vnto the riuer Indus, which is the vtmost limit of India West-ward. But many other writers haue set downe the whole length of India in this maner, namely, that it requireth 40 daies and nights sailing, with a good gale of a forewind: also, that from the North to the South coast thereof, is 2750 miles. M
Howbeit, *Agrippa* hath put down in writing that it is 3003 miles long, and 2003 broad. *Posidonius* took measure of it from the Northeast to the Southeast: & that by this means it is directly opposit vnto Gaule, which he likewise measured along the West coast, euen from the North west point where the Sun goeth down at Mid-summer, to the South-west where it setteth in the

* Euen at this day they set abroad their wares with the prices vpō the shore, and goe their waies: thē the forain merchants come and lay down the money, and haue away the merchandise: and so depart without any communication at all.

20030
copy 1

A in the midſt of Winter. He addeth moreouer and ſaith, That this Weſt wind which from be-
hind Gaule bloweth vpon India, is very healthſome & wholſome for that country, and this he
proued by very good reaſon & demonſtration: and verily the Indians haue a far different aſpect
of the ſky from vs. Other ſtars riſe in their Hemiſphære, which we ſee not. Two Summers they
haue in one yere, and as many haruеſts: and their winter between hath the Eteſian winds blow-
ing in our dog-daies, in ſtead of the Northern blaſts with vs. The winds are kind and mild with
them: the ſea alwaies nauigable: the nations there dwelling, & the cities and towns there built,
innumerable, if a man would take in hand to reckon them al, for India hath bin diſcouered, not
only by *Alexander* the great his mighty and puiſſant army, and by other kings his ſucceſſors (&
namely *Seleucus* and *Antiochus*, and their Admirall *Patrocles*, who ſailed about it euen to the
Hircane and Caſpian ſeas:) but alſo by diuers other Greek Authors, who making abode, & ſo-
B journing with the kings of India (like as *Megaſthenes* and *Dionyſius* ſent thither of purpoſe from
Philadelphus) haue made relation of the forces which thoſe nations are able to raiſe and main-
tain. And yet further diligence is to be imploied ſtil in this behalfe, conſidering they wrote of
things there ſo diuers one from another, and incredible withall. They that accompanied *Alex-
ander* the great in his Indian voiage, haue teſtified in their writings, that in one quarter of India
which he conquered, there were of towns 500 in number, and not one leſſe than the city Cos:
of ſeuerall nations nine. Alſo that India was a third part of the whole earth: & the ſame ſo wel
inhabited, that the people in it were innumerable. And this they ſaid (beleeue mee) not with-
out good apparance of reaſon; for the Indians were in manner the onely men of all others that
neuer went out of their own country. Moreouer, it is ſaid, That from the time of *Bacchus* vnto
C *Alexander* the Great, there reigned ouer them ſucceſſiuely 154 kings, for the ſpace of 5402 yeres
between, and 3 moneths ouer. As for the riuers in that country, they be of a wonderfull bignes.
And reported it is, that *Alexander* ſailed euery day at the leaſt 600 ſtadia vpon the riuer Indus,
and yet in leſſe than fiue moneths and ſome few daies ouer, he could not come vnto the end of
that riuer; and leſſe it is than Ganges by the confeſſion of all men. Furthermore, *Seneca* a Latine
writer, aſſaied to write certain commentaries of India: wherein he hath made report of 60 Ri-
uers therein, and of nations 120 lacking twaine. As great a labour it were to reckon vp & num-
ber the mountains that be in it. As for the hils Imaus, Emodiſus, Paropamiſus, as parts all and
members of Caucaſus, but one vpon another, and conioine together. And being paſt them yee
D go downe into a mighty large plain country, like to Ægypt. It remaineth now to ſhew the con-
tinent and firm land of this great country, and for the more euident demonſtration, let vs fol-
low the ſteps of *Alexander* the great, and his Hiſtoriographers. *Diogneus* and *Beton*, who ſet down
all the geaſts and iournies of that prince, haue left in writing, That from the Caſpian ports vn-
to the city Hecatompylos which is in Parthia, there are as many miles as we haue ſet down al-
ready. From thence to Alexandria in the Ariane country (which city the ſame king founded)
562 miles: from whence to Prophthaſia in the Dranganes land, 199 miles: & ſo forward to the
capitoll towne of the Arachoſians, 515 miles. From thence to Orthoſpanum, 250 miles: laſt of
all, from it to the city of Alexandria in Opianum, 50 miles. In ſome copies theſe numbers are
found to vary and differ. But to return to this foreſaid city, ſcituat it is at the very foot of Cau-
E caſus. From which to the riuer Chepta and Pencolaitis, a town of the Indians, are counted 227
miles. From thence to the riuer Indus & the towne Tapila, 60 miles: and ſo onward to the no-
ble and famous riuer Hidaſpes, 120 miles: from which to Hypaſis, a riuer of no leſſe account
than the other, 4900, or 3900. And there an end of *Alexanders* voiage: howbeit, he paſſed ouer
the riuer, and on the other ſide of the bank, he erected certaine altars and pillers, and there de-
dicated them. The letters alſo of the king himſelfe, ſent back into Greece, do cary the like cer-
tificate of his iournies, and agree iuſt herewith. The other parts of the country were diſcouered
& ſurueied by *Seleucus Nicator*; namely from thence to Heſudrus 168 miles: to the riuer Ioames
as much: & ſome copies adde 5 miles more therto: from thence to Ganges 112 miles: to Rho-
dapha 119, & ſome ſay, that between them two it is no leſſe than 325 miles. From it to Calini-
F paxa, a great town, 167 miles & an half: others ſay, 265. And ſo the confluent of the riuers Io-
manes & Ganges, where both meet together, 225 miles, & many put therto 12 miles more: from
thence to the town Palibotta 425 miles: & ſo to the mouth of Ganges where he falleth into the
ſea, 638 miles. As for the nations, which it pains me not to name, from the mountains Emodi,
& the principal cape of them, Imaus, which ſignifies in that country, language ful of ſnow, they

be theſe: the Iſari, Coſyri, Izgi, and vpon the very mountains, the Ghiſiotoſagi: alſo the Brachmanæ, a name common to many nations, among whom are the Maccocalingæ. Of riuers beſides, there are Pinnas & Cainas, the later of which twain runneth into Ganges, & both are nauigable. The people called Calingæ, coaſt hard vpon the ſea. But the Mandei & Malli, among whom is the mountain Mallus, are aboue them higher in the country. And to conclude, then you come to Ganges, the fartheſt bound and point of all that tract, India.

Chap. XVIII.

¶ *The riuer Ganges.*

MAny haue bin of opinion, & ſo haue written, that the ſpring of Ganges is vncertain, like as that alſo of Nilus: and that he ſwelleth, ouerfloweth, and watereth all the countries whereby he paſſeth, in the ſame ſort that Nilus doth. Others again haue ſaid that it iſſueth out of the mountains of Scythia: & how into it there run 19 other great riuers: of which ouer and aboue thoſe beforenamed, certain are nauigable; namely, Canucha, Vama, Erranoboa, Coſaogus, and Sonus. There be alſo that report, that Ganges preſently ariſeth to a great bigneſſe of his owne ſources and ſprings, and ſo breaketh forth with great noiſe and violence, as running downe with a fal ouer craggy and ſtony rocks: and when he is once come into the flat plains and euen country, that he taketh vp his lodging in a certain lake; and then out of it carrieth a mild and gentle ſtream, 8 miles broad where it is narroweſt; and 100 ſtadia ouer for the moſt part, but 160 where he is largeſt: but in no place vnder 20 paces deep, [*i.* a 100 foot.]

Chap. XIX.

¶ *The nation of India, beyond the riuer Nilus.*

WHen ye are ouer Ganges, the firſt region vpon the coaſt that you ſet foot into, is that of the Gandaridæ and the Calingæ, called Parthalis. The king of this countrey hath in ordinance for his wars 80000 foot, 1000 horſe, and 700 Elephants, ready vpon an houres warning to march. As for the other nations of the Indians that liue in the champion plaine countries, there be diuers ſtates of them, of more ciuility than the mountainers. Some apply themſelues to tillage and husbandry: others ſet their minds vpon martiall feats: one ſort of them practiſe merchants trade, tranſporting their owne commodities into other countries, and bringing in forrein merchandiſe into their own. As for the nobility and gentry, thoſe alſo that are the richeſt and mightieſt among them, they manage the affaires of State and Commonweale, and ſit in place of juſtice, or els follow the court, and ſit in counſell with the king. A fit eſtate there is beſides in great requeſt, & namely of Philoſophers & Religions, giuen wholly to the ſtudy of wiſdom & learning; and theſe make profeſſion of voluntary death: and verily when they are diſpoſed to die at any time, they make a great funerall fire, caſt themſelues into it, and ſo end their daies. Beſides all theſe, one thing there is among them halfe brutiſh, and of exceeding toile and trauell (and yet it is that which partly maintaineth all the other eſtates aboueſaid) namely, the practiſe of hunting, chaſing and taming Elephants. And in very truth, with them they plow their ground, vpon them they ride vp & down: with theſe beaſts are they beſt acquainted; they ſerue in the wars for maintenance of their liberty, and defence of their frontiers againſt all inuaſion of enemies. In the choiſe of them for war-ſeruice, they regard and conſider their ſtrength, their age, and bigneſſe of body. But to leaue them. An Iſland there is within the riuer Ganges, between two arms thereof, of great largeneſſe and capacity, which receiueth one nation by it ſelfe, apart from others, & named it is Modogalica. Beyond it are ſeated the Modubians and Molindians, where ſtandeth the ſtately city Molinda, ſcituat in a plentiful and rich ſoile. Moreouer, the Galmodroeſians, Pretians, Caliſſæ, Saſuri, Faſſalæ, Colubæ, Orxulæ, Abali, and Talactæ. The king of theſe countries hath in ordinary for his wars 50000 foot, 3000 horſe, and 400 Elephants. Then you enter into a country of a more puiſſant & valiant nation, to wit, the Andarians, planted with many villages well peopled: and moreouer with 30 great townes, fortified with ſtrong walls, towers, and baſtiles. Theſe find and maintain preſt & ready to ſerue the king in his wars, an Infantery of 100000 foot, a Cauallery of 2000 horſe, and 100 Elephants beſides, wel appointed. Of all the regions of India, the Dardanian country

is

20030
copy 1

A is moſt rich in gold mines,and the Selian in ſiluer. But aboue all the nations of India thorowout,and not of this tract and quarter only,the Praſij far exceed in puiſſance,wealth,and reputation; where the moſt famous,rich, and magnificent city Palibotria ſtands, whereof ſome haue named the people about it,yea and all the nation generally beyond Ganges,Palibotrians:their king keeps continually in pay 600000 foot men,and 30000 horſemen, and 9000 Elephants euery day in the yere, whereby you may ſoon gueſſe the mighty power & wealth of this prince. Beyond Palibotria,more within the firme land,inhabit the Monedes and Suari,where ſtandeth the mountain Maleus: and there for ſix moneths ſpace the ſhadowes in winter time fal Northward; and in ſummer ſeaſon go into the South. The pole Arcticke ſtarres in all that tract are ſeen but once in the yere,and that no longer than for 15 daies,as *Beton* reporteth. But *Megaſthe-*
B *nes* writeth,that this is vſuall in other parts of India. The Antarctique or South pole the Indians call Dromoſa. As for the riuer Iomanes,which runs into Ganges,it trauerſeth through the Palibotrians country,and paſſeth between the townes Methora and Cyriſoborca. Beyond the riuer Ganges,in that quarter and clymate which lieth Southward, the people are caught with the Sun,and begin to be blackiſh,but yet not all out ſo ſun-burnt and blacke indeed as the Æthyopians and Moores. And it ſeemeth, that the neerer they approch to the riuer Indus,the deeper coloured they are and tanned with the Sun: for you are not ſo ſoone paſt the Praſians country,but preſently you are vpon Indus: and among the mountaines of this tract,the Pygmæans,by report,do keepe. *Artemidorus* writeth, that betweene theſe two riuers there is a diſtance of 21 miles.

C

Chap. XX.

¶ *The riuer Indus.*

THe great riuer Indus,which the natiue people call Sandus,iſſueth out of a part or dependance of the hill Caucaſus, which is called Paropamiſus: hee takes his courſe and runs full againſt the Sun riſing,and makes 19 riuers more to loſe their names,which he takes in vnto him: among which the principall are theſe, Hydaſpis one,bringing with him 4 more: and Cantabra another,accompanied with 3 beſides. Moreouer,of ſuch as are of themſelues nauigable,without the help of others,Aceſines,and Hypaſis. And yet for all their additions, the riuer of Indus (ſuch a ſober and modeſt courſe as it were his waters keepe) is in no place either
D aboue 50 ſtadia ouer,or 15 paces, *i.* 75 foot,or 12 fathom and halfe deep. This riuer incloſeth within two branches of it,a right great Iſland named Praſiane,and another that is leſſe, called Patale. As for himſelfe,they that haue written the leaſt of him ſay he beareth veſſels for 1240 miles: and turning with the courſe of the Sun, keepeth him company Weſtward vntill hee is diſcharged into the Ocean. The meaſure of the ſea coaſt from Ganges vnto him I wil expreſſe generally and in groſſe,as I find it written, albeit there is no agreement at all of Authors touching this point. From the mouth of Ganges where he entreth into the ſea, vnto the cape Caliugon and the towne Dandagula,are counted 725 miles: from thence to Tropina 1225 miles. Then to the promontorie Perimula,where ſtands the chiefe mart or towne of merchandiſe in
E all India,they reckon 750 miles: from which to the towne aboue-ſaid Patale within the Iſle, 620 miles. The mountainers inhabiting betwixt it and Iomanes, are the Ceſti and Celiboni, wilde and ſauage people: next to them the Megallæ, whoſe king hath in ordinary preſt for ſeruice 500 Elephants, of foot and horſe a great number, but vncertaine it is how many, ſometime more, ſomtime fewer. As for the Chryſeans, Paraſangians,and Aſangians, they are full of the wilde and cruell Tygers: they are able to arme 30000 foot and 800 horſe, and to ſet out with furniture 300 Elephants. This country is on three ſides enuironed and incloſed with a raunge of high mountaines, all deſart and full of wilderneſſe for 625 miles, and of one ſide confined with the riuer Indus. Beneath thoſe wilde hills you enter among the Dari & Suræ: then you come againe to waſte deſarts for 188 miles,compaſſed about for the moſt part with great bars
F and banks of ſand,like as the Iſlands with the ſea. Vnder theſe deſart forreſts you ſhall meet with the Maltecores, Cingians, Marobians, Rarungians, Moruntes, Maſuæ, and Pangungæ. Now for thoſe who inhabit the mountains,which in a continuall raunge without interruption ſtand vpon the coaſts of the Ocean,they are free States and ſubiect to no Prince,and many fair townes and cities they hold among theſe cliffes and craggy hills. Then come you to the Na-

ræans, inclosed within the highest mountaine of all the Indian hills, Capitalia. On the other G
side of this mountaine great store there is all ouer it, of gold and siluer mines, wherein the Inhabitants do dig. Then you enter vpon the kingdom of Oratura, whose king indeed hath but ten Elephants in all, howbeit a great power of footmen. And so forward to the Varetates, who vnder their King keepe no Elephants at all for his seruice, trusting vpon their Cauallery and Fanterie, wherein they are strong. Next to them the Odomboerians & Salabastres, where standeth a goodly faire city called Horata, enuironed and fortified with deepe fosses and ditches full of standing water: wherein there keepe a great number of Crocodiles, which for the greedy appetite to deuoure mens bodies, wil suffer none to passe into the town but ouer the bridge. Another towne there is besides among them, of great name and importance, to wit, Automela, standing vpon the sea side: and otherwise much resort there is vnto it of merchants from all H
parts, by reason of 5 great riuers which meet all there in one confluence. Their king maintains in ordinary 1600 Elephants, 150000 footmen, and 5000 horse. The king of the Charmians is but poore to speake of: his strength lieth in 60 Elephants, for his power otherwise is but smal. Being past that realme, you come into the country of the Padians, the only nation of all the Indians, which is gouerned by women. One of this sex, they say, was begotten somtime by *Hercules*, in which regard she was the better accepted, and had the prerogatiue of the regencie ouer the greatest kingdome. From her the other Queens fetch their pedegree, and haue the dominion and rule ouer 30 great townes, and the command of 150000 foot, and 500 Elephants. Beyond this realme you come to the nation of the Syrieni, containing 300 Cities: and from them to the Deraugæ, Posunge, Bugæ, Gogyarei, Vmbræ, Nereæ, Brancosi, Nobundæ, Cocon- I
* Babul. dæ, Nesei, Pedatritæ, Solobriasæ, and Olostræ, who confine vpon the Island * Patale: from the vtmost point of which Ihand vnto the gates Caspiæ, are reckoned 18025 miles. Now on this side the riuer Indus, iust against them, as appear th by euident demonstration, there dwell the Amatæ, Bolingæ, Gallitalutæ, Dimuri, Megari, Ordabæ, and Mesæ. Beyond them the Vri and Sileni, and then you come to the desarts for 250 miles: which hauing passed ouer, you shall meet with the Organages, the Abaorts, Cibaræ, and the Suertæ: and beyond these, a wilderneſſe againe as great as the former. Passe on farther, you come among the Sarophages, Sorgæ, Baraomatæ, and the Gunbretes, of whom there be 13 seuerall nations, and each one hath two great cities apiece. As for the Aseni, they people three cities: their capitall city is Bucephala, built in the very place where king *Alexanders* horse called *Bucephalus* was interred. Aboue K
them are the mountainers on the rising of the hill Caucasus, named Soleadæ, and Sondræ: and when you are on the other side of the riuer Indus, as you go along the coast and banks thereof, you shall see the Samarabrians, the Sambrucenes, the Brisabrites, Osij, Autixeni, and Taxillæ, with a famous city called Amandra, of which all that tract now lying more flat and plaine within the countrey is named Amandria. Foure other nations there be besides of Indians, the Peucolaitæ, Arsagalites, Geretes, and Asei: for many of the Geographers set not down Indus the riuer, for to determine the marches of the Indians Westward; but lay thereto foure other prouinces and seuerall seigniories, to wit, of the Gedrosians, Arachotes, Arij, and Paropamisades.

L

Chap. XXI.

¶ *The Arij, and other nations depending vnto them.*

Other writers are of opinion, that the vtmost frontier and limit of India is the riuer Cophetes, and both it and all those quarters are included within the territorie of the Arij; yea and most of them affirme, that the city Nysa, as also the mountaine Merus consecrated to god *Bacchus*, belong vnto India as parcels thereof. This is that mountaine whereof arose the poeticall fable, That *Bacchus* therein was borne, and issued out of *Iupiters* thigh. Likewise they assigne and lay to India the country of the Aspagores, so full of vines, laurel, and box, and generally of all sorts of apple trees and other fruitfull trees that grow within Greece. Many strange, wonderfull, and in manner fabulous things they report of the fertilitie of that land, of the diuers sorts of corne, of trees bearing cotton, of wilde beasts, of birds, and other creatures there breeding and liuing: which because they are not properly belonging to this Treatise now in hand, I will reserue them for another part of this Worke, and write more particularly M

larly

20030
copy 1

A larly of them in their due and ſeuerall places. And as for thoſe 4 prouinces which I touched before, I will ſpeake of them anon: for now I haſten and thinke it long vntill I haue ſaid ſomewhat of the Iſland Taprobane. And yet before I come to it there be other Iſles which I cannot paſſe by, and namely that of Patala, which I noted to ly in the very mouth of the riuer Indus, and it carrieth the forme and ſhape of a triangle figure, and is 220 miles long. Without the mouth of the riuer Indus two other Iſles there be, Chryſe and Agyræ, ſo named (as I think) of the gold and ſiluer mines which they do yeeld: for I cannot eaſily beleeue, that the very earth and ſoile there is all gold and ſiluer entire, as ſome haue made report. Twenty miles from them lieth the Iſle Crocala: and 12 miles farther into the ſea, Bibaga, where of oiſters and other ſhel fiſhes called Purples are found good ſtore. And laſt of all, 9 miles beyond it, Toralliba ſhewes it ſelfe, and many other petty Iſlands of no regard.

B

Chap. XXII.

¶ *The Iſland Taprobane.*

IT hath beene of long time thought by men in antient daies, That Taprobane was a ſecond world, in ſuch ſort as many haue taken it to be the place of the Antipodes, calling it the Antichthones world. But after the time of *Alexander* the Great, and the voiage of his army into thoſe parts, it was diſcouered and knowne for a truth, both that it was an Iſland, and what cmpaſſe it bare. *Oneſicrátus* the Admiral of his fleet hath written, that the Elephants bred in this Iſland be bigger, more fierce and furious for war ſeruice than thoſe of *India*. *Megaſthenes* C ſaith there is a great riuer which parteth it in twaine, and that the people thereof dwelling along the riuer be called Palæogoni: adding moreouer, that it affordeth more gold and bigger pearles by farre than India doth. *Eratoſthenes* alſo tooke the meaſure thereof, and ſaith, that in length it beareth 7000 ſtadia, and in bredth 5000: that in it there be no cities or great towns, but villages to the number of 700. It begins at the Levant ſea of Oriental Indians, from which it ſtretcheth and extendeth between the Eaſt and Weſt of India; and was taken in times paſt to ly out into the ſea from the Praſians countrey 20 daies ſailing. But afterwards, for that the boats and veſſels vſed vpon this ſea in the paſſage thither, were made & wound of paper reeds like thoſe of the riuer Nilus, and furniſhed with the ſame kinde of tackling, the voiage thither D from the foreſaid country was gaged within a leſſe time: and well knowne it was, that according to the ſaile of our ſhips and gallies, a man might arriue there in 7 daies. All the ſea lying between is very ebbe, full of ſhallowes and ſhelues, no more than 5 fathom deepe: howbeit in certain chanels that it hath, it is ſo deep that it canot be ſounded, neither wil any anchors reach the bottom, and there reſt; and withall, ſo ſtreight & narrow theſe chanels are, that a ſhip cannot turne within them: and therefore to auoid the neceſſitie of turning about in theſe ſeas, the ſhips haue prows at both ends, and are pointed each way: in ſailing they obſerue no ſtar at all. As for the North pole, they neuer ſee it: but they carry euer with them certaine birds in their ſhips, which they ſend out oft times when they ſeeke for land, euer obſeruing their flight: for knowing well that they wil fly to land, they accompany them, bending their courſe accordingly: neither vſe they to ſaile more than one quarter of a yeare: and for 100 daies after the Sun is E entred into Cancer, they take moſt heed, and neuer make ſaile: for during that time it is winter with them. And thus much we come to knowledge of, by relation of antient Writers. But we came to far better intelligence, and more notable information, by certain Embaſſadors that came out of that Iſland, in the time of *Claudius Cæſar* the Emperor: which happened vpon this occaſion, and after this manner; It fortuned that a free ſlaue of *Annius Plocamus*, (who had farmed of the Exchequer the cuſtoms for impoſt of the red ſea) as he made ſaile about the coaſts of Arabia, was in ſuch wiſe driuen by the North windes beſides the realme of Carmania, and that for the ſpace of 15 daies, that in the end he fell with an harbour thereof called Hippuros, and there arriued. When he was ſet on land, he found the King of that Countrey ſo curteous F that hee gaue him entertainment for ſix moneths, and entreated him with all kindeneſſe that could be deuiſed. And as he vſed to diſcourſe and queſtion with him about the Romanes and their Emperour, he recounted vnto him at large of all things. But amongſt many other reports that he heard he wondred moſt of all at their iuſtice in all their dealings, & was much in loue therewith, and namely, that their Deniers of the money which was taken, were alwaies of

like

like weight,notwithſtanding that the ſundry ſtamps and images vpon the pieces ſhewed plain- G
ly that they were made by diuers perſons. And hereupon eſpecially was he mooued & ſollici-
ted to ſeeke for the alliance and amitie of the people of Rome : and ſo diſpatched 4 Embaſſa-
dours of purpoſe,of whom one *Rachias* was the chiefe and principall perſonage. By theſe Em-
baſſadours we are informed of the ſtate of that Iſland, namely, that it contained fiue hundred
great townes in it:& that there was a hauen therin regarding the South coaſt, lying hard vnder
Paleſimundum the principall citie of all that realme,and the kings ſeat and pallace:that there
were by iuſt account 200000 of commoners & citizens:moreouer,that within this iſland there
was a lake 270 miles in circuit, containing in it certain Iſlands good for nothing elſe but pa-
ſturage, wherein they were fruitfull;out of which lake there iſſued 2 riuers, the one,Paleſimun-
das, paſſing neere to the citie aboueſaid of that name, and running into the hauen with three H
ſtreames, whereof the narroweſt is fiue ſtadia broad,and the largeſt 15;the other Northward on
India ſide,named Cydara:alſo that the next cape of this country to India is called Colaicum,
from which to the neereſt port of India is counted foure daies ſailing : in the midſt of which
paſſage,there lieth in the way,the Iſland of the Sunne. They ſaid moreouer,that the water of
this ſea was all of a deepe greene colour;and more than that,full of trees growing within it:in-
ſomuch as the pilots with their helmes many times brake off the heads and tops of thoſe trees.
The ſtars about the North-pole,called Septentriones,the Waines or Beares, they wondred to
ſee here among vs in our Hemiſphere : as alſo the Brood-hen, called *Vergiliæ* in Latine, as if it
had been another heauen. They confeſſed alſo they neuer ſaw with them,the Moone aboue the
ground before it was 8 daies old, nor after the 16 day. That the Canopus, a goodly great and I
bright ſtar about the pole Antarcticke,vſed to ſhine all night with them. But the thing that
they maruelled and were moſt aſtonied at was this,that they obſerued the ſhadow of their own
bodies fell to our Hemiſphere,and not to theirs;and that the Sun aroſe on their left hand, and
ſet on their right,rather than contrariwiſe. Furthermore they related, that the front of that I-
ſland of theirs which looked toward India,contained 10000 ſtadia,& reached from the South-
Eaſt beyond the mountains Enodi. Alſo,that the Seres were within their kenning,whom they
might eaſily diſcouer from out of this their Iſland ; with whom they had acquaintance by the
meanes of trafficke and merchandiſe:and that *Rachias* his father vſed many times to trauell thi-
ther. Affirming moreouer,that if any ſtrangers came thither,they were encountred and aſſailed
by wild & ſauage beaſts:and that the inhabitants themſelues were gyants of ſtature,exceeding K
the ordinary ſtature of men, hauing red haire,eies of colour blewiſh,their voice for ſound hor-
rible,for ſpeech not diſtinct nor intelligible for any vſe of traffick and commerce. In all things
elſe their practiſe is the ſame that our merchants and occupiers do vſe : for on the farther ſide
of the riuer,when wares and commodities are laid downe, if they liſt to make exchange they
haue them away,and leaue other merchandiſe in lieu thereof to content the forrein merchant.
And verily no greater cauſe haue we otherwiſe to hate & abhor this exceſſiue ſuperfluitie,than
to caſt our eie ſo far and conſider with our ſelues,what it is that weſeeke for,from what remote
parts we fetch it,and to what end we ſo much deſire al this vanitie. But euen this Iſland Tapro-
bane,as farre off as it is,ſeeming as it were caſt out of the way by Nature, and diuided fro m all
this world wherein we liue,is not without thoſe vices and imperfections wherwith we are tain- L
ted and infected. For euen gold & ſiluer alſo is there in great requeſtand highly eſteemed:and
marble, eſpecially if it be faſhioned like a tortois ſhell. Iemmes and pretious ſtones ; pearles
alſo,ſuch as be orient and of the better ſort,are highly priſed with them:and herein conſiſteth
the very height of our ſuperfluous delights. Moreouer,theſe Embaſſadors would ſay, that they
had more riches in their Iſland,than we at Rome,but we more vſe thereof than they. They affir-
med alſo, that no man with them had any ſlaues to command : neither ſlept they in the mor-
ning after day-light,ne yet at all in the day time. That the maner of building their houſes was
low,ſomewhat raiſed aboue the ground, and no more adoe : that their markets were neuer
deare, nor price of victuals raiſed. As for courts, pleading of cauſes, and going to law, they
knew not what it meant. *Hercules* was the onely god whom they worſhipped. Their king was M
alwaies choſen by the voices of the people : wherein they had theſe regards ; that hee were
aged,milde,and childleſſe : but in caſe he ſhould beget children afterward, then hee was depo-
ſed from his regall dignitie, to the end that the kingdome ſhould not in proceſſe of time bee
hereditary and held by ſucceſſion, but by election onely. This king being thus choſen and
inueſted,

20030
copy 1

A inueſted,hath thirtie other gouernours aſſigned vnto him by the people: neither can any perſon be condemned to death, vnleſſe he be caſt by the more part of them, and pluralitie of voices:and thus condemned as he is,yet may he appeale vnto the people. Then are there 70 judges deputed to ſit vpon his cauſe: and if it happen that they aſſoile and quit this party condemned:then thoſe 30 who condemned him,are diſplaced from their ſtate and dignity,with a moſt bitter and ſharpe rebuke,and for euer after,as diſgraced perſons liue in ſhame and infamie. As for the king, arraied he is in aparrell as prince *Bacchus* went in old time: but the ſubiects and common people are clad in the habit of Arabians. If it fortune that the king offend,death is his puniſhment:howbeit,no man taketh in hand to doe execution. All men turne away their faces from him, and deigne him not a looke nor a word. But to do him to death in the end,they
B appoint a ſolemne day of hunting,right pleaſant and agreeable vnto Tygres and Elephants,before which beaſts they expoſe their king,and ſo he is preſently by them deuoured. Moreouer, in that Iſland good husbands they are for their ground,and till the ſame moſt diligently. Vines haue they no vſe of at all:for all ſorts of fruits otherwiſe they haue abundance. They take alſo a great pleaſure and delight in fiſhing,and eſpecially in taking of tortoiſſes:and ſo great they are found there,that one of their ſhels will ſerue to couer an houſe: and ſo the inhabitants doe imploy them in ſtead of rouſes. They count an hundred yeeres no long life there: that is theordinary time of their age. Thus much we haue learned and knowne as touching Taprobane. It remaineth now to ſay ſomewhat of thoſe foure Satrapies or prouinces, which we did put off vnto this place. Of them therefore as followeth.

C

Chap. XXIII.

¶ *Capiſſene, Carmania.*

BEyond thoſe nations that confine hard vpon the riuer Indus,as yee turn toward the mountaines,yee enter vpon the realme of Capiſſæne,wherein ſometime ſtood the citie Capiſſa, which *Cyrus* the king cauſed to be raſed. At this day there ſtandeth the citie Arachoſia, with a riuer alſo of that name in the country Arachoſia:which citie ſome haue called Cophe, founded by queene *Semiramis*. There likewiſe is to be ſeen the riuer Hermandus,which runneth by Abeſte, a city of the Aracoſians. The next that confront Aracoſia Southward, toward part of the Arachotes,are the Gedroſi:and on the Northſide,the Paropamiſades. As for the towne
D Cartana,named afterwards Tetragonius,ſcituate it is at the foot of the mountaine Caucaſus. This country lies ouer-againſt the Bactrians:then you come to the principall towne therof Alexandria, named ſo of king *Alexander* the founder thereof: vpon the marches whereof are the Syndrari,Dangulæ,Porapiani,Cantaces,and Maci. Moreouer,vpon the hill Caucaſus ſtandeth the towne Cadruſi,built likewiſe by the ſaid *Alexander*. On this ſide all theſe regions lieth the coaſt of the riuer Indus. Then followes the region of the Arianes,all ſcorched and ſenged with the parching heate of the Sunne, and inuironed about with deſarts: howbeit, many ſhadowie vallies lie between to allay the exceeding heat. Well peopled it is about the two riuers eſpecially,Tonderos and Aroſapes. Therein ſtands the citie Artaccana. Being paſt it,the riuer Arius runneth vnder the city Alexandria,built by *Alexander* the Great. The towne containes in com-
E paſſe 30 ſtadia. Then come you to Artacabane, a citie as it is much more ancient, ſo it is alſo fairer by far,which by *Antiochus* the king was walled the ſecond time,and enlarged to 50 ſtadia. The next in order is the nation of the Doriſci. The riuers Pharnacotis and Ophradus. Prophtaſia,a towne in Zaraſparia. The Drangæ,Argetæ,Zarangæ,and Gedruſij. Townes moreouer,Peucolais and Lymphorta. After you are paſt their territory,you enter into the deſarts of the Mithoricanes,and ſo to the riuer Mauain,and the nation of the Augutturi. The riuer Borru, the people called Vrbi, the nauigable riuer Ponamus, which paſſeth through the marches of the Pandanes. Ouer and beſides,the riuer Ceberon within the country of the Sorates,which in the mouth thereof where it falleth into the ſea,makes many baies and harbours. As you go far-
F ther,you come vpon the towne Candigramma,with the riuer Cophes: into which there runne other riuers that carry veſſels,to wit,Sadarus,Paraſpus, and Sodinus. As for the country Daritus,ſome would haue it to be a part of Ariana,and they ſet down the meaſure of them both together to be in length 1950 miles,& in breadth leſſe by half than India. Others haue ſet down that the country of the Gedruſians and Scyrians may contain 183 miles. Being paſſed which

quarters,

quarters,you enter into the region of the Ichthyophagi, ſurnamed Oritæ or mountainers (who haue a proper language by themſelues,and ſpeake not in the Indian tongue) which reaches on full for 200 miles. And beyond it you meet with the people of the Arbians,who likewiſe continue for other 200 miles. As for thoſe Ichthyophagi before-named, *Alexander* by an expreſſe edict forbad them all to feed on fiſh. Being paſt them, you are in the deſarts:and beyond them you come into Carmania,Perſis,and Arabia. But before that we treat diſtinctly of theſe countries,I thinke it meet to ſet downe what *Oneſicritus* (who hauing the conduct of a fleet vnder *Alexander* the great,ſailed from off India,about the Southerly coaſts of Perſis) reports according to thoſe intelligences which came lately from king *Iuba*. In like maner thoſe voiages of ours for theſe yeeres paſt,performed,by which euen at this day we are guided. Howbeit, in the reports made by *Oneſicritus* and *Nearchus*, of their nauigations,we finde neither the diſtance, ne yet the names of the ſeueral reſting places,after euery daies iournie. And to begin with the citie Xylenepolis built by *Alexander*,from which they entred firſt into their voiage,it is not put down by them,either in what place it is ſcituate,nor vpon what riuer. Yet theſe particulars following are by them reported worth remembrance:to wit,that in this voyage *Nearchus* founded a towne in thoſe parts:that the riuer Nabrus runs thereby, and is able to beare great veſſels : ouer-againſt which there is an Iſland 70 ſtadia within the ſea. Moreouer,that *Leonatus* cauſed Alexandria to be built in the frontiers of that region,by direction and commandement from king *Alexander*, where the riuer Argenus enters into the ſea, and yeelds a ſafe & commodious hauen. Alſo that the riuer Tuberum is nauigable,along the bankes whereof the Parites inhabit. And after them the Ichthyophagi,who tooke vp ſo long a tract,that they were 20 daies ſailing by their coaſts. They make relation likewiſe of the Iſle of the Sun,named alſo the couch or bed of the nimphs: This Iſland is red all ouer, and no liuing creature will liue therin,but is conſumed,& periſhes no man knoweth how,or vpon what cauſe. They ſpeake beſides of the nation of the Orians : as alſo of Hytanis a riuer in Carmania,which affordeth many baies and harbours,yea,and plentie of gold in the grauell and ſand therof. And here was the firſt place wherin they obſerued, that they had a ſight of the North-pole ſtar. As for the ſtarre *Arcturus*, they affirmed,that they ſaw it not euery night,nor at any time all night long. Furthermore,that the country of the Achæmenides in Perſea,reached thus farre. Ouer and beſides,that as they trauelled, ordinarily they found good ſtore of mines, wherein was digged for braſſe, yron, Arſenicke or Sardaracha and Vermilion. And then they came to the cape of Carmania:from which to the coaſt ouer-againſt them of the Maræ,a people in Arabia, the cut ouer ſea is 50 miles. Vpon theſe coaſts they diſcouered 3 Iſlands, whereof Organa onely is inhabited, by reaſon of freſh water within it, and from the continent it lieth about 25 miles. And foure Iſlands more they fell vpon,euen in the Perſian gulf ouer-againſt Perſia. And about theſe Iſlands they might ſe ſea-adders & Serpents ſo monſtruous great that as they came ſwimming toward them,they put the very fleet in great fright,for there were among them ſome,20 cubits long. Beyond it they met with the Iſland Acrotadus:likewiſe the Gaurates Iſles, wherein the nation the Chiani doe inhabit. About the middle of this gulfe or arme of the ſea,the riuer Hiperus hath his courſe,able to beare great hulkes and ſhips of burden. Alſo the riuer Sitiogagus, vpon which a man may paſſe in 7 daies to Paſargadia. Alſo a riuer that is nauigable called Phirſtimus,and an Iſland within it,but it is nameleſſe. As for the riuer Granius which runs through Suſiane,it carries but ſmall veſſels. Along the coaſt on the right hand of this riuer dwell the Deximontanes,who dreſſe and prepare Bitumen. Then the come to the riuer Oroatus,with a dangerous hauen or mouth where it falls into the ſea,vnleſſe a man be guided by skilfull pilots:& full againſt this riuer there are diſcouered 2 little Iſlands. Paſt which,the ſea is very low and ſhallow,full of ſhelues and ſands,more like a meere and mariſh water,than a ſea. Howbeit there be certaine trenches or channels in it that draw deepe water,wherein they may without danger ſaile. Then met they with the mouth of the riuer Euphrates. Alſo the lake which the two riuers Eulæus and Tigris doe make,neere vnto Characum. And ſo from thence they arriued vpon the riuer Tigris,at Suſa. And there an end of the nauigation performed by *Oneſicritus* and *Nearchus*. For after they had beene three months embarked and in their voiage vpon the ſea,they found *Alexander* at Suſa (where he feaſted and made ſolemne bankets) and that was 7 monthes after he parted from them at Patalæ. And thus much concerning the voiage of *Alexander* his fleet. Now afterwards from Syagrus,a Promontory in Arabia,it was counted vnto Patale 1332 miles, & held it was for certain then that,

20030
copy 1

A that the Weſt wind with the people of that country call Hypalus, was thought moſt proper for to make ſaile to the ſame place. Howbeit the age enſuing diſcouered a ſhorter and ſafer cut, namely, if from the ſaid promontorie or cape Syagrus, they ſet their courſe directly to the mouth of the riuer Zizerus, which maketh an harborough in India. And in truth this paſſage held a long time, vntill ſuch time that in the end the merchants found out a more compendious and ſhorter courſe, and gained by their voiage to India: for euery yeere now they ſaile thither, and for feare of pirats and rouers that were wont very much to infeſt and annoy them, they vſed to embarke in their ſhips certaine companies of Archers. And ſeeing that all theſe ſeas are now diſcouered, and neuer before ſo certainly, I will not thinke much of my pains, to declare
B and ſhew, the whole courſe of our Indian voiages from out of Ægypt. And firſt and formoſt this is a thing worthy to be noted and obſerued of euery man, that there is not a yeere goeth ouer our heads, but it coſts our State to furniſh a voiage into India, 500 hundred thouſand Seſterces, *i.* fifty millions of Seſterces. For which the Indians ſendeth backe againe commodities and merchandiſe of their owne, which being at Rome, are ſold for an hundred times as much as they coſt, or yeeld in the price an hundred fold gain. But to returne againe to our voiage, from Alexandria in Ægypt, it is two miles to Iuliopolis: from whence vpon the riuer of Nilus, they ſaile 303 miles to Coptus, which may be done in 12 daies ſpace, hauing the Eteſian winds at the poupe. From Coptus they trauell forwards vpon Cammels backs: and for great default of water in thoſe parts, there be certain ſet places for bait, lodging, and watering.
C The firſt is called Hydreuma 32 miles from Coptus. The ſecond one days journey from thence in a certaine mountaine. The third watering place at another Hydreuma, 95 miles from Coptus. The fourth againe in a ſecond mountaine. The fifth is at a third Hydreuma of *Apollo*, from Coptus 184 miles. Beyond which, the reſting place is vpon another hill. And then to Hydreuma the new, from Coptus 234 miles. Another water towne there is, called Hydreuma the old, named alſo Trogloditicum, where two miles out of the port way lieth a garriſon, keeping watch and ward both day & night: and foure miles diſtant it is from new Hydreuma. From whence they trauell to the towne Berenice, an hauen towne ſtanding vpon the red ſea, 258 miles from Coptus. But for as much as the journey all this way is for the moſt part performed in the night ſeaſon, by reaſon of the exceſſiue heat, & the trauellers are forced to reſt all the day long, there-
D fore twelue daies are ſet down for the whole voiage between Coptus and Berenice. The time then that they vſually begin to ſet ſaile, is about Midſummer before the dog daies, or preſently vpon the riſing of the dog ſtarre. And about the 30 daies end they arriue to Ocelis in Arabia, or els at Cama, within Saba, the countrey of incenſe. A third port there is beſides called Muza, vnto which there is no reſort of merchants out of India: neither is it in requeſt but with merchants that aduenture only for incenſe, drugs, & ſpices of Arabia. Howbeit peopled this country is within-forth, and hath diuers great townes. Of which, Saphar is the principall, and the kings ſeat: & another beſides of good importance called Sabe. But for them that would make a voiage to the Indians, the moſt commodious place to ſet forward is Ocelis: for from thence, and with the Weſt wind called Hypalus, they haue a paſſage of forty daies ſailing to the firſt
E towne of merchandiſe in India, called Muziris. Howbeit a port this is, not greatly in requeſt, for the daunger of pirates and rouers, which keep ordinarily about a place called Hydræ: and beſides that, it is not richly ſtored and furniſhed with merchandiſe. And more than ſo, the harborough is farre from the town, ſo as they muſt charge and diſchrge their wares to and fro in little boats. At the time when I wrot this ſtory, the king that reigned there, was named *Celebothras*. But another hauen there is more commodious, belonging to the Necanidians, which they cal Becare: the kings name at this preſent is *Pandion*: not far off is another town of merchandiſe within the firme land, called Maduſa. As for that region, from whence they tranſport pepper, in ſmall punts or troughes made of one peece of wood, it is named Corona. And yet of all theſe nations, hauens, and towns, there is not a name found in any of the former writers. By which it appeareth, that there hath been great change and alteration in theſe places. But to come again
F to India, our merchants returne from thence back in the beginning of our month December, which the Ægiptians cal Tybis, or at fartheſt before the ſixt day of the Ægyptians month Machiris, and that is before the Ides of Ianuary: and by this reckoning they may paſſe to and fro, and make return within the compaſſe of one yere. Now when they ſaile from India, they haue the Northeaſt wind Vulturnus with them: and when they be entered once into the red ſea, the

So as it appeareth that euery dais journy was aboue 32 miles.

South or Southweſt. Now wil we return to our purpoſed diſcourſe as touching Carmania. The coaſt wherof after the reckoning of *Niccarchus* may take in circuit 12050 miles. From the firſt marches thereof to the riuer Sabis is counted 100 miles. From whence all the way as far as to the riuer Andaius, the country is rich and plenteous, for in it are vineyards and corne fields wel husbanded. This whole tract is called Amuzia. The chiefe townes of Carmania be Zetis and Alexandria. Vpon the marches of this realme the ſea breaks into the land in two armes, which our countrymen call the red ſea, and the Greekes Erythræum, of a king named *Erythras*: or as ſome thinke, becauſe the ſea by reaſon of the reflection and beating of the Sun beams, ſeemes of a reddiſh colour. There be that ſuppoſe this redneſſe is occaſioned of the ſand and ground which is red: and others againe, that the very water is of the own nature ſo coloured.

Chap. XXIV.

¶ *The Perſian and Arabian gulfes.*

THis red ſea is diuided into two armes: that from the Eaſt is named the Perſian gulfe, being in compaſſe 2500 miles, by the computation of *Eratoſthenes*. Ouer againſt this gulfe, in Arabia (which lieth in length 1200 miles) on the other ſide another arme there is of it called the Arabian gulfe, which runs into the Ocean Azanius. The mouth of the Perſian gulfe where it maketh entrance is 5 miles ouer, and ſome haue made it but 4: from which to the fartheſt point thereof, take a direct and ſtraight meaſure by a line, and for certaine it is, that it containeth 1225 miles: and is faſhioned directly like a mans head. *Oneſichritus* and *Nearchus* write, That from the riuer Indus to the Perſian gulfe, and ſo from thence to Babylon by the meeres and fens of the riuer Euphrates, it is 2500 miles. In an angle of Carmania inhabit the Chelonophagi, *i.* ſuch as feed vpon the fleſh of Tortoiſes, and the ſhells of them ſerue for roofes to couer their cottages. They inhabit all that coaſt along the riuer Arbis, euen to the very cape: rough they are, hairy all their body ouer but their heads, and weare no garment but fiſh skins.

Chap. XXV.

¶ *The Iſland Caſſandrus: and the kingdomes vnder the Parthians.*

WHen you are paſt this tract of the Chelonophagi, directly toward India, there lieth fifty miles within the ſea the Iſland Caſſandrus, by report all deſart and not inhabited: and neere to it, with a little arme of the ſea between, another Iſland called Stois; wherein pearles are good chaffer, and yeeld gainfull trafficke. But to returne againe to Carmania, when you are beyond the vtmoſt cape thereof, you enter preſently vpon the Armozei, who ioyn vpon the Carmanians. But ſome ſay that the Arbij are between both: and that their coaſt may containe in the whole 402 miles. There are to be ſeen the port or hauen of the Macedonians, and the altars or columnes which *Alexander* erected vpon the very promontorie and vtmoſt cape. Where alſo be the riuers Saganos, Daras, and Salſos. Beyond which is the cape Themiſceas, and the Iſle Aphrodiſias well peopled. Then beginneth the realme of Perſis, which extendeth to the riuer Oroatus, that diuides it from Elymais. Ouer-againſt the coaſts of Perſis, theſe Iſlands be diſcouered, Philos, Caſſandra, and Aratia, with an exceeding high mountaine in it: and this Iſle is held conſecrated to *Neptune*. The very kingdome of Perſis Weſtward hath the coaſts lying out in length 450 miles. The people are rich, and giuen to royall and ſuperfluous expence in all things: and long ſince are become ſubiect to the Parthians, carying their name. And ſeeing we are come to ſpeake of them, we will briefly now mention their dominion and empire: the Parthians haue in all 18 realmes vnder them; for ſo they termed all their prouinces as they lie diuided about the two ſeas, as wee haue before ſaid: namely the red ſea Southward, and the Hircane ſea, toward the North. Of which, eleuen that lie aboue in the countrey, and are called the higher Prouinces, they take their beginning at the confines and marches of Armenia, and the coaſts of the Caſpians on the one ſide: and reach to the Scythians, whom they confront of the other ſide, with whom they conuerſe and keepe company together as Equalls. The other ſeuen are called the baſe or lower Realmes. As for the Parthians, their land was alwaies counted to ly at the foot and deſcent of thoſe mountains wherof we haue ſo often

ſpoken,

20030
copy 1

A ſpoken, which do enuirone and encloſe all thoſe nations. It confineth Eaſtward vpon the Arij, and Southward, vpon Carmania and the Arians: on the Weſt ſide it butteth vpon the Pratites and Modes: and on the North, boundeth vpon the realm of Hircania: compaſſed round about with deſerts and mountaines. The vtmoſt nations of the Parthians before yee come to thoſe deſarts be called Nomades: and their cheife townes ſeated toward the Weſt, are Iſlaris and Calliope, whereof we haue written before: but toward the Northeaſt, Europum; and Southeaſt Mania. In the heart and midland ſtandeth the citie Hecatompylos, as alſo Arſacia. And there likewiſe the noble region of Nyſæa in Parthyerum: together with the famous city Alexandropolis, bearing the name of *Alexander* the firſt founder.

Chap. XXVI.

B *Media, Meſopotamia, Babylon, and Seleucia.*

REquiſit now it is and needfull in this place to deſcribe the poſiture and ſituation of the Medians kingdom, and to diſcouer all thoſe countries round about, as farre as to the Perſian ſea, to the end that the deſcription of other regions hereafter to be mentioned, may the better be vnderſtood. Wherein this firſt and formoſt is to be obſerued, that the kingdome of Media on the one ſide or other confronteth both Perſis and Parthia, and caſting forth a crooked and winding horne as it were toward the Weſt, ſeemeth to encloſe within that compaſſe both the ſaid realmes. Neuertheleſſe, on the Eaſt ſide it confineth vpon the Parthians and Caſpians: on the South, Sittacene, Suſiane, and Perſis: Weſtward, Adiabene: and Northward, Ar-
C menia: as for the Perſians, they alwaies confronted the red ſea, whereupon it was called the Perſian gulfe. Howbeit, the maritime coaſt thereof is called Cyropolis, and that part which confineth vpon Media, Elymais. In this realme there is a ſtrong fort called Megala, in the aſcent of a ſteep high hill, ſo direct & vpright, that a man muſt mount vp to it by ſteps and degrees, and otherwiſe the paſſage is very ſtreight and narrow. And this way leadeth to Perſepolis the head city of the whole kingdome, which *Alexander* the great cauſed to be raſed. Moreouer in the frontiers of this Realme, ſtandeth the city Laodicea, built by king *Antiochus*. From whence as you turn into the Eaſt, the ſtrong fort or caſtle Paſſagarda is ſeated, which the ſages or wiſe men of Perſia called Magi, do hold, and therein is the tomb of *Cyrus*. Alſo the citie Ecbatana
D belonging to theſe ſages, which *Darius* the king cauſed to be tranſlated to the mountaines. Between the Parthians and the Arians lie out in length the Parotacenes. Theſe nations and the riuer Euphrates ſerue to limit and bound the ſeuen lower realmes abouenamed. Now are we to diſcourſe of the parts remainitg behind of Meſopotamia; ſetting aſide one point and corner thereof, as alſo the nations of Arabia, wherof we ſpake in the former booke. This Meſopotamia was in times paſt, belonging wholly to the Aſſyrians, diſperſed into pettie villages and burgades, all ſaue Babylon & Ninus. The Macedonians were the firſt, that after it came vnder their hands reduced it into great cities, for the goodneſſe and plenty of their ſoile and territorie. For now beſides the abouenamed townes, it hath in it, Seleucia, Laodicea, and Artemitá: likewiſe within the quarters of the Arabians named Aroei & Mardani, Antiochea: and that which
E being founded by *Nicanor*, gouernor of Meſopotamia, is called Arabis. Vpon theſe ioine the Arabians, but well within the countrey are the Eldamarij. And aboue them is the citie Bura, ſituat vpon the riuer Pelloconta: beyond which are the Salmanes and Maſeans Arabians. Then there joine to the Gordiæans thoſe who are called Aloni, by whom the riuer Zerbis paſſeth, and ſo diſcharged into Tigris. Neere vnto them are the Azones and Silices mountainers, together with the Orentians: vpon whom confronteth the city Gaugamela on the Weſt ſide. Moreouer, there is Sue among the rocks: aboue which are the Sylici and Claſſitæ, through whom Lycus the riuer runneth out of Armenia. Alſo, toward the Southeaſt, Abſitris, and the town Azochis. Anon you come down into the plains & champion country, where you meet with theſe
F towns, Dioſpage, Poſitelia, Stratonicea, & Anthemus. As for the city Nicephorium, as we haue already ſaid, it is ſeated neer to the riuer Euphrates, where *Alexander* the great cauſed it to be founded, for the pleaſant ſeat of the place, and the commodity of the country there adioining. Of the city Apamia we haue before ſpoken in the deſcription of Zeugma: from which they that goe Eaſtward meet with a ſtrong fortified town, in old time carrying a pourpriſe & compaſſe of 65 ſtadia, called the royall pallace of their great dukes & potentates, named Satrapæ,

vnto which from all quarters men reſorted to pay their impoſts, cuſtoms, and tributes; but now it is come to be but a fort and caſtle of defence. But there continue ſtill in their entire and as flouriſhing ſtate as euer, the city Hebata and Oruros, to which by the fortunat conduct of *Pompey* the Great, the limits and bounds of the Roman empire were extended; and is from Zeugma 250 miles. Some writers report, that the riuer Euphrates was diuided by a gouernor of Meſopotamia, and one arme thereof brought to Gobaris, euen in that place where we ſaid it parted in twain: which was done for feare leſt one day or other the riuer with his violent ſtreame ſhould indanger the city of Babylon. They affirme alſo, that the Aſſyrians generally called it * Armalchar, which ſignifieth a royall riuer. Vpon this new arme of the riuer aforeſaid, ſtood ſometime Agrani, one of the greateſt towns of that region, which the Perſians cauſed to be vtterly raſed and deſtroyed.

* Or rather Nahal Nalca, i. the kings riuer.

As for the city of Babylon, the chiefe city of all the Chaldæan nations, for a long time carried a great name ouer all the world: in regard whereof all the other parts of Meſopotamia and Aſſyria was named Babylonia: it contained within the walls 60 miles: the walls were 200 foot high, and 50 thick, reckoning to euery foot 3 fingers bredth more than our ordinary meaſure. Through the middeſt of this goodly great city paſſeth the riuer Euphrates: a wonderfull piece of worke, if a man conſider both the one and the other. As yet to this day the temple of *Iupiter Belus* there ſtands entire. This prince was the firſt inuenter of Aſtronomie. It is now decayed, and lieth waſte and vnpeopled, for that the city Seleucia ſtands ſo neere it, which hath drawne from it all reſort and traffique; and was to that end built by *Nicator* within 40 miles of it, in the very confluent where the new arm of Euphrates is brought by a ditch to meet with Tigris: notwithſtanding it is named Babylonia, a free ſtate at this day, and ſubiect to no man; howbeit they liue after the lawes and manners of the Macedonians. And by report, in this city there are 600000 citiſens. As for the walls thereof, it is ſaid they reſemble an Eagle ſpreading her wings: and for the ſoile, there is not a territorie in all the Eaſt parts comparable to it in fertilitie. The Parthians in deſpight again of this city, and to do the like by it, as ſomtime was done to old Babylon, built the city Cteſiphon within three miles of it, in the tract called Chalonitis, euen to diſpeople and impouerish it; which is now the head city of that kingdom. But when they could do little or no good thereby to diſcredit the ſaid new Babylon, of late dayes *Vologeſus* their king founded another city hard by called Vologeſo Certa. Moreouer, other cities there are beſides in Meſopotamia, namely Hipparenum, a city likewiſe of the Chaldæans, and innobled for their learning as well as Babylon; ſcituate vpon the riuer Narragon, which gaue the name vnto that city. Howbeit the Perſians cauſed this Hypparenum to be diſmantled, and the walls thereof to be demoliſhed. There be alſo in this tract the Orchenes towards the South, from whence is come a third ſort of the Chaldæans, called Orcheni. Being paſt this region, you meet with the Notites, Orthophants, and Græciophants. *Nearchus* and *Oneſicratus*, who regiſtred the voiage of *Alexander* the Great into India, report, That from the Perſian ſea to the city Babylon by the riuer Euphrates, is 412 miles. But the later and moderne Writers do count from Seleucia to the Perſian gulfe 490 miles. K. *Iuba* writeth, That from Babylon to Charax is 175 miles. Some affirme moreouer, That beyond Babylon the riuer Euphrates doth maintaine one entire courſe, and keepeth one channel 87 miles, before he is diuided into ſeuerall branches here and there, for to water the country: and that he holdeth on his courſe from his head to the ſea for the ſpace of 1200 miles. This varietie of Authors as touching the meaſure is the cauſe why a man may not ſo wel reſolue and conclude thereof, conſidering that euen the very Perſians agree not about the dimenſions of their Scœnes and Parafanges, but haue diuers meaſures of them. Whereas the riuer Euphrates giueth ouer his owne chanel, (which for the bredth thereof is a ſufficient munition to it ſelfe) and beginneth to part into diuers branches, which it doth about the marches & confines of Charax, in all the tract neere adioyning, great danger there is of the Attalæ, a theeuiſh nation amongſt the Arabians, who preſently ſet vpon all paſſengers comming and going to and fro. When you are paſt this infamous and ſuſpected Region, you ſhall enter into the Countrey of the Schenites. As for the Arabians which are called Nomades, they occupie all the coaſts of the riuer Euphrates, as farre as to the Deſarts of Syria. From the which place we haue ſaid that hee turned, and tooke his way into the South, abandoning the deſarts of Palmyrene. To conclude, from the beginning and head of Meſopotamia, it is counted to Seleucia, if you paſſe vpon the riuer Euphrates, 1125 miles:

20030
copy 1

A miles: and from the red ſea, if you go by the riuer Tigris, 320 miles: from Zeugma 527 miles: and to Zeugma from Seleucia in Syria vpon the coaſt of our ſea, is reckoned 175 miles. This is the very true and iuſt latitude there, of the firm land between the two ſeas, to wit, the Perſian gulfe and the Syrian ſea. As for the kingdome of Parthia, it may containe 944 miles. Finally, there is yet another towne of Meſopotamia vpon the banke of Tigris, neere the place where the riuers meet in one, called Digba.

Chap. XXVII.

¶ *The riuer Tigris.*

B MEet alſo and conuenient it is to ſay ſomewhat of the riuer Tigris. It begins in the land of Armenia the greater, iſſuing out of a great ſource; and euident to be ſeen in the very plaine. The place beareth the name of Elongoſine. The riuer it ſelfe ſo long as it runs ſlow and ſoftly is named Diglito; but when it begins once to carry a more forcible ſtreame it is called Tigris, for the ſwiftneſſe thereof; which in the Medians language betokens a ſhaft. It runs vp into the lake Arethuſa, which beareth vp aflote all that is caſt into it, ſuffering nothing to ſinke; and the vapors that ariſe out of it carry the ſent of Nitre. In this lake there is but one kind of fiſh, and that entreth not into the chanell of Tigris as it paſſeth through, not more than any fiſhes ſwim out of Tigris into the water of the lake. In his courſe and colour both he
C is vnlike, and as he goes may be diſcerned from the other: and being once paſt the lake, and incountreth the great mountain Taurus, he loſeth himſelf in a certain caue or hole in the ground, and ſo runs vnder the hill, vntill on the other ſide thereof he breaketh forth again, and appeares in his likeneſſe, in a place called Zoroanda. That it is the ſame riuer it is euident by this, that he carrieth through with him, and ſheweth in Zoroanda, whatſoeuer was caſt into him before he hid himſelfe in the caue aforeſaid. After this ſecond ſpring and riſing of his he enters into another lake, and runneth through it likewiſe, named Thoſpites; and once again takes his way vnder the earth through certain blinde gutters, and 25 miles beyond he putteth forth his head about Nymphæum. *Claudius Cæſar* reporteth, that in the countrey Arrhene, the riuer Tigris runs ſo neere the riuer Arſania, that when they both ſwell, and their waters are out, they ioyne
D both their ſtreams together, yet ſo, as the water is not mingled: for Arſanias being the lighter of the twain, ſwimmeth and floteth ouer the other for the ſpace wel-neere of 4 miles: but ſoon after they part aſunder, and Arſania turneth his courſe toward the riuer Euphrates, into which he entreth. But Tigris receiuing into him certain goodly great riuers out of Armenia, to wit, Parthenis, Agnice, and Pharion, & ſo diuiding the Arabians & Troeanes from the Adiabenes, and by this means making as it were an Iſland of Meſopotamia aforeſaid, after he hath paſſed by and viewed the mountaines of the Gordiæans, neere vnto Apamia a town of Meſene on this ſide Seleucia ſyrnamed Babylonia, 125 miles: diuiding himſelfe into two armes or channels, with the one he runneth Southward to Seleucia, watering as he goeth the country of Meſſene; and with the other windeth Northward: he goeth on the backſide of the ſaid Meſene, and cutteth through the plains of the Cauchians. Now when theſe two branches are re-vnited again,
E the whole is called Paſitigris. After this, he taketh into him out of Media, the great riuer Coaſpes: and ſo paſſing between Seleucia and Cteſiphon, as we haue ſaid, he fals into the meeres and lakes of Chaldæa, which he furniſheth and repleniſheth with water for the compaſſe of ſeuentie miles: which done, he iſſueth forth againe, guſhing out with a mighty great and large ſtreame, and running along the towne Charax, on the right hand thereof, he diſchargeth himſelfe into the Perſian ſea, carrying there a mouth ten miles ouer. Between the mouthes of theſe two riuers, Tigris & Euphrates, where they fall into the ſea, were counted in old time 25 miles, or as ſome would haue it but ſeuen: and yet both of them were nauigable, and bare right great ſhips. But the Orcheniens and other neighbor inhabitants, long ſince turned the courſe of Euphrates aſide to ſerue their owne turnes in watering their fields, and ſtopped the ordinarie paſ-
F ſages thereof, inſomuch as they forced him to run into Tigris, & not otherwiſe than in his chanell to fall into the ſea. The next country bordering vpon Tigris is called Parapotamia, in the marches whereof is the city Meſene, whereof we haue ſpoken. The chiefe towne thereof is Dibitach: from thence you enter preſently into the region Chalonitis, ioyning hard vpon Cteſiphon, a rich country, beautified not only with rowes of date trees, but alſo with Oliue, Apple,

and peare trees, and generally with all sorts of fruit. Vnto this country extends the mountaine Zagrus, comming along from out of Armenia, between the Medes and Adiabenes, aboue Parætacene and the realme of Persis. Chalonitis is from Persis 480 miles distant: & some write, that going the streight, direct, and neerest way, it is so much and no more from the Caspian sea to Assyria. Between these countries and Mesene lieth Sittacene, the same that Arbelitis and Palestine. The townes of importance therein are Sittace, held by the Grecians, scituat toward the East, and Sabata: but on the West side Antiochia, seated betweene the two riuers Tigris and Tornadotus. In like manner Apamia, which *Antiochus* the king so called after his mothers name. This City is inuironed as it were with the riuer Tigris, and diuided with the riuer Archous which passeth through it. Somwhat lower than these countries lieth the region Susian, wherein stood the antient royall pallace and seat towne of the Persian kings, Susa, founded by *Darius* son of *Hystaspes*; and from Seleucia Babylonia it is 450 miles distant: & as much from Ecbatana in Media, taking the way along the mountaine Charbanus. Vpon that branch of the riuer Tigris that taketh his course Northward, stands the towne Babytace; and from Susa it is 135 miles. The people of this country are the only men in the world that hate gold: and in very truth get it they do, and when they haue it, they bury it sure enough within the ground, that it may serue for no vse. Vpon the Susianes Eastward ioyn the Cossæans, Brigands, and theeues generally all. Likewise the Mizæans, a free state, and subiect to no gouernment, hauing vnder them 40 nations, all wilde, and liuing as they list. Aboue these quarters you enter into the countries of the Parthusians, Mardians, Saites, and Hyans, who confine vpon high Persia called Elemais, which ioineth to the maritime coasts of Persis, as is aboue said. The city of Susa is from the Persian sea 250 miles. On that side whereas the Armada of *Alexander* the Great came vp the great riuer Pasitigris to Susa, there stands a Village on the lake Chaldais, name Aphle, from which to Susa is 65 miles and an halfe by water. The next that border vpon the Susians Eastward are the Cossæans: and aboue the Cossæi Northward lieth Mesobatene vnder the hil Cambalidus, which is a branch and dependant of the mountain Caucasus; and from thence is the most easie and ready passage into the country Bactriana. The riuer Eulæus makes a partition betwixt the high country of Persis called Elimais, and Susiane. This riuer issueth out of the Medians country, & in the midst of his course loseth himself vnder the ground: but being once vp againe he runneth through Mesobatene, and inuironeth the fort & castle of Susa, with the Temple of *Diana*, which is had in great reuerence and honour aboue all other Temples in those parts: yea, and the very riuer it selfe is in much request, and the water thereof ceremoniously regarded; in such wise, as the kings drinke of no other, and therefore they fetch it a great way into the country. And it receiueth into it the riuer Hedypnus, which commeth along the Priuiledged place whereinto the Persians vse to retyre for sanctuarie, and one more out of the Susianes countrey. A towne there is planted neere vnto it, called Magoa, 15 miles from Charax: yet some there be that would haue this towne to stand in the vtmost marches of Susiana, euen close to the mountaines and desarts. Beneath the riuer Eubæus lieth Elimais, ioyning to Persis in the very maritime coast; 240 miles it is from the riuer Oroates to Charax: the towns in it be Seleucia and Sosirate, both scituate vpon the hanging of the hill Casyrus. The flat coast and leuell thereof, which lieth before it, is, as we haue said before, no lesse dangerous and vnaccessible than the Syrts, for quavemires, by reason of the great store of mud and sand together, which the riuers Brixia and Ortacea bring downe with them. Ouer and besides, the countrey Elemais is so fenny, and standeth with water so wet, that there is no way through it to Persis, but a man must fetch a great circuit and compasse about it to come thereto. Moreouer, it is much haunted and annoied with serpents, which breed and come downe in those riuers: And as troublesome as the passage is all the countrey ouer, yet that part yeeldeth the worst aduenues, and is least frequented, which is called Characene, of the towne Charax, which limits the kingdomes of Arabia, whereof we will speake anon more at large, after wee haue set downe the opinion of *M. Agrippa*, which he hath deliuered as touching these quarters: for he hath written, that Media, Parthia, and Persis are bounded on the East side with the riuer Indus; on the West with Tigris; on the North part with the two mountaines, Taurus and Caucasus; and on the South coast with the red sea: also that they extend in length 1320 miles, and in bredth eight hundred forty. Moreouer, that Mesopotamia by it selfe alone is inclosed Eastward with the Riuer Tigris, and Westward with Euphrates; hauing on the North side the mountaine

Taurus,

20030
copy 1

A Taurus, and on the South the Perſian ſea: lying out in length 800 miles, and in bredth 360: now to returne vnto Charax, the inmoſt towne within the Perſian gulfe, from which Arabia called Eudæmon, *i.* happie, begins and runneth forth in length; ſcituate it is vpon a mount artificially reared by mans hands between the confluents of Tygris on the right hand, and Eulæus on the left; and yet notwithſtanding it carrieth a pourpriſe or precinct of three miles compaſſe. Founded firſt it was by *Alexander* the great, who hauing drawne Coloners to inhabite it out of the kings city Durine (which then was ruinat) and leauing there behind him thoſe ſoldiers which were not fit for ſeruice, nor able to follow in the march, ordained, that this town ſhould be called Alexandria: and the territory about it Pellæum, of the town where himſelfe was born: and withall appointed, that it ſhould be peopled only with Macedonians. But this towne of his by
B him founded, was ouerthrowne and deſtroied by the two riuers aforeſaid. Afterwards K. *Antiochus* the fift rebuilt it again, and named it of himſelf Antiochia. But when it was decaied a ſecond time by theſe riuers, *Spaſines*, ſon of *Sogdonacus*, who held Arabia, bordering neere by as an abſolute king, and not (as *Iuba* reporteth) as a duke or gouernor vnder *Alexander*, raiſed great wharfes, and oppoſed mightie dams and cauſies againſt thoſe riuers, and ſo re-edified the town a third time. Which done, he called it after his own name Charax of Spaſines: and verily hee fortified thus the ſite and foundation thereof, three miles in length, and little leſſe in breadth. At the beginning it ſtood vpon the ſea-coaſt, and from the water ſide not aboue ten ſtadia, and euen from thence it hath certain falſe baſtard galleries: but by the report of *Iuba* in his time, 50 miles. Howbeit, at this day both the Arabian Embaſſadors, and alſo our merchants that come from thence, ſay it is from the ſea ſhore 125 miles. In ſuch ſort, that it cannot be found in any
C place of the world again, where the earth hath gained more, nor in ſo ſhort a time, of the water, by reaſon of the ſtore of mud brought down with riuers. And the more maruell it is, that conſidering the ſea floweth, and the tide riſeth far beyond this towne, yet thoſe made grounds are not beaten back, and carried away againe. In this very towne I am not ignorant that *Dionyſius* the lateſt of our moderne Geographers was born, whom *Auguſtus* the Emperor ſent of purpoſe beforehand into the Eaſt countries to diſcouer thoſe parts, and record faithfully in writing whatſoeuer he there found, for the better aduertiſement of his elder ſon, who was vpon his voiage aud expedition of Armenia, to war againſt the Parthians and Arabians. Neither haue I forgotten, that in my firſt entrance into this worke in hand, I made ſome proteſtation to follow
D thoſe who had written of their owne countries, as men lightly moſt diligent and of beſt intelligences in that behalfe. Howbeit, in this place I chuſe rather to follow our martiall captaines that haue warred there, and report me alſo to K. *Iuba*, who hath written certain books to *C. Cæſar Caligula*, as touching the occurrences in the Arabian voiage.

Chap. XXVIII.

¶ *Arabia, Nomades, Nabatæi, and Omani: Tylos and Ogyris two Iſlands.*

ARabia commeth behind no country in the world, for largeneſſe and greatneſſe, eſpecially reaching out in length a mighty way. For it beginneth at the fall and deſcent of the mountaine Amanus ouer-againſt Cilicia and Comagene, as we haue before ſaid: where it
E is peopled with many nations brought from thence thither by *Tigranes* the great, to inhabite that quarter, and in old time deſcended naturally, and reached as far as to our ſea & the Ægyptian coaſt, as we haue ſhewed; yea, and extendeth into the midland parts of Syria to the mountain Libanus, where the hils reach vp to the very clouds: vpon which bound the Ramiſians, then the Taraneans, and after them the Patami. As for Arabia it ſelf, being like a demie Iſland, runneth out between two ſeas, the red and the Perſian, by a certain artificiall workmanſhip of nature, framed according to Italy in likeneſſe of forme and bigneſſe: yea, and lieth along the ſea coaſts in manner of Italy. And more than that, it regardeth the ſame quarter and line of heauen, without any difference at all. This tract thereof, for the rich ſeat it hath, is named *Fœlix*,
F *i.* Happy. The nations therein dwelling, from our ſea-coaſts to the deſarts of Palmyreum, wee haue treated of already. Therfore ouerpaſſing them, we will diſcourſe of the reſt forward. Now then, the Nomades & thoſe robbers that ſo lie vpon the Chaldæans & trouble them, the people called Scenitæ, as we haue beforeſaid, do confine vpon. And euen they alſo make no certain place of abode and habitation, but are called Scenitæ, of their tabernacles and booths which they

they make of haire clothes,and encamp vnder them when & where they liſt. Being paſt them, G
you meet with the Nabatæans in the vale, who inhabite a towne there named Petra,little leſſe
than 2 miles large;inuironed with ſteep mountains round about,which cut off al the aduenues
to it:and beſides,hauing a riuer running through the midſt thereof. Diſtant it is from Gaza (a
town ſcituat vpon our coaſt in Syria) 600 miles:and from the Perſian gulfe 122. And here at
this town meet both the port high waies,to wit,the one which paſſengers trauell to Palmyra in
Syria,and the other,wherein they go from Gaza. Beyond Petra and the vale thereof, you enter
into the Omanes country:which reached ſomtime as far as to Carax, and inhabited 2 famous
towns built by queen *Semiramis*,namely,Abeſanius,and Soractia. But now all is but a wilder-
neſſe. Then come you to a town named Forath,ſcituat vpon the riuer Paſitigris, and ſubiect to
the king of the Caracins or Zarazins: to which towne there is much reſort from Petra, as to a H
ſhire towne: and from thence to Charax,they may paſſe with the tide when the water ebbeth
for the ſpace of 12 miles. But they that come by water out of the Parthian kingdom,meet with
a village called Teredon, lower than the place where Euphrates and Tigris meet together in
one. Where the Chaldæans inhabit the left hand coaſt of the riuer, and the Nomades called
Scenitæ,the right. Some writers affirm,that as ye ſaile and row vpon the riuer Tigris, yee paſſe
by two other townes diſtant far aſunder:the one called Barbatia in times paſt, and afterwards
Thumata,which our merchants that trafficke in thoſe parts, auouch to be ten daies ſaile from
Petra,and is vnder the king of the Characenes:and the other Apamia, ſcituat in the very place
where Euphrates the riuer ſo ſwelleth ouer his bankes, that he ioineth with Tigris in one con-
fluent. And therefore the Apamians, at what time as the Parthians are about to make inrodes I
and inuade their territorie,ſet open the ſluces,and breake vp the wharfes and banks that keepe
theſe two riuers aſunder,and ſo impeach their enterpriſe by the ouerflow and inundation of
the waters. Now being paſt Charax,we will diſcourſe of the other coaſts of Arabia, & namely
that which firſt was diſcouered and declared by *Epiphanes*. And to begin with the place where
ſometime the mouth of Euphrates was. When you are once paſt it,you meet with a riuer of ſalt
brackiſh water,and the promontory or cape Chaldonum:where the ſea is more like a deep pit
or whirlepoole than a ſea,for 50 miles. Vpon this coaſt you find the riuer Achana,and beyond
it,deſarts for 100 miles,vntil you come to the Iſland Ichara. Then ſheweth it ſelfe the gulfe or
arme of the ſea named Capeus,vpon which inhabit the Gaulopes and Chateni. Beyond them
another creeke called Gerraicus,and the towne Gerræ vpon it,fiue miles large;& fortified with K
turrets made of great huge ſtones ſquared,of ſalt minerall. Fifty miles from the ſea ſide is the
region Attene:and ouer-againſt it the Iſland Tylos,as many miles from the ſhore,with a town
in it,bearing the name of the Iſland,much frequented by merchants for the plentie of pearles
that there be ſold:and not far from it there is another ſomewhat leſſe, not paſt 12 miles from
the cape of the foreſaid Tylos. Beyond theſe there are diſcouered by report certaine great I-
ſlands,but as yet they haue not bin landed vpon by our merchants. As for this laſt Iſland,it con-
taineth as they ſay 112 miles and an halfe in circuit, & is far from Perſis; but no acceſſe there
is vnto it,but only by one narrow gutter or channell. Then ſheweth it ſelfe the Iſland Aſgilia.
And in theſe parts likewiſe are other nations,namely,the Nocheti,Zurachi,Borgodi,Cataræi,
and Nomades:and withall the riuer Cynos. Beyond that,as K. *Iuba* ſaith, there is no more diſ- L
couered vpon this ſea of that ſide, by reaſon of the dangerous rockes therein. And I maruell
much that he hath made no mention at all of the towne Batraſabe in the Omanians countrey,
ne yet of Omana, which the antient Geographers haue held to be an hauen of great impor-
tance in the kingdome of Carmania. *Item*,he ſaith not a word of Omne and Athanæ,which our
merchants report to be at this day 2 famous mart towns,much frequented by thoſe that traf-
ficke from the Perſian gulfe. Beyond the riuer Caius,as K. *Iuba* writeth,there is an hill, which
ſeemeth all ſcortched and burnt. Paſt which,you enter into the countrie of the Epimaranites:
and anon after into the region af the Ichthyophagi: and paſt them there is diſcouered a deſart
Iſland,and the Bathymians country:and ſo forward, the mountaines Eblitæi are diſcouered,
and the Iſland Omœnus,the hauen Machorbæ,the Iſlands Etaxalos,Onchobrice,and the peo- M
ple called Chadæi. Many other Iſlands alſo of no account,and nameleſſe: but of importance,
Iſura, Rhinnea; and one other verie neere thereto, wherein are ſtanding certaine Columnes
or pillers of ſtone engrauen with vnknowne Characters and Letters. A little beyond the port
towne Gobœa, and the deſart vnpeopled Iſlands Bragæ. The Nation of the Thaludæans:

the

20030
copy 1

A the region Dabanegoris, the mountaine Orſa with an hauen vnder it: the gulfe or arme of the ſea called Duatus, with many Iſlands therein. Alſo the mountaine Tricoryphus: the countrey Cardalena, the Iſlands Solanidæ and Capina. Soone after you fall vpon other Iſlands of the Ichthyophagi: and after them the people called Glarians. The ſtrond called Hammæum, wherein are golden mines. The region Canauna. The people Apitami and Gaſani. The Iſland Deuadæ, with the fountaine Goralus. Then come you to the Garphets country: the Iſlands Aleu & Amnamethu. Beyond which are the people called Darræ, the Iſland Chelonitis, & many other of the Ichthyophagi. The Iſle Eodanda which lieth deſart, & Baſage, beſides many other that belong to the Sabæans. For riuers you haue Thamar & Amnon, & in the the Iſlands Dolicæ, wherein be the fountaines Daulotes and Dora. Ilands beſides, to wit, Pteros, Labaris, Covoris and Sambracate, with a towne ſo named alſo in the firme land. On the South ſide ma-

B ny Iſlands there be, but the greateſt of them all is Camari. Then haue you the riuer Myſecros, the hauen Leupas, & the Sabæans called Scenitæ, for that they liue vnder tabernacles & rents. Moreouer, many other Iſlands. The chiefeſt mart or town of merchandiſe in thoſe parts is Acila, where the merchants vſe to imbarke for their voiage into India. Then followeth the region Amithoſcutia, and Damnia. The Mizians, both the greater and the leſſe: the Drimutians and Macæ. A promontory of theirs is ouer-againſt Carmania, and diſtant from it 50 miles. A wondrous thing is reported to haue bin there done, & that is this: that *Numenus* lord deputy vnder K. *Antiochus*, ouer Meſena, & general of his army, defeated the nauy of the Perſians in ſea-fight, and the ſame day with the opportunity of the tide returned to land againe, & gaue their horſe-

C men an ouerthrow to it: whereupon, in memoriall of a twofold victory in one day atchieued, he erected 2 triumphant trophies, the one in honor of *Iupiter*, & the other of *Neptune* Farre within the deep ſea there lieth another Iſland called Ogyris, diſtant from the continent 125 miles, and containing in circuit 112, much renowned for the ſepulchre of K. *Erythra*, who there was enterred. Another likewiſe there is of no leſſe account, called Dioſcoridu, lying in the ſea Azanium and is from Syagrum, the vtmoſt point or cape of the main, 280 miles. But to returne to the Continent: there remaine yet not ſpoken of, the Antarides toward the South, as you turn to the mountains, which continue for 7 daies iourny ouer: then theſe nations, Larendanes, Catabanes, and Gebanites: who haue many townes, but the greateſt are Nagia and Tamna, with 65 churches or temples within it, whereby a man may know how great it is. From thence you come to

D a promontory; from which to the continent of the Troglodites it is 50 miles. And in thoſe quarters remaine the Toanes, Acchitæ, Chatramotitæ, Tomabei, Antidalei, Lexianæ, Agrei, Cerbani, and Sabæi, of all the Arabians for their ſtore of frankincenſe moſt famous, as alſo for the largeneſſe of their country, reaching from ſea to ſea. Their townes ſcituate vpon the coaſt of the red ſea, are Marane, Marma, Cocolia and Sabatra. Within the firme land are theſe townes, Naſcus, Cardaua, Carnus, and Tomala, where the Sabæans keep their faires and markets for to vent and ſel their commodities of incenſe, myrrhe, and ſuch drugs and ſpices. One part of them are the Atramites, whoſe capitall city Sobotale, hath within the wals thereof 60 temples. But the roiall city and chiefe ſeat of the whole kingdome is Nariaba: ſcituat vpon a gulfe or arm of the ſea that reacheth into the land 94 miles, ful of Iſlands, beautified with ſweet odoriferous

E trees. Vpon the Atramites within the main land joine the Minæi: but the Elamites inhabit the maritine coaſt, where there ſtandeth a city alſo called Elamitum. To them the Cagulates lye cloſe: and their head towne is Siby, which the Greekes name Apate. Then come you to the Arſicodani and Vadei, with a great towne: and the Baraſei: beyond whom is Lichemia, and the Iſland Sygaros, into which no dogs will come willingly: and if any be put there, they will neuer lin wandring about the ſhore vntill they die. In the fartheſt part of the aboue-ſaid gulfe are the Leanites, whereof the gulfe tooke the name Leanites. Their head ſeat and roiall ſeat is Agra: but the city Leana, or as others would haue it, Ælana, is ſcituate vpon the verie gulfe. And hereupon our writers haue called that arme of the ſea Ælaniticum, others Ælenaticum; *Artemidorus*, Aleniticum; and king *Iuba*, Læniticum. Arabia is reported to take in circuit

F from Charax to Leana, 4870 miles. But *Iuba* thinketh it ſomewhat leſſe than 4000. Wideſt it is in the North parts betweene the townes Herous and Chrace. Now it remaineth that wee ſpeake of other parts within the Mid-land thereof. Vpon the Nabatæi, the Thimaneans doe border, after the deſcription of the old Geographers: but at this day, the Tauenes, Suellenes, and Saracenes: their principall Towne is Arra, wherein is the greateſt trafficke and

reſort

resort of merchants. Moreouer, the Hemnates and Analites, whose townes are Domada and E- G
rage: also the Thamusians, with their towne Badanatha: the Carreans, and their towne Chariati: the Achoali, and a city of theirs Phoda. Furthermore, the Minæi, descended as some thinke from *Minos* king of Crete: whose citie Charmæi hath 14 miles in compasse. Other towns likewise be there standing a far off, and namely, Mariaba, Baramalacum, a town ywis of no mean account: likewise Carnon, and Ramei, who are thought to come from *Rhadamanthus* the brother of *Minos*. Ouer and besides, the Homerites, with their towne Massala: the Hamirei, Gedranitæ, Anapræ, Iliſanitæ, Bochilitæ, Sammei, and Amathei; with these townes Nessa and Cennesseri. The Zamanenes, with these townes, Saiace, Scantate, and Bacasmani: the towne Rhiphearma, which in the Arabian tongue signifieth Barley: also the Antei, Rapi, Gyrei, and Marhatæi. The Helmadenes, with the towne Ebode. The Agarturi in the mountaines, hauing a towne 20 H
miles about, wherein is a fountaine called Emischabales, that is as much to say, as The Camels town. Ampelone, a colony of the Milesians: the towne Actrida: and the people Calingij, whose towne is named Mariaba, as much to say as, Lords of all. Towns moreouer, Pallon & Murannimal, neere vnto a riuer, by which men thinke that Euphrates springeth and breaketh forth aboue ground. Other nations besides, namely, Agrei and Ammonij: with a towne, Athenæ: and the Caurarani, which signifieth, Most rich in droues of cattell. Then the Caranites, Cæsanes, and Choanes. There were sometime also certaine townes in Arabia, held by Greeks, and namely, Arethusa, Lariſſa, and Chalcis, which all in the end came to ruine and were destroyed in diuers and sundry wars. The onely man among the Romans vntill this day that warred in those parts, was *Ælius Gallus* a knight of Rome. As for *Caius Cæsar* the son of *Augustus* the Emperor, I
he did but looke only into Arabia, and no more: but *Gallus* wasted townes that were not once named by Authors that wrote before, namely Egra, Annestum, Essa, Magusum, Tamuracum, Laberia, and the aboue-named Marieba, which was in circuit six miles about: likewise Caripeta, the farthest that he went vnto As for all other matters, he made report vnto the Senate of Rome, according as he had found and discouered in those parts; to wit, that the Nomades liue of milke and venison: the rest of the Arabians presse wine, like as the Indians do, out of dates: and oile of Sesama, a kinde of graine or pulse in those countries. That the Homerites country of all others is most populous and replenished with people: the Minæans haue plenteous and fruitfull fields, full of date trees and goodly hortyards stored with all sorts of fruit: but their principall riches lieth in cattell. The Cembanes and Arians are good warriours and martiall K
men, but the Chatramotites that way excell all the rest. The Caræans haue the largest territories and most fertile fields for corne. As for the Sabæans, their wealth standeth most vpon their woods and trees, that bring forth the sweet gums of Frankincense and myrrhe: also in mines of gold: hauing water at commandement to refresh their lands, and plenty besides of hony & wax. As concerning the sweet odours and spices that come from thence, we will speake thereof in a seuerall booke by it selfe. The Arabians weare miters or turbants ordinarily vpon their heads, or else go with their haire long and neuer cut it: as for their beards, them they shaue, saue only on their vpper lippe, which they let grow still: and yet some of them there be that suffer their beards to grow long and neuer cut them. But this one thing I maruell much at, that being such an infinit number of nations as they be, the one halfe of them liue by robberie and theeuing, L
howsoeuer the other liue by traffick and merchandise. Take them generally, they be exceeding rich; for with them the Romans and Parthians leaue exceeding sums of gold and siluer, for the commodities out of their woods and seas which they sell vnto them: but they themselues buy nothing of them againe. Now will we speake of the other coast opposite vnto Arabia. *Timosthenes* hath set downe, that the whole gulfe or arm of the sea called Red, was from one end to the other foure daies sailing: and from side to side, two daies: that the streights of the firth were seuen miles ouer. But *Eratosthenes* saith, that taking the measure at the very mouth, it is euerie way 1300 miles.

Chap. XXIX.

M

¶ *The gulfe of the Red Sea: likewise of the Trogloditicke and Æthiopian Seas.*

Artemidorus auoucheth, that the Red Sea toward Arabia side, is 1450 miles: but on the coast of the Troglodites 1182, vntill you come to the citie Ptolemais. Most Geographers haue set downe the breadth thereof to bee 462 miles: and that the mouth of it,

where

20030
copy 1

A where it openeth wide, ful againſt ſun-riſing in winter [*i.* South-weſt] ſome ſay, is 7 miles broad; and others 12. As for the poſiture ſcituation thereof, thus it lyeth: beyond the branch or arme thereof called Ælaniticus, there is another creeke which the Arabians call Æant, vpon which ſtandeth the towne Heroon. In old time there was a city called Cambiſu, betweene the Nelians and Marchandians, into which the ſicke and feeble ſouldiers of our armie were conueied, as to a place of retreat and repoſe. Beyond which, you enter into the land of Tyra: and there is the port Daneon to be ſeene, from which *Seſoſtris* a king of Ægypt, was the firſt that imagined and deuiſed to draw one arme of it with a channell nauigable, into Nilus, in that part where it run-neth to the place called Delta, and that for 62 miles ſpace, which is between the ſaid riuer and the red ſea. This enterpriſe of his was followed by *Darius* king of the Perſians: yea and by *Pto-*
B *lomæus* king of Egypt, ſecond of that name, who made a channell 100 foot ouer, and 30 deep, for 37 miles in length and an halfe, euen to the bitter fountaines. But this deſigne was interrup-ted and the ditch went no farther, for feare of a generall deluge and inundation: for found it was, that the red ſea lay aboue the land of Egypt three cubits. Some alledge not that to be the cauſe, but this, namely, That if the ſea were let into Nilus, the ſweet water thereof (wherof they drinke only and of none elſe) ſhould be corrupted thereby and marred. Yet neuertheleſſe, al-though this worke went not forward, the way is well beaten all the country ouer betweene the Red ſea, and the Ægyptian, for trafficke: and three ſeuerall ordinarie waies there are between: the one from Peluſium ouer the ſands; where, vnles there be reeds ſet vp pitched in the ground to giue guidance and direction, there would no path be found, for euer & anon the wind blow-eth the ſand ouer the tracts of mens feet and coureth all. A ſecond beginneth 2 miles beyond
C the mountaine Caſius, which after 60 miles commeth into the former Peluſiacke way. (Vpon this great rode way, the Arabians called Autei, do inhabit.) The third taketh his head and be-ginning at Gereum, which they call Adipſon, and holdeth on through the ſaid Arabians, & is 60 miles neerer way, but full of craggie hils and altogether without waters. All theſe foreſaid waies lead to the city Arſinoe, built vpon the gulfe Charandra by *Ptolomæus Philadelphus*, and bare his ſiſters name: and verily hee was the firſt that diſcouered thoſe parts, and ſearched nar-rowly into the region Trogloditicum: and the riuer that paſſeth by Arſinoe, he called Ptolo-mæus. Within a little of this place, there is a little town named Ænum; for which, ſome there be that write, Philotera. Beyond them, are the Azarei: Arabians of the wilder ſort & halfe Tro-
D glodites, by reaſon they marry their wiues from out of the Troglodites countrey. Beeing paſt theſe coaſts, you ſhall finde the Iſlands Sapyrene and Scytala: and within a little thereof, de-ſarts vntil you come to Myos-hormos, where there is a fountaine called Taduos, the mount Eos, the Iſland Lambe, many hauens beſides, and Berenice a town, bearing the name of the mo-ther to K. *Ptolomæus Philadelphus*, to which there is a way lying from Coptos, as we haue ſaid: & laſt of all the Arabians called Autei, and Gnebadei. Now it remaineth to ſpeake of the region Trogloditicum, which the antient men of old time called Michoe, & others Midoe: & therein ſtandeth the mountaine Pentedactylos. Vpon the coaſt of this country, there lie to be ſeen cer-taine Iſlands called Stenæ-deiræ: and others no fewer in number named Halonneſi: alſo Car-damine, and Topazos, which Iſland gaue the name to the precious ſtone called the Topaze.
E Then come you to an arme of the ſea betweene two lands, full of pettie Iſlands, whereof that which is called Mareu, is well ſerued with water ſufficient: another, Eratonos, is altogether dry and vnprouided of freſh water. Theſe Iſlands tooke name of two captains and gouernors there vnder the king. Within-forth farther into the firm land, inhabit the Candei, whom they call Ophiophagi, becauſe they are wont to feed on ſerpents: and in truth there is not another coun-try that breeds them more than it. K. *Iuba* who ſeemeth to haue taken great paines in the dili-gent peruſing and diſcouery of theſe parts, omitted in all this tract (vnleſſe there be ſome fault and defect in them that copied out his firſt originall) to ſpeake of a ſecond city named Bere-nice, with the addition of Panchryſos; as alſo of a third called Epidires, and yet renowned it is in regard of the place wherupon it is ſeated: for ſcituat it is vpon a knap of land bearing far into
F the red ſea, euen where the mouth of it is not aboue 4 miles & an halfe, from Arabia. Within the proſpect of this tract there is the Iſland Cytis, which alſo bringeth forth good ſtore of the Topaze ſtones. Beyond this quarter, nothing but woods and forreſts, where K. *Ptolomæus* ſurna-med *Philadelphus* built the city Ptolemais, onely for to chaſe and hunt the Elephant, neere to the lake Monoleus; and in regard of his game there, he named it Epi-theras. This is the verie

countrey

country mentioned by me in the ſecond booke: wherein for 45 daies before Mid-ſummer, or the entrance of the Sun into Cancer, and as many after, by the ſixt houre of the day, that is to ſay, about noone, no ſhadowes are to be ſeen: which being once paſt, all the day after they fall into the South. As for other daies of the yere beſides, they ſhew into the North: whereas in that citie Berenice which we mentioned firſt, vpon the very day only of the Sun-ſtead, at the ſixth houre or noon-tide, the ſhadowes are cleane gone and none to be ſeene (for otherwiſe there is no alteration at all to be obſerued throughout the yeare) for the ſpace of 600 miles all about Ptolemais. A ſtrange & notable thing worth obſeruation, that it ſhould be ſo but in one houre all the yere long, and a matter that gaue great light and direction to the world, yea and miniſtred occaſion to a ſingular inuention and ſubtil concluſion: for *Eratoſthenes* vpon this vndoubted argument and demonſtration of the diuerſitie of ſhadowes, ſet in hand hereupon to take the meaſure of the whole globe of the earth, and put it downe in writing to all poſteritie. Beyond this city Ptolemais, the ſea changeth his name and is called Azanium; ouer which the cape ſheweth it ſelfe, which ſome haue written by the name of Hiſpalus: alſo, anon appeareth the lake Mandalum, and in it the Iſland Colocaſitis; but in the deep ſea many more, wherin are taken many tortoiſes. Farther vpon this coaſt is the towne Suchæ, and then you may diſcouer in the ſea the Iſland Daphnis, and the city Aduliton, built by certaine Ægyptian ſlaues who ran away from their maſters and took no leaue: and verily this is the greateſt and moſt frequented mart towne of all the Troglodites country, and put the Ægyptians to them: and it is from Ptolemais 5 daies ſailing. Thither is brought great ſtore of yuorie, or the Elephants tooth, and of the horn of the Rhinoceros: there many a man haue plenty of the ſea-horſe hides, of tortoiſe ſhels, of little Monkies or Marmoſets: there alſo a man may be ſped with bondſlaues. A little beyond are the Æthiopians, called Aroteres: alſo the Iſlands named Aliæa: and beſides them other Iſlands, namely, Bacchias, Antibacchias, and Stratonis: being paſt them, there is a gulf in the coaſt of Æthiopia, as yet not diſcouered or knowne by any name: a thing that may make vs maruel much, conſidering that our merchants ſearch into farther corners than ſo. Alſo a promontory, wherein there is a fountaine of freſh water named Curios, much deſired of the ſailers that paſſe that way, and in great reſpect for the refreſhing that it yeeldeth vnto them: beyond it, is the harbor or port of Iſis, diſtant from the towne of the Adulites aboueſaid, ten days rowing with ores; and thither is the Troglodites myrrhe brought, and there laid vp. Before this hauen, there lie in the ſea two Iſlands, named Pſeudopylæ: and as many farther within, called Pylæ: in the one of them be certaine pillers of ſtones, ingrauen with ſtrange and vnknowne Letters. When you are paſt this hauen, you come to an arme of the ſea called Abalites: within it is the Iſland Diodori, and other lying deſart and vnpeopled. Alſo along the continent, there is much wilderneſſe: but being paſt them, you come to the towne Gaza: the promontorie alſo & port Moſſylites, vnto which ſtore of cynamon and canell is brought. Thus far marched K. *Seſoſtris* with his army. Some writers make mention of one town more in Æthiopia beyond all this, vpon the ſea ſide, called Baradaza. K. *Iuba* would haue the Atlantick ſea to begin at the promontorie or cape aboue-named, Moſſylites: on which ſea (as he ſaith) a man may ſaile very well with a Weſt-north-weſt winde, by the coaſts of his kingdomes of Mauritania or Marocco, as farre as to the coaſts of Gibralter called Gades: and ſure he ſpeaketh ſo confidently thereof, as I will not altogether diſcredit his reſolution in this behalfe. From a promontorie of the Indians called Lepteacra, and by others Drepanum, vnto the Iſle of Malchu, hee ſaith plainely, that by a ſtraight and direct courſe it is 15 hundred miles, and neuer reckon thoſe parts that are burnt with the Sun. From thence to a place called Sceneos, he affirmeth it is 225 miles: and from it to the Iſland Sadanum, 150 miles; and thus by this means he concludeth, that in all, to the open and knowne ſea, it is 1885 miles. But all other writers beſides him were of opinion, that there could not poſſibly be any ſailing vpon it, for the exceeding heat of the Sun. Ouer and beſides, the Arabians named Aſcitæ, doe much harme and annoyance from out of the Iſlands which they hold, vnto merchants that trafficke that way: for theſe Arabians, according as their name doth import, couple bottles made of good oxe leather, two by two together, and going vpon them with eaſe as it were a bridge vnder them, ſcoure the ſeas, and ſhooting their empoyſoned arrowes, practiſe pyracie, to the great loſſe and miſchiefe of merchants & ſailers. The ſame *Iuba* writeth moreouer, that there be certaine people of the Troglodites, named Therothoes, for their hunting of wilde beaſts, of their exceeding and wonderful ſwiftneſſe in chaſing of Deere

vpon

20030
copy 1

A vpon land:as the Ichthyophagi for courſing of fiſh in the ſea, ſwimming as naturally as if they were water creatures. Moreouer, he nameth other nations in thoſe parts,as the Bargeni,Zageres,Chalybes,Saxinæ,Syreces, Daremes and Domazanes. Furthermore, he affirmeth, that the people inhabiting along the ſides of Nilus from Syene vnto Meroe, are not Æthiopians, but Arabians,who for to ſeeke freſh water,approached Nilus;and there dwelt:as alſo that the citie of the Sunne,which we ſaid before in the deſcription of Ægypt,ſtandeth not farre from Memphis,was firſt founded and built by the Arabians. Contrariwiſe, other Geographers there be, who affirme that the farther ſide or banke of Nilus is no part of Æthiopia, and they lay it as a dependant annexed to Affrick.But be it as will be,I wil not greatly buſie my head thereabout, but ſuffer euery man to abound in his own ſence,and haue his own way:only I will content my
B ſelfe with this,to ſet downe the townes on both ſides thereof, in that order as they are declared vnto me. And firſt to begin with that ſide toward Arabia : after you are paſt Syene, enter you ſhall vpon the countrie of the Catadupi,and ſo forward into the land of the Syenites. Wherin theſe towns ſtand in order as followes : Tacompſon,which ſome haue called Thatire, Aranium, Seſanium, Sandura,Naſandum,Anadoma,Cumara, Beda and Bochiana,Leuphithorga,Tantarene,Machindira,Noa,Gophoa,Gyſtatæ,Megeda,Lea,Rhemnia, Nupſia,Direa,Patara,Bagada,Dumana,Rhadata,wherein a golden cat is worſhipded as a god. Boron in the midland part of the continent,and Mallos,the next towne to Meroe. Thus hath *Bion* digeſted and ſet them downe.But king *Iuba* hath raunged them otherwiſe in this manner. Firſt,Megatichos a towne ſcituate vpon a hill betweene Ægypt and Æthiopia,which the Arabians vſe to call Myrſon:
C next to it Tacompſon:then Aranium,Seſanium, Pide,Mamuda, and Corambis;neere vnto it a fountaine of liquid Bitumen: Hammodara, Proſda, Parenta, Mama, Theſſara, Gallæ, Zoton, Graucome,Emeum,Pidibotæ,Hebdomecontacometæ,and the Nomades, who ordinarily are encamped vnder tents and pauilions. Cyſte,Pemma,Gadagale, Palois, Primmis, Nupſis, Daſelis,Patis,Gambrenes,Magaſes, Segaſmala, Cranda, Denna, Cadeuma,Thena,Batha,Alana, Macum, Scammos,and Gora within an Iſland.Beyond which, Abala, Androcanis, Seres,Mallos & Agoce. And thus much on the ſide of Arabia. Now for Affrick ſide,they are in this wiſe reckoned. Firſt, Tacompſos, according to the others name, or a parcell rather of the former: then,Magora,Sea, Edoſa, Pelenaria,Pyndis,Maguſa, Bauma, Linitima, Spyntuma, Sydopta, Genſoa,Pindicitora,Eugo,Orſima,Suaſa,Maunia,Rhuma,Vrbubuma,Mulona,which town the
D Greeks were wont to call, Hypaton,Pagoargas,Zanones,& there begin the Elephants to come in,Mamblia,Berreſa,Cetuma. There was moreouer a towne ſometime named Epis,ſcituate againſt Meroe:but raſed it was and vtterly deſtroyed before that *Bion* wrote his Geography. See what cities and towns of name were recorded in times paſt to haue bin in thoſe parts,vntil you come to the Iſle Meroe. And yet at this day there is neither ſtick nor ſtone to be found of any of them in a manner on neither ſide. Only deſarts and a vaſt wilderneſſe in ſtead of them,by report made vnto *Nero* the Emperor by the Prætorian ſouldiers, ſent thither from him vnder the leading of a Tribune or Colonel,to diſcouer thoſe quarters of Æthiopia,& to relate accordingly:at what time as among other his deſignes,that Prince intended an expedition with his army againſt the Æthiopians. And yet before his time,euen in the daies of *Auguſtus Cæſar* of happie
E memory, the Romanes pierced thither with a power of armed men vnder the conduct of *Pub. Petronius*,a knight of Rome,and gouernour of Ægypt,deputed by the ſaid Emperour. Where he forced by aſſault and conquered all thoſe townes in Æthiopia which he then found ſtanding in this order following : namely, Pſelcis,Primis,Abaccis,Phthuris,Cambuſis,Attena,Stadiſis,where the riuer Nilus runs down with ſuch a mighty fall, that with the noiſe thereof the inhabitants there by loſe their hearing and become deafe. Beſides theſe he won alſo and ſacked Napata. And albeit he marched forward ſtill a great way into the countrie,euen 870 miles beyond Syene,yet this Romane armie of his laid not all waſt in thoſe parts,& left the country ſo deſart as now it is. No,no : It was the Ægyptians warres and not the Romanes that gaue the waſt to Æthiopia:and albeit ſomtimes it woon and otherwhiles loſt;one time bare the ſcepter
F and ruled,another time vnderwent the yoke, and were ſubdued : yet was it of great name in the world and puiſſant,vntill the reigne of king *Memnon*,who ruled at the time of the Trojane war : yea,and Syria was ſubject vnto it, as alſo the coaſt of our ſea in king *Cephas* daies,as appeareth by the fabulous tales that go as touching *Andromeda*. Semblably the Geographers varie and diſagree much about the meaſure and dimenſion of Æthiopia. And firſt of al others, *Dalion*, al-

beit he passed far beyond Meroe: after him, *Aristocreon*, *Bion*, and *Basilis*. As for *Simonides* (the yonger and the later writer) had soiourned the Meroe fiue yeares, when he wrote of Æthiopia. For *Timosthenes* the Admirall of *Ptolomæus Philadelphus* his naue, hath left in record, that from Syene to Meroe is 60 days iourny, without any further particularizing of the measure by miles. But *Eratosthenes* precisely noteth, that it is 625 miles. *Artemidorus* but 600. *Sebostus* affirmeth, That from the frontiers of Egypt it is 1675 miles. From whence, the last rehearsed Writers count forward but 1270. But all this difference and dispute about this point, is lately determined & ended by the report of those trauellers whom *Nero* sent of purpose to discouer those countries; & they made relation of the truth vpon their certain knowledge, that it is 874 miles from Syene in this maner particularly by iournies. Namely, from the said Syene to Hiera-Sycaminon 54 miles: from thence to Tama 75 miles: from Tama to the Euonymites country, the first of all the Æthiopians, 120. Forward to Acina 54. To Pitara 25. To Tergedum 106 miles. Where by the way it is to be noted, that in the midst of this tract lieth the Island Gagandus: where they began first to haue a sight of the birds called Parats; & beyond another Isle in the same way which is called Artigula, they might see monkies & marmosets: but being once beyond Tergedum, they met with the beasts Cynocephali. From thence to Napata 80 miles: this is the only little town among all the rest before named. From which to the Island Meroe is 360 miles. They reported moreouer, that about Meroe (& not before) the grasse and herbs appeared fresh and green, yea, and the woods shewed somwhat in comparison of all the way besides, and that they espied the tracts of Elephants & Rhinocerotes where they had gone. As for the town it selfe Meroe, they said it was within the Isle from the very entrie therof 70 miles: & that iust by, there was another Island called Tatu, which yeelded a bay or hauen to land at for them that took the arme & channell of Nilus on the tight hand. As for the building within Meroe, there were but few houses in it: that the isle was subject to a lady or queen named *Candace*, a name that for many yeres already went from one queen to another successiuely. Within this town there is the temple of great holinesse and deuotion in the honor of *Iupiter Hammon*: and in all that tract many other chappels. Finally, so long as the Ethyopians swaied the scepter and raigned, this Island was much renowned & very famous. For by report, they were wont to furnish the Ethyopian king with armed men 250000, & to maintain of Artisans 400000. Last of all there haue bin counted 45 kings of the Ethyopians, and so it is reported at this day.

Chap. XXX.

¶ *The manifold, strange, and wonderfull formes and shapes of men.*

All Ethyopia in generall was in old time called Ætheria: afterwards Atlantia: and finally of *Vulcans* son *Æthiops*, it took the name Ethyopia. No wonder it is, that about the coasts thereof there be found both men and beasts of strange and monstrous shapes, considering the agilitie of the suns fierie heat, so strong and powerfull in those countries, which is able to frame bodies artificially of sundry proportions, and to imprint and graue in them diuers forms. Certes, reported it is, that far within the country Eastward there are a kinde of people without any nose at all on their face, hauing their visage all plain and flat. Others again without any vpper lip, and some tongueless. Moreouer, there is a kind of them that want a mouth, framed apart from their nose-thrils: and at one and the same hole, and no more, taketh in breath, receiueth drinke by drawing it in with an oaten straw; yea, and after the same maner feed themselues with the grains of oats, growing on the own accord without mans labour and tillage, for their only food. And others there be, who in stead of speech and words, make signes, as well with nodding their heads, as mouing their other members. There are also among them, that before the time of *Ptolomæus Lathyrus* king of Egypt, knew no vse at all of fire. Furthermore, writers there be, who haue reported, that in the countrey neere vnto the meeres and marishes from whence Nilus issueth, there inhabit those little dwarfes called Pygmei. But to return againe to the vtmost coasts of Ethyopia, where we left: there is a continuall raunge and course of mountains all red like fire, as if they were euer burning. Moreouer, beyond Meroe there is a countrey lying aboue the Troglodites and the red sea: where, after you be three daies journy from Napata toward the coast of the said red sea, you shall find that in most places they saue raine water for their ordinarie vse to drinke, and otherwise: all the countrey betweene is very plenteous and full of

20030
copy 1

A of gold mines. All beyond this region is inhabited by the Atabuli, a people alſo of Ethiopia. As for the Megabares, whom ſome haue named Adiabares, they lie againſt Meroe, and haue a towne bearing the name of *Apollo*. Among them are certain Nomades encamping vnder tents and tabernacles, who liue of Elephants fleſh. Iuſt againſt them in a part of Africke are the long liuing Macrobians. Again, being paſt the Megabarenes, you come vnto the Memnones & Daveli: & 20 daies iourny from them, to the Critenſes. Beyond whom you meet with the Dochi, and the Gymnetes who are euer naked. Soon after you ſhall find the Anderæ, Mathitæ, Meſagebes, Hipporeæ, who be all ouer blacke, and therfore they colour and paint their bodies with a kind of red chalk or rudle called Rubrica. But vpon the coaſt of Africk are the Medimni. Beyond whom you ſhal come to another ſort of Nomades liuing vnder tents, who feed of no other
B thing but the milk of certain creatures headed like dogs, called Cynocephali: alſo to the Olabi and Syrbotæ, who are reported to be 8 cubits high. Moreouer, *Ariſtocreon* ſaith, that on Libya ſide, fiue daies iourny from Meroe, there is a town called Tole: & 12 daies iourny from thence, there ſtandeth Eſar, a town built by the Egyptians, who fled thither to auoid the cruelty and tyrannie of K. *Pſammeticus*. And reported it is, that the Egyptians held it for 300 yeres. Alſo, that the ſame fugitiues founded the towne Daron on the contrary ſide in the coaſt of Arabia. But that which *Ariſtocreon* nameth Eſar, *Bion* called Sapa, and ſaith withall, that the very word Sapa ſignifieth in the Ethyopian language, ſtrangers or aliens come from other parts. Hee affirmeth beſides, that their capitall city is within an Iſland, Sembobitis, and that Sai within Arabia, is the third city of that nation. Now between the mountains and the riuer Nilus, are the Symbarians and the Phalanges: but vpon the very hils liue the Aſachæ, who haue many other
C nations vnder them: and they are by report ſeuen daies iourney from the ſea. They liue vpon the veniſon of Elephants fleſh, which they vſe commonly to hunt and chaſe. As for the Iſland within Nilus, of the Semberrites, it is ſubiect to a queen. And eight daies iourney from thence lieth the country of the Ethiopians, named Nubæi. Their chiefe town Tenupſis is ſeated vpon the riuer Nilus. Beyond the Nubians, you enter vpon the countrie of the Sambri: where all the foure-footed beaſts, yea, euen the very Elephants, are without ears. Vpon the coaſt of Africk inhabit the Ptœambati and Ptœmphanæ: who haue a dog for their king, and him they obey, according to the ſignes which he maketh by mouing the parts of his bodie, which they take to be his commandements, and religiouſly they do obſerue them. Their head citie is Auriſpi, far
D diſtant from Nilus. Beyond them are the Achiſarmi, Phaliges, Marigeri, and Caſamarri. *Bion* affirmeth, That beyond Pſembobitis, there be other townes in the Iſlands of that coaſt, toward Meroe, all the way as you paſſe for 20 daies iourny. The towne of the next Iſland is Semberritarum, vnder the queen: likewiſe another called Aſar. Alſo there is a ſecond Iſland hauing in it the towne Daron: a third which they cal Medœ, wherein ſtandeth the town Aſel: and a fourth named Garode, like as the towne alſo. Then along the banks of Nilus are many townes, to wit, Navos, Modunda, Andabis, Setundum, Colligat, Secande, Navectabe, Cumi, Agroſpi, Ægipa, Candrogari, Araba, and Summara. The region aboue Sirbithim, where the mountains do end, is reported to haue vpon the ſea coaſt certaine Æthyopians called Niſicaſtes and Niſites, that is to ſay, men with three or foure eies apiece: not for that they are ſo eied indeed, but becauſe
E they are excellent archers, & haue a ſpeciall good eie in aiming at their marke, which lightly they wil not miſſe. *Bion* affirmeth moreouer, That from that clime of the heauen which beares aboue the greater Syrtes, & bendeth toward the South Ocean ſea, they be called Dalion, to wit, the Ciſorians and Longopores, who drinke and vſe rain water only. And beyond Oecalices for fiue daies iournie, the Vſibalks, Iſuelians, Pharuſeans, Valians and Ciſpians. All the reſt are nothing but deſarts not inhabited. But then he telleth fabulous and incredible tales of thoſe countries. Namely, that Weſtward there are people called Nigrœ, whoſe king hath but one eie, and that in the mids of his forehead. Alſo he talketh of the Agriophagi, who liue moſt of panthers and lions fleſh. Likewiſe of the Pomphagi, who eat all things whatſoeuer. Moreouer, of the Anthropophagi, that feed on mans fleſh. Furthermore, of the Cynamolgi, who haue
F heads like dogs. Ouer and beſides, the Artabatites who wander and go vp and downe in the foreſts like foure-footed ſauage beaſts. Beyond whom, as he ſaith, be the Heſperij, & Peroeſi, who, as we ſaid before, were planted in the confines of Mauritania. In certain parts alſo of Ethyopia the people liue of Locuſts only, which they pouder with ſalt, and hang vp in ſmoke to harden, for their yerely prouiſion, and theſe liue not aboue 40 yeares at the moſt. Finally, *Agrippa* ſaith

that all Ethiopia,and take the land with it of *Prester Iehan* bordering vpon the red sea, contai- G
neth in length 2170 miles:& in bredth,together with the higher Egypt,1291. Some Geographers haue taken the bredth in this manner. From Miroe to Sirbitum, 12 daies iournie vpon Nilus:from thence to the country of the Dauillians another 12, and from them to the Ethyopian Ocean 6 daies. But in general all writers in a manner do resolue vpon this, that betweene Ocean and Meroe,it is 725 miles: and from thence to Syene,as much as we haue set downe before. As for the posture and scituation of Ethyopia,it lies Southeast & Southwest. In the meridian South parts thereof,there be great woods of Ebene especially, alwaies greene. Toward the mids of this region,there is a mighty high mountain looking ouer the sea,that burns continually,which the Greeks cal Theon ochema,*i.* The chariot of the gods: from the which it is counted foure daies iourny by sea to the promontory or cape called Hesperion-Ceras, which
Cap de bonne Esperance confines vpon Africk,neere to the Hesperian Ethyopians. Some writers hold,that this tract is H
beautified with pretty little hils,and those pleasantly clad & garnished with shadowie groues, wherein the Ægipanes,and Satyres do conuerse.

Chap. XXXI. *The Islands in the Æthyopian Sea.*

Ephorus,*Eudoxus*,and *Timosthenes*,do all agree in this,that there be very many Islands in all that sea. *Clitarchus* witnesseth,that report was made to *Alexander* the Great,of one aboue the rest,which was so rich and well monied, that for an ordinary horse the inhabitants would not stick to giue a talent of gold:also of another, wherein was found a sacred hill adorned with a goodly wood vpon it,where the trees distilled and dropped sweet water of a wonderfull odoriferous smell. Moreouer,full against the Persian gulf,lieth the Isle named Cerne, opposite vnto Æthiopia,but how large it is,or how far off it beareth into the sea from the continent,is not certainly knowne:this only is reported, that the Ethyopians and none but they, are the inhabitants therof. *Ephorus* writeth,that they who would saile thither from the red sea, are not able for extreme heate to passe beyond certain columnes or pillars, for so they call the little Isles there. Howbeit *Polybius* auoucheth,that this Island Cerne where it lieth in the vtmost coast of the Mauritanian sea ouer-against the mountaine Atlas, is but 8 stadia from the land. And *Cornelius Nepos* affirmeth,that likewise it is not aboue a mile from the land, ouer against Carthage:& besides,that it is not aboue two miles in circuit. There is mention made also by authors,of anorher Isle before the said mountain Atlas,named also therupon Atlantis. K
And fiue daies sailing from it,appeare the desarts of the Ethyopian Hesperians,together with the foresaid cape,which we named Hesperion-Ceras,where the coasts of the land begin first to turn about their forefront to wind Westward,and regard the Atlanticke sea. Iust ouer-against this cape,as *Xenophon Lampsacenus* reporteth, lye the Islands called Gorgates,where sometimes the Gorgones kept their habitation,and 2 daies sailing they are thought to be from the firme land. *Hanno*,a great commander and generall of the Carthaginians,landed there with an army: who made this report from thence,That the women were all ouer their bodies hairy:as for the men,he could not catch one of them,so swift they were of foot that they escaped out of all sight: but he flead two of these Gorgone women and brought away their skins,which for a testimoniall of his being there,and for a wonder to posteritie,he hung vp in *Iunoes* temple,where L
they were seen vntill Carthage was won and sacked. Beyond these Isles,there are by report,two more discouered,by the name of Hesperides. But so vncertaine are all the intelligences deliuered concerning these parts,that *Statius Sebosus* affirmeth,that it is 40 good daies sailing from the Islands of these Gorgones along the coast of Atlas, vnto the Isles of the Hesperides; and from thence to Hesperion-Ceras,but one. As little resolution and certaintie there is, as touching the Islands of Mauritania. In this only they all jumpe and accord, that K. *Iuba* discouered some few of them ouer-against the Autolotes,in which he meant and purposed to die Gætulian purple.

Chap. XXXII.

M

¶ *Of the Islands Fortunatæ,or Canarie.*

Some Authors there be who thinke,that the Islands Fortunatæ,and certaine others besides them,are beyond the Antolotes: among whom, the same *Sebosus* aboue rehearsed was so bold,as to speake of their distances: and namely,that the Island Iunonia is from Gades 750 miles:

20030
copy 1

A 750 miles:and that from it Weſtward,the Iſles Pluvialia and Capraria,are as much. Alſo that in the Iſland Pluvialia there is no freſh water,but only that which they haue by ſhowrs of rain. He ſaith moreouer,that from them to the Fortunate Iſlands are 250 miles; which lie 8 miles from the coaſt of Mauritania to the left hand,called the coaſt of the Sun, or Valley of the ſun, for that it is like a valley or hollow leuell flore of earth,whereupon alſo it is called Planaria,reſembling an euen plain. And in very truth,this vally containeth in circuit 300 miles: wherein are trees to be ſeen that grow vp in height to 144 foot. As for the Iſlands named Fortunatæ, *Iuba* learned thus much by diligent inquiſition,that they lie from the South neere to the Weſt 625 miles from the Iſlands Purpurariæ,where they die purple; ſo as to come thither,a man muſt ſaile 250 miles aboue the Weſt,and then for 75 miles more bend his courſe Eaſtward:he ſaith alſo,that the firſt of theſe Iſlands is called Ombrion, wherein ate to be ſeen no token or
B ſhew at all of houſes. Alſo that among the mountains,it hath a lake or meere: and trees reſembling the plant Ferula,out of which they preſſe water:that which iſſueth out of the black trees of that kinde,is bittet;but out of the whiter ſort,ſweet and potable. As for a ſecond,he writeth that it is named Iunonia,wherein there is one little houſe or chappell made of ſtone: beyond it,but neere by,there is a third of the ſame name,but leſſe than the other:and then you come to a fourth called Capraria,full of great Lizards. Within a kenning from theſe, lyeth the Iſland Niuaria,which tooke this name of the ſnow that lieth there continually,and beſides, it is full of miſts and fogs. The next to it and the laſt of all,is Canaria,ſo called, by reaſon of a number of dogs of mighty bigneſſe;of which K.*Iuba* brought away two;& in this Iſland there are ſome marks remaining of buildings which giue teſtimonie that ſomtime it was inhabited and peo-
C pled. And as all theſe Iſlands generally do abound plentifully in fruitfull trees, & flying fouls of all ſorts:ſo this aboue the reſt named Canaria, is repleniſhed with rowes of date trees that beare abundance of dates,and likewiſe with pine trees that yeeld ſtore of Pine nuts. Furthermore he affirmeth,that there is great plenty of hony in it:that the riuers therein are well ſtored with fiſh,and the Sturgeon eſpecially:in which there groweth the red Papyrus as ordinarily as in Nilus. Howbeit in concluſion he ſaith, that theſe Iſles are much annoied with great whales and ſuch monſters of the ſea,that daily are caſt vpon the ſhore,which lie aboue ground & putrifie like carrion. Thus hauing at large gone through the deſcription of the globe of the earth as well without as within,it remaineth now to knit vp briefely with the meaſure and compaſſe
D of the ſeas.

Chap. XXXIII.

¶ *A ſummarie of the earth,digeſted according to the dimenſions thereof.*

Polybius ſaith, that from the ſtreights of Gibralter, vnto the very mouth and firth of Mœotis,it is found by a direct and ſtraight courſe to be 3437 miles and an halfe. Begin there again,and hold on a right courſe Eaſtward to Sicily, it is 1260 miles and an halfe. From thence forward to the Iſland Creta,375 miles: forward to Rhodes, 146 miles and an halfe: to the Chelidoniæ Iſles as much,and ſo to Cyprus 325 miles: from whence to Seleucia Pieria in Syria 115 miles. Which particulars being laid together,make by computation the groſſe ſum
E of 2340 miles. Howbeit, *Agrippa* counteth 3440 miles for all this diſtance aboue-ſaid, beginning at the ſtraits of Gibraltar aboue-ſaid,and carrying the length ſtraight forward to the gulf of Iſſa. In which reckoning of his,I wot not whether ther be an error in the number,foraſmuch as the ſame writer hath ſet down from the ſtreit of Meſſine in Sicilie to Alexandria in Egypt, 1250 miles. As for the whole circuit that may be comprehending therein, all the gulfes and creekes before-named, from the ſame point where we firſt began,as far as to the lake Mœotis,is 15600 miles. *Artemidorus* addeth thereto 756 miles. And the ſame Geographer writeth, that take the lake Mœotis to the reſt,all commeth to 17390 miles. Loe,what the meaſure is of the ſeas taken by Philoſophers and learned men,without armor and weapon in hand; of men I ſay,
F who haue not feared to hazard themſelues boldly and prouoke Fortune, in trauerſing the ſeas ſo farre off. Now are we to compare reſpectiuely the greatneſſe of each part of the world in ſeuerall:notwithſtanding that I ſhall finde much ado and difficulty enough therein, conſidering the diſagreement of authors in that behalf. But moſt plainly ſhal this appeare which we ſeek for, by ioining longitude & latitude together:acording to which preſcript rule to begin with

Europe, it may wel contain in largenes 8148 miles. Africk (taking the middle and mean computation between them all that haue ſet it down) containeth in length 3748 miles. As for the bredth of ſo much as is known and inhabited, in no place where it is wideſt exceedeth it 250 miles. True it is, that *Agrippa* would haue it to contain 910 miles in breadth, beginning at the bounds of Cyrene, and ſo comprehending in this meaſure the deſarts thereof as far as to the Garamants, ſo far as is knowne and diſcouered, and then the whole meaſure collected into one generall ſum, amounteth to 4608 miles. As for Aſia, confeſſed it is and reſolued vpon by all Geographers, that in length it carrieth 63750 miles: and verily in bredth (if you account from the Æthiopian ſea to Alexandria ſcituate vpon Nilus, ſo as your meaſure run through Meroe and Syrene) it taketh 1875 miles: wherby it appeareth euidently, that Europe is little wanting of halfe as big again as Aſia: and the ſame Europa, is twiſe as much again as all Africa & a ſixt part ouer. Reduce now all theſe ſums together, it wil be found cleare, that Europ is a third part of the whole earth, & an eight portion ouer and ſomwhat more: Aſia, a fourth part, with an ouerdeale of 14: and Africk a fifth part, with an ouer-plus of a ſixtieth portion. To this calculation, we wil ſet to, as it were to boot, one ſubtill deuiſe & inuention more of the Greeks, which ſheweth their ſingular wit (to the end we ſhould omit nothing that may ſerue our turn in this Geographie of ours) and that is this: after that the poſiture and ſite of euery region is knowne and ſet downe, how a man may likewiſe come to the knowledge what ſocietie and agreement there is between the one & the other, either by length of daies and nights, by the ſhadow at noon day, or by equality of climats of the world. To bring this about effectually, I muſt part and digeſt the whole earth into certain ſections or euen portions, anſwerable to thoſe in heauen; whereof there be very many) which our Aſtronomers and Mathematicians cal Circles; but the Greeks, Parallels.

G H I

Chap. XXXIV.

¶ *The diuiſion of the earth into Climates or lines Parallele, and equall ſhadowes.*

FOr to make an equall partition of the world, begin we wil at the Meridionall Indians, & go directly as far as Arabia, and the inhabitants of the red ſea Vnder this climat are compriſed the Gedroſians, Perſians, Carmanes, and Elimæans: Parthyene, Aria, Suſiane, Meſopotomia, Seleucia ſyrnamed Babylonia, Arabia, ſo far as Petræ incluſiuely, Cœle-Syria, & Peluſium in Egypt: the low Low-countries, which are called the tract of Alexandria: the maritine coaſts of Africk: all the towns of Cyrenaica, Thapſus, Adrumetum, Clupea, Carthage, Vtica, both Hippoes, Numidia, both realmes of Mauritania, the Atlanticke ſea, and *Hercules* pillars. In all the circumference of this climat and parellele, at noon tide vpon an Equinoctiall day, the ſtile in the diall which they call Gnomon 7 foot long, caſteth a ſhadow not aboue 4 foot. The longeſt night or day in this climate, is 14 houres: and contrariwiſe the ſhorteſt, ten. The ſecond circle or parallele line, beginneth at the Indians Occidentall, and paſſeth through the mids of Parthia, Perſepolis, the hithermoſt parts of Perſis (in reſpect of Rome) the hither coaſt of Arabia, Iudæa, and the borders neere vnto the mountaine Libanus. Vnder the ſame are contained alſo Babylon, Idumæa, Samaria, Hieruſalem, Aſcalon, Ioppe, Cæſarea, Phœnice, Ptolemais, Sydon, Tyrus, Berytrus, Betrys, Tripolis, Byblus, Antiochia, Laodicea, Seleucia, the Sea coaſts of Cilicia, Cyprus the South part of Candy, Lilybœum in Sicilia, the North parts of Africke and Numidia. The Gnomon in a diall vpon the Equinoctiall day 35 foot of length, maketh a ſhadow 24 foot long. The longeſt day or night is 14 houres Equinoctial, and the fift part of an houre. The third circle beginneth at the Indians next vnto the mountaine Imaus, and goeth by the Caſpian gates or ſtreights hard by Media, Cataonia. Cappadocia, Taurus, Amanus, Iſſus, the Cilician ſtraits, Soli, Tarſus, Cyprus, Piſidia, Syde in Pamphilia, Lycaonia, Patara in Lycia, Xanthus, Caunus, Rhodus, Cous, Halicarnaſſus, Gnidus, Doris, Chius, Delus, the mids of the Cyclades, Gytthium, Malea, Argos, Laconia, Elis, Olympia, Meſſene, Peloponneſus, Syracuſa, Catine, the mids of Sicily, the South part of Sardinia, Cardei, and Gades. In this clime the Gnomon of 100 inches, yeeldeth a ſhadow of 77 inches. The longeſt day hath Equinoctiall houres 14 & an halfe, with a 30 part ouer. Vnder the fourth circle or parallele lye they that are on the other ſide of Imaus, the South parts of Cappadocia, Galatia, Myſia, Sardis,

K L M

20030
copy 1

A Sardis, Smyrna, Sipylus, the mountaine Tmolus in Lydia, Caria, Ionia, Trallis, Colophon, Epheſus, Miletus, Samos, Chios, the Icarian ſea, the Iſles Cyclades lying Northward, Athens, Megara, Corinth, Sicyon, Achæa, Patræ, Iſthmos, Epirus, the North parts of Sicily, * Narbonenſis Gallia toward the Eaſt, the maritime parts of Spaine beyond new Carthage, and ſo into the Weſt. To a Gnomon of 21 foot, the ſhadowes anſwer of 17 foot. The longeſt day is fourteen Æquinoctiall houres, and two third parts of an houre. The 5 diuiſion containeth vnder it, from the entrance of the Caſpian ſea, Bactra, Iberia, Armenia, Myſia, Phrygia, Helleſpontus, Troas, Tenedus, Abydus, Scepſis, Ilium, the hill Ida, Cyzicum, Lampſacum, Sinope, Aniſum, Heraclea in Pontus, Paphlagonia, Lemnus, Imbrus, Thaſus, Caſſandria, Theſſalia, Macedonia,
B Lariſſa, Amphipolis, Theſſalonice, Pella, Edeſſa, Beræa, Pharſaliæ, Caryſtum, Eubœa, Bœotia, Chalcis, Delphi, Acarnania, Ætolia, Apollonia, Brundiſium, Tarentum, Thurij, Locri, Rhegium, Lucani, Naples, Puteoli, the Tuſcan ſea, Corſica, the Baleare Iſles, the middle of Spain. A Gnomon of 7 foot giueth ſhadow ſix foot. The longeſt day is 15 Æquinoctiall houres. The ſixt paralell compriſeth the city of Rome, and containeth withall the Caſpian nations, Caucaſus, the North parts of Armenia, Apollonia vpon Rhindacus, Nicomedia, Nicæa, Chalcedon, Bizantium, Lyſimachia, Cherrhoneſus, the gulfe Melane, Abdera, Samothracia, Maronea, Ænus, Beſſica, the midland parts of Thracia, Pœonia, the Illyrians, Dyrrhachium, Canuſium, the vtmoſt coaſts of Apulia, Campania, Hetruria, Piſæ, Luna, Luca, Genua, Liguria, Antipolis, Maſſilia, Narbon, Tarracon, the middle of Spain called Tarraconenſis, & ſo through Luſitania.
C To a Gnomon of 9 foot, the ſhadow is anſwerable 8 foot. The longeſt day hath 15 Æquinoctiall houres, and the 9 part of an houre, or the fift, as *Nigidius* is of opinion. The 7 diuiſion begins at the other coaſt of the Caſpian ſea, and falls vpon Callatis, Boſphorus, Boryſthenes, Tomos, the backe parts of Thracia, the Tribals country, the reſt of Illyricum, the Adriaticke ſea, Aquileia, Altinum, Venice, Viceria, Patavium, Verona, Cremona, Ravenna, Ancona, Picenum, Marſi, Peligni, Sabini, Vmbria, Ariminium, Bononia, Placentia, Mediolanum, and all beyond Apenninum: alſo ouer the Alps, Aquitane in Gaule, Vienna, Pyræneum, and Celtiberia. The Gnomon of 35 foot, caſteth a ſhadow 36 foot in length; yet ſo, as in ſome part of the Venetian territorie, the ſhadow is equall to the Gnomon. The longeſt day is 15 Æquinoctiall houres, and three fift parts of an houre. Hitherto haue we reported the labors in this point of antient
D Geographers, and what they haue reported. But the moſt diligent and exacteſt modern Writers that followed, haue aſſigned the reſt of the earth not yet ſpecified, to three other ſections or climats. The firſt, from Tanais through the lake Mœtis and the Sarmatians, vnto Boryſthenes, and ſo by the Dakes and a part of Germany, containing therein France and the coaſts of the Ocean, where the day is 16 houres long. A ſecond, through the Hyperboreans and Britain, where the day is 17 houres long. Laſt of all is the Scythian paralell, from the Rhiphæan hills into Thule: wherein (as we ſaid) it is day and night continually by turnes, for ſixe moneths. The ſame writers haue ſet downe two paralell circles, before thoſe points where the other began, and which we ſet downe. The one through the Iſlands Meroe and Ptolemais vpon the red ſea, built for the hunting of Elephants, where the longeſt daies are but 12 houres and an halfe:
E the ſecond paſſing through Syrene in Ægypt, where the day hath 13 houres. And the ſame authors haue put to euery one of the other circles, euen to the very laſt, half an houre more to the daies length than the old Geographers.

Thus much of the Earth.

THE

THE SEVENTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

THus, as you see, we haue in the former books sufficiently treated of the vniuersall world; of the Lands, Regions, Nations, Seas, Islands, and renowned Cities therein contained. It remaines now to discourse of the liuing creatures comprised within the same, and their natures: a point doubtlesse that would require as deepe a speculation as any part else thereof whatsoeuer, if so be the spirit and minde of man were able to comprehend and compasse all things in the world. And to make a good entrance into this treatise and history, me thinkes of right we ought to begin at Man, for whose sake it should seeme that Nature made and produced all other creatures besides: though this great fauour of hers, so bountifull and beneficiall in that respect, hath cost them full deare. Insomuch as it is hard to iudge, whether in so doing she hath done the part of a kinde mother, or a hard and cruell step-Dame. For first and formost, of all other liuing creatures, man she hath brought forth all naked, and cloathed him with the good and riches of others. To all the rest she hath giuen sufficient to clad them euery one according to their kinde; as namely, shells, cods, hard hides, prickes, shag, bristles, haire, downe feathers, quills, skales, and fleeces of woll. The very trunkes and stems of trees and plants she hath defended with barke and rinde, yea and the same sometimes double, against the iniuries of heate and cold: Man alone, poore wretch, she hath layed all naked vpon the bare earth, euen on his birth day, to cry and wraule presently from the very first houre that hee is borne in such sort, as among so many liuing creatures there is none subiect to shed teares and weepe like him. And verily to no babe or infant is it giuen once to laugh before he be forty daies old, and that is counted very early, and with the soonest. Moreouer, so soone as he is entred in this manner to enioy the light of the Sunne, see how he is immediatly tyed and bound fast, and hath no member at libertie: a thing that is not practised vpon the yong whelpes of any beast among vs, be he neuer so wilde. The childe of man thus vntowardly borne, and who another day is to rule and command all other, loe how he lieth bound hand and foot, weeping and crying, and beginning his life in miserie, as if he were to make amends and satisfaction by his punishment vnto Nature, for this onely fault and trespasse, that he is borne aliue. O folly of all follies, euer to thinke (considering this simple beginning of ours) that we were sent into this world to liue in pride, and cary our heads aloft! The first hope that we conceiue of our strength, the first gift that Time affourdeth vs, maketh vs no better yet than foure footed beasts. How long is it ere we can go alone? how long before we can prattle and speake, feed our selues, and chew our meat strongly? what a while continueth the mould and crowne of our heads to beate and pant, before our braine is well settled; the vndoubted marke and token that bewraieth our exceeding great weakenesse aboue all other creatures? What should I say of the infirmities and sicknesses that do soone seise vpon our feeble bodies? what need I speake of so many medicines and remedies deuised against these maladies: besides the new diseases that come euery day, able to checke and frustrate all our prouision of physicke whatsoeuer? As for all other liuing creatures, there is not one, but by a secret instinct of nature knoweth his own good, and wherto he is made able; some make vse of their swift feet, others of their slight wings; some are strong of limne; others are apt to swim, and practise the same: man only knoweth nothing vnlesse he be taught; hee can neither speake, nor goe, nor eate, otherwise than he is trained to it: and to be short, apt and good at nothing he is naturally, but to pule and cry. And hereupon it is, that some haue beene of this

opinion,

20030
copy 1

A *opinion, That better it had been, and ſimply beſt for a man, neuer to haue been borne, or elſe ſpeedily to die. None but we doe ſorrow and waile, none but we are giuen to exceſſe and ſuperfluitie infinitely in euery thing, and ſhew the ſame in euery member that we haue. Who but we againe are ambitious and vain-glorious? who but we are couetous and greedie of gathering good? we and none but we deſire to liue long and neuer to die, are ſuperſtitious, carefull of our ſepulture and buriall, yea and what ſhall betide vs when we are gone. Mans life is moſt fraile of all others; and in leaſt ſecuritie he liueth: no creature luſteth more after euery thing than he: none feareth like vnto him, and is more troubled and amazed in his fright: and if he beſe once vpon anger, none more raging and wood than he. To conclud, all other liuing creatures liue orderly and well, after their owne kinde: we ſee them flocke and gather together, and ready to make head and ſtand againſt all others of a contrary kinde: the lyons as fell and ſauage as they be, fight not one with another; ſerpents ſting not ſerpents, nor bite one another with their venomous teeth: nay the very monſters and huge*
B *fiſhes of the ſea, war not among themſelues in their owne kinde: but beleeue me, Man at mans hand receiueth moſt harme and miſchiefe.*

Chap. I.

¶ *The ſtrange and wondrous ſhapes of ſundry nations.*

C IN our Coſmographie and reports of nations and countries, wee haue ſpoken in generall of all mankinde, ſpred ouer the face of the whole earth: neither is it our purpoſe at this preſent to decipher particularly all their cuſtomes and manners of life, which were a difficult enterpriſe, conſidering how infinit they be, and as many in manner as there be ſocieties and aſſemblies of men. Howbeit I thinke it good, not to ouer-paſſe all, but to make relation of ſome things concerning thoſe people eſpecially, who liue fartheſt remote from our ſeas; among whom I doubt not but I ſhall find ſuch matter, as to moſt men will ſeeme both prodigious and incredible. And verily who euer beleeued that the Æthiopians had bin ſo blacke, before he ſaw them with his eies: nay what is it, I pray you, that ſeemeth not a wonder at the firſt ſight? How many things are judged impoſſible before they are ſeene done and effected? And certes, to ſpeake a truth, The power and majeſtie of Nature, in euery particular action of hers & ſmall things, ſeemeth incredible, if a man conſider the ſame ſeuerally, and enter not into a generall conceit of
D her wholly as ſhe is. For to ſay nothing of the painted peacocks feathers, of the ſundry ſpots of tygres, luzernes, and panthers, of the variable colours and markes of ſo many creatures beſides: let vs come to one only point, which to ſpeake of ſeemes but ſmall, but being deepely weighed and conſidered, is a matter of exceeding great regard, and that is, The varietie of mens ſpeech; ſo many tongues and diuers languages are amongſt them in the world, that one ſtranger to another ſeemeth well-neere to be no man at all. But come to view and marke the variety that appeares in our face and viſage, albeit there be not paſt ten parts or little more therin, ſee how among ſo many thouſands as we are, you ſhall not find any two perſons, who are not diſtinct in countenance and different one from another: a thing that no artificer nor painter (be he neuer ſo cunning and his craftſmaſter euery way) can performe, but in a few pictures, and take what
E heed he can with all his curious affectation. And yet thus much muſt I aduertiſe the readers of this mine hiſtory by the way, that I will not pawne my credit for many things that herein I ſhall deliuer, nor bind them to beleeue all I write as touching ſtrange and forrein nations: refer them rather I will to mine authors, whom in all points (more doubtfull than the reſt) I will cite and alledge, whom they may beleeue if they liſt: onely let them not thinke much to follow the Greeke writers, who from time to time in this behalfe haue been more diligent in penning, and more curious in ſearching after antiquities.

Chap. II.

F ¶ *Of the Scythians, and the diuerſitie of other nations.*

THat there bee Scythians, yea, and many kindes of them that feed ordinarily of mans fleſh, wee haue ſhewed alreadie in our former diſcourſes. A report haply that would be thought incredible, if we did not conſider and thinke withall, how in the very middle and heart of the world, euen in Sicily and Italy, here hard by, there haue beene ſuch monſters of men,

men,namely,the Cyclopes and Lyſtrigones: nay, if we were not credibly informed, that euen G
of late daies,and go no farther than to the other ſide of the Alpes,there be thoſe that kill men
for ſacrifice after the maner of thoſe Scythian people;& that wants not much of chewing and
eating their fleſh. Moreouer,neere vnto thoſe Scythians that inhabit toward the pole Articke,
and not far from that climate which is vnder the very riſing of the North-eaſt wind,and about
that famous caue or whole out of which that wind is ſaid to iſſue,which place they call Geſ-
clithron,[*i.* the cloiſter or key of the earth]the Arimaſpians by report do dwel,who as we haue
ſaid before,are known by this marke,for hauing one eie only in the mids of their forehead:and
theſe maintain war ordinarily about the mettall mines of gold, eſpecially with griffons,a kind
of wilde beaſts that flie,and vſe to fetch gold out of the veines of thoſe mines(as commonly it
is receiued:)which ſauage beaſts(as many authors haue recorded,and namely,*Herodotus* & *Ari-*
ſteas the Proconneſian,two writers of greateſt name) ſtriue as eagerly to keepe and hold thoſe H
golden mines,as the Arimaſpians to diſſeize them therof,and to get away the gold from them.
Aboue thoſe, are other Scythians called Anthropophagi, where is a countrie named Abari-
mon,within a certain vaile of the mountain Imaus,wherin are found ſauage & wild men,liuing
and conuerſing vſually among the bruit beaſts, who haue their feet growing backward,& tur-
ned behind the calues of their legs,howbeit they run moſt ſwiftly. Theſe kinde of men can en-
dure to liue in no other aire nor in any clime elſe than their own,which is the reaſon that they
cannot be drawne to come vnto other kings that border vpon them, nor could be brought vnto
Alexander the great:as *Beton* hath reported, the marſhall of that princes campe,& who alſo put
downe his geſts and iournies in writing. The former Anthropophagi or eaters of mans fleſh,
whom we haue placed about the North-pole, ten daies iournie by land aboue the riuer Bory- I
ſthenes,vſe to drink out of the skuls of mens heads,and to weare the ſcalpes haire & al,in ſtead
of mandellions or ſtomachers before their breaſts, according as *Iſogonus* the Nicean witneſſes.
The ſame writer affirmeth moreouer, That in Albanie there be a ſort of people borne with eies
like owles,whereof the ſight is fire red:who from their childhood are grey headed,and can ſee
better by night than day. He reporteth alſo,that tenne daies iourny beyond Boryſthenes, the
Sauramates neuer eat but one meale of meat in three daies. *Crates* of Pergamus ſaith, That in
Helleſpont about Parium there was a kind of men(whom he nameth Ophiogenes) that if one
were ſtung with a ſerpent,with touching only,will eaſe the paine:and if they doe but lay their
hands vpon the wound,are wont to draw forth all the venome out of the body. And *Varro* teſti- K
fies,that euen at this day there be ſome there who wariſh & cure the ſtinging of ſerpents with
their ſpittle,but there are but few ſuch,as he ſaith. *Agatharcides* writes,that in Affrick the Pſyl-
lians (ſo called of king *Pſyllus*, from whoſe race they were deſcended, and whoſe ſepulchre or
tombe is at this day preſent to be ſeene in a part of the greater Syrtes)could do the like. Theſe
men had naturally that in their own bodies,which like a deadly bane and poyſon would kill al
ſerpents: for the very aire & ſent that breathed from them,was able to ſtupifie and ſtrike them
ſtarke dead. And by this means they vſed to try the chaſtitie and honeſtie of their wiues. For ſo
ſoon as they were deliuered of children,their manner was to expoſe and preſent the ſilly babes
new borne,vnto the moſt fell and cruell ſerpents they could find: for if they were not right,but
gotten in adultery,the ſaid ſerpents would not auoid & fly from them. This nation verily in ge- L
nerall hath been defeated,& killed vp in manner all by the Naſamones, who now inhabit thoſe
parts wherin they dwelt:howbeit a kind remains ſtill of them, deſcended from thoſe that made
ſhift away and fled,or elſe were not preſent at the ſaid bloudy battell, but there are very few of
them at this day left. The Marſians in Italy at this preſent continue with the like naturall ver-
tue againſt ſerpents:whom being reputed for to haue deſcended from ladie *Circes* ſon,the peo-
ple in this regard do highly eſteem,& are verily perſuaded,that they haue in them the ſame fa-
cultie by kinde. And what great wonder is this,conſidering that all men carry about them that
which is poyſon to ſerpents: for if it be true that is reported, they will no better abide the
touching with mans ſpittle,than ſcalding water caſt vpon them:but if it happen to light with- M
in their chawes,or mouth, eſpecially if it come from a man that is faſting, it is preſent death:
Beyond thoſe Naſamones,and their neighbours confining vpon them (the Machlyes)there be
found ordinarily Hermaphrodites,called Androgyni,of a double nature, and reſembling both
ſexes,male and female,who haue carnal knowledge one of another interchangeably by turns,as
Calliphanes reports. *Ariſtotle* ſaith moreouer,that on the right ſide of their breaſt they haue a lit-

tle

20030
copy 1

A tle teat or nipple like a man, but on the left they haue a full pap or dug like a woman. In the ſame Affricke, both *Iſogonus* and *Nymphodorus* doe auouch, there be certain houſes and families of ſorcerers: who, if they chance to bleſſe, praiſe, and ſpeak good words, bewitch preſently withall; inſomuch as ſheepe therewith die, trees wither, and infants pine and winder away. *Iſogonus* adds furthermore, That ſuch like there be among the Triballians and Illyrians, who with their very eie ſight can witch, yea, and kil thoſe whom they look wiſtly vpon any long time, eſpecially if they be angred, and that their eies bewray their anger: and more ſubiect to this daunger be men growne, than children vnder fourteene yeares of age. This alſo is in them more notable and to be obſerued, that in either eie they haue two ſights or apples. Of this kind and property, as *Apollonides* mine author ſaith, there be certaine women in Scythia named Bithyæ. *Philarchus* witneſſeth, That in Pontus alſo the whole race of the Thibians, and many others beſides, haue
B the ſame quality, & doe the like: and known they are (ſaith he) by theſe markes, In one of their eies they haue two ſights, in the other the print or reſemblance of an horſe. He reports beſides of theſe men, that they wil neuer ſinke or drowne in the water, be they charged neuer ſomuch with weighty and heauy apparel. Not vnlike to theſe there are a people in Æthiopia called Pharnaces, whoſe ſweat if it chance to touch a mans body, preſently he falleth into a phthiſick or conſumption of the lungs. And *Cicero* a Romane writer here among vs teſtifieth, that generally all women that haue ſuch double apples in their eies, haue a venemous ſight, and doe hurt therewith. See how nature, hauing engraffed naturally in ſome men this vnkind appetite (like wild beaſts) to feed commonly vpon the bowels and fleſh of men, hath taken delight alſo & pleaſure to giue them inbred poiſons in their whol body, yea & venom in the very eies of ſome;
C that there ſhould be no naughtineſſe in the world againe, but the ſame might be found in man. Not farre from Rome city, within the territory of the Faliſci, there be ſome few houſes, & families called Hirpiæ, which at their ſolemne yearely ſacrifice celebrated by them in the honour of *Apollo* vpon the mount Soracte, walke vpon the pile of wood as it is on fire, in great iolity, and neuer a whit are burnt withall. For which cauſe it is ordained by an expreſſe areſt or act of the Senat, that they ſhould be priuiledged, and haue immunity of warfare and all other ſeruices whatſoeuer. Some men there be that haue certaine members and parts of their bodies naturally working ſtrange and miraculous effects, and in ſome caſes medicinable. As for example, king *Pyrrhus*, whoſe great toe of his right foot was good for them that had big, ſwelled, or
D indurate ſpleenes, if he did but touch the parties diſeaſed, with that toe. And they ſay moreouer, that when the reſt of his body was burnt (after the manner) in the funerall fire, that great toe the fire had no power to conſume: ſo, that it was beſtowed in a litle caſe for the nones, and hung vp in the temple for a holy relique. But principally aboue all other countries, India and the whole tract of Æthiopia is full of theſe ſtrange and miraculous things. And firſt & formoſt the beaſts bred in India be very big, as it may appeare by their dogs, which for proportion are much greater than thoſe in other parts. And trees grow there to that tallneſſe, that a man cannot ſhoot a ſhaft ouer them. The reaſon hereof is the goodneſſe and fatneſſe of the ground, the temperat conſtitution of the aire, and the abundance of water: which is the cauſe alſo that vnder one fig tree [beleeue it that liſt] there may certaine troupes and ſquadrons of horſmen ſtand
E in couert, ſhaded with the boughes. And as for reeds, they be of ſuch a length, that between euery ioint they will yeeld ſufficient to make boats able to receiue three men apeece, for to row therein at eaſe. There are to be ſeene many men there aboue fiue cubits tall: neuer are they known once to ſpit: troubled they are not with pain in the head, tooth-ach, or griefe of the eies; and ſeldome or neuer complaine they of any ſorance in other parts of the body, ſo hardy are they, and of ſo ſtrong a conſtitution thorough the moderat heat of the Sun. Ouer and beſides, among the Indians be certain Philoſophers, whom they call Gymnoſophiſts, who from the Sun riſing to the ſetting thereof are able to endure all the day long, looking full againſt the Sunne, without winking or once mouing their eies: & from morning to night can abide to ſtand ſomtimes vpon one leg, and ſometimes on the other in the ſand, as ſcalding hot as it is. Vpon a cer-
F taine mountaine named Milus, there be men whoſe feet grow the tother way backward, and of either foot they haue eight toes, as *Megaſthenes* doth report. And in many other hils of that countrey, there is a kind of men with heads like dogs, clad all ouer with skins of wild beaſts, who in lieu of ſpeech vſe to bark: armed they are and well appointed with ſharp and trenchant nailes: they liue vpon the prey which they get by chaſing wild beaſts, & fowling. *Cteſias* writes

that

that there were discouered and knowne of them aboue 120000 in number. By whose report also, in a certaine country of India the women beare but once in their life, and their infants presently waxe grey so soone as they are borne into the world. Also, that there is a kind of people named Monoscelli, that haue but one leg apeece, but they are most nimble, and hop wondrous swiftly. The same men are also called Sciopodes, for that in hotest season of the Summer, they ly along on their back, and defend themselues with their feet against the Suns heate: and these people as he saith are not farre from the Troglodites. Againe, beyond these Westward, some there be without heads standing vpon their necks, who cary eies in their shoulders. Among the Westerne mountains of India the Satyres haunt, (the country wherein they be, is called the region of the Cartaduli) creatures of all other most swift in footmanship: which one whiles run with all foure; otherwhiles vpon two feet only like men: but so light footed they are, that vnlesse they be very old and sick, they can neuer be taken. *Tauron* writeth, That the Choromandæ are a sauage and wild people: distinct voice and speech they haue none, but in stead thereof, they keep an horrible gnashing and hideous noise: rough they are and hairy all ouer their bodies, eies they haue red like the houlets, and toothed they be like dogs. *Eudoxus* saith, That in the Southern parts of India, the men kind haue feet a cubit long, but the wome so short & smal, that thereupon they be called Struthopodes, *i.* sparrow footed. *Megasthenes* is my Author, that among the Indian Nomades there is a kind of people, that in stead of noses haue only two smal holes, and after the manner of snakes they haue their legs & feet limmer, wherwith they crawle and creep, and named they are Syrictæ. In the vtmost marches of India, Eastward, about the source & head of the riuer Ganges, there is a nation called the Astomes, for that they haue no mouths: all hairy ouer the whole body, yet clothed with soft cotton and down that come from the leaues of trees: they liue only by the aire, and smelling to sweet odors, which they draw in at their nosthrils: No meat nor drinke they take, only pleasant sauours from diuers and sundry roots, floures, and wild fruits growing in the woods they entertaine: and those they vse to carry about with them when they take any farre journey, because they would not misse their smelling. And yet if the sent be any thing strong and stinking, they are soone therwith ouercome, & dy withal. Higher in the country, and aboue these, euen in the edge and skirts of the mountains, the Pygmæi Spythamæi are reported to be: called they are so, for that they are but a cubit * or three * shaftments (or spannes) high, that is to say, three times nine inches. The clime wherein they dwel is very wholsome, the aire healthy, and euer like to the temperature of the Spring: by reason that the mountains are on the North side of them, & beare off all cold blasts. And these prety people *Homer* also hath reported to be much troubled & anoied by cranes. The speech goeth, that in the Spring time they set out all of them in battell aray, mounted vpon the backe of rammes and goats, armed with bowes and arrowes, and so downe to the sea side they march, where they make foule worke among the egges & yong cranelings newly hatched, which they destroy without all pitty. Thus for three months this their journy and expedition continueth, and then they make an end of their valiant seruice: for otherwise if they should continue any longer, they were neuer able to withstand the new flights of this foule, grown to some strength and bigneſſe. As for their houses and cottages, made they are of clay or mud, fouls feathers, and birds egge shels. Howbeit, *Aristotle* writes, That these Pygmæans liue in hollow caues & holes vnder the ground. For all other matters he reports the same that all the rest. *Isogonus* saith, that certain Indians named Cyrni, liue a hundred and fortie yeares. The like he thinketh of the Æthyopian Macrobij, and the Seres: as also of them that dwell on the mount Athos: and of these last rehearsed, the reason verily is rendred to be thus, because they feed of vipers flesh, & therefore is it that neither lice breed in their heads, nor other vermine in their cloths, for to hurt & annoy their bodies. *Onesicritus* affirmeth, That in those parts of India where there are no shadowes to be seene, the men are fiue cubits of stature, and two hand breadths ouer: that they liue 130 yeares, and neuer age for all that and seem old, but die then, as if they were in their middle and settled age. *Crates* of Pergamus nameth those Indians who liue aboue an hundred yeare, Gymnetes: but others there be, and those not a few, that call them Macrobij. *Ctesias* saith there is a race or kinred of the Indians named Pandore, inhabiting certaine vallies, who liue two hundred years: in their youthfull time the haire of their head is white, but as they grow to age, waxeth black. Contrariwise, others there be neer neighbours to the Macrobij, who exceed not fortie years, and their women beare but once in their life time. And this also is auouched by *Agatharcides*,

* πυγων.
* σπιθαμιαι.

20030
copy 1

A *tharcides*, who affirmeth moreouer, that all their feeding is vpon locuſts, and that they are very quicke and ſwift of foot. *Clitarchus* and *Megaſthenes* both name them Mandri, and thinke they haue 300 villages in their countrey. Moreouer, that the women bring forth children at ſeuen yeares of age, and wax old at forty. *Artemidorus* affirmes, that in the Iſland Taprobana the people liue exceeding long without any malady or infirmitie of the body. *Duris* maketh report, That certaine Indians ingender with beaſts, of which generation are bred certaine monſtrous mungrels halfe beaſts and halfe men. Alſo, that the Calingian women of India conceiue with childe at fiue yeares of age, and liue not aboue eight. In another tract of that countrey there be certaine men with long ſhagged tailes, moſt ſwift and light of foot: and ſome againe that
B with their eares couer their whole body. The Orites are neighbours to the Indians, diuided onely from them by the riuer Arbis, who are acquainted with no other meate but fiſh, which they ſplit and ſlice into pieces with their nailes, and roſt them againſt the Sun, and then make bread thereof, as *Clitarchus* reporteth. *Crates* of Pergamus ſaith likewiſe, that the Troglodites aboue Ethyopia be ſwifter than horſes: and that ſome Æthiopians are aboue eight cubites high: and theſe are a kinde of Ethiopian Nomades, called Syrbotæ, as he ſaith, dwelling along the riuer Aſtapus toward the North pole. As for the nation called Meniſmini, they dwel from the Ocean ſea twenty dayes iourney, who liue of the milke of certain beaſts that we cal Cynocephales, hauing heads and ſnouts like dogs. And whole heards and flocks of the females they keepe and feed, killing the male of them all, ſaue onely to ſerue for maintenance of the breed. In the deſarts of Africke ye ſhall meet oftentimes with Fairies, appearing in the ſhape of men
C and women, but they vaniſh ſoone away like fantaſticall deluſions. See how Nature is diſpoſed for the nones to deuiſe full wittily in this and ſuch like paſtimes to play with mankinde, thereby not only to make her ſelf merry, but to ſet vs a wondring at ſuch ſtrange miracles. And I aſſure you, thus dayly and hourely in a manner playeth ſhe her part, that to recount euery one of her ſports by themſelues, no man is able with all his wit and memory. Let it ſuffice therfore to teſtifie and declare her power, that we haue ſet downe thoſe prodigious and ſtrange workes of hers ſhewed in whole nations: and then go forward to diſcourſe of ſome particulars approued and knowne in man.

Chap. III.

D

¶ *Of prodigious and monſtrous births.*

THat women may bring forth three at one birth appeares euidently by the example of the three twins *Horatij* and *Curiatij*. But to go aboue that number is reputed and commonly ſpoken to be monſtrous, and to portend ſome miſhap: but only in Egypt, where women are more than ordinary fruitfull, by drinking of Nilus water, which is ſuppoſed to help generation. Of late yeres, and no longer ſince than in the later end of the reigne of *Aug. Cæſar*, at Oſtia there was a woman (a Commoners wife) deliuered at one birth of two boies & as many girles, but this was a moſt prodigious token, and portended no doubt the famine that enſued ſoone after. In Peloponneſus there is found one woman that brought forth at foure births 10 Chil-
E dren, and the greater part of them all did well and liued. *Trogus* ſaith, that in Egypt it is an ordinarie thing for a woman to haue ſeuen at a birth. It falleth out moreouer, that there come into the world children of both ſexes, whom wee call Hermophrodites. In old time they were knowne by the name of Androgyni, and reputed then for prodigious wonders, how ſoeuer now men take delight and pleaſure in them. *Pompey* the great, in his Theatre which hee adorned and beautified with ſingular ornaments and rare deuices of antique worke, as wel for the admirable ſubiect and argument thereof, as the moſt curious and exquiſit hand of cunning and skilfull artificers, among other images and pourtracts there ſet vp, repreſented one *Eutiche* a Woman of Tralleis, who after ſhe had in her life time borne thirty births, her corps was caried out by twenty of her children to the funerall fire to be burnt, according to the maner of that coun-
F trey. As for *Alcippe* ſhe was deliuered of an Elephant, marie that was a monſtrous and prodigious token, and foreſhewed ſome heauy fortune that followed after. Alſo in the beginning of the Marſians war there was a bondwoman brought forth a Serpent. In ſum, there be many miſ-ſhapen monſters come that way into the world, of diuers and ſundry formes. *Claudius Cæſar* writeth, That in Theſſalie there was borne a monſter called an Hippocentaure, that is, halfe

a man and halfe a horse, but it died the very same day. And verily after he came to weare the diadem, we our selues saw the like monster sent vnto him out of Egypt, embalmed and preserued in honey. Among many strange examples appearing vpon record in Chronicles, we reade of a childe in Sagunt, the same yeare that it was forced and rased by *Anabal*, which so soone as it was come forth of the mothers wombe presently returned into it againe.

Chap. IIII.

¶ *Of the change of one Sex to another, and of Twins borne.*

IT is no lie nor fable, that females may turne to be males: for we haue found it recorded, that in the yearely Chronicles called Annals, in the yere when *Publius Licinius Crassus*, and *C. Cassius Longinus* were Consuls, there was in Cassinum a maid childe, vnder the very hand and tuition of her parents, without suspition of being a changeling became a boy: and by an Ordinance of the Soothsayers called Aruspices, was confined to a certain desart Island, and thither conueyed. *Licinius Mutianus* reporteth, that he himselfe saw at Argos one named *Arescon*, who before time had to name *Arescusa*, and a married wife: but afterwards in processe of time came to haue a beard, and the generall parts testifying a man, and thereupon wedded a wife. Likewise (as he saith) he saw at Smyrna a boy changed into a girle. I my selfe am an eye witnesse, That in Africke one *L. Cossicius* a citisen of Tisdrita, turned from a woman to be a man vpon the very mariage day, who liued at the time I wrot this booke. Moreouer, it is obserued, that if women bring twins, it is great good hap if they all liue, but either the mother dieth in childbed, or one of the babes, if not both. But if it fortune that the twinnes be of both sexes, the one male, the other female, it is ten to one if they both escape. Moreouer this is well knowne, that as women age sooner than men, and seeme old, so they grow to their maturitie more timely than men, and are apt from procreation before them. Last of all, when a woman goeth with childe, if it bee a man childe, it stirreth oftner in the wombe, and lieth commonly more to the right side: whereas the female moueth more seldom, and beareth to the left.

Chap. V.

¶ *The Generation of Man, the time of childe-birth from seuen moneths to eleuen, testified by many notable examples out of historie.*

ALl other creatures haue a set time limited by Nature, both of going with their yong, and also of bringing it forth, each one according to their kinde: Man only is borne all times of the yeare, and there is no certaine time of his abode in the wombe after conception; for one commeth into the world at the seuen moneths end, another at the eighth, and so to the beginning of the ninth and tenth. But before the seuenth moneth there is no infant euer borne that liueth. And none are borne at seuen moneths end, vnlesse they were conceiued either in the very change of the moone, or within a day of it vnder or ouer. An ordinary thing it is in Egypt for women to go with yong eight moneths, and then to be deliuered. And euen in Italy also now adaies children so borne liue and do well: but this is against the common receiued opinion of all old writers. But there is no certainty to ground vpon in all these cases, for they alter diuers waies. Dame *Vestilia* (the widow of *C. Herditius*, wife afterward to *Pomponius*, and last of all maried to *Orfitus*, all right worshipful citisens, and of most noble houses) had 4 children by her three husbands, to wit *Sempronius*, whom she bare at the seuenth moneth, *Suillius Rufus* at the eleuenth: and seuen moneths also she went with *Corbulo*, yet they liued all, and these two last came both to be Consuls: After all these sons, she bare a daughter, namely *Cæsonia* (wife to the Emperor *Caius Caligula*) at the eighth moneths end. They that are borne thus in this moueth haue much ado to liue, and are in great danger for forty dayes space: yea, and their mothers are very sickly, and subiect to fall into vntimely trauell all the fourth moneth and the eighth, and if they fall in labor and come before their time they die. *Massurius* writeth, that *L. Papyrius* the Pretor or Lord chief Iustice, when a second heire in remainder made claim, and put in plea for his inheritance of the goods, made an award, and gaue iudgement against him, in the behalfe of an Infant the right heire, borne after the decease of his father; vpon this, That the mother came in and testified, how she was deliuered of that childe within thirteene

moneths

20030
copy 1

A moneths after the death of the Teſtator: the reaſon was, becauſe there is no definite time certaine for women to go with childe.

Chap. VI.

¶ *Of Conceptions: and ſignes diſtinguiſhing the ſex in great bellied women before they are deliuered.*

IF ten dayes after a woman hath had the company of a man ſhee feele an extraordinary ache in the head, and perceiue giddineſſe in the brain as if all things went round; finde a dazling
B and miſtineſſe in the eies, abhorring and loathing meat, and withall a turning and wambling in the ſtomacke; it is a ſigne that ſhe is conceiued, and beginneth to breed: if ſhe goe with a boy better coloured will ſhe be all the time, and deliuered with more eaſe, and by the 40 day ſhe ſhall feele a kinde of motion and ſtirring in her wombe. But contrarie it falleth out in the breeding of a girle, ſhe goeth more heauily with it, and findeth the burthen heauier, her legs and thighes about the ſhare will ſwell a little. And ninetie dayes it will be before ſhe abſolutely perceiueth any mouing of the infant. But be it male or female ſhee breeds, they put her to much paine and grieuance when their haire beginneth to bud forth, and euer at the full of the Moone: and euen the very infants after they are borne are moſt amiſſe and fartheſt out of frame about that time. And verily great care muſt be had of a woman with child all the time ſhe goeth therewith, both in her gate, and in euery thing elſe that can be named: for if women
C feed vpon ouer-ſalt and poudered meat they wil bring forth a child without nailes: and if they hold not their wind in their labor, longer it will be ere they be deliuered, and with more difficultie. Much yawning in the time of trauell is a deadly ſigne; like as to ſneeſe preſently vpon conception threatneth abortion or a ſlip.

Chap. VII.

¶ *Of the conception and generation of Man.*

I Am abaſhed much, and very ſory to thinke and conſider what a poore and tickliſh beginning man hath, the proudeſt creature of all others, when the ſmel only of the ſnuffe of a can-
D dle put out is the cauſe oft times that a woman fals into vntimely trauel. And yet ſee, theſe great tyrans, and ſuch as delight only in carnage and bloudſhed haue no better original. Thou then that preſumeſt vpon thy bodily ſtrength, thou that ſtandeſt ſo much vpon Fortunes fauors, and haſt thy hands full of her bountifull gifts, taking thy ſelf not to be a foſter-child and nurceling of hers, but a naturall ſon borne of her owne body: thou I ſay that buſieſt thy head euermore, and ſetteſt thy minde vpon conqueſts and victories: thou that art vpon euerie good ſucceſſe and pleaſant gale of proſperity puffed vp with pride, and takeſt thy ſelfe for a god, neuer thinkeſt that thy life when it was hung vpon ſo ſingle a thred, with ſo ſmall a matter might haue miſcarried. Nay more than that, euen at this day art thou in more danger than ſo, if thou chance to be but ſtung or bitten with the little tooth of a Serpent; or if but the verie kernell
E of a raiſin go downe thy throat wrong, as it did with the poet *Anacreon*, which coſt him his life. Or, as *Fabius* a Senator of Rome, and Lord chiefe Iuſtice beſides, who in a draught of milk fortuned to ſwallow a ſmall haire, which ſtrangled him. Well then, thinke better of this point, for he verily that will euermore ſet before his eies and remember the frailty of mans eſtate, ſhall liue in this world vprightly and in euen ballance, without inclining more to one ſide than vnto another.

Chap. VIII.

¶ *Of thoſe that be called Agrippæ.*

F TO be borne with the feet forward is vnnaturall and vnkinde: and ſuch as come in that order into the world the Latines were wont to name Agrippæ, as if a man ſhould ſay, born hardly and with much ado. And in this maner *M. Agrippa* (as they ſay) came forth of his mothers wombe, the only man almoſt, known to haue brought any good fortune with him, and proſpered in the world of all that euer were in that ſort borne. And yet as happy as hee was,

and how well ſoeuer he chieued in ſome reſpects,he was much pained with the gout,and paſſed all his youth and many a day after in bloudy wars,and in danger of a thouſand deaths. And hauing eſcaped all theſe harmfull perils,vnfortunate he was in all his children, and eſpecially in his two daughters the *Agrippinæ* both,who brought forth thoſe wicked Imps ſo pernicious to the whole earth,namely *C. Caligula* and *Domitius Nero*,two Emperours, but two fiery flames to conſume and waſte all mankinde. Moreouer, his infelicitie herein appeared, that hee liued ſo ſhort a time,dying as he did a ſtrong and luſty man, in the 51 yeare of his age, tormented and vexed with the adulteries of his owne wife,oppreſſed with the heauy and intolerable ſeruitude that he was in vnder his wiues father. In which regards it ſeems he paid full deare for the preſage of his vntoward birth and natiuitie. Moreouer,*Agrippina* hath left in writing, That her ſon *Nero* alſo,late Emperor, who all the time of his reigne was a very enemy to all mankinde, was borne with his feet forward. And in truth by the right order and courſe of Nature, a man is brought into the world with his head firſt,but is carried forth with his feet formoſt.

Chap. IX.

¶ *Births cut out of the wombe.*

BVt more fortunate are they a great deale whoſe birth coſteth their mothers life, parting from them by means of inciſion: like as *Scipio Africanus* the former, who came into the world in that manner: and the firſt that euer was ſirnamed *Cæſar*,was ſo called for the like cauſe. And hereof comes the fore-name alſo of the *Cæſones*. In like ſort alſo was that *Manlius* borne who entred Carthage with an army.

Chap. X.

¶ *Who are Vopiſci.*

THe Latines were wont to call him Vopiſcus [or rather Opiſcus] who being one of two twins,hapned to ſtay behinde in the wombe the full terme, when as the other miſcarried by abortiue and vntimely birth. And in this caſe there chance right ſtrange accidents,although they fall out very ſeldome.

Chap. XI.

¶ *Examples of many Infants at one birth.*

FEw creatures there be beſides women,that ſeeke after the male,and can skill of their companie after they be once conceiued with yong: one kind verily or two at the moſt there is knowne to conceiue double one vpon the other. We find in books written by Phyſitians, and in their records who haue ſtudied ſuch matters,and gathered obſeruations,that there haue paſſed or bin caſt away from a woman at one only ſlip, 12 diſtinct children:but when it falleth out that there is ſome pretty time betwixt two conceptions,both of them may tarry their full time,and be borne with life,as appeared in *Hercules* and his brother *Iphiclus*; as alſo in that harlot who was deliuered of two infants,one like her owne husband, the other reſembling the Adulterer: likewiſe in a Proconneſian bond-ſeruant,who was in one day gotten with childe by her maſter, and alſo by his Baily or Procurator; and being afterwards deliuered of two children,they bewrayed plainly who were their fathers. Moreouer, there was another who went her full time,euen nine moneths for one childe,but was deliuered of another at the fiue moneths end. Furthermore in another, who hauing dropped downe one childe at the end of ſeuen moneths,by the end of the ninth came with two twinnes more. Ouer and beſides it is commonly ſeen,that children be not alwaies anſwerable to the parents in euery reſpect: for of perfect fathers and mothers who haue all their limmes,there are begotten children vnperfect and wanting ſome members: and contrariwiſe, parents there are maimed and defectiue in ſome part,who neuertheleſſe beget children that are ſound and entire, and with all that they ſhould haue. It is ſeen alſo,that infants are at a default of thoſe parts their parents miſſe: yea and they carry often times certaine markes, moles, blemiſhes,and skarres of their fathers and mothers,

as

20030
copy 1

A as like as may be. Among the people called Dakes the children vſually beare the markes imprinted in their armes, of them from whom they deſcend, euen to the fourth generation.

Chap. xii.

¶ *Examples of many that haue been very like and reſembled one another.*

IN the race and family of the *Lepidi* it is ſaid there were three of them (not ſucceſſiuely one after another, but out of order after ſome intermiſſion) who had euery one of them at their
B birth a little pannicle or thin skin growing ouer their eye. Some haue bin known to reſemble their grandſires, and of two twins one hath beene like the father, the other the mother; but he that was borne a yere after hath bin ſo like his elder brother, as if he had bin one of the twins. Some women there be that bring all their children like to themſelues; and others againe as like to their husbands: and ſome like neither the one nor the other. You ſhall haue Women bring all their daughters like to their fathers, and contrariwiſe their ſonnes like to themſelues. The ſame is notable, and yet vndoubted true, of one *Nicæus* a famous Wreſtler of Conſtantinople, hauing to his mother a woman begotten in adulterie by an Æthiopian, and yet with white skin nothing different from other women of that countrey, was himſelfe black, and reſembled his grandſire the Æthiopian aboueſayd. Certes, the cogitations and diſcourſes of the minde make much for theſe ſimilitudes and reſemblances whereof we ſpeake, and ſo likewiſe many
C other accidents and occurrent obiects are thought to be very ſtrong and effectuall therin, whether they come in ſight, hearing, and calling to remembrance, or imaginations only conceiued and deeply apprehended in the very act of generation, or the inſtant of conception. The wandring cogitation alſo and quicke ſpirit either of father or mother, flying to and fro all on a ſudden from one thing to another at the ſame time, is ſuppoſed to be one cauſe of this impreſſion, that maketh either the foreſaid vniforme likeneſſe, or confuſion and varietie. And hereupon it commeth, and no maruell it is, that men are more vnlike one another, than other Creatures: for the nimble motions of the ſpirit, the quicke thoughts, the agilitie of the minde, the varietie of diſcourſe in our wits, imprinteth diuers formes, and many marks of ſundry cogitations: whereas the imaginatiue facultie of other liuing creatures is immoueable, & alwaies continu-
D eth in one: in all it is alike, and the ſame ſtill in euery one, which cauſeth them alwaies to engender like to themſelues, each one in their ſeuerall kindes. *Artenon* a mean man amongſt the Commons, was ſo like in all points to *Antiochus* King of Syria, that *Laodicea* the Queen, after that *Antiochus* her husband was killed, ſerued her owne turne by the ſaid *Artenon*, and made him play the part of *Antiochus*, vntill ſhe had by his meanes, as in the Kings perſon, recommended whom ſhe would, and made ouer the kingdome and crown in ſucceſſion and reuerſion to whom ſhe thought good. *Vibius* a poore commoner of Rome, and *Publicius* one newly of a bond ſlaue made a free-man, were both of them ſo like vnto *Pompey* the Great, that hardly the one could be diſcerned from the other, ſo liuely did they repreſent that good viſage of his ſo full of honeſtie, ſo fully expreſſed they and reſembled the ſingular maieſtie of that countenance which
E appeared in *Pompeius* his forehead. The like cauſe it was that gaue his father alſo the ſyrname of *Menogenes*, his Cooke, albeit he was ſyrnamed already *Strabo*, for his ſquint eyes: but hee would needs beare the name of a defect and infirmitie euen in his bond-ſeruant, for the loue he had vnto him by reaſon of his likeneſſe. So was one of the *Scipio's* alſo ſyrnamed *Serapius* vpon the like occaſion, after the name of one *Serapia*, who was but a baſe ſlaue of his, and no better than his ſwine heard, or dealer in buying and ſelling of ſwine. Another *Scipio* after him of the ſame houſe came to be ſyrnamed *Salutio*, becauſe a certaine jeſter of that name was like vnto him. After the ſame manner one *Spinter*, a player of the ſecond place or part, and *Pamphilus* another player of the third part, or in the third place, gaue their names to *Lentulus* and *Metellus*, who both were Conſuls together in one yeare, for that they reſembled them ſo truly. And cer-
F tes mee thinkes this fell out very vntowardly, and was but a ridiculous pageant, and a very vnſeemly ſhew vpon a ſtage, to ſee both Conſuls liuely repreſented there at once in the perſons of theſe two players. Contrariwiſe, *Rubrious* the ſtage player was ſirnamed *Plancus*, becauſe he was ſo like to *Plancus* the Orator. Againe, *Burbuleius* and *Menogenes*, both players of Enterludes, reſembled *Curio* the father or the elder, and *Meſſala Cenſorius*, for all he had been Cenſor

that the one could not ſhift and auoid the ſyrname of *Burbuleius*, and the other of *Monogenes*. There was in Sicily a certaine fiſherman who reſembled in all parts *Suria* the Pro-conſull, not only in viſage and feature of the face, but alſo in mowing with his mouth when hee ſpake, in drawing his tongue ſhort, and in his huddle and thicke ſpeech. *Caſſius Seuerus* that famous orator was reproched for being ſo like vnto *Mirmillo* a drouer or keeper of kine and oxen. *Toranius* a merchant ſlaue-ſeller, ſold vnto *M. Antonius* (now one of the two great Triumvirs) two moſt beautiful and ſweet faced boyes, for twins, ſo lik ewere they one to the other, albeit the one was borne in Aſia, and the other beyond the Alps. But when *Antony* afterwards came to know the ſame, and that this fraud and couſenage was bewraied and detected by the language & ſpeech of the boyes, he fell into a furious fit of choler, and all to berated the foreſaid *Toranius*. And when among other challenges he charged him with the high price he made him pay (for they coſt him two hundred Seſterces, as for twins, when they were none ſuch) the wily merchant being his craftſmaſter anſwered, That it was the cauſe why he held them ſo deare, and ſold them at ſo deare a rate: for (quoth he) it is no maruell at all that two brethren twins that lay both together in one belly do reſemble one the other; but that there ſhould be any found borne as theſe were in diuers countries, ſo like in all reſpects as they, he held it for a moſt rare and wonderfull thing. This anſwer of his was deliuered in ſo good time, and ſo fitly to the purpoſe, that *Antonie* the great man, who neuer was well but when he outlawed citiſens of Rome, and did confiſcat their goods, he I ſay that erewhile was all enraged and ſet vpon reuiling and reprochfull termes, was not only appeaſed, but alſo contented ſo with his bargaine, that he priſed thoſe two boies as much as any thing elſe in all his wealth.

Chap. XIII.

¶ *The cauſe and manner of generation.*

Some bodies there be by a ſecret of nature ſo diſagreeing, that they are vnfit for generation one with another. And yet as barren as they be ſo coupled together, fruitfull they are enough being ioyned with others. Such were *Auguſtus* the Emperor and his wife *Liuia*. In like manner ſome men there be as well as women, that can skill of getting and breeding none but daughters: and others there be againe that are good at none but ſonnes: and many times it falleth out that folke haue ſonnes and daughters both, but they by turnes, this yeare a ſon, the next yeare a daughter, in order. So [*Cornelia*] the mother of the *Gracchi*, who for twelue childbeds kept this courſe duly: and *Agrippina*, the wife of *Cæſar Germanicus*, for nine, euer changing from the male to the female. Some women are barren all their youth; and others again beare but once in their whole life. Some neuer go their full time with their children; and ſuch women, if peraduenture by helpe of phyſicke or other good means, and choice keeping, they ouercome this infirmitie, bring daughters ordinarily and no other. The Emperor *Auguſtus* among other ſingularities that he had by himſelfe during his life, ſaw ere he died the nephew of his neece, that is to ſay his progenie to the fourth degree of lineall diſcent: and that was *M. Scyllanus*, who hapned to be borne the ſame yeare that he departed out of this world. He hauing been Conſull, and afterward Lord Gouernor of Aſia, was poyſoned by prince *Nero*, to the end that he might thereby attaine to the empire. *Qu. Metellus Macedonicus* left behind him ſix children, and by them eleuen nephewes: but daughters in law and ſons in law, and of all ſuch as called him father, ſeuen. In the Chronicles of *Auguſtus Cæſars* acts for his time, we finde vpon record, that in his twelfth Conſulſhip, when *L. Sylla* was his companion and collegue in gouernment, vpon the eleuenth day of Aprill, *C. Criſpinus Helarus* a gentleman of Feſulæ, came with ſolemne pompe into the Capitoll, attended vpon with his nine children, ſeuen ſons and two daughters; with 27 Nephewes the ſonnes of his children, and 29 nephewes more, once remoued, who were his ſons nephewes, and twelue Neeces beſides that were his childrens daughters, and with all theſe ſolemnly ſacrificed.

CHAP.

20030
copy 1

Chap. XIIII.

¶ *Of the ſame matter more at large.*

A Woman commonly is paſt childe-bearing after 50 yeares of her age. And for the moſt part their monthly termes ſtay at forty. As for men, it is cleare and wel knowne, that king *Maßiniſſa* when he was aboue 86 yeres old, begat a ſon whom he called *Methymathmas*: & *Cato Cenſorius* that famous Cenſor begat another vpon the daughter of *Salonius* his vaſſal, when hee was paſt 80 yeares of age. And hereof it commeth, that the race which came of his other children were ſurnamed *Liciniani*, but the off-ſpring of this laſt ſonne, *Salonini*, from whom *Cato Vticenſis* (who ſlew himſelfe at Vtica) is lineally deſcended. Moreouer, it is not long ſince, that dame *Cornelia* of the houſe and linage of the *Scipio's*, bare vnto *Lu. Saturninus* her husband (who died whiles he was Prouoſt of the city of Rome) a ſon named *Voluſius Saturninus*, and who afterwards liued to be Conſull, who was begotten when his father was 62 yeares old with the better. To conclude, there haue beene amongſt meaner perſons very many knowne to haue gotten children after fourſcore and fiue.

Chap. XV.

¶ *Of Womens monethly ſickneſſe.*

OF all liuing creatures a woman hath a flux of bloud euery moneth: and hereupon it is, that in her wombe onely there are found a falſe conception called *Mola*, *i.* a Moone-calfe, that is to ſay, a lump of fleſh without ſhape, without life, and ſo hard withal, that vneth a knife will enter and pierce it either with edge or point. Howbeit, a kinde of mouing it hath, and ſtaieth the courſe of her moneths: and ſometime after the manner of a childe indeed, it coſteth the woman her life: otherwhiles it waxeth in her belly as ſhe groweth, and ageth with her; now and then alſo it ſlippeth and falleth from her with a laske and looſeneſſe of the guts. Such a thing breeds likewiſe in the bellies of men, vpon the hardneſſe of liuer or ſpleen, which the Phyſitions call *Scirrhus*, *i.* an hard wedge and cake vnder their ſhort-ribs. And ſuch an one had *Oppius Cato* a nobleman of Rome, late Pretour. But to come againe to women, hardly can there be found a thing more monſtrous than is that flux & courſe of theirs. For if during the time of their ſickneſſe, they happen to approch or go ouer a veſſel of wine, be it neuer ſo new, it wil preſently ſoure if they touch any ſtanding corne in the field, it wil wither and come to no good. Alſo, let them in this eſtate handle graffes, they will die vpon it: the herbes and young buds in a garden if they do but paſſe by, will catch a blaſt, and burne away to nothing. Sit they vpon or vnder trees whiles they are in this caſe, the fruit which hangeth vpon them will fall. Do they but ſee themſelues in a looking glaſſe, the cleare brightneſſe thereof turneth into dimneſſe, vpon their very ſight. Look they vpon a ſword, knife, or any edged toole, bee it neuer ſo bright, it waxeth duskiſh, ſo doth alſo the liuely hue of yvorie. The very bees in the hiue die. Yron & ſteele preſently take ruſt, yea, and braſſe likewiſe, with a filthy, ſtrong, and poiſoned ſtink, if they lay but hand thereupon. If dogs chance to taſte of womens fleures, they run mad therewith; and if they bite any thing afterwards, they leaue behinde them ſuch a venome, that the wounds are incureable: nay the very clammy ſlime Bitumen, which at certaine times of the yere floteth and ſwimmeth vpon the lake of Sodom, called Aſphaltites in Iury, which otherwiſe of the owne nature is pliable enough, ſoft and gentle, and ready to follow what way a man would haue it, cannot be parted and diuided aſunder (for by reaſon of the viſcoſitie, it cleaueth and ſticketh like glue, and hangeth all together, pluck as much as a man will at it) but only by a thred that is ſtained with this venomous bloud: euen the ſilly Piſmires (the leaſt creatures of all others) hath a perceiuance & ſence of this poiſon, as they ſay; for they caſt aſide & will no more come to that corn, which they haue found by taſt to be infected with this poiſon. This malady, ſo venomous and hurtful as it is, followeth a woman ſtil euery 30 daies; and at 3 moneths end, if it ſtay ſo long, it commeth in great abundance. And as there be ſome women that haue it oftner than once a month, ſo there are others again that neuer ſee ought of it. But ſuch lightly are barren, and neuer bring children. For in very deed, it is the materiall ſubſtance of generation: and the mans ſeed ſerueth in ſtead of a runnet to gather it round into a curd: which afterwards in proceſſe of time

time quickneth and grows to the form of a body; which is the cauſe that if women with childe G
haue this flux of the moneths, their children are not long liued, or elſe they proue feeble, ſickly and full of filthie humours, as *Nigidius* writeth.

Chap. xvi.

¶ *In like manner, of births: and infants in the mothers wombe.*

THe ſame *Nigidius* is of opinion, that a womans milke, nource to her owne child & giuing it ſucke, will not corrupt and be naught for the babe, if ſhe conceiue againe by the ſame man to whom ſhe brought the former childe. Alſo it is held, that in the beginning & end of the foreſaid menſtruall fleures, a woman is very apt to conceiue. Moreouer, it is commonly receiued for an infallible argument in women, that they are fruitfull and with childe, if when H
they annoint their eies with their owne ſpittle as with a medicine, the ſame appeare infected and to change the colour thereupon. Furthermore, doubtleſſe it is, that children breed their fore teeth in the ſeuenth moneth after they are borne, and firſt thoſe in the vpper chaw, for the moſt part: likewiſe that they ſhed the ſame teeth about the ſeuenth yere of their age, & others come vp new in the place. Certaine it is alſo, that ſome children are borne into the world with teeth, as *M. Curius*, who thereupon was ſurnamed *Dentatus*, and *Cn. Papyrius Carbo*, both of them very great men and right honourable perſonages. In women the ſame was counted but an vnlucky thing, & preſaged ſome misfortune, eſpecially in the daies of the KK. regiment in Rome: for when *Valeria* was borne toothed, the wizards and Soothſayers being conſulted thereabout, anſwered out of their learning by way of Propheſie, That look into what citie ſhe was caried to I
nource, ſhe ſhould be the cauſe of the ruine and ſubuerſion thereof; whereupon had away ſhee was and conueied to Sueſſa Pometia, a city at that time moſt flouriſhing in wealth and riches: and it proued moſt true in the end, for that city was vtterly deſtroied. *Cornelia* the mother of the *Gracchi* is ſufficient to proue by her own example, that women are neuer borne for good whoſe genitall parts for procreation are growne together, and yeeld no entrance. Some children are borne with an entire whole bone that taketh vp all the gum, inſtead of a row of diſtinct teeth; as a ſon of *Pruſias* king of the Bythinians, who had ſuch a bone in his vpper chaw. This is to be obſerued about teeth, that they onely check the fire and burn not to aſhes with other parts of the body: and yet as inuincible as they are and able to reſiſt the violence of the flame, they rot and become hollow with a little catarrhe or wateriſh rheume that droppeth and diſtilleth vpon K
them: white they may be made, with certaine mixtures and medicines called *Dentifices*. Some weare their teeth to the very ſtumps onely with vſe of chawing; others againe looſe them firſt out of their head; they ſerue not onely to grind our meat for our daily food and nouriſhment, but neceſſary alſo they be for the framing of our ſpeech. The fore-teeth ſtand in good ſtead to rule and moderate the voice by a certaine conſent and tuneable accord, anſwering as it were to the ſtroke of the tongue: and according to that row and ranke of theirs wherein they are ſet, as they are broader or narrower, greater or ſmaller, they yeeld a diſtinction and varietie in our words, cutting and hewing them thicke and ſhort, framing them pleaſant, plaine, and ready, drawing them out at length, or ſmuddering and drowning them in the end: but when they bee once falne out of the head, man is bereaued of all means of good vtterance and explanation of L
his words. Moreouer, there are ſome preſages of good or bad fortune, gathered by the teeth: men ordinarily haue giuen them by nature 32 in all, except the nation of the Turduli. They that haue aboue this number, may make account (as it is thought) to liue the longer. As for women, they haue not ſo many: they that haue on the right ſide in the vpper iaw two eie-teeth, which the Latines call Dogs-teeth, may promiſe themſelues the flattering fauors of Fortune, as it is well ſeene in *Agrippina* the mother of *Domitius Nero*: but contrariwiſe, the ſame teeth double in the left ſide aboue, is a ſigne of euill lucke. It is not the cuſtome in any countrey to burne in a funerall fire the dead corps of any infant before his teeth be come vp; but hereof will we write more at large in the Anatomie of man, when wee ſhall diſcourſe purpoſely of euerie member and part of the body. *Zoroaſtres* was the onely man that euer wee could heare of, who laughed the ſame day that he was borne: his brain did ſo euidently pant and beat, that it would beare vp their hands that laid them vpon his head: a moſt certain preſage & fore-token of that great learning that afterward, he attained vnto. This alſo is held for certain and reſolued vpon that a man at three yeares of age, is come to one moitie of his growth and height. As alſo this

is

20030
copy 1

A is obſerued for an vndoubted truth, that generally all men come ſhort of the ful ſtature in time paſt, and decreaſe ſtil euery day more than other: and ſeldome ſhall you ſee the ſon taller than his father; for the ardent heat of the elementarie fire (whereunto the world enclineth already now toward the later end, as ſomtimes it ſtood much vpon the waterie element) deuoureth and conſumeth that plentifull humor and moiſture of naturall ſeed, that engendreth all things: and this appeareth more euidently by theſe examples following. In Crete, it chanced that an hill claue aſunder in an earth-quake, and in the chink thereof was found a body ſtanding, 46 cubits high; ſome ſay it was the body of *Orion*; others, of *Otus*. We find in chronicles & records of good credit, that the body of *Oreſtes* being taken vp, by direction from the Oracles, was ſeuen cubits long. And verily that great and famous poet *Homer*, who liued almoſt 1 000 yeres ago, complai-
B ned and gaue not ouer, That mens bodies were leſſe of ſtature euen then, than in old time. The Annales ſet not downe the ſtature and bigneſſe of *Nævius Pollio*; but that he was a mighty gy-ant, appeareth by this that is written of him, namely, that it was taken for a wonderfull ſtrange thing, that in a great rout & preſſe of people that came running together vpon him, he had like to haue bin killed. The talleſt man that hath bin ſeen in our age, was one named *Gabbara*, who in the daies of prince *Claudius* late Emperor, was brought out of Arabia; nine foot high was hee, and as many inches. There were in the time of *Auguſtus Cæſar* 2 others, named * *Puſio* and *Secun-*
C *dilla*, higher than *Gabbara* by halfe a foot, whoſe bodies were preſerued and kept for a wonder in a charnell houſe or ſepulchre within the gardens of the Saluſtians. Whiles the ſame *Auguſtus* ſate as preſident, his niece *Iulia* had a little dwarfiſh fellow not aboue 2 foot and a hand bredth high, called *Conopas*, whom ſhe ſet great ſtore by and made much of: as alſo another ſhe dwarfe named *Andromeda*, who ſomtime had been the ſlaue of *Iulia* the princeſſe, and by her made free. *M. Varro* reporteth, that *Manius Maximus*, and *M. Tullius*, were but two cubits high, & yet they gentlemen and knights of Rome: and in truth we our ſelues haue ſeen their bodies how they lie embalmed and cheſted, which teſtifieth no leſſe. It is well knowne that there be ſome that naturally are neuer but a foot and a halfe high; others again ſomwhat longer; and to this heigth they came in three yeres, which is the full courſe of their age, and then they die. Wee reade moreouer in the Chronicles, that in Salamis one *Euthimenes* had a ſon, who in three yeres grew to be three cubits high, but he was in his gate ſlow and heauy, and in his wit as dull and bloc-
D kiſh; howbeit in his time vndergrowne he was, and his voice changed to be great, and at three yeares end died ſuddenly of a generall crampe or contraction of all the parts of his body. It is not long ſince I ſaw my ſelfe the like in all reſpects (ſauing that vndergoing aforeſaid) in a ſon of one *Cornelius Tacitus*, a Roman knight, and a procurator or general receiuer and Treaſurer for the State in Gaule Belgique; ſuch the Greeks call Ἐκπαμπόδας, *i. Ectrapelos*; wee in Latine haue no name for them.

* Ten foot and an halfe.

* Such an one as little *John*, for ſo the nick-name ſignifieth.

Chap. XVI.

¶ *Certaine notable obſeruations in bodies of men and women.*

E WE ſee tried by experience, that take meaſure of a man from the ſole of the foot vp to the crowne of the head, ſo far it is between the ends of his two middle and longeſt fingers, when he ſtretcheth out his armes and hands to the full. As alſo, that ſome men and women be ſtronger of the right ſide than of the left: others againe that be as ſtrong of one as the other; and there be, that are altogether left handed, and beſt with that hand; but that is ſeldome or neuer ſeen in women. Moreouer, men weigh heauier than women; and in euerie kind of creature, dead bodies be more heauy than the quicke: and the ſame parties ſleeping weigh more than waking. Finally, obſerued it is, that the dead corps of a man floteth on the water with the face vpward; but contrariwiſe women ſwim groueling, as if Nature had prouided to ſaue their honeſty and couer their ſhame, euen when they are dead.

Chap. XVIII.

F ¶ *Examples of diuers extraordinarie caſes in mans body.*

WE haue heard, that ſome mens bones are ſollid and maſſie, and ſo do liue without any marrow in them: you may know them by theſe ſignes, they neuer feele thirſt, nor put forth any ſweat; and yet we know that a man may conquer and maſter his thirſt if hee liſt:

list: for so a gentleman of Rome one *Iulius Viator*, descended from the race of the Vocontians our allies; being falne into a kind of dropsie between the skin and the flesh during his minority and nonage, and forbidden by the Physicions to drink; so accustomed himselfe to obserue their direction, that naturally he could abide it: insomuch, that all his old age euen to his dying day he forbare his drink. Others also haue bin able to command and ouer-rule their nature in many cases, and breake themselues of diuers things. G

Chap. xix.

¶ *Strange natures and properties of diuers persons.*

IT is said, that *Crassus* (grandfather to that *Crassus* who was slaine in Parthia) was neuer known to laugh all his life time, and thereupon was called *Agelastus*; and contrariwise, many haue bin found that neuer wept. Also that sage and renowned wise man *Socrates*, was seene alwaies to carry one and the self-same countenance, neuer more merry and cheerefull nor more solemne and vnquiet, at one time than at another. But this obstinate constancy and firm cariage of the mind, turneth now and then in the end into a certain rigour and austerity of nature, so hard and inflexible that it cannot be ruled, and in very truth despoileth men of all affections; and such are called of the Greekes, Apathes, who had the experience of many such: and (that which is a maruellous matter) those especially that were the great pillars of philosophy and deep learned Clerks, namely *Diogenes* the Cinicke; *Pyrrho*, *Heraclitus* and *Timo*; and as for him he was so far gone in his humor, that he seemed professedly to hate all mankind. But these were examples of a corrupt, peruerse, & froward nature. As for other things, there be sundry notable obseruations in many; as in *Antonia* the wife of *Drusus*, who as it was well knowne, neuer spit: in *Pomponius* the poet, one that had sometimes bin Consull, who neuer belched. But as for such as naturally haue their bones not hollow, but whole and solid, they be very rare and seldom seene, and called they are in Latine *Cornei*, *i*. hard as horne. H I

Chap. xx.

¶ *Of bodily strength and swiftnesse.*

VArro in his treatise of prodigious and extraordinary strength, maketh report of one *Tritanus*, a man that of body was but little and lean withall, howbeit of incomparable strength, much renowned in the fence schoole, and namely, in handling the Samnites weapons, wearing their manner of armor, and performing their feats and masteries of great name. He maketh mention also of a sonne of his, a souldier, that serued vnder *Pompeius* the Great, who had all ouer his body, yea and throughout his armes and hands, some sinewes running streight out in length, others crossing ouerthwart lattise-wise; and he saith moreouer of him, that when an enemie out of the camp gaue him defiance and challenged him to a combat, he would neither put on defensiue harnesse, ne yet arme his right hand with offensiue weapon; but with naked hand made meanes to foile and ouercome him, and in the end when hee had caught hold of him, brought him away perforce into his own camp with one finger. *Iunius Valens* a captaine, pensioner or centurion of the gard-souldiers about *Augustus Cæsar*, was woont alone to beare vp a charriot laden with certain hogsheads or a butt of wine, vntill it was discharged thereof, & the wine drawne out: also his manner was with one hand to stay a coach against all the force of the horses striuing and straining to the contrary; and to perform other wonderfull masteries, which are to be seen engrauen vpon his tombe; and therefore (qd. *Varro*) being called *Hercules Rusticellus*, he tooke vp his mule vpon his back and carried him away. *Fusius Saluius* hauing two hundred pound weights at his feet, and as many in his hands, and twise as much vpon his shoulders, went withall vp a paire of staires or a ladder. My selfe haue seene one named *Athanatus*, do wonderfull strange matters in the open shew and face of the world, namely, to walke his stations vpon the stage with a cuirace of lead weighing 500 pound, booted besides with a pair of buskins or greiues about his legges that came to as much in weight. As for *Milo* the great wrestler of Crotone, when he stood firm vpon his feet, there was not a man could make him stir one foot; if he held a pomegranat fast within his hand, no man was able to stretch a finger of his and force it out at length. It was counted a great matter, that *Philippides* ran 1140 stadia, to K L M

wit,

20030
copy 1

A wit, from Athens to Lacedæmon in two daies, vntill *Laniſis* a courtier of Lacedæmon, and *Philonides* footman to *Alexander* the great, ran between Sicyone and Olis in one day, 1200 ſtadia. But now verily at this day we ſee ſome in the grand cirque, able to indure in one day the running of 160 miles. And but a while agoe we are not ignorant, that when *Fonteius* & *Vipſanus* were Conſuls, a yong boy but 9 yeres old, between noon and euening ran 75 miles. And verily a man may wonder the more at this matter, and come to the full conceit thereof, if he do but conſider, that it was counted an exceeding great iourny that *Tiberius Nero* made with three chariots (ſhifting from one to the other freſh) in a day and a night, riding poſt haſte vnto his brother *Druſus* then lying ſicke in Germany, and all that was but 200 miles.

B

Chap. xxi.

¶ *Examples of good Eie-ſight.*

VVE find in hiſtories as incredible examples as any be, as touching quickneſſe of Eie-ſight. *Cicero* hath recorded, that the whole Poeme of *Homer* called Ilias, was written in a piece of parchment, which was able to be couched within a nut ſhel. The ſame writer maketh mention of one that could ſee and diſcerne out-right 135 miles. And *M. Varro* nameth the man, and ſaith he was called *Strabo*; who affirmeth thus much moreouer of him, that during the Carthaginian war he was wont to ſtand and watch vpon Lilybæum, a cape in Sicily, to diſcouer the enemies fleet looſing out of the hauen of Carthage, and was able to tel the very
C juſt number of the ſhips. *Callicrates* vſed to make Piſmires and other ſuch like little creatures, out of yvorie ſo artificially, that other men could not diſcerne the parts of their body one from another. There was one *Myrmecides*, excellent in that kinde of workmanſhip: who of the ſame matter wrought a chariot with foure wheeles and as many ſteeds, in ſo little roome, that a ſilly flie might couer all with her wings. Alſo he made a ſhip with all the tackling to it, no bigger than a little bee might hide it with her wings.

Chap. xxii.

¶ *Of Hearing.*

D AS for hearing, there is one example wonderfull. For the bruit of that battell, whereupon Sybaris was forced & ſacked, was heard the very ſame day as far as Olympia [in Greece.] As touching the news of the Cimbrians defeature, as alſo the report and tidings of the victorie ouer the Perſians, made by the Roman Caſtores, the ſame day that it was atchieued, were held for diuine reuelations rather than humane reports, and the knowledge thereof came more by way of viſion than otherwiſe.

Chap. xxiii.

¶ *Examples of Patience.*

E MAny are the calamities of this life, incident to mankind, which haue affoorded infinite trials of mens patience, in ſuffering paines in their body. Among others, for women, the example of *Leæna* the courtiſan, is moſt rare and ſingular, who for all the dolorous tortures that could be deuiſed, would neuer bewray *Harmodius* and *Ariſtogiton*, who ſlew the tyranous king. And for men, *Anaxarchus* did the like, who being for ſuch a cauſe examined vpon the racke, in the midſt of his torments bit off his own tongue with his teeth, the only means wherby he might haply reueale and diſcloſe the matter in queſtion, and ſpit it in the face of the tyrant that put him to his torture.

Chap. xxiiii.

F ¶ *Examples of Memorie.*

AS touching memorie, the greateſt gift of Nature, and moſt neceſſary of all others for this life; hard it is to iudge and ſay who of all others deſerued the chiefe honor therein: conſidering how many men haue excelled, and woon much glory in that behalfe. King *Cyrus*

was

was able to call euery souldier that he had through his whole army by his owne name. *L. Scipio* could do the like by all the citizens of Rome. Semblably, *Cineas*, Embassador of king *Pyrrhus*, the very next day that he came to Rome, both knew and also saluted by name all the Senate, & the whole degrees of Gentlemen and Cauallerie in the citie. *Mithridates* the king, reigned ouer two and twentie nations of diuers languages, and in so many tongues gaue lawes and ministred iustice vnto them, without truchman: and when he was to make speech vnto them in publicke assembly respectiuely to euery nation, he did performe it in their own tongue without interpretor. One *Charmidas* or *Charmadas*, a Grecian, was of so singular a memory, that he was able to deliuer by heart the contents word for word of all the books that a man would call for out of any librarie, as if he read the same presently within book. At length the practise hereof was reduced into an art of Memory: deuised and inuented first by *Simonides Melicus*, and afterwards brought to perfection and consummate by *Metrodorus Sepsius*; by which a man might learne to rehearse againe the same words of any discourse whatsoeuer after once hearing: and yet there is not a thing in man so fraile and brittle againe as it, whether it be occasioned by disease, by casual iniuries or occurrents, or by feare, through which it faileth somtime in part, and otherwhiles decaieth generally, and is clean lost. One with the stroke of a stone, fell presently to forget his letters onely, and could reade no more; otherwise his memorie serued him well enough. Another with a fall from the roofe of a very high house, lost the remembrance of his owne mother, his next kinsfolks, friends, and neighbors. Another in a sickneſse of his, forgot his own seruants about him: and *Messala Corvinus* the great Orator, vpon the like occasion, forgot his own proper name. So fickle and slipperie is mans memorie: that oftentimes it assaieth and goeth about to leese it selfe, euen whiles a mans body is otherwise quiet and in health. But let sleep creepe at any time vpon vs, it seemeth to be vanquished, so as our poore spirit wandreth vp and downe to seeke where it is, and to recouer it againe.

Carneades, according to *Cicero* and *Quintilian*.

G H I

Chap. XXV.

¶ *The praise of C. Iulius Cæsar.*

FOr vigor and quickneſse of spirit, I take it, that *C. Cæsar* Dictatour, went beyond all men besides. I speake not now of his vertue and constancie, neither of his high reach and deep wit, whereby he apprehended the knowledge of all things vnder the cope of heauen; but of that agilitie of minde, that prompt and ready conceit of his, as nimble and actiue as the verie fire. I haue heard it reported of him, that he was wont to write, to reade, to indite letters, and withall to giue audience to suiters & heare their causes all at one instant. And being employed, as you know he was, in so great and important affairs, he ordinarily indited letters to foure secretaries or clerkes at once: and when he was free from other greater busineſse, he would otherwise finde seuen of them work at one time. The same man in his daies fought 50 set battels with banners displaied against his enemies: in which point, he alone out-went *M. Marcellus*, who was seene 40 times saue one in the field. Besides the carnage of citizens that hee made in the ciuill wars when he obtained victory, he put to the sword 1192000 of his enemies, in one battell or other. And certes for mine owne part, I hold this for no speciall glory and commendation of his, considering so great iniurie done to mankind by this effusion of bloud; which in some part he hath confessed himselfe, in that he hath forborne to set downe the ouerthrowes & bloud-shed of his aduersaries (fellow citizens) during the ciuill wars. Yet *Pompey* the great deserues honour more iustly for scouring the seas, and taking from the rouers 846 saile of ships. But to return again to *Cæsar*, ouer and aboue the qualities of worth before rehearsed, an especiall property of his owne he had, for clemency and mercy, wherein he so far forth surmounted all other men, that hee repented therof in the end. As for his magnanimity, it was incomparable, and he left such a president behind him, as I forbid all men to match or second it. For to speake of his sumptuosities, of his largesses, of the magnificent shewes exhibited to the people, the exceeding cost & charges therein bestowed, with all the stately furniture thereto belonging, were a point of him that fauored such lauish expence and superfluities. But herein appeared his true hautineſse of mind indeed, and that vnmatchable spirit of his, that when vpon the battel at Pharsalia, as wel the cofers & caskets with letters & other writings of *Pompey*, as also those of *Scipio's* before Thapsus, came into his hands, he was most true to them, and burnt all without reading one scrip or scrol.

copy 1

Chap. XXVI.

¶ *The commendation of Pompey the great.*

AS concerning all the titles and victorious triumphs of *Pompey* the great, wherein hee was equall in renowne and glory, not onely to the acts of *Alexander* the great, but alſo of *Hercules* in a manner, and god *Bacchus*: if I ſhould make mention therof in this place, it would redound not to the honour onely of that one man, but alſo to the grandeur and Maieſtie of the Roman empire. In the firſt place then, after he had recouered Sicily, and reduced it vnder obeiſance (where his firſt riſing was, and where hee began to ſhew himſelfe in the quarrell of the Common weale, and to ſide with *Sylla*) hauing alſo conquered and ſubdued Africke, and raunged it vnder the obedience of Rome, where he acquired the ſurname of *Magnus*, by reaſon of the great booty and pillage which he brought from thence; being no higher of birth and calling, than a Roman gentleman or man of armes, entred with triumphant chariot into Rome: a thing that was neuer ſeene before in a man of that place and qualitie. Immediatly after this, he made a voiage into the Weſt, and hauing brought vnder obeiſance of the Romans 876 great townes, which he forced by aſſault betweene the Alpes and the marches of Spaine, he erected trophies and triumphant columnes vpon the mountain Pyrenæus, with the title and inſcription of theſe victorious exploits; and neuer made one word of his victorie ouer *Sertorius*, ſo braue a mind he carried with him. And after the ciuill troubles and broiles appeaſed & quenched (which drew after them all forreine wars) he triumphed againe the ſecond time, being as yet but a knight of Rome: ſo oftentimes a generall of command & conduct; before he euer ſerued as ſoldier in the field. Theſe famous deeds atchieued, ſent out he was in another expedition, to ſcoure & cleere all the ſeas, and ſo forward into the Eaſt parts. From whence he returned with more titles ſtil of honor to his country, after the manner of thoſe that winne victories at the ſolemne feſtiuall *Games; for as the victors vſe not themſelues to accept the chaplets and guirlands in their own names, but to be crowned therwith in the behalf of their natiue countries; euen ſo, *Pompeius*, in that temple which he cauſed to be built of the bootie and pillage woon from the enemies, and dedicated to * *Minerva*, entituled the citie with the whole honour, and attributed all to them in an inſcription or table engrauen in this manner: *Pompeius the Great, Lord Generall, hauing finiſhed the warres which continued thirtie yeares, during which he had diſcomfited, put to flight, ſlaine, or receiued to mercie vpon ſubmiſſion 2183000 men: ſunke or taken 846 ſaile, woon and brought to his deuotion, of cities, townes and caſtles, to the number of 1538: ſubdued and put vnder ſubiection all lands and Nations, betweene the lake Mæotis and the red ſea, hath dedicated of right and good deſert this temple to Minerva.* This is the briefe and ſummarie of his ſeruice in the Eaſt. As for the triumph, wherein he rode the third day before the Calends of October, in the yeare wherein *M. Meſſala* and *M. Piſo* were Conſuls, the tenure and title ran in this form: Whereas *Cn. Pompeius* hath cleared all the ſea coaſts from Pyrats and rouers, and thereby recouered vnto the people of Rome the lordſhip and ſoueraignetie of the ſeas; and withall ſubdued Pontus, Armenia, Paphlagonia, Cappadocia, Cilicia, Syria, the Scythians, Iudæa, and the Albanois: the Iſland Creta, and the Baſtarnians, hath triumphed ouer them all, as alſo for the vanquiſhing of the 2 kings *Mithridates* and *Tigranes*. But the greateſt glorie of all glories in him was this (as himſelfe deliuered openly in a ful aſſembly, at what time as he diſcourſed of his owne exploits) That whereas Aſia when he receiued it, was the vtmoſt frontier prouince and limit of the Roman Empire, hee left the ſame in the very heart & mids therof, and ſo deliuered it vp to his countrey. Now if a man would ſet *Cæſar* on the other ſide againſt him, & likewiſe rehearſe his noble acts, who indeed of the two ſeemed greater in the ſight of the world, he had need verily to fetch a circuit about the world, and comprehend the whole globe thereof, which were an infinit piece of work, and in all reaſon impoſſible.

Olympia Nemæa, Pythia, Iſthmia.

* Or Victorie.

Chap. XXVII.

¶ *The praiſe of Cato, the firſt of that name.*

IN ſundry other kindes of vertues many men haue diuerſly excelled. But *Cato*, the firſt of the *Porcian* houſe, was thought to be the only perſon who was able to perform three things in the higheſt degree that are moſt commendable in a man. For firſt and formoſt he was a ſingular

good Oratour: secondly, a most braue captaine and renowned commander in the field: and last of all, a right worthy Senatour and approued counsellor. And yet in my conceit, all these excellent parts seeme to haue shined more bright (although he came after the other) in *Scipio Æmylianus*. To say nothing of this blessed gift besides, that he was not hated and spighted of so many men, as *Cato* was. But if you will seeke for one especiall thing in *Cato* by himselfe, this is reported of him, That he was judicially called to his answer 44 times, and neuer was there man accused oftner than he, yet went he euer cleare away and was acquit.

Chap. XXVIII.

¶ *Of Valour and Fortitude.*

AN endlesse peece of worke it were to know and set downe who bare the prize for valiancy, & namely if we admit the fabulous tales of poets. As for the poet *Ennius*, he had in greatest admiration. *T. Cæcilius Teucer*, and especially his brother: and in regard of those two, he compiled the sixt booke of his Annales to the rest. But *L. Siccius Dentatus*, a Tribune of the Commons, not long after the banishment of the kings, when *Sp. Tarpeius* and *A. Æterinus* were Consuls, by most voices surpasses in this kind, if it be true that a number of men report of him: namely, that he serued in 120 foughten fields: 8 times maintained combate with his enemy, giuing defiance, and euermore got the vpper hand: carrying before him the glorious markes of 45 skarres receiued by wounds, and neuer a one in the backe parts of his body. Moreouer, he woon the spoile of 34 seuerall enemies: and had giuen him of his captains, for his prowesse and good seruice, 18 headlesse speares, 25 caparisons and furnitures of great horses, 83 chains, 160 bracelets for to adorne his arms: 26 crowns, or triumphant chaplets, whereof 14 were ciuick, for rescuing of Roman citizens in jeopardy of death, 8 of beaten gold, 3 other murall, for mounting first ouer the enemies wall: and last of all, one obsidionall, for enforcing the enemy to leuie and breake vp his siege and depart; also with a stipend or pension-fee out of the Exchequer & chamber of the city; and lastly, the prise or ransom of ten prisoners, with 20 oxen besides to make vp the reward; and in this glorious pompe and shew he followed nine captain Generals going before him, who by his means triumphed all. Ouer and besides (which I suppose was the worthiest act that euer he did) he accused in open court before the body of the people, one commander and great captaine, named *T. Romulus* (notwithstanding he had bin a Consul) and conuicted him for his ill management and conduct of the wars. As for *Manlius Capitolinus*, he wan as many honourable testimonies of valour, but that he lost them all again, with that vnhappy end of his life that he made. Before he was full 17 yeres of age, hee had gained already two complete spoiles of his enemies. He was the first Roman knight or man of armes, that was honored with a murall crowne of gold for scaling ouer the wall in an assault; with six ciuicke chaplets for sauing the life of citizens six times out of the enemies hands. Moreouer, he receiued 37 gifts of the people for his good seruice, and carried the skars in the fore-part of his body of 33 wounds. He rescued *P. Seruilius*, Generall of the Roman Cauallerie, & in the rescue was himselfe wounded for his labor, in shoulder and thigh both. Aboue all other hardy acts, he alone guarded and defended the Capitoll, and thereby the whole State of Rome, against the Gaules: a braue piece of seruice, but that he marred all againe in aspiring to be king ouer the same. In these aboue rehearsed examples, certes vertue hath carried a great stroke, but yet fortune hath been the mightier, and preuailed more in the end. And in my iudgement verily, none may right & iustly prefer any man before *M. Sergius*; albeit *Catiline* his nephewes son discredited that name of his, & derogated much from the honor of his house. The second time that he went into the field and serued, his had was to lose his right hand: and in two other seruices hee was wounded no fewer than 23 times: by meanes whereof hee had little vse of either hand, and his feet stood him in no great stead. Howbeit, thus maimed and disabled as hee was for to be a souldiour, hee went many a time after to the warres, attended with one slaue onely, and performed his deuoire. Twise was he taken prisoner by *Annibal* (for he dealt not I may tell you with ordinary enemies) and twise brake he prison and made escape, notwithstanding, that for twentie moneths space he was euery day ordinarily kept bound with chaines and fetters. Foure times fought hee with his left hand onely, vntill two horses one after another, were killed vnder him. Then hee made himselfe a right hand of yron, which he fastened to his arme, and fighting with the help of it, he raised

20030
copy 1

A raiſed the ſiege from before Cremona, and ſaued Placentia. In France he forced 12 fortified camps of the enemies. All which exploits appeare vpon record in that Oration of his which he made in his Pretorſhip, at what time as his Colleagues and companions in gouernement would not permit him to be at the ſolemne ſacrifices, becauſe he had a maim, and wanted a lim But what heaps of crowns and chaplets, thinke you, would he haue gathered together, if he had bin committed and matched with any other enemies but *Annibal*? Certes, to know a man of worth indeed, much materiall it is to conſider in what time hee liueth, and is imploied, for the proofe of his valour. For what ſtore of ciuick coronets and garlands, yeelded either the battell of Trebia and Ticinus, or of Thraſymenus the lake? What crowne could haue bin gained and
B woon at the iourney of Cannæ, where the beſt ſeruice was by good footmanſhip to flie & run away? To conclude, all others may vaunt verily, that they haue vanquiſhed men; but *Sergius* may boaſt, that he hath conquered and ouercome euen Fortune her ſelfe.

Chap. XXIX.

¶ *The commendation of ſome men for their quicke wits.*

WHo is able to make a muſter as it were of them that haue been excellent in wit: ſo difficult a matter it is to run through ſo many kinds of ſciences, and to take a ſuruey of curious handi-workes in ſuch varietie, of moſt rare and ſingular artiſanes? Vnleſſe haply we agree vpon this, and ſay, that *Homer* the Greeke poet excelled all other, conſidering
C either the ſubiect matter, or the happy fortune of his worke. And hereupon it was, that *Alexander* the Great (for in this ſo proud a cenſure and compariſon, I ſhal do beſt to cite the iudgment of the higheſt, and of thoſe that be not ſubiect to enuie) hauing found among the ſpoils of *Darius* the king, his perfumier or casket of ſweet ointments, and the ſame richly imbelliſhed with gold and coſtly pearls and precious ſtones, when his friends about him ſhewed him many vſes whereto the ſaid coffer or cabinet might be put vnto, conſidering that *Alexander* himſelf could not away with thoſe delicate perfumes, being a warriour, and ſlurried with bearing armes, and following warfare: when, I ſay, his gallants about him could not reſolue well what ſeruice to put it to: himſelfe made no more ado but ſaid thus, I will haue it to ſerue for a caſe of *Homers* bookes: judging hereby, that the moſt rare and precious worke proceeding from that ſo admi-
D rable a wit of man, ſhould be beſtowed and kept in the richeſt box and casket of all others: the ſame prince, in the forcing and ſaccage of the citie of Thebes, cauſed by expreſſe commandement, That the dwelling houſe & whole family of *Pindarus* the Poet ſhould be ſpared. He built againe the natiue city wherein *Ariſtotle* the Philoſopher was borne: and in ſo glorious a ſhew of his other worthy deeds, would needs intermingle this teſtimony of his bounty, in regard of that rare clerke who gaue light to all things in the world. The murderers of *Archilochus* the poet, the very Oracle of *Apollo* at Delphi diſcloſed and reuealed. When *Sophocles* the prince of all tragicall Poets was dead in Athens, at what time as the citie was beſieged by the Lacedæmonians, god *Bacchus* appeared ſundry times by way of viſion in a dreame to *Lyſander* their king, admoniſhng him to ſuffer his delight, and him whom he ſet moſt ſtore by, for to be enterred.
E Whereupon the king made diligent enquirie who lately was departed this life in Athens: and by relation of the citizens ſoone found it out and perceiued who it was that the foreſaid god meant, and ſo gaue them leaue to bury *Sophocles* in peace, and to performe his funeralls without any moleſtation or impeachment.

Chap. XXX.

¶ *Of Plato, Ennius, Virgil, M. Varro, and M. Cicero.*

F DEnis the tyrant, borne otherwiſe to pride and cruelty, being aduertiſed of the comming and arriuall of *Plato*, that great clerke and prince of learning, ſent out to meet him a ſhip adorned with goodly ribbands, and himſelfe mounted vpon a charriot drawne with foure white horſes, receiued him as if he had bin a K. at the hauen, when hee dis barked and came aland. *Iſocrates* ſold one Oration that he made for 20 talents of gold. *Æſchines* that famous oratour of Athens in his time, hauing at Rhodes rehearſed that accuſatorie oration which he had made

made against *Demosthenes*, read withall his aduersaries defence againe; by occasion wherof he G
was confined to Rhodes, and there liued in banishment: and when the Rhodians that heard it
wondred thereat; Nay (qd. *Æschines*) you would haue maruelled much more at it, if you had
heard the man himselfe pronouncing it, & pleading *Viua voce*: yeelding thus as you see a no-
table testimony of his aduersary, in the time of his aduersitie. The Athenians exiled *Thucidides*
their Generall Captaine: but after he had written his Chronicle, they called him home again,
wondring at the eloquence of the man, whose vertue and prowesse they had before condemned.
The KK. of Egypt and Macedonie gaue a singular testimony how much they honoured *Menan-*
der the Comicall poet, in that they sent Embassadors for him, and a fleet to waft him for his
more securitie: but he wan vnto himselfe more fame and glory by his owne setled iudgement,
for that he esteemed more of his owne priuat study and following his book, than of all those fa-
uors offered vnto him from great princes. Moreouer, there haue bin great personages and men H
of high calling at Rome, who haue shewed the like in token, how they esteemed and regarded
the learned crew of forrein nations. *Cn. Pompeius*, after he had dispatched the war against *Mi-*
thridates, inrended to go and visit *Posidonius*, that renowned professor of learning; and when hee
should enter into the mans house, gaue streight commandement to his Lictors or Huishers,
that they should not (after their ordinary maner with all others) rap at his dore; and this great
warriour, vnto whom both the East and West parts of the world had submitted, vailed bonet,
as it were, and based his armes and ensignes of state which his officers carried, before the verie
dore of this Philosopher. *Cato*, syrnamed *Censorius*, vpon a time when there came to Rome that
noble embassage from Athens, consisting of three, the wisest sages among them; when hee had I
heard *Carneades* speake (who was one of those three) gaue his opinion presently, That those em-
bassadors were to be dispatched and sent away with all speed; for feare least if that man argued
the case, it would be an hard piece of worke to sound and find out the truth, so pregnant were
his reasons, and so witty his discourses. But Lord! what a change is there now in mens manners
and dispositions! This *Cato*, the renowned Censor, both now and at all times else, could not a-
bide to haue any Grecian within Italy, but alwaies gaue judgement to them all in generall to
be expelled: but after him there comes his nephew once remoued, or his nephewes sonne, who
brought one of their Philosophers ouer with him, when he had bin military Tribune or knight
marshall: and another likewise vpon his embassage to Cypres. And verily a wonder it is and a
memorable thing to consider how these two *Catoes* differed in another point: for the former of
them could not away with the Greek tongue; the other that killed himselfe at Vtica, esteemed K
it as highly. But to leaue strangers, let vs now speak of our own countrimen, so renowned in this
behalfe. *Scipio Africanus* the elder, gaue expresse order, and commanded, That the statue of *Q.*
Ennius the poet should be set ouer his tomb, to the end, that the great name and stile of *Afri-*
canus, or indeed the booty rather that hee had woon and carried away from a third part of the
world, should in his monument vpon the reliques of his ashes be read together with the title of
this poet. *Augustus Cæsar* late Emperor, expressely forbad that the Poeme of *Virgil* should be
burned, notwithstanding that he by his last wil and testament on a modesty, gaue order to the
contrary: by which means there grew more credit and authority vnto the Poet, than if himselfe
had approued and allowed his owne verses. *Asinius Pollio* was the first that set vp a publicke Li- L
brary at Rome, raised of the spoile and pillage gained from the enemies. In the Library of
which gentleman, was erected the image of *M. Varro*, euen whiles he liued: a thing that won as
great honor to *M. Varro* in mine opinion (considering that amongst those fine wits, whereof a
great number then flourished at Rome, his hap only was to haue the garland at the hands of a
noble citizen and an excellent Orator beside:) as that other nauall crowne gained him, which
Pompey the Great bestowed vpon him for his good seruice in the pyrats war. Infinite examples
more there are of vs Romans, if a man would seeke after them and search them out: for this
only nation hath brought forth more excellent and accomplished men in euery kinde, than all
the lands besides of the whole world. But what a sin should I commit, if I proceeded farther
and speake not of thee, O *M. Cicero*? and yet how should I possibly write of thee according to M
thy worthinesse? would a man require a better proofe of thy condigne praises, than the most ho-
norable testimony of the whole body of that people in generall, and the acts onely of thy Con-
sulship, chosen out of al other vertuous deeds throughout thy whole life? Thine eloquence was
the cause that all the Tribes renounced the law *Agraria*, as touching the diuision of Lands a-

among

20030
copy 1

among the commons, albeit their greateſt maintenance and nouriſhment conſiſted therein. Through thy perſuaſion they pardoned *Roſcius*, the firſt author of that ſeditious bill and law, whereby the States and degrees of the city were placed diſtinctly in their ſeats at the Theatre: they were content I ſay, and tooke it well, that they were noted and pointed at for this difference in taking place and rowms, which he firſt brought in. By means of thy orations, the children of proſcript and outlawed perſons were aſhamed and abaſhed to ſue for honorable dignities in common-weale: thy witty head it was that put *Catiline* to flight, and baniſhed him the city: thou, and none but thou didſt out-law *M. Antonius*, and put him out of the protection of the State. All haile therefore, O *M. Tullius*, faire chieue thee, thou that firſt was ſaluted by the name of *Parens patriæ, i.* Father of thy countrey: firſt that deſerued triumpth in thy long robe, & the laurel garland, for thy language: the only father indeed of eloquence & of the Latin tongue: and (as *Cæſar* Dictator ſomtime thine enemy hath written of thee) haſt deſerued a crown aboue all other triumphs, by how much more praiſe-worthy it is, to haue amplified and ſet out the bounds and limits of Roman wit and learning, than of Roman ground and dominion.

Chap. XXXI.

¶ *Of a certaine Maieſtie in behauiour and cariage.*

THoſe, who among other gifts of the minde haue ſurpaſſed other men in ſage aduiſe and wiſdome, were thereupon at Rome ſurnamed *Cati*, and *Corculi*. In Greece, *Socrates* carried the name away from all the reſt, being deemed by the Oracle of *Apollo Pythius*, the wiſeſt man of all others.

Chap. XXXII.

¶ *Of Authoritie.*

AGaine, *Chilo* the Lacedemonian was of ſo great reputation among men, that his ſayings were held for Oracles; and three precepts of his were written in letters of gold, & conſecrated in the temple of *Apollo* at Delphi: where the firſt was this, *Know thy ſelfe:* the ſecond, *Set thy minde too much on nothing*. The third, *Debt and Law are alwaies accompanied with miſery*. His hap was to die for ioy, vpon tidings that his ſon wan the beſt prize, and was crowned victour at the ſolemne game Olympia; and when he ſhould be interred, all Greece did him honour, and ſolemnized his Funerals.

Chap. XXXIII.

¶ *Perſons of a diuine ſpirit and heauenly nature.*

AMong women, *Sybilla* was excellent at diuination, and for a certaine fellowſhip and ſocietie with cœleſtiall wights, of great name. As for men, among the Greeks, *Melampus:* and with vs Romans, *Martius*, carried as great an opinion.

Chap. XXXIV.

¶ *Scipio Naſica.*

SCipio *Naſica* was iudged once by the Senat (ſworne to ſpeak without paſſion and affection) to be the beſt & honeſteſt man that euer was from the beginning of the world: howbeit the ſame man, as vpright as he was, ſuffered a repulſe and diſgrace at the peoples hands in his white Robe when he ſued for a dignity; and to conclude, in the end his hap was not to depart this life in his owne countrey; no more than it was the will of God that *Socrates* the wiſeſt man (ſo deemed by the Oracle of *Apollo*) ſhould die out of priſon.

Chap. XXXV.

¶ *Of Chaſtitie.*

SVlpitia, daughter of *Paterculus*, and wife to *Fulvius Flaccus*, by al the voices in general of Roman dames, carried away the prize for continencie, and was elected out of the hundred principall matrons of Rome to dedicate and conſecrate the image of *Venus*, according to

and ordinance out of *Sybils* bookes. *Claudia* likewise, was by a religious and deuout experiment proued to be such another, at what time as she brought the mother of the gods, *Cybele* to Rome. G

Chap. XXXVI.

¶ *Of Pietie or kindenesse.*

IN all parts verily of the world, there haue been found infinite examples of naturall loue and affection, but one example thereof at Rome hath been knowne singular aboue all others, and incomparable. There was a poore young woman of the common sort, and therefore base and of no account, who lately had been in childbed, whose mother was condemned to perpetuall prison, and there lay, for some great offence that she had committed: this daughter of hers and young nource aforesaid, obtained leaue to haue accesse vnto her mother, and euermore by the H gaoler was narrowly searched for bringing to her any victuall, because her iudgment was to be famished to death: thus she went and came so long, vntill at last she was found suckling of her mother with the milke of her breasts. This was reputed for such a strange and wondrous example, that the mother was released and giuen to the daughter for her rare piety and kindnes: both of them had a pension out of the city allowed them for their amintenance for euer; and the place where this hapned was consecrated to *Pietie*: in so much, as when *C. Quintius* and *M. Acilius* were Consuls, there was a temple to her built, in the very place where this prison stood, iust whereas now standeth the Theatre of *Marcellus*. The father of the *Gracchi* happened to light vpon and take two serpents within his house, whereupon he sent out to the Sooth-sayers for to I know, what this thing might presage? who made this answer, That if he would himselfe liue, the female snake should be killed; Nay marry (qd. he) not so, but rather kill the male; for my wife *Cornelia* is yong enough, and may haue more children. This said he, meaning to spare his wiues life, in consideration of the good she might do to the common-weale. And in truth; like as the wizards propheſied, so it fell out soone after, and their words tooke effect. *M. Lepidus* so entirely loued his wife *Apuleia*, that he died for very thought and griefe of heart, after shee was diuorced from him and turned away. *P. Rutilius* chanced to be somewhat ill at ease and sickish, but hearing of his brothers repulse, and that hee was put by his Consulship (for which he stood in suit) died suddenly for sorrow. *P. Catienus Philotimus* so loued his Lord and master, that notwithstanding he was by him made his sole heire of all that euer he had, yet for kind heart, cast him- K selfe into the funerall fire to be burnt with him.

Chap. XXXVII.

¶ *Of diuers excellent men in many Arts and Sciences, and namely in Astrologie, Grammer, and Geometrie.*

IN the skill and knowledge of sundry Sciences, an infinit number of men haue excelled; howbeit, we wil but take the very floure of them all, and touch those only whom meet it is to be named for their speciall desert. In Astrologie, *Berosus* was most cunning; in so much as the L Atheniens for his diuine predictions and prognostications, caused his statue with a golden tongue, to be erected in the publicke schoole of their Vniuersitie. For Grammer, *Apollodorus* was singular, and therefore was highly honored of the States of Greece, called Amphictyones. In Physicke, *Hippocrates* excelled, so far forth as by his skill hee foretold of a pestilence that should come out of Sclauonia; and for to cure and remedie the same, sent forth his disciples and schollers to all the cities about. In recompence of which good desert of his, all Greece by a publick decree ordained for him the like honors, as vnto *Hercules*. For the very same cunning and science, king *Ptolomæ* gaue vnto *Cleombrotus* of Cea (at the solemne feast holden in the honour of the great mother of the gods) a hundred talents, and namely for curing the king *Antiochus*. *Critobulus* likewise acquired and got himselfe a great name, for drawing an arrow forth of king *Philips* eie, and curing the wound when he had don, so as the sight remained, & no blemish or deformity appeared. But *Asclepiades* the Prusian, surpassed all others in this kind, who was the M first author of that new sect which bare his name, reiected the embassadors, the large promises & fauors offered of K. *Mithridates*: found out the way and means to make wine wholesome and

medici-

20030
copy 1

A medicinable for ſicke folke: and recouered a man to his former ſtate of health, who was caried forth vpon his biere to be buried: and laſtly he attained the greateſt name; for laying a wager againſt fortune, and pawning his credit ſo farre as he ſhould not be reputed a Phyſitian, in caſe he euer were known to be ſicke or any way diſeaſed. And in truth the wager hee woon; for his hap was to liue in health vntill he was very aged, and then to fall downe from a paire of ſtaires, and ſo to die ſuddenly. A ſingular teſtimonie of skill and cunning *M. Marcellus* gaue vnto *Archimedes* that notable Geometrician and Enginer of Syracuſa, who in the ſaccage and rifling of that city gaue expreſſe commandement concerning him alone, that no violence ſhould be done vnto him: howbeit hee will failed of his execution, by occaſion of a ſouldier, who in that
B hurly-burly ſlew him, not knowing who he was. Much commended and praiſed is *Cteſiphon* of Gnoſos, for his notable knowledge in Architecture, and namely for the wonderful frame of *Dianaes* Temple at Epheſus. *Philon* likewiſe was highly eſteemed for making the Arſenall at Athens, able to receiue 1000 ſhips. *Cteſibius* alſo was much accounted of for deuiſing winde Inſtruments; and by means of certain engins to draw and ſend water to any place. *Dinocrates* alſo the enginier eterniſed his name for caſting the plot and deuiſing the modell of Alexandria in Egypt, at what time as *Alexander* the great founded it. To conclude, this mighty prince and commander *Alexander* ſtreightly forbad by expreſſe edict, That no man ſhould draw his pourtrait in colours but *Apelles* the painter: that none ſhould engraue his perſonage but *Pyrgoteles* the grauer: and laſt of all, that no workman ſhould caſt his image in braſſe but *Lyſippus* a Founder. In which three feats many Artiſans haue excelled for their rare workmanſhip.

C

Chap. XXXVIII.

¶ *Singular works of Artificers.*

KIng *Attalus* cheapned one picture wrought by the *Ariſtides* Theban, and 100 talents for it. *Ceſar* the Dictator offered to *Timomachus* eight talents for two pourtraits, to wit, of *Medea* and *Aiax*, which he meant to ſet vp and conſecrate in the temple of *Venus Genetrix*. King *Candaulas* bought of *Butarchus* a painted table, wherein was drawne the defeature and deſtruction of the Magnetes, which tooke vp no great roome, and weighed out the poiſe thereof in good gold. King *Demetrius*, ſirnamed *Expugnator*, [*i.* the conqueror and great forcer of cities]
D forbare to ſet Rhodes on fire, becauſe he would not burne one painted table the handiworke of *Protogenes*. *Praxiteles* was innobled for a rare Imager and cutter in ſtone and marble: he eterniſed his memoriall by making one image of *Venus* for the Gnidians, ſo liuely, that a certaine yong man became ſo amorous of it, and ſo doted thereon, that he went beſide himſelfe: which piece of worke was eſteemed of ſuch worth by *Nicomedes*, that whereas the Gnidians owed him a great ſum of money, he would haue taken it for full paiment of the whole debt. The ſtatue of *Iupiter Olympius* is to be ſeen, and dayly commendeth the workman *Phydias*. *Iupiter* likewiſe *Capitolinus*, and *Diana* in Epheſus yeeld good teſtimonies of *Mentors* cunning: and the tooles or inſtruments of the ſaid workeman were conſecrated (for their exquiſit making) vnto them in their temples, and there remaine.

E

Chap. XXXIX.

¶ *Of Seruants and Slaues.*

I Haue not knowne or heard to this day, of a man borne a ſlaue, that was priſed ſo high as *Daphnis* the Grammarian was: for *Cn. Piſaurenſis* held him at 300700 Seſterces to *M. Scaurus* a great and principall man of Rome. Howbeit in this our age certain ſtage players haue gon beyond this price, and that not a little: mary they were ſuch as had bought out their freedome before, and were not then ſlaues. And no maruell, for we finde vpon record, that the great
F Actor *Roſcius* in former time might yerely diſpend by the ſtage 500000 Seſterces. Vnleſſe a man deſire in this place to heare of the Treaſurer and purueior general of the army in Armenia for the late wars of King *Tyridates*, who was infranchiſed by means of *Nero*, for 120000 Seſterces, but it was the war that coſt thus much, and not the man. Like as *Sutorius Priſcus* gaue vnto *Seianus* 3500 Seſterces for *Pæzon* one of his gelded Eunuchs: For a man would ſay that this

was

was more to satisfie his filthy lust, than for any special beauty to be seen in the said *Pæzon*. But he tooke the vantage of the time, and went cleare away with this impious villanie: for at what time as he bought him, the city was in perplexitie and sorrow, and no man for thinking of greater affaires and troubles, had any leisure to finde fault or say a word in reproofe of such enormities. G

Chap. XL.

¶ *The excellencie of Nations.*

DOubtlesse it is, and past all question, that of all Nations vnder the Sun, the Romans excell and are the only men for all kinde of vertues. But to determine who is the happiest man in all the world is aboue the reach of humane wit; considering that some take contentment and repose felicitie in this thing, others in that, and euery one measureth it according to his seuerall fancy and affection: but to say a truth, and iudge aright indeed, laying aside all the glosing flatteries of fortune, and without courting her to determin this point, There is no man to be counted happy in this world. Right well it is on our side, and Fortune dealeth in exceeding fauor with vs, if we may not iustly be called vnhappy: for put case there be no other miserie and calamitie besides, yet surely a man is euer in feare lest Fortune will frowne vpon him, and do him a shrewd turne one time or other: and admit this feare once, there can be no sound happinesse and contentment in the minde. What shall I say moreouer than this, that no man is at all times wise and in his perfect wits? Would God that this were taken of most men for a Poets word only, and not a true saying indeed. But such is the vanity and folly of poore mortall men, that they flatter themselues, and are very witty to deceiue themselues, making their accounts and reckonings of good and euill fortune like to the Thracians, who by certain white and blacke stones which they cast into a certaine vessell, and there laid vp for the better proofe and triall of euery dayes fortune; and at the last day and time of their death they fall to parting these stones one from another, and telling them apart, and accotding to the number of the white and blacke, giue iudgement and pronounce of each ones fortune. But what say they to this, that many times it falleth out, that the day marked with a white stone, for a good day, had in it the beginning & ouerture of some great misfortune and calamitie? How many men haue seemed to fall into Fortunes lap, and entred vpon great empires and dominions, which in the end turned to their afflictions and miseries? How many haue we seen ouerthrowne, punished extremely, and brought to vtter ruine, euen by means of their owne good parts and commendable gifts? Certes these be good things & great fauors, if a man could make ful account to enioy them but one houre with contentment. But thus verily stands the case, and this is the ordinary course of this world: one day is the judge of another, and the day of death iudgeth and determineth all: and therefore there is no trust in them, neither may wee assure our selues of any. To say nothing of this, that our good fortunes are not in number equall to our bad: and say there were as many of the one as of the other, Is there any one ioy to be weighed in true ballance against the least grief and sorrow that commeth? Foolish and sottish men that we are for all our curiositie! for we reckon our daies by tale and number, whereas we should ponder and peise them by weight. H I K L

Chap. XLI.

¶ *Of the highest tipe and pitch of felicity.*

Lampido the Lacedemonian Lady is the only woman that euer was knowne to haue beene daughter to a King, a Kings wife, and mother to a King. Also *Pherenice* was known alone to be the daughter, sister, and mother to them that wan the victorie and carried away the best prise at the Olympian games. In one house and race of the *Curices* there were known three excellent Orators one after another by discent from the father to the son. The only family and line of the *Fabij* affoorded three Presidents of the Senat in course, one immediatly vnder another, to wit, *M. Fabius Ambustus* the father, *Fabius Rullianus* the father, *Fabius Rullianus* the son, and *Q. Fabius Gurges* the nephew. M

Chap. XLII.

¶ *Examples of Fortunes mutabilitie.*

INfinite other examples we haue of the varietie and inconſtancie of Fortune: for what great ioyes to ſpeake of, gaue ſhe euer, but vpon ſome miſhap or other? Again, the greateſt miſeries and calamities that haue bin, haue they not enſued vpon the moſt ioyes and contents.

Chap. XLIII.

¶ *Of one twice outlawed and out of protection: as alſo of Q. Metellus and L. Sylla.*

B

FOrtune preſerued for 36 yeares *M. Fidueſtius* a Senator, outlawed by *Sylla*: yet hapned hee afterward to be outlawed the ſecond time; for he out-liued *Sylla*, and continued vnto the time of *Marcus Antonius*: and for certain it is knowne, that by him hee was baniſhed and outlawed againe, for no other reaſon but becauſe he had been ſo before-time. So kind was Fortune to *P. Ventidius*, as that ſhe would haue him to triumph alone ouer the Parthians: but ſhee had before time ſo good as played with him, when ſhee ſaw him led (being a boy) as priſoner in *Cn. Pompeius Strabo* his triumph for the defeature and ouerthrow of the Aſulanes. Although *Maſſurius* teſtifieth, that he was ſo led in triumph as a ſlaue twice: *Cicero* ſaith, that hee was at
C first but a Mulitier, and draue mules laden with meale for the oven, to ſerue the campe. Many other affirme, that in his youth hee was a poore ſouldier, and ſerued as a footman in his ſingle trouſes and grieues. Moreouer, ſuch good fortune had *Balbus Cornelius*, as to the ſenior Conſull and declared Elect before his fellow: but before time he had beene in trouble, and iudicially accuſed, yea and a Iury was impanelled to go vpon him, ſo as he was in danger to be whipped, vpon their verdict. Well, this mans hap for all this was to be the firſt Roman Conſull of Forreiners, and namely Iſlanders within the main Ocean: he (I ſay) attained to that honor, which our forefathers denied flatly to the Latines their neighbors. Among other notable examples, *L. Fulvius* may go for one, who was Conſull of the Tuſculans when they reuolted and rebelled againſt the Romans: howbeit forſaking his owne citiſens, and returning to Rome, was preſent-
D ly by the whole people aduanced to the ſame honour amongſt them, and he was the man alone knowne to haue triumphed in Rome ouer them whoſe Conſull he was, euen the ſame yere that he himſelfe was as a Roman enemie in the field. *L. Sylla* was the only man vntill our time that challenged vnto himſelfe the ſyrname of *Fælix*. But how was hee adopted as it were into this name, forſooth euen by ſhedding and ſpilling ſo much innocent bloud of Roman citiſens, and by waging war againſt his natiue country? And whereupon I pray you grounded he this happineſſe of his, and had ſo great an opinion thereof, if this were not it, that he was able to baniſh, that he was able to baniſh, confiſcate, and put to death ſo many thouſand citiſens? O falſe and deceitfull interpretation, dangerous, vnhappy, and pernicious euen to poſteritie and the time to come! For were not they more bleſſed and happy, who then fortuned to loſe their liues,
E (whoſe death at this day we pitty, and whom we take compaſſion of) than *Sylla*, whom all men at this day hateth and abhorreth? Moreouer, was not his end more cruell and horrible than the ſorrow of all thoſe that by him were outlawed, and their goods forfeit? for his owne wretched body did eat, gnaw, and conſume it ſelfe, and bred daily and hourely lothſome vermine to put the ſame to paine and torment. And ſay that he diſſembled all this, and would not be knowne of it; and ſuppoſe we gaue credit that laſt dreame of his (wherein he lay as it were dead or in a trance) vpon which he gaue out this ſpeech, that himſelfe and none but he had the glory to ſurmount all enuy: yet in this one thing he plainly confeſſed that his felicitie came ſhort & was defectiue, in that he had not time to conſecrate the Capitoll Temple. *Q. Metellus* in that funerall oration of his which he made in praiſe and commendation (as the maner was) of *L. Me-*
F *tellus* his father, gaue theſe laudable reports of him, that he had been the ſoueraigne Pontifie or high-Prieſt of Rome, twice Conſull, Dictator, Generall of the horſe, one of the fifteen Quindecemvirs deputed for diuiſion of lands among the ſouldiers and Commons: and that in the firſt Punicke warre he ſhewed many Elephants in a triumph: moreouer he left in writing, that hee had accompliſhed ten of the greateſt and beſt points belonging to this life: in the ſeeking whereof

whereof and in attaining thereunto, all the great Sages of the world spend their whole life: for (saith he) his desire was, and he thereto aimed, namely, to be a most doubty and hardy warrior, an excellent orator, a right valiant captaine and commander: also, to haue the conduct, charge, and execution of the greatest and most important affaires, to be in the highest place of honor, to be singular in wisdome, to be accounted the principall and chiefe in Senat, to come to great riches by good and lawful means, to leaue much faire issue behind him: and to conclude, to be simply the best man of all other, and the principall person in the city. To these perfections he (and none but he since Rome was Rome) attained. Now to confute this were a long and needlesse piece of worke, considering that one only mischance checked these fauors of Fortune, and fully disproued all: for the very same *Metellus* became blinde in his old age, for hee lost his eies in a skare-fire, at what time hee would haue saued and got away the *Palladium, i.* Image of *Minerua*, out of the temple of *Vesta*. His act I confesse was vertuous and memorable, but the event was ill for him and miserable. In regard whereof I know not how he should be called vnhappy and wretched: and yet I see not why he should be named happy and fortunate. This I must needs say in conclusion, that the people of Rome granted vnto him that priuiledge, that neuer man in the world was knowne to haue, namely, to ride in his coach to the Senat house so oft as he sate at the councell table. A great prerogatiue I confesse, and most stately, but it was allowed him for want of his eyes.

Chap. XLIV.

¶ *Of another Metellus.*

A Sonne likewise of this *Q. Metellus*, who gaue out those commendations aforesaid of his father, may be put in the ranke of the most rare presidents of felicitie in this world: for besides the most honorable dignities and promotions hee was aduanced vnto in his life time, and the glorious addition and syrname of *Macedonicus*, which he got in Macedonie; when he was dead, there attended vpon his dead corps at his funerals to inter him, foure of his sons; the one Pretor for the time being; the other three had been Consuls in their time: & of these three, two had triumphed in Rome, and the third had been Censor. These were points, I may tell you, of great note and regard, and few men are to be found in comparison, that can come to any one of them. And yet see! in the very prime and floure of all these honors, it fortuned that *Catinius Labeo*, syrnamed *Macerio*, a Tribune or protector of the Commons (whom he before by vertue of his Censorship had displaced out of the Senat) waited his time when he returned about noone from *Mars* field, and seeing no man stirring in the market place, nor about the Capitoll, tooke him away perforce to the cliffe Tarpeius, with a full purpose to pitch him downe headlong from thence and to breake his necke. A number came running about him, of that crue and company which was woont to salute him by the name of Father; but not so soone as such a case required, considering this so sudden an occurrent: and when they were come, went but slowly about any rescue, and kept a soft pace, as if they had waited vpon some corps to a buriall; and to make resistance and withstand perforce the Tribune, armed as he was with his sacrosanct and inuiolable authoritie, they had no warrant by Law: insomuch as hee was like to haue perished and come to a present mischiefe, euen for his vertue, and faithfull execution of his Censorship, had there not been one Tribune of ten found, hardly and with much adoe to step between and oppose himselfe against his Collegue, and so by good hap rescued him out of his clutches, and saued him as it were at the very pits brinke, enen from the vtter point of death. And yet he liued afterwards of the courtesie and liberalitie of other men: for why, All his goods from that day forward were seised as forfeit and confiscate, by that Tribune whom before-time he had condemned: as if hee had not suffered punishment and sorrow enough at his hands, to haue his necke so wrythed by him, as that the bloud issued out at his very eares. Certes for mine owne part I would reckon this for one of his crosses and calamities, That hee was an enemie to the later *Africanus Æmylianus*, euen by the testimonie and confession of *Macedonicus* himselfe: for after the death of the said *Africanus*, these were his words vnto his owne sonnes; Go your waies sirs and do honour to his Obsequies, for the funerall of a greater personage, and a better Citisen, shall you neuer see. And this spake he to them when as they had conquered Creta and the Baleare Islands, and thereof were syrnamed *Creticus* and *Balearicus*, and

20030
copy 1

A and had worne the lawrell diadem in triumph; being himſelfe already entituled with the ſtile of *Macedonicus*, for the conqueſt of Macedonie. But if we conſider and weigh that onely wrong and iniurie offered him by the Tribune, who is it that can iuſtly deeme him happy, being expoſed as he was to the pleaſure, mercy, and force of his enemie, far inferior to *Africanus*, and ſo to come to confuſion? What were all his victories to this one diſgrace? what honors and triumphant chariots ſtrooke not Fortune downe with her foot, and ouerturned all againe, or at leaſt wiſe ſet not back again with this her violent courſe, ſuffering a Roman Cenſor to be haled and tugged in the very heart of the city (the only way indeed to bring him to his death) to be harried I ſay vp to that capitoll hill there to make his end, whither aforetime hee aſcended triumB phant, but neuer committed that outrage vpon thoſe priſoners and captiues whom hee lead in triumph, and for whoſe ſpoiles he triumphed, as to hale and pull them in that rude ſort? And verily the greater was this outrage, and ſeemed the more heinous, in regard of the felicity that afterward enſued: conſidering, that this *Macedonicus* was in danger to haue loſt ſo great an honor as he had in his ſolemne and ſtately ſepulture, namely when he was caried forth to his funerall fire by his triumphant children, as if he had triumphed once again at his buriall. In ſum, that can be no ſound and aſſured felicitie that is interrupted with any indignitie or diſgrace whatſoeuer: much leſſe by ſuch an one as this was. To conclude, I wot not well whether there be more cauſe to glory for the modeſt cariage of men in thoſe daies, or to grieue at the indignitie of the thing, in that among ſo many *Metelli* as there were, ſo audacious a villanie as this was of *Catinius* was neuer reuenged vnto this day.

C

Chap. XLV.

¶ *Of Auguſtus Cæſar late Emperor.*

AS touching the late Emperor *Auguſtus*, whom all the world rangeth in this ranke of men fortunat: if we conſider the whole courſe of his life we ſhal find the wheele to haue turned often, and perceiue many changes of variable fortune. Firſt, his owne vncle by the mothers ſide put him by the Generalſhip of the horſe; and notwithſtanding all his earneſt ſuit preferred *Lepidus* to that place before him: ſecondly, he was noted and thought hardly of for thoſe outlawries of Roman citiſens, and thereby purchaſed himſelfe much hatred and diſpleaD ſure: tainted alſo he was for being one of thoſe three in the Triumvirate, yoked and matched with wicked companions and moſt dangerous members to the weal publique: and this galled him the more, that in this fellowſhip, the Roman empire was not equally and indifferently parted among them three, but *Antonie* went away with the greateſt ſhare by odds. Alſo his ill fortune was in the battell before Philippos to fall ſicke, to take his flight, and for three daies, diſeaſed as he was, to lurke and lie hidden within a mariſh: whereupon (as *Agrippa* and *Mecænas* confeſſe) he grew into a kinde of dropſie, ſo as his belly and ſides were puffed vp and ſwelled with a wateriſh humor, gotten and ſpred betwixt the fleſh and the skin. Furthermore, he ſuffered ſhipwrecke in Sicily, and there likewiſe he was glad to skulk within a caue in the ground. What ſhould I ſay, how when he was put to flight at ſea, and the whole power of his enemies E at his heeles, he beſought *Proculeius* in that great danger to rid him out of his life: how he was perplexed for the quarrels and contentions at Peruſium: in what feare and agonie hee was in the battell of Actium (a towne of Albanie) as alſo for the iſſue of the Pannonian warre, for the fall of a bridge and a towne both. So many mutinies among his ſoldiers; ſo many dangerous diſeaſes: the iealouſie and ſuſpition that he had euermore of *Marcellus*: the roproch & ſhame he ſuſtained for confining and baniſhing *Agrippa*: his life ſo many times laid for, by poiſon and other ſecret traines: the death of his children, ſuſpected to haue bin by indirect meanes: the double ſorrow and griefe of heart thereby, and not altogether for his childeleſſe eſtate. The aF dulterie of his owne daughter, and her purpoſe of taking his life away, detected and publiſhed to the World: the reproch full departure and ſlipping aſide of *Nero* the ſonne of his Wife: another adulterie commited by one of his owne Neeces. Ouer and aboue all this, thus many more croſſes and troubles comming one in the necke of another: namely, want of pay for his ſouldiers, the rebellion of Sclauonia, the muſtering of ſlaues and bond-ſeruants to make vp his army, for want of other able youths to leuy vnto the warres: Peſtilence in Rome Citie: famin and drought vniuerſally throughout Italy: and that which more is, a deliberat purpoſe

and

and reſolution of his to famiſh and pine himſelfe to death, hauing to that end faſted 4 dayes and 4 nights; and in that time receiued into his body the greater part of his owne death. Beſides, the ouerthrow and rout of *Varius* his forces, the foule ſtaine and blemiſh to the touch of his honor and maieſtie very neere: the putting away of *Poſthumius Agrippa* after his adoption, and the miſſe that he had of him after his baniſhment: then, the ſuſpition that hee conceiued of *Fabius* for diſcloſing his ſecrets: adde hereto the opinion and conceit he tooke of his owne wife and *Tiberius*, which ſurpaſſed all his other cares. To conclude, that god, and he who I wot not whether obtained heauen, or deſerued it more, departed this life, and left behinde him as heire to the crowne his enemies ſonne.

Chap. XLVI.

¶ *Whom the gods iudge moſt happy.*

I Cannot ouerpaſſe in this diſcourſe and conſideration the Oracles of Delphos, deliuered from that heauenly god to chaſtiſe and repreſſe as it were the folly and vanitie of men: and two there be which giue anſwer to the point in queſtion after this manner: Firſt, that *Phedius*, who but a while before died in the ſeruice of his countrey, was moſt happy. Moreouer, *Gyges* (the moſt puiſſant king in thoſe daies of all the earth) ſent a ſecond time to know of the Oracle, who was the happieſt man next him: and anſwer was made, That *Aglaus Pſophidius* was happier than the former. Now this *Aglaus* was a good honeſt man well ſtept in yeares, dwelling in a very narrow corner of Arcadia, where he had a little houſe and land of his own, ſufficient with the yearely commodities thereof to maintaine him plentifully with eaſe, out of which hee neuer went, but employed himſelfe in the tillage and husbandry thereof, to make the beſt benefit he could: in ſuch ſort that (as it appeared by that courſe of life) as he coueted leaſt, ſo he felt as little trouble and aduerſitie while he liued.

Chap. XLVII.

¶ *Who was canoniſed a god here vpon earth liuing.*

BY the ordinance and appointment of the ſame Oracle, as alſo by the aſcent and approbation of *Iupiter* the ſoueraigne god, *Euthymus* the famous wreſtler (who alwaies wan the beſt prize at Olympia ſaue once) was reputed and conſecrated a god whiles he liued, and knew thereof: born he was at Locri in Italy, where one ſtatue of his, as alſo another at Olympia, were both in one day ſtricken with lightning: whereat I ſee *Callimachus* wondred, as if nothing elſe were worthy admiration, and gaue order that he ſhould be ſacrificed vnto as a god: which was performed accordingly both whiles he liued, and after hee was dead. A thing that I maruell more at than any thing elſe, That the gods were therewith contented, and would permit ſuch a diſhonour to their maieſtie.

Chap. XLVIII.

¶ *Of the longeſt liues.*

THe terme and length of mans life is vncertaine, not only by reaſon of the diuerſity of climats, but alſo becauſe Hiſtorians haue deliuered ſuch varietie of mens ages, and euerie man by himſelfe hath a ſeuerall time limited vnto him at the very day of his birth. *Heſiod* (the firſt writer, as I take it, who hath treated of this argument, and yet like a Poet) in his fabulous diſcourſe touching the age of man ſaith forſooth, that a crow liues nine times as long as we; and harts or ſtags 4 times as long as hee, but Rauens thrice as long as they. As for his other reports touching the Nymphs and the bird Phœnix, they are more like poeticall tales, than true relations. *Anacreon* the Poet maketh mention, that *Argantonius* king of the Tarteſſians, liued 150 yeares: and *Cynaras* likewiſe King of the Cyprians ten yeares longer. *Theopompus* affirmeth, that *Epimenides* the Gnoſſian died when he was 157 yeares old. *Hellanicus* hath written, That amongſt the Epians in Ætolia there be ſome that continue full two hundred years: and with him accordeth *Damaſes*: adding moreouer, that there was one *Pictoreus* among them, a man of exceeding ſtature, mighty and ſtrong withall, who liued three hundred yeares.

Ephorus

20030
copy 1

A *Ephorus* teſtifieth, that ordinarily the kings of Arcadia were 300 yeares old ere they died. *Alexander Cornelius* writeth of one *Dando* a Sclauonian, who liued 500 yeres. *Xenophon* in his treatiſe of old age, makes mention of a King of the Latines, or as ſome ſay, ouer a people vpon the ſea coaſts, who liued 600 yeares; and becauſe he had not lied loud enough already, he goes on ſtill and ſaith, that his ſon came to 800. All theſe ſtrange reports proceed from the ignorance of the times paſt, and for want of knowledge how they made their account; for ſome reckoned the Summer for one yeare, and the Winter for another. There were againe that reckoned euery quarter for a yeare, as the Arcadians, whoſe yeare was but three moneths. Ye ſhall haue ſome, and namely the Egyptians, that count euery change or new Moon for a yeare: and therefore no
B maruell if ſome of them are ſaid to liue 1000 yeares. But to paſſe from theſe vncertainties, to things confeſſed and doubtleſſe. Held it is in maner for a certain truth, that *Arganthinus* King of Calis reigned full 80 yeares, and it is thought he was 40 yeares old when he came vnto the crowne. And as vndoubted true it is, that *Maſaniſſa* ware the crown 60 yeares. As alſo that *Gorgias* the Sicilian liued vntill he was 108 yeares old. As for *Q. Fabius Maximus* (a Roman) hee continued Augure 63 yeares. *M. Perpenna*, and of late daies *L. Voluſius Saturninus*, out-liued all thoſe Senators which ſate in councell with them when they were Conſuls, and whoſe opinions they were wont to aske. As for *Perpenna*, when hee died, hee left but 7 of thoſe Senators aliue, whom he had either choſen or re-elected in his Cenſorſhip: and he liued himſelfe 98 yeares. Where by the way one thing commeth into my mind worth the noting, That one Luſtrum or
C 5 yeares ſpace there was, and neuer but one, in which there died not a Roman Senator, and that was from the time that *Flaccus* and *Albinus* the Cenſors finiſhed their ſuruey, & ſolemnly purged the city after the order, to the comming in of the next new Cenſors; being from the foundation of Rome 579 yeres. *M. Valerius Corvinus* liued 100 yeares complete: between his firſt and ſixt Conſulate were 46 yeares; he tooke his ſeat vpon the yuorie chaire of eſtate, and was created a magiſtrate Curule 21 times, and no man elſe ſo often. *Metellus* the Pontifie or ſoueraigne prieſt liued full as long as he.

To come now to women: *Liuia* the wife of *Rutilius* liued 97 yeares with the better. *Statilia* a noble lady of Rome, in the time of *Claudius* the Emperor, was knowne to be 99 yeares of age. *Ciceroes* wife *Terentia* out-liued her husband vntill ſhe was 103 yeres old. *Clodia* wife to *Oſilius*,
D went beyond her, and ſaw 115 yeres, & yet ſhe had in her youth 15 children. *Luceia* a common vice in a play, followed the ſtage and acted thereupon 100 yeares. Such another vice that plaid the foole & made ſport between whiles in interludes, named *Galaria Copiola*, was brought again to act her feats vpon the ſtage, when *Cn. Pompeius* and *Q. Sulpitius* were Conſuls, at the ſolemne plaies vowed for the health of *Aug. Cæſar* the Emperor, in the 104 yere of her age: the firſt time that euer ſhe entred the ſtage, to ſhew proofe of her skil in that profeſſion, was 91 yeres before, and then ſhe was brought thither by *M. Pomponius* an Ædile of the Commons, in the yere that *C. Marius* and *Cn. Carbo* were Conſuls. And once again *Pompeius* the Great, at the ſolemne dedication of his ſtately Theatre, trained the old woman to the ſtage for to make a ſhew; to the wonder of the world. Moreouer, *Aſconius Pædianus* is mine Author, that one *Samula* liued 110
E yeares; and therefore I maruell the leſſe, that one *Stephanio* (who was the firſt of the long robe that brought dancing and footing vpon the ſtage) plaid his part & danced in both the Secular plaies, as well thoſe that were ſet out by *Auguſtus* late Emperor, as which *Claudius* exhibited in his 4 Conſulate, conſidering that between the one and the other there were but 63 yeares: and yet liued *Stephanio* many a day after. *Mutianus* witneſſeth, that in Tempſis (for ſo is the creſt or pitch of the mountain Tmolus called) folke liued ordinarily 150 yeares. At that age *T. Fullonius* of Bononia entred his name into the Subſidie book, at the time that *Cl. Cæſar* held the generall tax: and that he was ſo old indeed, appeared truly as wel vpon record in the regiſters office, by conferring and laying together ſeueral paiments by him made from time to time, as alſo by certain things he had ſeen and known done in his life time (for the Emperor had a ſpeci-
F all care and regard, that way to find out the truth.)

Chap. XLIX. *Of diuers Horoſcopes or Natiuities of men.*

THis point would require the conference and aduice of Aſtrologers: for *Epigenes* ſaith, it is not poſſible for a man to liue 122 yeres: and *Beroſus* is of opinion, that one canot paſſe 117. The proportion and reckoning holdeth ſtill for good, which *Petoſiris* and *Neſepſos*

calculated and grounded vpon their Quadrant, which they call *Tetartemorion*, that is to ſay, the compaſſe in the Zodiaque of three ſignes: Orientall, which determine of the life or death of men, according to which account it is euident, that in the tract or clymat of Italy men may reach to 126 yeares. The aboue-named Aſtrologers affirmed, that a man could not poſſibly paſſe the ſpace of 90 degrees from the Aſcendent or erection of his natiuitie (which they call Anaphoras) and that euen this courſe through the degrees of three ſignes, is many times interrupted and cut ſhort, either by the oppoſition and encounter of ſome wicked planets, or by the maligne aſpects of them or the Sun. On the other ſide, *Aſclepiades* and his ſect affirme, that the length of our life proceedeth from the influence of the [fixed] ſtars: but as touching the vtmoſt terme thereof they ſet downe nothing definitiuely: mary thus much they ſay, That the fewer ſort of men liue any long time; for that the greateſt number by far haue their natiuitie incident and liable to the dangerous houres and time, either of the moones occurrence (as in her Quadrature, Oppoſition, and Sextile aſpect) or of daies according to the number of ſeuen or nine (which are daily and nightly marked and obſerued:) whereupon enſueth the rule of the dangerous graduall yeares, called Clymactericke: and ſuch as are in that wiſe borne, lightly liue not aboue 54 yeares. And here we may ſee by the doubtfulneſſe and incertitude of this ſcience of Aſtrologie, how vncertain this whole matter is which we haue in hand. Moreouer, wee found the contrarie by experience and many examples; and namely in the laſt taxation, numbring, and review of the prouinces ſubiect to Rome within Italy, that was taken vnder the *Cæſars Veſpaſians*, the father and the ſonne, both Emperors and Cenſors. And here we need not to ſearch euery corner, and to ranſacke euery place very narrowly; we will onely giue inſtance and ſet downe the examples of the one moity thereof, namely that tract which lieth betweene Apennine and the Po. At Parma three men were found that liued ſixe ſcore yeares: at Brixels, one that liued 125 yeares: at Plaiſance one elder by a yeare: at Faventia there was one woman 132 yeares old: at Bononie, *L. Terentius* the ſonne of *Marcus*; and at Ariminum, *M. Aponius*, reckoned each of them 150 yeares. *Tertulla* was knowne to be 137 yeares old. About Plaiſance there is a towne ſcituate vpon the hills, named Velleiacium, wherein ſix men brought a certificate, that they had liued an hundred yeares apiece: foure likewiſe came in with a note of an hundred and twenty yeares: one, of an hundred and fourteene, namely *M. Mutius*, ſon of *Marcus*, named *Galerius fælix*. But becauſe we will not dwell long in a matter ſo euident and commonly confeſſed: in the review taken of the eighth region of Italy, there were found in the rolle 54 perſons of an hundred yeares of age: 57 of an hundred and ten: two, of 125: foure of 130: as many that were 135 or 137 yeares old: and laſt of all, three men of an hundred and fortie. But let vs leaue theſe ages, and conſider a while another inconſtant variety in the nature of mortall men: *Homer* reporteth, that *Hector* and *Polydamas* were borne both in one night, men ſo different in nature and qualitie. Whiles *C. Marius* was Conſull, and *Cn. Carbo* with him, who had been twice before Conſull, the fifth day before the calends of Iune, *M. Cæcilius Ruffus* and *C. Licinius Calvus* were borne vpon a day, and both of them verily proued great Orators: but they ſped not alike, but mightily differed one from another in the end. And this is a thing ſeen daily to happen throughout the World, conſidering that in one houre kings and beggars are borne, likewiſe lords and ſlaues.

Chap. L.

¶ *Sundry examples of diuers Diſeaſes.*

Pvb. Cornelius Rufus, who was Conſul together with *M. Curius*, dreamed that he had loſt his ſight, and it proued true indeed, for in his ſleep he became blind & neuer ſaw again. Contrariwiſe *Phalereus*, [or *Iaſon Phereus*] being giuen ouer by the Phyſitions for an impoſtume he had in his cheſt, in diſpaire of all health (purpoſing to kill himſelfe for to be rid out of his paine) ſtabbed his breaſt with a knife: but he found this deadly enemy to be his onely Phyſition. *Q. Fabius Maximus* being long ſicke of a quartane Ague, ſtrucke a battell with the People of Sauoy and Auvergne neere the riuer Iſara, vpon the ſixth day before the Ides of Auguſt, wherein

20030
copy 1

A wherein he ſlew of his enemies 13000, and therewith was deliuered from his feuer, and neuer had it after. Certes this gift of life that we haue from nature, be it more or leſſe, is fraile & vncertain; and ſay that it be giuen to any in largeſt meaſure, it is but ſcant yet, and very ſhort, yea and of but ſmall vſe, if wee conſider the whole courſe thereof from the beginning to the end. For firſt, if we count our repoſe and ſleep in the night ſeaſon, a man can be truly ſaid to liue but halfe his life; for ſurely a good moity and halfe deale thereof which is ſpent in ſleeping, may be likened well to death: and if he cannot ſleep, it is a pain of all pains, and a very puniſhment. I reckon not in this place the yeares of our infancie, which age is void of reaſon and ſenſe; ne yet of old age, which the longer it continueth, the more are they plagued that be in it. What ſhould I ſpeake of ſo many kindes of dangers, ſo many diſeaſes, ſo many feares, ſo many penſiue
B cares, ſo many prayers for death, as that in maner we pray for nothing oftner? In which regards how can a man be ſaid to liue the while? and therefore Nature knoweth not what better thing to giue a man than ſhort life. Firſt and formoſt, the ſenſes wax dull, the members and limmes grow benummed, the eye ſight decaieth betimes, the hearing followeth ſoone after, then faile the ſupporters, the teeth alſo and the very inſtruments that ſerue for our food and nouriſhment: and yet forſooth all this time ſo full of griefe & infirmities is counted a part of our life. Hereupon it is taken for a miraculous example, and that to which again we canot find a fellow, that *Xenophilus* the muſitian liued 105 yeares, without any ſickneſſe or defect in all his body. For all other men, beleeue me, are vexed at certain houres (like as no other creatures beſides) with the peſtiferous heats and ſhaking colds of the feuer in euery ioynt, ſinew, and muſcle of the bo-
die, which go and come, keeping their times in their ſeuerall fits, not for certain houres in the
C day only, but from one day to another, and from night to night; one while euery third day or night, otherwhiles euery fourth, yea and ſomtime a whole yeare together. Moreouer, what is it but a very diſeaſe, to know the time and houre of a mans death, and ſo to die forſooth in wiſedome? For maladies there be in which Nature hath ſet down certain rules and lawes: namely a quartaine feuer neuer lightly begins in the ſhorteſt daies of the yeare, neither in the 3 moneths of winter [to wit, December, Ianuarie, Februarie.] Some diſeaſes are not incident to thoſe that are aboue 60 yeares of age: others againe do end and paſſe away when youths begin to be vndergrowne, and eſpecially this is obſerued in yong maidens. Moreouer, old folke of all other are leaſt ſubiect to take the plague. Furthermore, ſickneſſes there be that follow this re-
D gion or that, aſſailing and infecting the inhabitants generally therein. There be ſome againe that ſurpriſe and take hold of ſeruants only, both all and ſome: others touch the beſt perſons alone of the higheſt calling, and ſo from degree to degree. But in this place obſerued vſually it is by experience, That a peſtilence beginning in the South parts, goeth alwaies towards the Weſt, and neuer lightly but in winter, neither continueth it aboue three moneths.

† Alq etiam morb⁹ eſt aliquis per ſapientiam moriho. per ſtudium ſapientiæ. Ramaz. de morb. Art.

CHAP. LI.

¶ *Of the ſignes of death.*

E NOw let vs take a view of deadly tokens in ſicknes: in rage and furious madneſſe, to laugh is a mortall ſigne: in frenzie, wherein men are beſtraught of their right wits, to take care of the skirts, fringes, and welts of their garments, that they be in good order; to keepe a fumbling and pleiting of the bed-cloathes, the neglect of ſuch things as would trouble them in their ſleepe, and breake it: the voluntarie letting go of their water; prognoſticate death. A man may ſee death alſo in the eyes and noſe moſt certainly of all other parts: as alſo in the maner of lying, as namely when the patient lieth alwaies on his backe with his face vpward. We gather ſignes alſo by the vneuen ſtroke of the arterie; as alſo when the pulſe beateth ſo vnder the phyſitians hand as if he felt an ant creeping vnder it. Other ſignes alſo there be, which *Hipocrates* the prince and chief of all Phyſitions hath very wel obſerued and ſet down. Now where-
F as there be an infinite number of ſignes that preſage death; there is not one knowne than can aſſure a man certainly of life and health. For *Cato* that famous Cenſor, writing to his ſonne as touching this argement, hath deliuered, as it were out of an Oracle, That there is an obſeruation of death to be collected euen in them that are in the moſt perfect health: for (ſaith hee) youth reſembling age, is a certaine ſigne of vntimely death or ſhort life. As for diſeaſes, they

† magnitudo anicul'æ

are so innumerable, that *Pherecydes* of the Iland Syros died of a great quantity of Lice that G
came crawling out of his body. Some are knowne to be neuer free from the Ague, as *C. Mecænas*. The same man for three yeares before hee died neuer laid his eies together for sleepe a minute of an houre. *Antipater Sidonius* the Poet, once a yeare during his life had an ague fit vpon his birth day: he liued for all that to be an old man, and vpon the day of his natiuitie died in such a fit.

Chap. LII.

¶ *Of such as were carried forth vpon the Biers to be buried, and reuiued againe.*

H

A Viola, one that had bin Consull, came again to himselfe when he was cast or put into the funerall fire to be burnt: but because the flame was so strong that no man could come neere to recouer him, he was burnt quicke. The like accident befell to *Lu. Lamia*, Pretor lately before. As for *C. Ælius Tubero*, that he was brought aliue again from the like fire, after he had bin Pretor of Rome, both *Messala Rufus* and many besides constantly affirme. See how it goeth with mortall men: see, I say, our vncertaine state and condition, and how we are born, exposed, and subiect to these and such like occasions of fortune: insomueh as in the case of man there is no assurance at all, no not in his death. We reade in Chronicles, that the ghost of *Hermotimus Clazomenius* was woont vsually to abandon his body for a time, and wandering vp and
downe into far countries, vsed to bring him newes from remote places, of such things as could I
not possibly be knowne vnlesse it had bin present there: and all the while his body lay as halfe dead, in a trance. This manner it continued so long, vntill the Cantharidæ, who were his mortall enemies, tooke his body vpon a time in that extasie, and burnt it to ashes; and by that means disappointed his poore soule when it came backe againe, of that sheath, as it were, or case where she meant to bestow her selfe. Moreouer, we finde in records, that the spirit or ghost of *Aristæas* in the Iland Proconnesus, was seen euidently to fly out of his mouth in forme of a Rauen; and many a like tale followeth thereupon. For surely I take it to be no better than a fable, which is in like manner reported of *Epimenides* the Gnosian, namely, that when he was a boy, he being for heate and trauell in his iourney all wearie, laid him downe in a certain caue, where he slept 57 yeares. At length he wakened as it were vpon the next morning, and wondred K
at such a sudden change of euery thing he saw in the world, as if hee had taken but one nights sleepe. Hereupon, forsooth, in as many daies after as he slept yeares, he waxed old. Howbeit he liued in all 175 yeares. But to returne to our former discourse, women of all others by reason of their sex are most subiect to this danger, to be reputed for dead when there is life in them: and namely because of the disease of the matrice called the rising of the Mother: which if it be brought againe, and setled streight in the place, they soone recouer and take breath againe. Not impertinent to this treatise is that notable and elegant booke among the Greeks compiled by *Heraclides*, where he writeth of a woman that for a seuen-night lay for dead, and fetched not her breath sensibly, who in the end was raised againe to life. Moreouer *Varro* reporteth, that
vpon a time when the twenty deputy Commissioners were diuiding lands in the territory of L
Capua, there was one there carried forth vpon his bier to be burnt, and came home again vpon his feet. Also, that the like hapned at Aquinum. Likewise, that in Rome one *Corfidius*, who had maried his owne Aunt by the mothers side, after he had taken order for his funeralls, and set out a certaine allowance therefore, seemed to yeeld vp his ghost and die: howbeit hee reuiued againe, and it was his chance to carry him forth indeed vnto buriall, who had prouided the furniture before for his funerall. This *Varro* writeth besides of other miraculous matters, which verily are worth the rehearsall at large. One of them is this: Two brethren there were, by birth and calling gentlemen of Rome; whereof the elder, named *Corfidius*, hapned in all appearance to die: and when his last will and testament was once opened and published, the yonger brother (who was his heire) was very busie and ready to set forward his funerall. In the mean time M
the man who seemed dead fell to clap one hand against another, and therewith raised the seruants in the house: when they were come about him, he recounted vnto them, that he was come from his yonger brother, who had recommended his daughter to his tuition and guardenage: and moreouer, had shewed and declared vnto him, in what place he had secretly hidden certain

gold

20030
copy 1

A gold vnder the ground, without the priuity of any man; requeſting him withal to imploy that funerall prouiſion which he had prepared for him, about his own buriall and ſepulture. As he was relating this matter, his brothers ſeruitors came in great haſt to this elder brothers houſe, and brought word their maſter was departed this life: and the treaſure before-ſaid was found in the place accordingly. And verily there is nothing more common in our daily ſpeech, than of theſe diuinations; but they are not to be weighed in equall ballance with theſe, nor to be reported or credited all ſo confidently, forſomuch as for the moſt part they are meere lies, as we will proue by one notable example. In the Sicilian voiage it fortuned that *Gabienus*, one of the braueſt ſeruitors that *Cæſar* had at ſea, was taken priſoner by *Sex. Pompeius*, and by commandement from him his head was ſtricken off in a maner, and ſcarce hung to the neck by the skin, B and ſo lay he all day long vpon the ſands in the ſhore. When it grew toward euening, and that a great companie were flocked about him, he fetched a great groane, and requeſted that *Pompeius* would come vnto him, or at leaſtwiſe ſend ſome one of his deare familiars that were neere vnto him. And why? Come I am (quoth he) from the infernal ſpirits beneath, and haue a meſſage to deliuer vnto him. Then *Pompey* ſent diuers of his friends to the man, vnto whom *Gabienus* related in this maner; That the infernall gods were well pleaſed with the iuſt quarrell and cauſe of *Pompey*, and therefore he ſhould haue as good iſſue therof as he could wiſh. This, quoth he, was I charged and commanded to deliuer. And for a better proofe of the truth in effect, ſo ſoon as I haue done mine errand I ſhall forthwith yeeld vp the ghoſt. And ſo it hapned indeed. Hiſtories alſo make mention of them that haue appeared after they were committed to earth. But our purpoſe is to write of Natures works, and not to proſecute ſuch miraculous end pro- C digious matters.

Chap. LIII.

¶ *Of ſudden Deaths.*

AS for ſudden death, that is to ſay, the greateſt felicitie and happines that can befall man, many examples wee haue thereof that alwaies ſeeme ſtrange and maruellous; howbeit they are common. *Verrius* hath ſet forth a number of them, but I will keepe within a meane, and make choice of them all. Beſides *Chilon* the Lacedemonian, of whom we ſpake before, the died ſuddenly for very ioy, *Sophocles* the poet, and *Denis* a king or tyran of Sicily: both D of them vpon tydings brought vnto them, that they had won the beſt priſe among the tragical Poets. Preſently after that famous defeat at Cannæ, a mother died immediatly vpon the ſight of her ſon aliue, whom by a falſe meſſenger ſhe heard to haue bin ſlain in that battell. *Diodorus* a great profeſſed Logician, for very ſhame that hee could not preſently aſſoile a friuolous queſtion, nor anſwer to ſome demands propoſed by *Stilbo*, ſwouned and neuer came again. Without any apparant cauſe at all that could be ſeen, diuers haue left their life: namely two of the *Cæſars*, the one Pretor for the time being, the other who had borne that dignity, the father of *Cæſar* the Dictator: both of them in the morning when they were new riſen, and putting on their ſhooes, the one at Piſæ, the former at Rome. In like maner *Q. Fabius Maximus* in his very Conſulſhip, vpon the laſt day of December, [which was the laſt alſo of his magiſtracie, had hee E liued longer] in whoſe place *Rebilus* made ſute to be Conſull for a very few houres that remained of that yere. Semblably *C. Vulcatius Gurgius* a Senator. All of them in perfect health, ſo luſtie and well liking that they thought to go forth preſently, and of nothing leſſe than to dy before. *Q. Æmylius Lepidus*, euen as he was going out of his bed chamber, hit his great toe againſt the dore ſill, and therewith died. *C. Aufidius* was gotten forth of his houſe, and as he was going to the Senat, ſtumbled with his foot in the Comitium or common place of aſſemblies, and died in the place. Moreouer, a certain Embaſſador of the Rhodians, who had to the great admiration of all that were preſent, pleaded their cauſe before the Senat, in the very entry of the Councell houſe, as he was going forth, fell downe dead and neuer ſpake word. *Cn. Bæbius Pamphilus*, who had bin Pretor, died ſuddenly as he was asking a boy what it was a clocke. *A. Pompeius*, ſo ſoon as he had worſhipped the gods in the Capitoll, and ſaid his Oraſons, immediately died. So did *M. Iuventius Talva* the Conſull, as hee was offering ſacrifice. And *Caius Seruilius Panſa*, as hee ſtood at a ſhop in the market place about eight of the clocke in the morning, leaning vpon his brother *P. Panſa* his ſhoulders. *Bæbius* the Iudge, as hee was adiourning

ning the day of ones appearance in the court. *M. Terentius Corax*, whiles he was writing letters in the market place. No longer since than the very last yeare, a Knight of Rome, as hee was talking with another that had been Consul, and rounding him in the eare, fell downe starke dead. And this hapned before the yvorie statue of *Apollo*, which stands in the Forum of *Augustus*. But aboue all others it is strange, that *C. Iulius* a Surgeon should die as he was dressing of a sore eie with a salue, and drawing his instrument along the eye. What should I say of *L. Manlius Torquatus*, a man who had bin somtime Consul, whose hap was to die sitting at supper, euen in reaching for a cake or wafer vpon the boord. *L. Durius Valla* the physition died whiles he was drinking a potion of mede or sweet honied wine. *Appius Ausetius* being come out of the Baine, after he had drunk a draught of honied wine, as he was supping off a rere egge died. *P. Quintius Scapula* as he was at supper in *Aquillius Gallus* his house. *Decimus Sausetius* the Scribe, as he sate at dinner in his owne house. *Cornelius Gallus*, one who had bin Lord Pretor, and *T. Aetherius* a Roman Knight, died both in the very act of *Venus*, whiles they lay vpon women. The like befell in our daies to two gentlemen of Rome, who died both as they were dealing contrary to nature with one and the same counterfeit Iester named *Mithycus*, a youth in those daies of surpassing beauty. But of all others, *M. Ofilius Hilarus*, an actor and plaier in comedies, as it is reported by antient writers, died most secure of death, & with the greatest circumstances about it: for after he had much delighted the people, & made them sport to their contentment on his birth day, he kept a feast at home in his house; and when supper was set forth vpon the table, hee called for a messe of hot broth in a pottinger to drinke off; and withall casting his eye vpon the maske or visor he put on that day, fitted it for his visage, and tooke off the chaplet or garland from his bare head, and set it thereupon: in this habit, disguised as he sate, hee was starke dead and key cold before any man perceiued it: vntill he that leaned next vnto him at the boord put him in minde of his pottage that it cooled, and making no answer, they found in what case he was.

These examples all be of happy deaths: but contrariwise there be an infinite number that are as miserable & vnfortunat. *L. Domitius*, a man descended of a most noble house and parentage, being vanquished by *Caesar* before Marseils, and taken prisoner at Corfinium by the same *Caesar*; for very irksomnesse of his tedious life, poisoned himselfe: but after he had drunke the poison, repented of that which he had done, and did all that euer hee could to liue still, but in vaine. We finde vpon record in the publique registers, that when *Felix* one of the carnation or flesh-coloured liuery that ranne with chariots in the great cirque or shew-place was had forth dead to be burnt, one of his fauorits and consorts flung himselfe into his funerall fire for company. A friuolous and small matter it is to speak of; but they of the other part that sided with the aduerse faction of other liueries, because this act should not turne to the honor and credit of their concurrent the actiue Chariotier aboue named, gaue it out and said, that this his friend and wel-willer did not do it for any loue he bare him, but that his head was intoxicate with the strong sauor of the incense and odors that were in the fire, and so being beside himself, wist not what he did. Not long before this chanced, *M. Lepidus*, a gentleman of Rome descended of a most noble family, who (as is aboue said) died for thought and griefe of heart that hee had diuorced his wife, was by the violent force of the flame cast forth of the funerall fire; & because of the extreme heat thereof, no man could come neere to lay his corps again in the place where it was & should be: they were fain to make another fire hard by of dry vine cuttings, and such like sticks, and so he was burnt bare and naked as he was.

Chap. LIIII.

¶ *Of Buriall or Sepulture.*

TO burne the bodies of the dead hath bin no antient custome among the Romans: the maner was in old time to inter them. But after they were giuen once to vnderstand, that the corses of men slain in the wars afar off, and buried in those parts, were taken forth of the earth again, ordained it was to burne them. And yet many families kept them still to the old guise and ceremonie of committing their dead to the earth: as namely the house of the *Cornelij*, whereof there was not one by report burned before *L. Sylla* the Dictator, and he willed it expressely, and prouided for it before hand, for feare himselfe should be so serued as *C. Marius* was, whose corps he caused to be digged vp after it was buried. Now in Latine he is said to be

20030
copy 1

A be *Sepultus*, that is beſtowed or buried any way, it makes no matter how: but *humatus* properly, who is interred only, or committed to the earth.

Chap. LV.

¶ *Of the Ghoſts, or ſpirits of men departed.*

After men are buried, great diuerſitie there is in opinion, what is become of their ſouls & ghoſts, wandering ſome this way, and others that. But this is generally held, that in what eſtate they were before men were born, in the ſame they remain when they are dead. For neither body nor ſoule hath any more ſence after our dying day, than they had before the day of our natiuitie. But ſuch is the folly & vanitie of men, that it extendeth ſtil euen to the future
B time; yea, and in the very time of death flattereth it ſelfe with fond imaginations, and dreaming of I know not what life after this: for ſome attribute immortality to the ſoule: others deuiſe a certain transfiguration therof; & there be again who ſuppoſe, that the ghoſts ſequeſtred from the body, haue ſenſe; whereupon they do them honour and worſhip, making a god of him that is not ſo much as a man. As if the maner of mens breathing differed from that in other liuing creatures; or as if there were not to be found many other things in the World, that liue much longer than men, and yet no man iudgeth in them the like immortality. But ſhew me what is the ſubſtance and body as it were of the ſoule by it ſelfe? what kind of matter is it apart from the body? where lieth her cogitation that ſhe hath? how is her ſeeing, how is her hearing performed? what toucheth ſhe? nay, what doth ſhe at al? How is ſhe emploied? or if there be in her
C none of all this, what goodneſſe can there be without the ſame? But I would know where ſhee ſetleth and hath her abiding place after her departure from the body? and what an infinit multitude of ſouls like ſhadows would there be, in ſo many ages, as well paſt as to come? how ſurely theſe be but fantaſtical, fooliſh, and childiſh toies; deuiſed by men that would faine liue alwaies, and neuer make an end. The like foolery there is in preſeruing the bodies of dead men: & the vanity of *Democritus* is no leſſe, who promiſed a reſurrection thereof, and yet himſelf could neuer riſe again. And what a folly is this of all follies to think (in a miſchief) that death ſhould be the way to a ſecond life? what repoſe and reſt ſhould euer men haue that are borne of a woman, if their ſoules ſhould remain in heauen aboue with ſence, whiles their ſhadows tarried be-
D neath among the infernall wights? Certes, theſe ſweet inducements and pleaſing perſuaſions, this fooliſh credulitie and light beliefe, marreth the benefit of the beſt gift of Nature, to wit, Death, it doubleth beſides the paine of a man that is to die, if he happen to thinke and conſider what ſhall betide him the time to come. For if it be ſweet and pleaſant to liue, what pleaſure and contentment can one haue, that hath once liued, and now doth not. But how much more eaſe and greater ſecuritie were it for each man to beleeue himſelfe in this point, to gather reaſons, and to ground his reſolution and aſſurance vpon the experience that he had before hee was borne.

Chap. LVI.

E ¶ *The firſt inuenters of diuers things.*

Before we depart from this diſcourſe of mens nature, me thinks it were meet and conuenient to ſhew their ſundry inuentions, and what each man hath deuiſed in this world. In the firſt place, prince *Bacchus* brought vp buying and ſelling: he it was alſo that deuiſed the diadem that royall enſigne and ornament, and the manner of triumph. Dame *Ceres* was the firſt that ſhewed the way of ſowing corne, whereas before-time men liued of maſt. She taught alſo how to grind corne, to knead dough, and make bread thereof, in the land of Attica, Italy, and Sicily; for which benefit to mankind, reputed ſhe was a goddeſſe. She it was that beganne to make lawes, howſoeuer others haue thought, that *Rhadamanthus* was the firſt law giuer. As for
F Letters, I am of opinion, that they were in Aſſyria from the beginning time out of mind; but ſome thinke, and namely *Gellius*, that they were deuiſed by *Mercurie* in Ægypt: but others ſay they came firſt from Syria. True it is that *Cadmus* brought with him into Greece from Phœnice to the number of ſixteen, vnto which, *Palamedes* in the time of the Troian war added foure more in theſe characters following, Θ. Ξ. Φ. Χ. And after him *Simonides Melicus* came with other foure;

foure,to wit,Z.H.T.Ω, the force of all which letters we acknowledge and ſee euidently expreſſed in our Latine Alphabet. *Ariſtotle* is rather of mind, that there were 18 letters in the Greeke Alphabet from the beginning,namely, A.B Γ.Δ.E.Z I.K.Λ M.N.O.Π.P.Σ.T.Υ Φ,and that the other two Θ and and X. were ſet to by *Epicharmus*, and not by *Palamedes*. *Anticlides* writeth, That one in Egypt named *Menon*,was the inuentor of letters,fifteene yeares before the time of *Phoroneus*, the moſt antient king of Greece;and he goeth about to proue the ſame by antient records and monuments out of hiſtories. Contrariwiſe, *Epigenes*, an author as renowned, and of as good credit as any other,ſheweth, That among the Babylonians there were found Ephemerides containing the obſeruation of the ſtars, for 720 yeares,written in bricks and tiles: and they that ſpeake of leaſt,to wit,*Beroſus* and *Critodemus*,report the like for 480 yeares. Whereby it appeareth euidently,that letters were alwaies in vſe,time out of mind. The firſt that brought the Alphabet into Latium or Italy,were the Pelaſgians. *Euryalus* and *Hyperbius*,two brethren at Athens, cauſed the firſt bricke and tile-kils,yea,and houſes thereof to be made:whereas before their time men dwelt in holes and caues within the ground. *Gellius* is of opinion, that *Dexius* the ſonne of *Cælus*,deuiſed the firſt houſes that were made of earth and cley: taking his patterne from Swallowes and Martins neſts. *Cecrops* founded the firſt towne that euer was, and called it after his owne name Cecropia: which at this day is the caſtle or citadell in Athens. Some will haue that Argos was built before it,by king *Phoroneus*. And others againe, that Sycione was before them both. And the Ægyptians affirme, That long before that, their city Dioſpolis was founded. *Cinyra*,the ſonne of *Agriopa* deuiſed tiling and ſlating of houſes firſt, as alſo found out the braſſe mines;both within the Iſle Cyprus. He inuented alſo pinſers,hammers,yron crows, and the Anuil or Stithe. *Danaus* ſunk the firſt pits for wels in Greece, which then was called Argos Dipſion;& ſailed out of Egypt thither,for that purpoſe. *Cadmus* at Thebes (or, as *Theophraſt*. ſaith) in Phœnice,found out ſtone quarries firſt. *Thraſon* was the firſt builder of towne wals:of towers & fortreſſes,the Cyclops,as *Ariſtotle* thinketh: but the Tyrinthians according to *Theophraſt*. Weauing was the inuention of the Egyptians:and dying wool,of the Lydians in Sardis. *Cloſter* the ſon of *Arachne* taught the firſt making of the ſpindle for woollen yearne: and *Arachne* her ſelfe was the firſt ſpinner of flax thred, the weauer of linnen,and of nets. *Niceas* the Megarean deuiſed the fullers craft. *Bœthius* ſhewed the art of ſowing,as wel for tailors as Corviners and ſhoomakers. The Egyptians would haue the skill of phyſicke to haue bin firſt among them:but others affirme, That *Arabus* the ſon of *Babylon* & *Apollo*,was the author thereof. The firſt Herbariſt and Apothecarie, renowned for the knowledge of ſimples, & compoſition of medicines,was *Chiron*,ſon of *Saturne* & *Phyllira*. *Ariſtotle* thinketh,that *Lydus* the Scythian taught the feat of caſting and melting braſſe, with the tempering alſo of the ſame: howbeit, *Theophraſtus* ſaith it was *Delas* the Phrygian. As for the forges & furnaces of braſſe,ſome think the Chalypes deuiſed,others attribute that to the Cyclopes. The diſcouery of the yron and ſteel mines,as alſo the working in them,was the inuention (as *Heſiodus* ſaith) of thoſe in Creet, who were called Dactyli Idæi. Likewiſe of ſiluer, *Erichthonius* the Athenian beareth the name, or (after ſome) *Aeacus*. The gold mines,together with the melting and trying therof, *Cadmus* the Phœnician firſt found out neere the mountain Pangæus:but there be that giue the praiſe hereof to *Thoas* & *Aeaclis* in Panchaia: or els to *Sol* the ſon of *Oceanus*, to whom *Gellius* attributeth the inuention of Phyſick,and making hony. *Midacritus* was the firſt man that brought lead out of the Iſland Caſſiteris. And the Cyclopes inuented firſt the yron-ſmiths forge. *Corœbus* the Athenian deuiſed the potters craft,ſhewing how to caſt earthen veſſels in moulds,& bake them in furnaces. And therin, *Anacharſis* the Scythian,or after ſome, *Hyperbios* the Corinthian, inuented the caſt of turning the roundel or globe. Carpenters art was the inuention of *Dædalus*,as alſo the tools thereto belonging,to wit,the ſaw,the chip-axe,and hatchet,the plumb line;the augoer and wimble,the ſtrong glew,as alſo fiſh-glew,and ſtone-Saudre. As for the rule & ſquare, the leuell,the turners inſtrument,and the key, *Theodorus Samius* deuiſed them. *Phidon* the Argiue,or *Palamedes* as *Gellius* rather thinketh,found out meaſures and weights. *Pyrodes* the ſon of *Cilix*,deuiſed the way to ſtrike fire firſt out of the flint;and *Prometheus*,the means to preſerue & keep it in a ſtalke of *Ferula*,or Fennell gyant. The Phrygians inuented firſt the wagon & chariot with foure wheeles. As for trafficke and merchandiſe,the Carthaginians had the firſt honour thereof. *Eumolpus* the Athenian was of name for planting, pruning, and cutting vines: alſo for ſetting and graffing trees. *Staphylus* the ſonne of *Silenus* taught men how to delay wine

with

20030
copy 1

A with water. *Ariſtæus* the Athenian inuented the making of oyle oliue, as alſo the preſſe & mill thereto belonging. The ſame man taught the caſt of drawing hony out of the combs. *Buzyges* the Athenian, or as others would haue it, *Triptolemus*, yoked oxen firſt for tillage of the ground, and deuiſed the plough. The Egyptians were the firſt of al men that were gouerned by the monarchy; and the Athenians, by a popular ſtate. After the reigne of *Theſeus*, the firſt king or tyrant was *Phalaris*, at Agrigentum in Sicily. The Lacedæmonians brought in bondage and ſlauery, firſt. The firſt judgement that paſſed for life and death, was in the court Ariopagus at Athens. The firſt battell that euer was fought, was between the Africanes and Egyptians; & the ſame performed by baſtons, clubs, & coulſtaues, which they call Phalangæ. Shields, bucklers,
B and targets were deuiſed by *Prætus* and *Aniſius*, when they warred one againſt the other: or els by *Calchus* the ſon of *Athamas*. *Midias* of Meſſene made the firſt cuirace. And the Lacedæmonians, the mourian, the ſword, and the ſpeare. The Carians deuiſed the grieues, the creſts, and pennaches vpon helmets. *Scythes* the ſon of *Iupiter*, deuiſed bow & arrowes: although ſome ſay that *Perſes* the ſon of *Perſeus* inuented arrows. The Ætolians inuented the launce and the pike: the dart with a loup, *Ætolus* the ſon of *Mars*, deuiſed. As for the light iauelins, and the Partuiſanes, *Tyrrhenus* brought them firſt into vſe: & *Penthesilea* the Amazon-queene, the gleiue, bill, battell-axe, and halbard. *Piſeus* found out the bore-ſpeare and chaſing ſtaffe. Among engines of artillery, the Cretes inuented the Scorpion or croſſe-bow: the Syrians, the Catapult: the Phœnicians the baliſt or brake, and the ſling. *Pyſeus* the Tyrrhenian brought vp the vſe of the braſen
C trumpet: and *Artenon Clozomenius* of the pauois, mantilets, targuet-roofs, for the aſſault of cities. The engine to batter wals (called ſometime the horſe, and now is named the ram) was the deuiſe of *Epeus* at Troy. *Bellerophon* ſhewed firſt how to ride on horſeback. *Peleth ronius* inuented ſaddle, bridle, and other furniture for the horſe. The Theſſalians called Centaures, inhabiting neere to the mountain Pelius, were the firſt that fought on horſeback. The Phrygians deuiſed firſt to driue and draw a chariot with two horſes; *Erichthonius*, with foure. *Palamedes* inuented (during the Troian war) the manner of ſetting an army in battell array: alſo the giuing of ſignall, the priuie watch-word, the *Corps de guard*, the watch and ward. In the time of the ſaid war, *Sinon* deuiſed the ſentinels and watch-towers, as alſo the eſpiall. *Lycanor* was the firſt maker of truce. *Theſeus* of leagues and alliances. *Car*, of whom Caria tooke the name, obſerued firſt the
D flight and cry of birds, and thereby gaue preſages and fore-tokens. *Orpheus* went farther in this skil, and tooke marks from other beaſts. *Delphus* pried into beaſts inwards, and therby foretold things to come. *Amphiaraus* was the firſt that had knowledge in Pyromancie, & gathered ſigns by ſpeculation of fire: like as *Tyreſias* the Thebane, by the feeding and geſture of birds. *Amphictyon* gaue the interpretation of ſtrange and prodigious ſights, as alſo of dreames. *Atlas* the ſon of *Libya* (or as ſome ſay, the Egyptians; & as others, the Aſſyrians) inuented Aſtrology: & in that ſcience *Anaximander* deuiſed the Sphere. As for the knowledge & deſtinction of the winds *Æolus* the ſon of *Hellen*, he profeſſed it firſt. *Amphion* brought muſicke firſt into the world. The flute and the ſingle pipe or recorder were the inuentions of *Pan*, the ſon of *Mercurie*. The crooked cornet, *Midas* in Phrygia deuiſed. And in the ſame country, *Marſyas* inuented the double
E fluit. But *Amphion* taught firſt to ſing and play to the Lydian meaſures: *Thamyras* the Thracian to the Dorian: and *Marſyas* of Phrygia to the Phrygian. *Amphion* likewiſe (or, as ſome ſay, *Orpheus*, and after others *Linus*) plaied firſt vpon the Citterne or the Lute. *Terpander* put ſeuen ſtrings more vnto it: *Simonides* added thereto an eight: and *Timotheus* the ninth. *Thamiras* was the firſt that plaied vpon the ſtringed inſtrument, Lute Cittern, or harpe, without ſong: & *Amphion* ſung withal, or according to ſome, *Linus*. *Terpander* was the firſt that ſet ſongs for the foreſaid ſtringed inſtrument. And *Dardanus* the Trœzenian began firſt vocall muſicke to the pipe. The Curets taught to daunce in armour; and *Pyrrhus* the Moriſk, in order of battell: and both theſe were taken vp firſt in Crete. The heroick or hexametre verſe we acknowledge to haue come firſt from the Oracle of *Pythius Apollo*. But about the original of Poemes & Poetry, there
F is a great queſtion among authors. And it is probably gathered by hiſtories, that there were Poets before the time of ths Trojane war. *Pherecides* of Syros, in the daies of king *Cyrus*, inuented firſt the writing in proſe. *Cadmus* the Mileſian wrote Chronicles, and compiled the firſt hiſtory. *Lycaon* hath the report of ſetting out the firſt publicke games, and prouing of maſteries & feats of ſtrength of actiuity, in Arcadia. To *Acoſtius* in Iolcum we are beholden for the firſt ſolemnities and games at funerals: and after him to *Theſeus*, in the ſtreights of Iſthmus. *Hercules*

inſtituted

instituted the exercise of wrestlers and champions at Olympia: and *Pythus* was the first plaier at tennise. *Gyges* the Lydian gaue the first proofe of painting and limning, in Ægypt: but in Greece, *Euchir* a cousin of *Dædalus* was the first painter, as *Aristotle* supposeth; but after *Theophrastus*, it was *Polygnotus* the Athenian. *Danaus* was the first that sailed with a ship, and so he passed the seas from Egypt to Greece; for before that time they vsed but troughs or flat planks, deuised by K. *Erythra* to crosse from one Island to another in the red sea. But we meet with some writers who affirme, that the Troians and Mysians were the first sailers, and deuised nauigation before them in Hellespont, when they set out a voiage against the Thracians. And euen at this day in the British ocean, there be made certaine wicker boats of twigs couered with lether and stitched round about: in Nilus, of paper, cane-reed and rushes. *Philostephanus* witnesseth, that *Iason* first vsed the long ship or gally: but *Egesias* saith, that it was *Paralus*: *Ctesias* attributes it to *Samyras*; *Saphanas* to *Semyramis*: and *Archimachus*, to *Ægeon*. *Damastes* testifieth, that the Erythræans made the Bireme or gally with two banks of oares. *Thucydides* writeth that *Aminocles* the Corinthian built the first Trireme with three rows of oars to a side. *Aristotle* saith, that the Carthaginians were the first that set to sea the Quadrireme with 4 ranks of oares to a side: and *Nesichthon* the Salaminian, set aflote the first Quinquereme with 5 course of oares on either side. *Zenagoras* of Syracusa brought vp those of six; and so from it to those of ten, *Mnesigeton* was the inuenter. It is said, that *Alexander* the Great built gallies for 12 bankes to a side: and *Philostephanus* reporteth, that *Ptolemæ* syrnamed *Soter*, rose to fifteen: *Demetrius* the son of *Antigonus*, to thirty; *Ptolomæ Philadelphus*, to forty: and *Ptolomæ Philopator* syrnamed *Tryphon*, to fifty. As for ships of burthen and merchandise, as hoyes, &c. *Hippus Tyrius* inuented them. The Cyrenians made fregates; the Phœnicians, the bark; the Rhodians, the Pinace and Brigantine: and last of all the Cyprians made the hulke and great carrack. The Phœnicians were the first that in sailing, obserued the course of the stars. The Copeans deuised the oare: the Plateans inuented the broad and flat end thereof: *Icarus* the sailes: *Dædalus* the mast and the crosse saile-yard. The vessels for transporting of horses, were the inuention of the Samians, or else of *Pericles* the Athenien. The Thasij had the honour for framing the long ships couered with hatch: for before-time they fought only from out of the hin-decke in the poupe, and the fore-castle in the proe. Then came *Piseus* the Tyrrhene, and armed the stem and beake-head of the shippe with sharpe tines and pikes of brasse: *Eupalamus* deuised the anchor: *Anacharsis* made it first with two teeth or floukes: the grapling hookes and the yron hands were the deuise of *Pericles* the Athenien; and finally, *Typhis* inuented the help of the helme, for the Pylot to steere & rule the ship. The first that set out an Armada to the sea for fight was *Minos*. The first that killed beasts was *Hyperbius* the son of *Mars*: and *Prometheus* ventured to slay an oxe or a Bœufe.

Chap. LVII.

¶ *Wherein appeared first the generall agreement of all Nations.*

THe secret consent of all countries was shewed first in this, That they should vniuersally in all places vse the Ionian letters.

Chap. LVIII.

¶ *Of Antique Letters.*

THe old characters of Greeke letters, were the same in manner that the Latine be in these daies; and this appeareth sufficiently by an antique table of brasse which came from the temple at Delphos, the which at this day is in the great library of the Palatium dedicated to *Minerua*, by the liberality of the Emperors, with this or such like inscription vpon it, Ναυσικράτης πατρώνυμος, Ἀθηναῖος, κόρᾳ ἐ ἀθηναίᾳ ἀνέθηκαν, *i. Nausicrates* (the son) of *Tisamenus* an Athenien, caused this table to be made and set vp to the noble virgin *Minerua*.

Chap. LIX.

¶ *When Barbers were first seene at Rome.*

THe next thing that all people of the world agreed in, was to entertain Barbers, but it was late first ere they were in any request at Rome. The first that entered Italy came out of Sicilie, and it was in the 454 yeare after the foundation of Rome. Brought in they were by

20030
copy 1

A by *P. Ticinius Mena*, as *Varro* doth report; for before-time they neuer cut their haire. The firſt that was ſhauen euery day was *Scipio Africanus*; and after him commeth *Auguſtus* the Emperor, who euermore vſed the raſor.

Chap. LX.

¶ *Of Horologies or Dials, when they were firſt deuiſed.*

THe third vniuerſal accord of all nations, was in the obſeruation how the houres went; and this was a point grounded vpon good reaſon: but at what time, and by whom this was de-
B uiſed in Greece, we haue declared in the ſecond booke of this work; & long it was before this order came vp at Rome, as well as the vſe of the Barber. In the 12 tables of Romane lawes, there is no mention at all made but of Eaſt and Weſt; after certain yeres the noon-ſtead point in the South quarter alſo was obſerued, and the Conſuls bedle or crier pronounced noon, when ſtanding at the hall or chamber of the councell, he beheld the Sun in that wiſe betweene the pulpit called Roſtra, and the Grecoſtaſis [which was a place where forrein embaſſadours gaue their attendance:] but when that the ſame ſun inclined downeward from the columne named Mœnia, to the common gaole or priſon, then he gaue warning of the laſt quarter of the day, and ſo pronounced. But this obſeruation would ſerue but vpon cleere daies, when the ſun ſhined: and yet there was no other means to know how the day went, vntill the firſt Punicke war. *Fabi-*
C *us Veſtalis* writeth, that *L. Papyrius Curſor*, 12 yeres before the war with *Pyrrhus*, was the firſt, that for to do the Romans a pleaſure, ſet vp a ſun-dyall to know what it was a clocke, vpon the temple of *Quirinus* at the dedication thereof, when his father had vowed it before him. Howbeit mine aurhor ſheweth not either the reaſon of the making of that diall, or the workman; ne yet from whence it was brought, nor in what writer he found it ſo written. *M. Varro* reporteth, that the firſt diall was ſet vp in the common market place, vpon a columne neere the foreſaid Roſtra, in the time of the firſt Punicke war, by *M. Valerius Meſſala* the Conſull, preſently after the taking of Catana in Sicily; from whence it was brought; thirty yeares after the report that goeth of the foreſaid quadrant and diall of *Papyrius*; namely, in the yeare after the foundation of the city 477. And albeit the ſtrokes and lines of this Horologe or diall agreed not fit with the
D houres, yet were the people ruled and went by it for an hundred yeares ſaue one, euen vntill *Q. Martius Philippus* (who together with *L. Paulus* was Cenſor) ſet another by it, framed & made more exquiſitly according to Art. And this piece of work among other good acts done by the Cenſor during his office, was highly accepted of the people as a ſingular gift of his. Yet for all this, if it were a cloſe and cloudy day wherein the Sun ſhone not out, men knew not what it was a clocke certainly; and thus it continued fiue yeres more. Then at laſt, *Scipio Naſica* being Cenſor with *Lænas*, made the deuiſe firſt to diuide the houres both of day and night equally, by water, diſtilling and dropping out one veſſell into another. And this manner of Horologe or water-clocke, he dedicated in the end within houſe, and that was in the 595 yere from the buil-
E ding of Rome. Thus you ſee how long it was, that the people of Rome could not certainly tell how the day paſſed. Thus much concerning the Nature of man: let vs returne now to diſcourſe of other liuing creatures; and firſt of land-beaſts.

THE

THE EIGHTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I.

¶ *Of landbeasts. The praise of Elephants: their wit and vnderstanding.*

PAsse we now to treat of other liuing creatures, and first of land-beasts: among which, the Elephant is the greatest, and commeth neerest in wit and capacitie, to men; for they vnderstand the language of that country wherin they are bred, they do what soeuer they are commanded, they remember what duties they be taught, and withall take a pleasure and delight both in loue and also in glory, nay more than all this, they embrace goodnesse, honestie, prudence, and equitie (rare qualities I may tel you to be found in men) and withal haue in religious reuerence (with a kinde of deuotion) not only the stars and planets, but the sun and moon they also worship. And in very truth, writers there be who report thus much of them, That when the new moon beginneth to appeare fresh and bright, they come downe by whole heards to a certaine riuer named Amelus, in the desarts and forests of Mauritania, where after that they are washed and solemnly purified by sprinckling and dashing themselues all ouer with the water, & haue saluted and adored after their manner that planet, they returne again into the woods & chases, carrying before them their yong calues that be wearied and tired. Moreouer, they are thought to haue a sense and vnderstanding of religion & conscience in others; for when they are to passe the seas into another country, they wil not embarke before they be induced thereto by an oath of their gouernors and rulers, That they shall returne again: and seene there haue bin diuers of them, being enfeebled by sickneſſe (for as big and huge as they be, subject they are to grieuous maladies) to lie vpon their backs, casting and flinging herbes vp toward heauen, as if they had procured and set the earth to pray for them. Now for their docility and aptnesse to learne any thing; the king they adore, they kneele before him, and offer vnto him garlands and chaplets of floures and green herbes. To conclude, the lesser sort of them, which they call Bastards, serue the Indians in good stead to eare and plough their ground.

CHAP. II.

¶ *When Elephants were put to draw first.*

THe first time that euer they were knowne to draw at Rome, was in the triumph of *Pompey* the Great, after he had subdued Africke, for then were two of them put in geeres to his triumphant chariot. But long before that, it is said that Father *Bacchus* hauing conquered India, did the like when he triumphed for his conquest. Howbeit, in that triumph of *Pompey*, *Procilius* affirmeth, That coupled, as they were, two in one yoke, they could not possibly go in at the gates of Rome, In the late solemnity of tournois & sword-fight at the sharp, which *Germanicus Cæsar* exhibited to gratifie the people, the elephants were seen to shew pastime with leaping & keeping a stir, as if they danced, after a rude and disorderly manner. A common thing it was

20030
copy 1

A was among them to fling weapons & darts in the aire ſo ſtrongly, that the winds had no power againſt them; to flouriſh alſo before hand; yea, and to encounter and meet together in fight like ſword-fencers; and to make good ſport in a kinde of Moriske dance: and afterwards to go on ropes and cords: to carry (foure together) one of them laid at eaſe in a litter, reſembling the maner of women newly brought a bed: laſt of all, ſome of them were ſo nimble and well practiſed, that they would enter into an hall or dining place where the tables were ſet full of gueſts, and paſſe among them ſo gently and daintily, weighing as it were their feet in their going, ſo as they would not hurt or touch any of the company as they were drinking.

Chap. III.

B

¶ *The docilitie of Elephants.*

THis is knowne for certaine, that vpon a time there was an Elephant among the reſt, not ſo good of capacity, to take out his leſſons, and learn that which was taught him: and being beaten and beaten again for that blockiſh and dull head of his, was found ſtudying and conning thoſe feats in the night, which he had bin learning in the day time. But one of the greateſt wonders of them was this, that they could mount vp and clime againſt a rope; but more wonderfull, that they ſhould ſlide downe again with their heads downward. *Mutianus*, a man who had in his time bin thrice Conſull, reporteth thus much of one of them, that he had learned to make the Greeke characters, and was wont to write in that language thus much, *Thus haue I written, and made an offering of the Celticke ſpoiles*. Likewiſe hee ſaith, that himſelfe ſaw at
C Puteoli, a certain ſhip diſcharged of Elephants embarked therein; and when they ſhould be ſet aſhore, and forced to go forth of the veſſel, to which purpoſe there was a bridge made for them to paſſe ouer, they were affrighted at the length thereof, bearing out ſo far from the land into the water: and therefore to deceiue themſelues, that the way might not ſeeme ſo long, went backward with their tails to the banke, and their heads toward the ſea. They are ware, & know full well that their only riches (for loue of which, men lay wait for them) lieth in their armes and weapons that Nature hath giuen them: king *Iuba* calleth them their hornes: but *Herodotus*, who wrote long before him, and the cuſtome of ſpeech, hath tearmed them much better, teeth. And therefore when they are ſhed and fallen off, either for age, or by ſome caſualtie, the Elephants themſelues hide them within the ground. And this in truth is the only yuory: for all the
D reſt, yea, and theſe teeth alſo ſo far as lay couered within the fleſh, is of no price, and taken for no better than bone. And yet of late daies, for great ſcarcitie & want of the right teeth, men haue bin glad to cut and ſaw their bones into plates, and make yvorie therof. For hardly can we now come by teeth of any bignes, vnleſſe we haue them out of India. For all the reſt that might be gotten in this part of the world between vs and them, hath bin imploied in ſuperfluities only, and ſerued for wanton toies. You may know yong Elephants by the whitenes of theſe teeth: and a ſpeciall care and regard haue theſe beaſts of them aboue all. They looke to one of them alwaies, that the point be ſharp; and therefore they forbeare to occupie it, leaſt it ſhould bee blunt againſt they come to fight: the other they vſe ordinarily, either to get vp roots out of the earth, or to caſt down any banks or mures that ſtand in their way. When they chance to be en-
E compaſſed round about with hunters, they ſet formoſt in the rank to be ſeen, thoſe of the heard that haue the leaſt teeth: to the end, that their price might not be thought worth the hazard and venture in chaſe for them. But afterwards, when they ſee the hunters eager, and themſelues ouermatched and weary, they breake them with running againſt the hard trees, and leauing them behind, eſcape by this ranſome as it were, out of their hands.

Chap. IIII.

¶ *The clemencie of Elephants: their foreſight and knowledge of their owne dangers: alſo the fell fierceneſſe of the Tygre.*

F A Wonder it is in many of theſe creatures, that they ſhould thus know wherefore they are hunted, and withall take heed & beware of all their dangers. It is ſaid, that if an elephant chance to meet with a man wandering ſimply out of his way in the wilderneſſe, hee will mildly and gently ſet him in the right way again. But if he perceiue a mans freſh footing, before he eſpie the man, he will quake and tremble for feare of being forelaid & ſurpriſed: he wil

ſtay from farther following the ſent, look about him euery way, ſnuffe and puffe for very anger. Neither will he tread vpon the tract of a mans foot, but dig it out of the earth, and giue it the next Elephant vnto him, and he againe to him that followeth, and ſo from one to another paſſeth this intelligence and meſſage as it were, to the vtmoſt rank behind. Then the whole heard makes a ſtand, and caſt round about to returne backward, and withall put themſelues in battel array: ſo long continueth that ſtrong virulent ſmel of mens feet, and runneth through them all, notwithſtanding for the moſt part they be not bare but ſhod. Semblably, the Tigreſſe alſo, how fierce and cruell ſhe be to other wilde beaſts, & careth not a whit for a very Elephant; if ſhee happen to haue a ſight of a mans footing, preſently, by report, carieth away her young whelpes, and is gon. But how commeth ſhe to this knowledge of a man? where ſaw ſhe him euer before, whom thus ſhe feareth? for ſurely ſuch wild woods & foreſts are not much trauelled & frequented by men. Set caſe, that they may wel wonder at the ſtrange ſight and nouelty of their tracts, which are ſo ſeldome ſeen, how know they that they are to be feared? Nay, what ſhould be the reaſon, that they dread to ſee a man indeed, being as they are, far bigger, much ſtronger, and ſwifter by many degrees than a man? Certes, herein is to be ſeen the wonderfull worke of Nature, and her mightie power; that the greateſt, the moſt fell and ſauage beaſts that be, hauing neuer ſeen that which they ought to feare, ſhould incontinently haue the ſence and conceit, why the ſame is to be feared.

Chap. V.

¶ *The vnderſtanding and memorie of Elephants.*

THe Elephants march alwaies in troups. The eldeſt of them leadeth the vaward, like a captaine: and the next to him in age, commeth behind with the conduct of the arrereguard. When they are to paſſe ouer any riuer, they put for moſt the leaſt of al their company, for feare, that if the bigger ſhould enter firſt, they would, as they trod in the channell, make the water to ſwell and riſe, and ſo cauſe the fourd to be more deepe. *Antipater* writeth, that K. *Antiochus* had two Elephants, which he vſed in his wars aboue all the reſt; and famous they were for their ſurnames, which they knew well enough, and wiſt when any man called them thereby: and verily, *Cato* reciting in his Annals the names of the principall captaine Elephants, hath left in writing, That the Elephant which fought moſt luſtily in the point of the Punick war, had to name Surus, by the ſame token, that the one of his teeth was gone. When *Antiochus* on a time would haue ſounded the fourd of a certaine riuer, by putting the Elephants before, Ajax refuſed to take the water, who otherwiſe at all times was wont to lead the way. Wherupon the king pronounced with a loud voice, That look which Elephant paſſed to the other ſide, he ſhould be the captain and chiefe. Then Patroclus gaue the venture: & for his labor had a rich harniſh and capariſon giuen him, & was all trapped in ſiluer (a thing wherin they take moſt delight) and made beſides the ſoueraigne of all the reſt. But the other that was diſgraced thus, and had loſt his place, would neuer eat any meat after, but died for very ſhame of ſuch a reprochfull ignominy. For among other qualities, maruellous baſhfull they are: for if one of them be ouermatched & vanquiſhed in fight, he wil neuer after abide the voice & braying of the conqueror, but in token of ſubmiſſion, giueth him a turfe of earth, with veruaine or graſſe vpon it. Vpon a kind of ſhamefaced modeſty, they neuer are ſeen to ingender together, but perform that act in ſome couert & ſecret corner. They go to rut, the male at 5 yeres of age, the femal not before ſhe is 10 yeres old. And this they do euery third yere: and they continue therein fiue daies in the yeare (as they ſay) and not aboue: for vpon the ſixt day they all to waſh themſelues ouer in the running riuer: & before they be thus purified, return not to the heard. After they haue taken one to another once, they neuer change: neither fall they out and fight about their femalls, as other creatures do moſt deadly and mortally. And this is not for want of loue and hot affection that way: for reported it is of one Elephant, that he caſt a fancy and was enamoured vpon a wench in Ægypt that ſold noſegaies & garlands of floures. And leſt any man ſhould thinke that hee had no reaſon thereto, it was no ordinary maiden, but ſo amiable, as that *Ariſtophanes* the excellent Grammarian, was wonderfully in loue with her. Another there was, ſo kind and full of loue, that he fanſied a youth in the army of *Ptolomæus*, that ſcarce had neuer an haire vpon his face, and ſo entirely he loued him, that what day ſoeuer he ſaw him not, he would forbeare his meat

20030
copy 1

A meat,and eat nothing.K.*Iuba* likewiſe reporteth alſo of an Elephant that made court to another woman,who made and ſold ſweet ointments and perfumes. All theſe teſtified their loue and kindnes,by theſe tokens: joy they would at the ſight of them, and looke pleaſantly vpon them:make toward them they would(after their rude and homely manner)by all means of flatterie:and eſpecially in this,that they would ſaue whatſoeuer people caſt to them for to eat,and lay the ſame ful kindly in their laps and boſomes. But no maruel it is that they ſhould loue who are ſo good of memorie.For the ſame *Iuba* ſaith, That an Elephant tooke knowledge and acquaintance of one man in his old age,and after many a yere,who in his youth had bin his ruler and gouernor.He affirmeth alſo,that they haue by a ſecret diuine inſtinct,a certain ſence of juſtice and righteous dealing.For when K.*Bacchus* meant to be reuenged of 30 Elephants,that he had cauſed to be bound vnto ſtakes,and ſet other 30 to run vpon them, appointing alſo cer-
B tain men among to pricke and prouoke them thereto;yet for all that,could not one of them be brought for to execute this butcherie,nor be miniſters of anothers crueltie.

Chap. VI.

¶ *When Elephants were firſt ſeen in Italy.*

THe firſt time that Elephants were ſeen in Italy,was during the war of K. *Pyrrhus*;& they called them by the name of *Lucæ boues*,*i*.Lucane oxen, becauſe they had the firſt ſight of them in the Lucans countrie,and it was in the 472 yere after the cities foundation.But in Rome it was ſeuen yeres after ere they were ſeen,and then they were ſhewed in a triumph. But
C in the yere 502,a number of them were ſeen at Rome by occaſion of the victorie of *L. Metellus Pontifex* ouer the Carthaginians:which Elephants were taken in Sicilie.For 142 of them were conueied ouer vpon planks and flat bottomes,which were laied vpon ranks of great tuns and pipes ſet thicke one by another.*Verrius* ſaith,that they were cauſed to fight in the great cirque or ſhew place,and were killed there with ſhot of darts and iauelins for want of better counſel, and becauſe they knew not well what to do with them:for neither were they willing to haue them kept and nouriſhed,ne yet to be beſtowed vpon any kings.*L. Piſo* ſaith they were brought out only into the ſhew place or cirque aforeſaid, and for to make them more contemptible were chaſed round about it by certaine fellowes hired thereto,hauing for that purpoſe certain
D ſtaues and perches,not pointed with iron,but headed with bals like foiles.But what became of them afterward,thoſe Authours make no mention: who were of opinion that they were not killed.

Chap. VII.

¶ *Their fights and combats.*

MVch renowned is the fight of one Roman with an Elephant,at what time as *Annibal* forced thoſe captiues whom he had taken of our men,to skirmiſh one againſt another to the vtterance.For the only Roman that remained vnſlaine at that vnnaturall conflict,he
E would needs match with an Elephant, and ſee the combate himſelfe, aſſuring him vpon his word,that if he could kil the beaſt,he ſhould be diſmiſſed and ſent home with life & liberty. So this priſoner entred into ſingle fight with the Elephant,& to the great hearts griefe of the Carthaginians ſlew him out-right. *Anniball* then ſent him away indeed according to promiſe and couenant;but conſidering better the conſequence of this matter; and namely, that if this combat were once by him bruted abroad,the beaſts would be leſſe regarded, and their ſeruice in the wars not eſteemed; made after him certaine light horſemen to ouertake him vpon the way to cut his throat,ſo making him ſure for telling tales. Their long ſnout or trunke which the Latins call *Proboſcis*,may be eaſily cut off, as it appeared by experience in the wars againſt K.*Pyrrhus*.*Feneſtella* writeth,That the firſt fight of them in Rome, was exhibited in the grand
F Cirque,during the time that *Claudius Pulcher* was Ædile Curule,when *M. Antonius* and *A. Poſthumius* were Conſuls:in the 650 yere after the citie of Rome was built. In like maner,20 yeres after,when the *Luculli* were Ædiles Curule,there was repreſented a combat between bulls and Elephants.Alſo in the ſecond Conſulſhip of *C. Pompeius* at the dedication of the temple to *Venus Victoreſſe*,20 of them,or as ſome write,17 fought in the great Cirque. In which ſolemnitie

the Gætulians were ſet to launce darts and jauelins againſt them. But among all the reſt, one G
Elephant did wonders: for when his legs and feet were ſhot and ſtucke full of darts, he crept vp-
on his knees, and neuer ſtaied til he was gotten among the companies of the ſaid Gætulians,
where he caught from them their targets and bucklers perforce, flung them aloft into the aire,
which as they fell, turned round, as if they had bin trundled by art, & not hurled & thrown with
violence by the beaſts in their furious anger: and this made a goodly ſight, and did great plea-
ſure to the beholders. And as ſtrange a thing as that was ſeen in another of them, whoſe fortune
was to be killed out of hand with one ſhot: for the dart was ſo driuen, that it entered vnder the
eie, and pierced as far as to the vitall parts of the head, euen the ventricles of the brain. Wher-
upon all the reſt at once aſſaied to break forth and get away, not without a great hurry & trou-
ble among the people, notwithſtanding they were without the liſts, and thoſe ſet round about H
with yron grates and bars. [And for this cauſe *Cæſar* the Dictatour, when afterwards hee was to
exhibit the like ſhew before the people, caſt a ditch round about the place, letting in the water
and ſo made a mote thereof: which prince *Nero* afterwards ſtopped vp, for to make more room
for the knights and men of armes.] But thoſe Elephants of *Pompey* being paſt all hope of eſca-
ping and going cleere away, after a moſt pittifull manner and rufull plight that cannot bee ex-
preſſed, ſeemed to make mone vnto the multitude, crauing mercie and pittie, with grieuous
plaints and lamentations, bewailing their hard ſtate and wofull caſe: in ſuch ſort, that the peo-
ples hearts earned again at this piteous ſight, and with tears in their eies, for very compaſſion,
roſe vp all at once from beholding this pageant, without regard of the perſon of *Pompey* that
great Generall and Commander, without reſpect of his magnificence and ſtately ſhew, of his I
munificence and liberality, where he thought to haue woon great applauſe and honor at their
hands; but in lieu thereof fell to curſing of him, and wiſhing all thoſe plagues and misfortunes
to light vpon his head, which ſoon after inſued accordingly. Moreouer, *Cæſar* the Dictatour in
his third Conſulſhip exhibited another fight of them, and brought forth 20 to maintain skir-
miſh againſt 500 footmen: and a ſecond time he ſet out 20 more, with woodden turrets vpon
their backs, containing 60 defendants a piece: and he oppoſed againſt them 500 footmen, and
as many horſe. After all this, *Claudius* and *Nero* the Emperors brought them forth one by one
into ſingle fight, with approued, expert, and accompliſhed fencers, at the end of al the other ſo-
lemnitie when they had done their prizes. This beaſt, by report of all writers, is ſo gentle to all
others that are but weak, and not ſo ſtrong as himſelfe, that if he paſſe through a flock or heard K
of ſmaller cattell, it will with the noſe or trunke which ſerueth in ſtead of his hand, remoue and
turn aſide whatſoeuer beaſt commeth in his way, for feare he ſhould go ouer them, and ſo cruſh
and tread vnder his foot any of them, ere it were aware. And neuer do they any hurt, vnleſſe they
be prouoked thereto. Alwaies walke they by troups together, and worſt of all other can they
away with wandring alone, but loue company exceeding well. If it fortune that they be inuiro-
ned with horſmen, look how many of their fellows be feeble, weary, or wounded, thoſe they take
into the mids of their ſquadron: and as if there were marſhalled and ordered by a Serjeant of
a band, or heard the direction of ſome Generall, ſo skilfully and as it were with guidance of
reaſon, do they maintain fight by turns, and ſucceed one after another in their courſe. The wild
ſort of them, after they be taken, are ſooneſt brought to be tame and gentle, with the iuice or L
decoction of husked barly.

Chap. VIII.

¶ *The manner of taking Elephants:*

THe Indians are wont to take Elephants in this manner: the gouernor driueth one of them
that are tame, into the chaſe and forreſts, and when he can meet with one of them alone, or
ſingle him from the heard, he all to beateth the wilde beaſt till he hath made him wearie,
and then he mounteth vpon him & ruleth him as wel as the former. In Africk they catch them
in great ditches which they make for that purpoſe: into which, if one of them chance to wan- M
der aſtray from his fellowes, all the reſt immediatly come to ſuccour him; they heap together a
deale of boughs, they rol down blocks & ſtones, and whatſoeuer may ſerue to raiſe a banke, and
with all that euer they can do, labor to plucke him out. Before-time, when they meant to make
them tractable, their maner was, by a troup of horſmen to driue or train them by little & little
a long

20030
copy 1

A a long way in a certain lawn or vally, made by mans hand for the nones, ere they were aware, and when they were incloſed within ditches or bankes, there they would keep them from meat ſo long, vntil for very hunger they would be glad to come to hand for food: & by this they might know they were gentle and tame enough to be taken, if they would meekly take a branch of a bow preſented and offred vnto them. But now adaies, ſince they ſeek after them for their teeths ſake, they make no more ado but ſhoot at their legges, which otherwiſe naturally are tender enough and the ſofteſt part of their whole body. The Troglodites, a people bounding vpon Æthiopia, who liue only vpon the veniſon of Elephants fleſh, vſe to clime trees that be neer their walk, and there take a ſtand: from thence (letting all the heard to paſſe quietly vnder the trees)
B they leap down vpon the buttocks of the hinmoſt: then he that doth this feat, with his left hand laieth faſt hold vpon his taile, and ſets his feet and legs faſt in the flanke of the left ſide, and ſo hanging and bending backward with his body, he cutteth the ham-ſtrings of one of his legges with a good keen bil or hatchet that he hath of purpoſe in his right hand: which done, the Elephant beginneth to ſlack his pace, by reaſon that one of his legs is wounded: the man then maketh ſhift to get away and alighteth on foot, and for a farwell he hougheth the ſinews likewiſe of the other ham; and all this doth he in a trice with wonderful agility and nimblenes. Others haue a ſafer way than this, but it is more ſubtill and deceitfull: they ſet or ſtick in the ground a great way off, mighty great bows ready bent; to hold theſe faſt, they chuſe certain tal luſty, and ſtrong fellows, and as many others as ſufficient as they, to draw with all their might and maine
C the ſaid bowes againſt the other, and ſo they let flie againſt the poore Elephants as they paſſe by, jauelins and bore-ſpears, as if they ſhot ſhafts, and ſtick them therwith, and ſo follow them by their bloud. Of theſe beaſts, the femals are much more fearfull than the male kind.

Chap. IX.

¶ *The manner of taming Elephants.*

AS furious and raging mad as they be ſometime, they are tamed with hunger and ſtripes: but men had need to haue the help of other Elephants that are tame already, to reſtraine the vnruly beaſt with ſtrong chains: of all times, when they go to rut they are moſt out of
D order and ſtarke wood; down go the Indian ſtables and beaſt ſtals then, which they ouer-turne with their teeth; and therfore they keepe them from entring into that fit, and ſeparate the femals apart from the males, making their parks and encloſures aſunder, as they doe by other beaſts. The tamed ſort of them ſerue in the wars, and carry little caſtles or turrets with armed ſouldiers, to enter the ſquadrons and battalions of the enemies: and for the moſt part, all the ſeruice in the wars of the Eaſt, is performed by them, and they eſpecially determine the quarrell: theſe be they that breake the ranks, beare down armed men that are in the way, and ſtampe them vnder foot. Theſe terrible beaſts (as outragious otherwiſe as they ſeem) are frighted with the leaſt grunting that is of a ſwine: be they wounded at any time or put into a fright, backeward alwaies they go, and do as much miſchiefe to their own ſide that way, as to their enemies.
E The African Elephants are afraid of the Indian, and dare not look vpon them; for in truth the Indian Elephants be far bigger.

Chap. X.

¶ *How they breed and bring forth their young: and of their nature otherwiſe.*

THe common ſort of men thinke, that they go with young ten yeres: but *Ariſtotle* ſaith that they go but two yeares, and that they breed but once and no more in their life, and bring not aboue one at a time: alſo that they liue commonly by courſe of nature 200
F yeres, and ſome of them 300. Their youthful time and ſtrength of age beginneth when they be 60 yeres old: they loue riuers aboue all things, and lightly ye ſhall haue them euermore wandring about waters; and yet by reaſon otherwiſe of their big and vnwealdie bodies, ſwim they cannot. Of all things they can worſt away with cold, and that is it they are moſt ſubiect vnto, and feele greateſt inconuenience by: troubled they be alſo with the collick, and ventoſities, as alſo with the flux of the belly: other maladies they feele not. I find it written in hiſtories, that if

they drinke oile, the arrows and darts which ſtick in their bodies wil come forth and fall off : G
but the more that they ſweat, the ſooner wil they take hold and abide in ſtil the faſter. The eating of earth breedes the conſumption in them, vnleſſe they feed and chew often therof: they deuoure ſtones alſo. As for the trunks and bodies of trees, it is the beſt meat they haue, & therin take they moſt delight. If the date trees be too high that they cannot reach the fruit, they will ouerturn them with their forehead, and when they lie along, eat the dates. They chew and eat their meat with their mouth: but they breath, drink, and ſmell, with their trunke, which not improperly is called their hand. Of all other liuing creatures, they cannot abide a mouſe or a rat, and if they perceiue that their prouander lying in the manger, taſt and ſent neuer ſo little of them, they refuſe it and wil not touch it. They are mightily tormented with paine, if they chance in their drinking to ſwallow down an horſleech (which worm, I obſerue, they begin now H
to cal, a bloud-ſucker:) for ſo ſoon as the horſleech hath ſetled faſt in his wind-pipe, he putteth him to intollerable pains. Their hide or skin of their back is moſt tough & hard; but in the belly, ſoft & tender: couered their skin is neither with haire nor briſtle, no not ſo much as in their taile, which might ſerue them in good ſtead to driue away the buſie & troubleſome flie (for as vaſt & huge a beaſt as he is, the flie hanteth & ſtingeth him) but ful their skin is of croſſe wrinkles lattiſewiſe; & beſides that, the ſmell thereof is able to draw and allure ſuch vermin to it: & therefore when they are laid ſtretched along, and perceiue the flies by whole ſwarms ſetled on their skin, ſuddenly they draw thoſe cranies and creuiſes together cloſe, and ſo cruſh them all to death. This ſerues them in ſtead of taile, main, and long haire. Their teeth beare a very high price, and they yeeld the matter of greateſt requeſt, and moſt commendable, for to make the ſta- I
tues and images of the gods: but ſuch is the ſuperfluity and exceſſe of men, that they haue deuiſed another thing in them to commend; for they find forſooth a ſpecial dainty taſt in the hard callous ſubſtance of that which they cal their hand: for no other reaſon (I beleeue) but becauſe they haue a conceit that they eat yvorie, when they chew this griſtle of their trunk. In temples are to be ſeen Elephants teeth of the greateſt ſize: howbeit in the marches of Africke where it confineth vpon Æthiopia, they make of yuory the very principals and corner poſts of their houſes: alſo with the Elephants tooth they make mounds & pales both to incloſe their grounds, and alſo to keep in their beaſts within park, if it be true that *Polybius* reporteth, from the teſtimony of king *Gulufſa*.

Chap. XI. K

¶ *Where the Elephants are bred : how the Dragons and they diſagree.*

ELephants breed in that part of Africke which lieth beyond the deſarts and wilderneſſe of the Syrtes : alſo in Mauritania: they are found alſo amongſt the Æthyopians and Troglodites, as hath beene ſaid : but India bringeth forth the biggeſt: as alſo the dragons that are continually at variance with them, & euermore fighting, and thoſe of ſuch greatneſſe, that they can eaſily claſp and wind round about the Elephants, and withall tye them faſt with a knot. In this conflict they die, both the one and the other: the Elephant he fals downe dead as conque- L
red, and with his heauy weight cruſheth and ſqueaſeth the dragon that is wound and wreathed about him.

Chap. XII.

¶ *The wittincſſe and policie in theſe creatures.*

WOnderfull is the wit and ſubtilty that dumbe creatures haue, and how they ſhift for themſelues and annoy their enemies; which is the only difficulty that they haue to ariſe & grow to ſo great an heigth and exceſſiue bignes. The dragon therfore eſpying the Elephant when he goeth to reliefe, aſſaileth him from an high tree and launceth himſelfe M
vpon him; but the Elephant knowing well enough he is not able to withſtand his windings & knittings about him, ſeeketh to come cloſe to ſome trees or hard rocks, and ſo for to cruſh and ſquiſe the dragon between him and them: the dragons ware hereof, entangle and ſnarle his feet & legs firſt with their taile: the Elephants on the other ſide, vndo thoſe knots with their trunk as with a hand: but to preuent that againe, the Dragons put in their heads into their ſnout, and

ſo

20030
copy 1

A ſo ſtop their wind,and withall fret and gnaw the tendereſt parts they find there. Now in caſe theſe two mortall enemies chance to re-incounter on the way,they briſtle & bridle one againſt another,and addreſſe themſelues to fight; but the chiefe thing the dragons make at is the eie, whereby it comes to paſſe,that many times the Elephants are found blinde,pined for hunger, and worne away,and after much languiſhing, for very anguiſh and ſorrow die of their venome. What reaſon ſhould a man alledge of this ſo mortall warre betweene them, if it be not a very ſport of Nature,and pleaſure that ſhe takes, in matching theſe two ſo great enemies together, and ſo euen and equall in each reſpect? But ſome report this mutuall war between them after another ſort,and that the occaſion thereof ariſeth from a naturall cauſe: for (ſay they) the Ele-
B phants bloud is exceeding cold,and therefore the dragons be wonderful deſirous thereof to refreſh and coole themſelues therewith during the parching hot ſeaſon of the yeare. And to this purpoſe they ly vnder the water, waiting their time to take the Elephants at a vantage when they are drinking; where they catch faſt hold firſt of their trunke, and they haue not ſo ſoone claſped and intangled it with their taile, but they ſet their venomous teeth in the Elephants eare (the onely part of all their body which they cannot reach vnto with their trunke) and ſo bite it hard: now theſe dragons are ſo big withal,that they are able to receiue all the elephants bloud: thus are they ſucked dry vntill they fall down dead: and the dragons alſo,drunke with their bloud,are ſqueeſed vnder them,and ſo dy together.

Chap. XIII.

C ¶ *Of Dragons.*

IN Æthyopia there be as great dragons bred as in India, namely 20 cubits long: but I marruell much at this one thing,that king *Iuba* ſhould think they are creſted. They are bred moſt in a countrey of Æthyopia where the Aſachæi inhabit. It is reported, that vpon their coaſt they are inwrapped foure or fiue of them one within another, like to a hurdle or lattiſe-worke, and thus paſſe the ſeas to find out better paſturage in Arabia, cutting the waues, and bearing their heads aloft,which ſerue them in ſtead of ſailes.

Chap. XIV.

D ¶ *Of monſtrous great Serpents, and namely of thoſe called Boæ.*

MEgaſthes writeth,that there be ſerpents among the Indians growne to that bigneſſe, that they are able to ſwallow ſtags or bulls all whole. *Metrodorus* ſaith,that about the riuer Rhyndacus in Pontus, there be ſerpents that catch and deuoure the fowles of the aire, be they neuer ſo ſwift winged,and ſoare they neuer ſo high. Well knowne it is,that *Attilius Regulus*, Generall vnder the Romans during the wars againſt the Carthaginians,aſſailed a Serpent neere the riuer Bagrada,which caried in length 120 foot; and before hee could conquer him was driuen to diſcharge vpon him arrowes,quarrels, ſtones,bullets,and ſuch like ſhot,out of brakes,ſlings,and other engins of artillery,as if he had giuen the aſſault to ſome ſtrong warlike towne: the proofe whereof was to be ſeen by the marks remaining in his skin and chawes;
E which vntill the war of Numantia remained in a temple or conſpicuous place of Rome. And this is the more credible,for that we ſee in Italy other ſerpents named Boæ, ſo big and huge, that in the daies of the Emperor *Claudius* there was one of them killed in the Vaticane,within the belly whereof there was found an infant all whole. This ſerpent liueth at the firſt of kines milk,and thereof takes the name Boæ. As for other beaſts which ordinarily of late are brought from all parts into Italy,and oftentimes haue there been ſeen,needleſſe it is for me to deſcribe their formes in particular curiouſly.

Chap. XV.

F ¶ *Of Scythian beaſts,and thoſe which are bred in the North parts.*

VEry few ſauage beaſts are ingendred in Scythia for want of trees & paſturage. Few likewiſe in Germany bordering vpon it. Howbeit that country brings forth certaine kindes of goodly great wild bœufs: to wit,the Biſontes,mained with a collar like Lions: and the

Vri,

Vri, a mighty ſtrong beaſt and a ſwift, which the ignorant people call Buffles, whereas indeed G
the Buffle is bred in Africke, and ſomewhat reſembles a calfe rather, or ſtag. The Northerne
regions bring forth wilde horſes, which there are found in great troups: like as in Aſia and in
Africk there are to be ſeen wild Aſſes. Moreouer, a certain beaſt called the Alce, very like to a
horſe, but that his eares are longer, and his necke alſo with two markes diſtinguiſhing them a-
ſunder. Moreouer, in the Iſland of Scandinavia there is a beaſt called Machlis, not much vn-
like the Alce aboue-named: common he is there, & much talk we haue heard of him, howbeit
in theſe parts he was neuer ſeen. He reſembles, I ſay, the Alce, but that he hath neither ioynt in
the hough, nor paſternes in his hind legs; and therefore he neuer lieth downe, but ſleepeth lea-
ning to a tree. Wherefore the hunters that lie in wait for theſe beaſts, cut down the trees while
they are aſleepe, and ſo take them: otherwiſe they ſhould neuer be taken, they are ſo ſwift of H
foot, that it is wonderfull. Their vpper lip is exceeding great, and therefore as they graſe and
feed they go retrograde, leſt if they went paſſant forward, they ſhould fold that lip double vn-
der their muzzle. There is (they ſay) a wild beaſt in Pæonia, called Bonaſus, with a maine like
an horſe, otherwiſe reſembling a bull: mary his hornes bend ſo inward with their tips toward
his head, that they ſerue him in no ſtead at all for fight, either to offend, or defend himſelf: and
therefore all the helpe hee hath is in his good footmanſhip, and otherwhiles in his flight by
dunging, which he will ſquirt out from behind him three acres in length. This his ordure is ſo
ſtrong and hot, that it burneth them that purſue him, like fire, if haply they touch it. A ſtrange
thing it is, and wonderfull, that the Leopards, Panthers, Lions, and ſuch like beaſts, as they go,
draw in the points of their claws within their body, as it were into ſheaths, becauſe they ſhould I
neither breake nor wax blunt, but be alwaies keene and ſharpe: alſo, that when they runne they
ſhould turne the hooked nailes of their pawes back, and neuer ſtretch them forth at length but
when they meane to aſſaile or ſtrike any thing.

Chap. XVI.

¶ *Of Lions.*

THe Lions are then in their kind moſt ſtrong and couragious, when the haire of their main
or collar is ſo long that it couereth both necke and ſhoulders. And this comes to them
at a certain age, namely to thoſe that are ingendred by Lions: for ſuch as haue Pards to K
their ſires neuer haue this ornament, no more than the Lioneſſe. Theſe Lioneſſes are very le-
cherous, aad this is the cauſe that the Lions are ſo fell and cruell. This, Africke knowes beſt,
and ſees moſt; and eſpecially in a great drought, when for want of water a great number of
wild beaſts reſort by troups to thoſe few riuers that be there, and meet together: and hereupon
it is, that ſo many ſtrange ſhaped beaſts of a mixt and mungrell kind are there bred, whiles the
males either perforce or for pleaſure leap and couer the females of all ſorts. From hence it is
alſo that the Greeks haue this common prouerbe, *That Africke euermore brings forth ſome new and
ſtrange thing or other.* The Lion knoweth by ſent and ſmell of the Pard, when the Lioneſſe his
mate hath played falſe, and ſuffered her ſelfe to be couered by him; and preſently with all his
might and maine runneth vpon her for to chaſtiſe and puniſh her. And therefore when the Li- L
oneſſe hath done a fault that way, ſhe either goeth to a riuer and waſheth away the ſtrong and
ranke ſauor of the Pard, or elſe keepeth aloofe and followeth the Lion afar off, that he may not
catch the ſaid ſmell. I ſee it is commonly held, that the Lioneſſe brings forth yong but once
in her life, for that her whelps in her kinling teare her belly with their nailes, and make them-
ſelues roome that way. *Ariſtotle* writeth otherwiſe, a man whom I cannot name but with great
honour and reuerence, and whom in the hiſtorie and report of theſe matters I meane for the
moſt part to follow. And in very truth King *Alexander* the Great, of an ardent deſire that he
had to know the natures of all liuing creatures, gaue this charge to *Ariſtotle*, a man ſingularly
accompliſhed with all kinds of ſcience and learning, to ſearch into this matter, and to ſet down
the ſame in writing: and to this effect commanded certaine thouſands of men, one or other, M
throughout all the tract as well of Aſia as Greece, to giue their attendance and obey him: to
wit, all Hunters, Falconers, Fowlers, and Fiſhers that liued by thoſe profeſſions: Item, all For-
reſters, Park-keepers, and Wariners: all ſuch as had the keeping of heards and flockes of cat-
tell: of bee-hiues, fiſh-pooles, ſtewes, and ponds: as alſo thoſe that kept vp fowle tame or wild,

in

20030
copy 1

A in mew: thoſe that fed poultry in barton or coup: to the end that he ſhould be ignorant of nothing in this behalfe, but be aduertiſed by them, according to his Commiſſion, of all things in the world. By his conference with them he collected ſo much, as thereof hee compiled thoſe excellent bookes *de Animalibus, i.* of Liuing creatures, to the number almoſt of 50. Which being couched by me in a narrow roome and briefe ſummary, with addition alſo of ſome things which he neuer knew, I beſeech the Readers to take in good worth: and for the diſcouerie and knowledge of all Natures works, which that moſt noble and famous King that euer was deſired ſo much to know, to make a ſhort ſtart abroad with me, and in a briefe diſcourſe by mine own pains and diligence digeſted, to ſee all. To return now vnto our former matter: That great phi-
B loſopher *Ariſtotle* therefore reporteth, That the Lioneſſe at her firſt litter bringeth forth fiue whelps, and euery yeare after fewer by one: and when ſhe commeth to bring but one alone, ſhe giueth ouer and is barren. Her whelps at the firſt are without ſhape like ſmall gobbets of fleſh no bigger than weeſels. When they are ſix moneths old they can hardly go, and for the two firſt they ſtir not at all. Lions there be alſo in Europe (only between the riuers Achelous and Neſtus) and theſe verily be far ſtronger than thoſe of Africke or Syria. Moreouer, there are two kinds of Lions: the one ſhort, wel truſſed, and compact, with more criſp and curled mains, but theſe are timerous and cowards to them that haue long and plain haire; for thoſe paſſe not for any wounds whatſoeuer. The Lions lift vp a leg when they piſſe, as dogs do: and moreouer, they haue a ſtrong and ſtinking breath, their very body alſo ſmelleth rank. Seldom they drink,
C and eate but each other day; and if at any time they feed til they be full, they wil abſtain from meat three daies after. In their feeding, whatſoeuer they can ſwallow without chewing, downe it goes whole: and if they finde their gorge and ſtomacke too full, and not able indeed to receiue according to their greedy appetite, they thruſt their pawes down their throats, and with their crooked clees fetch out ſome of it again, to the end they ſhould not be heauy and ſlow vpon their fulneſſe, if haply they be put to find their feet and fly. Mine Author *Ariſtotle* ſaith moreouer, That they liue very long: and hee proueth it by this argument, That many of them are found toothleſſe for very age. *Polybius*, who accompanied [*Scipio*] *Æmylianus* in his voiage of Africke, reporteth of them, That when they be growne aged they will prey vpon a man: the reaſon is, becauſe their ſtrength will not hold out to purſue in chaſe any other wild beaſts: then
D they come about the cities and good towns of Africke, lying in wait for their prey, if any folk come abroad: and for that cauſe, he ſaith, that while hee was with *Scipio*, hee ſaw ſome of them crucified and hanged vp, to the end that vpon the ſight of them other Lions ſhould take example, and be skarred from doing the like miſchiefe. The Lion alone of all wilde beaſts, is gentle to thoſe that humble themſelues vnto him, and will not touch any ſuch vpon their ſubmiſſion, but ſpareth what creature ſoeuer lieth proſtrate before him. As fell and furious as he is otherwhiles, yet he diſchargeth his rage vpon men, before he ſets vpon women, and neuer preyeth on babes vnleſſe it be for extreme hunger. They are verily perſuaded in Lybia, that they haue a certain vnderſtanding when any man doth pray or intreat them for any thing. I haue heard it reported for a truth, by a captiue woman of Getulia (which being fled was brought home again
E to her maſter) that ſhe had pacified the violent fury of many Lions within the woods and forreſts, by faire language and gentle ſpeech; and namely, that for to eſcape their rage, ſhee hath been ſo hardy as to ſay, ſhe was a ſilly woman, a baniſhed fugitiue, a ſickly, feeble, & weak creature, an humble ſuiter and lowly ſuppliant to him the nobleſt of all other liuing creatures, the Soueraigne and commander of all the reſt, and that ſhe was too baſe and vnworthy for his glorious Maieſtie to prey vpon her. Many and diuers opinions are currant, according to the ſundry occurrences that haue hapned, or the inuentions that mens wits haue deuiſed as touching this matter; namely, that ſauage beaſts are dulced and appeaſed by good words and faire ſpeech: as alſo that fell ſerpents may be trained and fetched out of their holes by charmes; yea and by certaine coniurations and menaces reſtrained and kept vnder for a puniſhment: but whether
F it be true or no, I ſee it is not yet by any man ſet downe or determined. To come againe to our Lions, the ſigne of their intent and diſpoſition is their taile; like as in horſes, their eares: for theſe two marks and tokens certainly hath Nature giuen to the moſt couragious beaſts of all others, to know their affections by: for when the Lion ſtirs not his taile, he is in a good mood, gentle, mild, pleaſantly diſpoſed, and as if he were willing to be plaied withall: but in that fit he is ſeldome ſeen, for lightly he is alwaies angry. At the firſt when he entreth into his choler,

he

he beateth the ground with his taile: when he groweth into greater heats, he flappeth and jerketh his flanks and ſides withall, as it were to quicken himſelfe, and ſtir vp his angry humour. His maine ſtrength lieth in his breſt: hee maketh not a wound (whether it be by laſh of taile, ſcratch of claw, or print of tooth) but the bloud that followeth is black. When his belly is full all his anger is paſt, and he doth no more harme. His generoſitie and magnanimitie he ſhewes moſt in his dangers: which courage of his appeareth not only herein, that he ſeems to deſpiſe all ſhot of darts againſt him, defending himſelfe a long time onely with the terrible aſpect of his countenance, proteſting as it were that he is vnwilling to deale, vnleſſe he be forced thereto in his owne defence, *i. ſe defendendo*, and at length maketh head again, not as compelled or driuen thereto for any perill that hee ſeeth, but angred at their folly that aſſaile or ſet vpon him: but herein alſo is ſeen rather his noble heart and courage, That be there neuer ſo many hounds and hunters following after him, ſo long as he is in the open plains where he may be ſeene, hee maketh ſemblance as though he contemned both dog and man, diſmarching and retiring with honour, and otherwhiles ſeeming in his retreit to turne again and make head: but hauing gained the thickets and woods, and gotten into the forreſts out of ſight, then he skuds away, then he runneth amain for life, as knowing full well, that the trees and buſhes hide him, that his ſhamefull diſlodging and flight is not then eſpied. When hee chaſeth and followeth after oher beaſts he goeth alwaies ſaltant or rampant; which he neuer vſeth to do when he is chaſed in ſight, but is only paſſant. If he chance to be wounded, he hath a maruellous eye to mark the party that did it, and be the hunters neuer ſo many in number, vpon him he runneth only. As for him that hath let fly a dart at him, and yet miſſed his marke and done no hurt to him, if he chance to catch him, he all to touzeth, ſhaketh, toſſeth, and turneth him lying along at his feet, but doth him no harme beſides. When the Lioneſſe fighteth for her yong whelps, by report, ſhe ſetteth her eies wiſtly and entirely vpon the ground, becauſe ſhee would not be affrighted at the ſight of the chaſing ſtaues of the hunters. Lions are nothing at all crafty and fraudulent, neither be they ſuſpitious: they neuer look askew, but alwaies caſt their eye directly forward, and they loue not that any man ſhould in that ſort looke ſide-long vpon them. It is conſtantly beleeued, that when they ly a dying they bite the earth, & in their very death ſhed teares. This creature, ſo noble as hee is, and withall ſo cruell and fell, trembleth and quaketh to heare the noiſe of cart-wheeles, or to ſee them turne about; nay hee cannot abide of all things Chariots when they be void and empty: frighted hee is with the cockes combe, and his crowing much more, but moſt of all with the ſight of fire. The Lion is neuer ſicke but of the peeuiſhneſſe of his ſtomacke, loathing all meat: and then the way to cure him is to ty vnto him certaine ſhee Apes, which with their wanton mocking and making mowes at him, may moue his patience, and driue him for the very indignitie of their malapert ſaucineſſe, into a fit of madneſſe; and then ſo ſoone as he hath taſted their bloud he is perfectly wel again: and this is the only help. *Q. Scævola* the ſon of *Publius* was the firſt at Rome that in his Curule Ædileſhip exhibited a fight and combat of many Lions together, to delight the people: but *L. Sylla*, who was afterward Dictator, was the firſt of all others that in his Pretorſhip repreſented a ſhew of 100 lions with maines and collars of haire: and after him, *Pompey* the Great ſhewed 600 of them fighting in the grand Cirque, whereof 315 were male Lions with mane. And *Cæſar* Dictator brought 400 into the ſhew-place. The taking of them in old time was a very hard piece of worke, and that was commonly in pit-falls: but in the Emperor *Claudius* his daies it chanced, that a ſhepheard or heardſman who came out of Gætulia taught the manner of catching them: a thing otherwiſe that would haue beene thought incredible, and altogether vnbeſeeming the name and honour of ſo goodly a beaſt. This Getulian, I ſay, fortuned to incounter a Lion, and when he was violently aſſailed by him, made no more ado but threw his mandilion or caſſocke full vpon his eyes. This feat or caſt of his was ſoone after practiſed in the open Shew-place, in ſuch ſort that a man would hardly haue beleeued but hee that ſaw it, that ſo furious a beaſt ſhould ſo eaſily be quailed, and daunted ſo ſoone as euer hee felt his head couered, were the things neuer ſo light; making no reſiſtance, but ſuffering one to do what hee would with him, euen to binde him faſt, as if in very truth all his vigour and ſpirit reſted in his eies. Leſſe therefore is it to be maruelled at, that *Lyſimachus* ſtrangled a Lion, when as by the commandement of *Alexander* the Great he was ſhut vp alone together with him. The firſt man that euer yoked them a Rome, and made them to draw in a chariot, was *M. Antonius*. And verily it was in

the

20030
copy 1

A the time of ciuill warre, after the battell fought in the plaines of Pharſalia; a ſhrewd and vnhappy preſage of the future euent, and namely for men of an high ſpirit & braue mind in thoſe daies, to whom this prodigious ſight did prognoſticate the yoke of ſubiection: for what ſhould I ſay how *Anthony* rode in that wiſe with the Courteſan *Cytheris* a common Actreſſe in Interludes vpon the ſtage? To ſee ſuch a ſight was a monſtrous ſpectacle, that paſſed all the calamities of that time. It is reported that *Hanno* (one of the nobleſt Carthaginians that euer were) was the firſt man that durſt handle a Lion with his bare hand, and ſhew him gentle and tame, to follow him all the city ouer in a ſlippe like a dog. But this deuice and tricke of his turned to his great damage and vtter vndoing: for the Carthaginians hereupon laid this ground, that *Hanno*, a man of ſuch a gift, ſo witty and inuentiue of all deuiſes, would be able to perſuade the people to whatſoeuer his minde ſtood; and that it was a dangerous and tickliſh point, to put
B the liberty of ſo great a ſtate as Carthage was, into the hands and managing of him who could handle and tame the furious violence of ſo ſauage a beaſt, and thereupon condemned and baniſhed him. Moreouer we find in hiſtories many examples alſo of their clemencie and gentleneſſe, ſeen vpon diuers caſuall occaſions. *Mentor* the Syracuſian fortuned in Syria to meet with a Lion, who after an humble maner in token of obedience and ſubmiſſion, ſeemed to tumble and wallow before him: he aſtonied for feare ſtarted backe and began to fly; but the wild beaſt followed him ſtill, and was ready at euery turne to preſent himſelfe before him, licking the very tracks of his foot-ſteps as he went, in flattering manner, as if he would make loue vnto him. *Mentor* at length was ware that the Lion had a wound in his foot, and that it ſwelled therwith: whereupon he gently plucked out the ſpill of wood that had gotten into it, and ſo eaſed
C the beaſt of his paine. This accident is for a memoriall repreſented in a picture at Syracuſa. Semblably, *Elpis* a Samian being arriued and landed in Africk, chanced to eſpy neer the ſhore a Lion gaping wide, and ſeeming afar off to whet his teeth at him in menacing wiſe: he fled apace to take a tree, calling vpon god *Bacchus* to help him (for then commonly wee fall to our praiers when we ſee little or no hope of other helpe:) but the Lion ſtopt him not in his flight, albeit he could haue croſſed the way well enough, but laying himſelfe downe at the tree root, with that open mouth of his wherewith he had skared the man, made ſignes to moue pitty and compaſſion. Now ſo it was, that the beaſt hauing lately fed greedily, had gotten a ſharp bone within his teeth, that put him to exceeding paine: beſides that, hee was almoſt famiſhed: and
D he looking pittifully vp to the man, ſhewed how he was puniſhed himſelfe among thoſe verie weapons wherewith he was wont to anoy others, and after a ſort with dumb and mute prayers beſought his help. *Elpis* aviſed him well a pretty while; and beſides that hee was not very forward to venture vpon the wilde beaſt, he ſtaied the longer and made the leſſe haſt, while he conſidered rather this ſtrange and miraculous accident, than otherwiſe greatly feared. At laſt he comes downe from the tree and plucks out the bone, whiles the Lion held his mouth handſomly to him, and expoſed himſelfe to his helpfull hand as fitly as he poſſibly could. In requitall of which good turne, it is ſaid, that ſo long as this ſhip of his lay there at anchor, the Lion furniſhed him and his company with good ſtore of veniſon ready killed to his hand. And vpon this occaſion *Elpis* after his return dedicated a temple to *Bacchus*: which vpon this reaſon the
E Greeks called Κιλωνος Διονυσου, *i.* of gaping *Bacchus*; or Σωτηρος Διονυσου, *i.* the chappell of *Bacchus* the Sauiour. Can we maruell any more from henceforth, that wild beaſts ſhould marke and know the footing of a man, ſeeing that in their extremities and neceſſities they haue recourſe to him alone for hope of ſuccour? Why went not they to other creatures? or who taught them that the hand of man was able to cure them? vnleſſe this be the reaſon, that griefe, anguiſh, and extreme perill forceth euen ſauage beaſts to ſeeke all means of help and reliefe.

Chap. XVII.

¶ *Of Panthers.*

F

Demetrius the philoſopher, ſo wel ſeen into the ſpeculation of Natures works, & the cauſes thereof, makes mention of as memorable a caſe as the former, touching a Panther: for as he ſaith there was a Panther deſirous to meet with a man, & therefore lay in the mids of an high-way vntill ſome paſſenger ſhould come by, and ſuddenly was eſpied by the father of

of *Philinus* the Philoſopher, who trauailed that way. The man (for feare) began to retire and go backe againe, but the wild beaſt kept a tumbling and vauting all about him; doubtleſſe and by all apparance after a flattering ſort, as if it would haue had ſomwhat; and ſuch a toſſing and tormenting of it ſelfe ſhe made, ſo piteouſly, that it might ſoone be ſeene in what griefe and pain the Panther was. The poore beaſt had but lately kindled, and her young whelps were falne into a ditch, afarre off: well, the firſt point that the man ſhewed of pitty and commiſeration was, not to be affraid; and the next was, to haue regard and care of her: follow he did the Panther, as ſhe ſeemed to train and draw him by his garment (which with her clawes ſhee tooke hold of daintily) vntill they were come to the pit or ditch aboue-ſaid. So ſoon then as he knew the cauſe of her griefe and ſorrow, and withall what might be the reward of his courteſie, euen as much as his life came to, he drew forth her little ones that were fallen into the ſaid pit: which don, ſhe and her whelps together leaping and ſhewing gambols for ioy, accompanied him, and through the wilderneſſe directed him vntill he was gotten forth. So as it appeared in her, that ſhee was thankfull vnto him, and requited his kindneſſe, albeit there paſſed no couenant nor promiſe between them of any ſuch recompence: a rare example to be found euen among men. This ſtory and ſuch like giue great colour of truth to that which *Democritus* reporteth, namely, that *Thoas* in Arcadia ſaued his life by means of a dragon. This *Thoas* being but a very childe, had loued this dragon when he was but yong, very well, and nouriſhed him: but at laſt, being ſomewhat fearfull of his nature, and not well knowing his qualities, and fearing withall the bignes that now he was growne vnto, had carried him into the mountains and deſarts: wherein it fortuned that he was afterward ſet vpon and inuironed by theeues: whereupon he cried out, and the dragon knowing his voice, came forth and reſcued him. As for babes and infants caſt forth to periſh, and ſuſtained by the milke of wilde beaſts, like as *Romulus* and *Remus* our firſt founders, who were ſuckled by a ſhe wolfe; ſuch things in mine opinion are in all reaſon to be attributed more to fortune and fatall deſtinies, than to the nature of thoſe beaſts. The Panthers and Tygers are in a maner the only beaſts (for the varietie of ſpotted skins and * furres which they yeeld) in great requeſt, and commendable: for other beaſts haue each one a proper colour of their owne, according to their kind: Lions there be all blacke, but they are found in Syria only. The ground of the Panthers skin is white, beſet all ouer with little black ſpots like eies. It is ſaid, that all foure-footed beaſts are wonderfully delighted and enticed by the ſmell of Panthers; but their hideous looke and crabbed countenance, which they bewray by ſhewing their heads, skareth them as much againe: wherefore their maner is to hide their heads, and hauing trained other beaſts within their reach by their ſweet ſauour, they fly vpon them and worrie them. Some report, that they haue one marke on their ſhoulder reſembling the Moone, growing and decreaſing as ſhe doth, ſometime ſhewing a full compaſſe, and otherwhiles hollowed and pointed with tips like hornes. In all this kind and race of wild beaſts now adaies they cal the male * Variæ and Pardi, and great abundance there is of them in Africke and Syria. Some there be againe that make no other difference betweene the Luzernes and Leopards, and theſe Panthers, but only this, that the Panthers are white: and as yet I know no other marks to deſcry them by. There paſſed an old Act and Ordinance of the Senate, forbidding expreſly that any Panthers of Africke ſhould be brought into Italy. Againſt this edict, *Cn. Auſidius* a Tribune of the commons put vp another bill vnto the people; and granted it was, That for the ſolemnitie of the games Circenſes they might be brought ouer. *Scaurus* was the firſt man who in his Ædileſhip exhibited a ſhew vnto the people of 150 Luzernes together. After him *Pompey* the Great brought forth 410. The Emperor *Auguſtus* 420: who alſo in the yere that *Q. Tubero* and *Fabius Maximus* were Conſuls together (vpon the 4 day before the Nones of May, at the dedication of the Theatre of *Marcellus*) was the firſt of all others that ſhewed a tame Tyger within a cage: but the Emperor *Claudius* foure at once.

* i. The Lubernes or Luzernes.

* i. Luzernes or Libards.

Chap. XVIII.

¶ *Of the Tyger and his nature: of Camels, Chamelopardales, and when they were firſt ſeen at Rome.*

TYgers are bred in Hircania and India: this beaſt is moſt dreadfull for incomparable ſwiftneſſe, and moſt of all ſeen it is in the taking of her yong: for her litter (whereof there is a great

20030
copy 1

A great number) by the hunters is ſtolne and caried away at once, vpon a moſt ſwift horſe for the purpoſe; lying in wait to eſpy when the dam is abroad: and ſhifteth this booty from one freſh horſe to another, riding away vpon the ſpur as hard as they can. But when the Tygreſſe comes and finds her den & neſt empty (for the male Tygre hath no care nor regard at all of the yong) ſhe runs on end after her yong ones, following thoſe that caried them away, by the ſent of their horſe footing. They perceiuing the Tygreſſe to approch, by the noiſe ſhe maketh, let fall or caſt from them one of her whelps: vp ſhe taketh it in her mouth, and away ſhe runneth toward her den, ſwifter for the burthen that ſhe carrieth. And preſently ſhe ſetteth out again, followeth the queſt after her fawnes, and ouertaketh the Hunter that had them away. Thus runneth ſhe to and fro, vntill ſhe ſee that they be embarqued and gone; and then for very anger that ſhe hath not ſped of her purpoſe, ſhee rageth vpon the ſhore and the ſands for the loſſe of her
B Fawnes.

As for Camels, they are nouriſhed in the Levant or Eaſt parts among other heards of great cattell: two kindes there be of them, the Bactrians and the Arabick: differing herein, that the Bactrians haue two bunches vpon their backs; the other but one apiece there, but they haue another in their breſt, wherupon they reſt and ly. Both ſorts want the vpper row of teeth in their mouthes, like as bulls and kine. In thoſe parts from whence they come they ſerue all to carry packs like labouring horſes, and are put to ſeruice alſo in the wars, and are backed of horſmen: their ſwiftneſſe is comparable to that of horſes; they grow to a iuſt meaſure, and exceed not a certaine ordinary ſtrength. The Camell in his trauelling will not goe a iot farther than his ordinary iourney; nether will hee carry more than his accuſtomed and vſuall load. Naturally they doe hate horſes. They can abide to be foure daies together without drinke: and
C when they drinke or meet with water, they fil their skin full enough to ſerue both for the time paſt and to come: but before they drinke they muſt trample with their feet to raiſe mud and ſand, and ſo trouble the water, otherwiſe they take no pleaſure in drinking. They liue commonly fifty yeares, and ſome of them an hundred. Theſe creatures alſo otherwhile fall to be mad, ſo much as it is. Moreouer, they haue a deuice to ſplay euen the very females, to make them fit for the warres; for if they be not couered they become the ſtronger and more couragious.

Two other kinds of beaſts there be that reſemble in ſome ſort the Camels: the one is called
D of the Æthiopians, the Nabis, necked like an horſe, for leg and hooſe not vnlike the bœufe, headed directly like a Camell, beſet with white ſpots vpon a red ground, whereupon it taketh the name of Camelopardalus: and the firſt time that it was ſeen at Rome, was in the games Circenſes, ſet out by *Cæſar* Dictator. Since which time he comes now and then to Rome, to be looked vpon more for ſight, than for any wild nature that hee hath: whereupon ſome call her the ſauage Sheepe.

Chap. XIX.

¶ *Of the Chaus and Cephus.*

E THe Hinde-wolfe, which ſome call Chaus, and the Gaules were wont to name Rhaphius, reſembling in ſome ſort a Wolfe with Leopards ſpots, were ſhewed firſt in the ſolemnitie of the games and plaies exhibited by *Cn. Pompeius* the Great. He alſo brought out of Æthyopia other beaſts named Cephi, *i.* Semivulpes, whoſe foreſeet were like to mens hands, and the hinde feet and legs like thoſe of a man. He was neuer ſeen afterward at Rome.

Chap. XX.

¶ *Of the Rhinoceros.*

F IN the ſame ſolemnities of *Pompey*, as many times elſe was ſhewed a Rhinoceros, with one horne and no more, and the ſame in his ſnout or muzzle. This is a ſecond enemy by nature the Elephant: hee fileth that horne of his againſt hard ſtones, making it ſharpe againſt he ſhould fight; and in his conflict with the Elephant he layes principally at his belly, knowing it to be more tender than the reſt. He is full as long as he, his legs are much ſhorter, and of the box colour.

Chap. XXI.

¶ *Lynces or Onces, and Marmozets or Apes, called Sphinges: of Crocutes, Monkies, Engliſh bœufes, Leococrutes, Eale: Æthiopian bulls, the Mantichore and Lycornes: of the ſerpents called Catoblepes, and the Baſiliske.*

ONces are common, ſo are Marmozets, with a browne duskiſh haire, hauing dugs in their breſt. Æthiopia breedeth them, like as many other monſtrous beaſts, to wit, horſes with wings, and armed with hornes, which they cal Pegaſi. Alſo the Crocutes [a kind of maſtiue dogs] ingendred betwixt a dog and a Wolfe: theſe are able to craſh with their teeth all they can come by: and a thing is no ſooner downe their ſwallow, and got into their ſtomacke, but preſently they digeſt it. Moreouer, the Cercopitheci, *i.* Monkies with black heads, otherwiſe haired like Aſſes, differing from other Apes in their cry. The Indians haue certain bœufs with one horne, and others with 3. Alſo the Leocrocuta, a moſt ſwift beaſt, as big almoſt as an he Aſſe, legged like an Hart, with a necke, taile, and breſt of a Lion, headed like theſe grayes or Badgers, with a clouen foot in twaine: the ſlit of his mouth reacheth to his eares, in ſtead of teeth an entire whole bone. They report that this beaſt feigneth a mans voice. They haue alſo among them another beaſt named Eale, for bignes equall to the riuer-horſe, tailed like an Elephant, either black or reddiſh tawny of colour: his mandibles or chawes reſemble thoſe of the Bore, he hath hornes aboue a cubit long, which he can ſtir or moue as he liſt: for being in fight he can ſet them both or one of them as he will himſelfe, altering them euery way, one while ſtreight forward to offend, otherwhiles bending byas, as he hath reaſon to nort or puſh toward, or auoid an enemie. But the moſt fell and cruell of all others of that country be the wild buls of the forreſt, greater than our common field buls, moſt ſwift, of colour brended, their eies gray or blewiſh, their haire growing contrary, their mouth wide and reaching to their eares: their hornes likewiſe hard by, moueable; their hide as hard as a flint, checking the dent of any weapon whatſoeuer, and cannot be pierced: all other wilde beaſts they chaſe and hunt, themſelues canot be taken but in pit-falls: in this their wildneſſe and rage they dy, & neuer become tame. *Cteſias* writeth, that in Æthiopia likewiſe there is a beaſt, which he calls Mantichora, hauing three ranks of teeth, which when they meet together, are let in one within another like the teeth of combs, with the face and eares of a man, with red eies, of colour ſanguine, bodied like a Lion, and hauing a taile armed with a ſting like a Scorpion: his voice reſembles the noiſe of a flute and trumpet ſounded together: very ſwift he is, and mans fleſh of all other he chiefly deſireth. In India there be found bœufs whole hoofed, with ſingle hornes; alſo a wilde beaſt named Axis [as ſome thinke a muske cat] with a skin like a fawne or hind-calfe, howbeit marked with more and whiter ſpots. This beaſt is conſecrated to *Bacchus*, and vnder his protection. The Orſians of India hunt Apes, and take a number of them white all ouer. But the moſt fell and furious beaſt of all other is the Licorne or Monoceros: his body reſembles a horſe, his head a ſtag, his feet an Elephant, his taile a bore; he loweth after an hideous manner, one black horne he hath in the mids of his forehead, bearing out two cubits in length: by report, this wild beaſt cannot poſſibly be caught aliue. Among the Heſperian Æthiopians there is a fountain named Nigris, the head (as many haue thought) of the riuer Nilus, and good reaſon there is for it, alledged by vs before: neere which ſpring keepeth a wild beaſt called Catoblepes, little of body otherwiſe, heauy alſo and ſlow in al his limnes beſides, but his head only is ſo great that his body is hardly able to beare it, he alwaies carrieth it downe to the earth, for if hee did not ſo, hee were able to kill all mankind; for there is not one that looketh vpon his eies, but he dies preſently. The like propertie hath the ſerpent called a Baſiliske: bred it is in the prouince Cyrenaica, and is not aboue twelue fingers bredth long: a white ſpot like a ſtarre it carrieth on the head, and ſets it out like a coronet or diadem: if he but hiſſe once, no other ſerpents dare come neere: hee creepeth not winding and crawling byas as other ſerpents doe, with one part of the body driuing, the other forward, but goeth vpright and aloft from the ground with one halfe part of his body: he killeth all trees and ſhrubs not onely that he toucheth, but alſo that hee breatheth vpon: as for graſſe and herbes, thoſe he ſindgeth and burneth vp, yea, and breaketh ſtones in ſunder: ſo venimous and deadly he is. It is receiued for a truth, that one of them on a

time

20030
copy 1

A time was killed with a launce by an horſman from his horſe-back, but the poiſon was ſo ſtrong that went from his body along the ſtaffe, as it killed both horſe and man: and yet a ſilly weazle hath a deadly power to kill this monſtrous ſerpent, as pernicious as it is [for many kings haue been deſirous to ſee the experience thereof, and the manner how he is killed.] See how Nature hath delighted to match euery thing in the world with a concurrent. The manner is, to caſt theſe weazles into the hole and dcranies were they lye, (and eaſie they be to know by the ſtinking ſent of the place about them:) they are not ſo ſoone within, but they ouercome them with their ſtrong ſmell, but they die themſelues withall; and ſo Nature for her pleaſure hath the combat diſpatched.

CHAP. XXII.

B

¶ *Of Wolues.*

IT is commonly thought likewiſe in Italy, that the eye ſight of wolues is hurtful; in ſo much, as if they ſee a man before hee eſpy him, they cauſe him to loſe his voice for the time. They that be bred in Affrick and Ægypt, are but little, and withal nothing liuely, but without ſpirit. In the colder clime, they be more cruell and eger. That men may be transformed into wolues, and reſtored againe to their former ſhape, we muſt confidently beleeue to be a lowd lie, or elſe giue credit to all thoſe tales which we haue for ſo many ages found to be meere fables. But how this opinion grew firſt, & is come to be ſo firmly ſetled, that when we would giue men
C the moſt opprobrious words of defiance that we can, we terme them * *Verſipelles*, I thinke it not much amiſſe in a word to ſhew. *Euanthes* (a writer among the Greekes, of good account and authority) reporteth, that he found among the records of the Arcadians, That in Arcadia there was a certaine houſe and race of the *Antæi*, out of which one euermore muſt needs be transformed into a wolfe: and when they of that family haue caſt lots who it ſhall be, they vſe to accompany the party vpon whom the lot is falne, to a certaine meere or poole in that country: when he is thither come, they turne him naked out of all his clothes, which they hang vpon an oke thereby: then he ſwimmeth ouer the ſaid lake to the other ſide, and being entered into the wilderneſſe, is preſently transfigured and turned into a wolfe, and ſo keepeth company with
D his like of that kind for nine yeeres ſpace: during which time, (if he forbeare all the while to eat mans fleſh) he returneth againe to the ſame poole or pond, and being ſwomme ouer it, receiueth his former ſhape againe of a man, ſaue only that he ſhall look nine yeeres elder than before. *Fabius* addeth one thing more and ſaith, That he findeth againe the ſame apparell that was hung vp in the oake aforeſaid. A wonder it is to ſee, to what paſſe theſe Greekes are come in their credulity: there is not ſo ſhameleſſe a lye, but it findeth one or other of them to vphold and maintaine it. And therefore *Agriopas*, who wrote the Olympionicæ, telleth a tale of one *Dæmænetus Parrhaſius*, That he vpon a time at a certain ſolemne ſacrifice (which the Arcadians celebrated in the honour of *Iupiter Lycæus*) taſted of the inwards of a child that was killed for a ſacrifice, according to the manner of the Arcadians (which euen was to ſhed mans bloud in
E their diuine ſeruice) and ſo was turned into a wolfe: and the ſame man ten yeeres after, became a man againe, was preſent at the exerciſe of publick games, wreſtled, did his deuoir, and went away with victory home againe from Olympia. Ouer and beſides, it is commonly thought and verily beleeued, that in the taile of this beaſt, there is a little ſtring or haire that is effectuall to procure loue, and that when he is taken at any time, he caſteth it away from him, for that it is of no force and vertue vnleſſe it be taken from him whiles he liues. He goeth to rut in the whole yere not aboue twelue dayes. When he is very hungry and can get no other prey, he feedeth vpon the earth. In the caſe of preſages and fore-tokens of things to come, this is obſerued That if men ſee a wolfe abroad, cut his way and turne to their right hand, it is good; but if his mouth be full when he doth ſo, there is not a better ſigne or more lucky in the world againe.
F There be of this kind that are called Hart-wolues, ſuch as we ſaid that *Pompey* ſhewed in the grand Cirque, brought out of Fraunce. This beaſt (they ſay) be he neuer ſo hungry when hee is eating, if he chaunce to look backe, forgetteth his meat, ſlinketh away, and ſeeketh for ſome other prey.

* i Turn coats.

Chap. XXIII.

¶ *Of Serpents.*

AS touching ſerpents we ſee it ordinary, that for the moſt part they are of the colour of the earth, wherein they lie hid: and an infinite number of ſorts there be of them. The ſerpent Ceraſtes hath many times foure ſmall hornes, ſtanding out double; with mouing whereof ſhe amuſeth the birds, and traineth them vnto her for to catch them, hiding all the reſt of her body.

Amphisbæna hath two heads as it were, namely one at the taile; as if ſhe were not hurtfull enough to caſt her poyſon at one mouth only. Some are ſcaled, others ſpotted and painted, but generally the venom of them all is deadly. There be of them that from the boughes of trees ſhoot and launce themſelues: in ſuch manner, as that we are not onely to take heed of ſerpents as they go and glide vpon the ground, but alſo to looke vnto them that fly as a dart or arrow ſent out of an engin. The Aſpides ſwell about the necke when they purpoſe to ſting: and no remedie is there for them that are ſtung and bitten by them, vnleſſe the wounded parts be cut off preſently. This peſtilent creature, as venomous as he is, hath one point yet of vnderſtanding or affection rather; you ſhall not ſee them wandring abroad but two and two together, male and female, as if they were yoked together: and unneth or not at all can they liue alone without their mate; ſo that if one of them be killed, it is incredible how the other ſeeks to be reuenged: it purſueth the murderer, and knoweth him again among a number of people, be they neuer ſo many: him it courſeth, and layeth for his life; notwithſtanding what difficulties ſoeuer, he breaketh through all, be it neuer ſo far thither, and nothing may impeach this reuenging humor, vnleſſe ſome riuer be between to keep it backe, or that the party make ſpeed to eſcape away in great haſte. And I aſſure you, I am not able to ſay, whether Nature hath bin more free and prodigall in ſending among vs ſuch noiſome things, or giuing vs remedies againe for them. For to begin withall, ſhe hath afforded to this creature but a darke ſight, and dim eyes; and thoſe not placed in the forepart of the head, to ſee forward and directly, but ſet in the very temples. And hereof it is, that theſe ſerpents are raiſed oftner by their hearing than ſight.

Chap. XXIV.

¶ *Of the Rat of India called Ichneumon.*

BEſides the foreſaid infirmitie, there is mortall war between them and the Ichneumones or Rats of India. A beaſt this is well knowne to the Aſpis, in this regard eſpecially, that it is bred likewiſe in the ſame Ægypt. The manner of this Ichneumon is, to wallow oft times within the mud, and then to dry it ſelfe againſt the Sun: and when he hath thus armed himſelf as it were with many coats hardned in this manner, he goeth forth to combat with the Aſpis. In fight he ſets vp his taile, and whips about turning his taile to the enemie, and therein latcheth and receiueth all the ſtrokes of the Aſpis, and taketh no harme thereby: and ſo long he maintaineth a defenſiue battell, vntill he eſpy a time, turning his head a to-ſide, that hee may catch the Aſpis by the throat, and throtle it. And not content thus to haue vanquiſhed this enemie, he addreſſeth himſelfe to the conflict with another, as hurtful euery way & dangerous as the former.

Chap. XXV.

¶ *Of the Crocodile, Scinke, and Riuer-Horſe.*

THe riuer Nilus nouriſheth the Crocodile; a venomous creature, foure footed, as dangerous on water as land. This beaſt alone, of all other that keepe the land, hath no vſe of a tongue; he only moueth the vpper jaw or mandible, wherewith he biteth hard: and otherwiſe terrible he is, by reaſon of the courſe and ranke of his teeth, which cloſe one within another, as if two combes grew together. Ordinarily he is aboue eighteene cubits in length. The female layeth egs as big as geeſe do, and ſitteth euer vpon them out of the water: for a certaine naturall foreknowledge ſhe hath, how far the riuer Nilus will that yeare riſe when he is at the higheſt,

20030
copy 1

A higheſt and without it will ſhee be ſure to ſit. There is not another creature againe in the world, that of a ſmaller beginning, groweth to a bigger quantity. His feet be armed with claws for offence, and his skin ſo hard, that it will abide any injury whatſoeuer, and not be pierced. All the day time the Crocodile keepeth vpon the land, but he paſſeth the night in the water: and in good regard of the ſeaſon he doth the one and the other. When he hath filled his belly with fiſhes, he lieth to ſleep vpon the ſands in the ſhore: and for that he is a great and greedie deuourer, ſomewhat of the meat ſticketh euermore between his teeth. In regard whereof commeth the wren, a little bird called there Trochilos, and the king of birds in Italy: and ſhee for her victuals ſake, hoppeth firſt about his mouth, falleth to pecking or picking it with her little
B neb or bill, and ſo forward to the teeth, which he cleanſeth; and all to make him gap. Then getteth ſhee within his mouth, which he openeth the wider, by reaſon that he taketh ſo great delight in this her ſcraping and ſcouring of his teeth and chaws. Now when he is lulled as it were faſt aſleep with this pleaſure and contentment of his: the rat of India, or Ichneumon aboueſaid ſpieth his vantage, and ſeeing him lye thus broad gaping, whippeth into his mouth, and ſhooteth himſelfe downe his throat as quicke as an arrow, and then gnaweth his bowels, eateth an hole through his belly, and ſo killeth him.

Within the riuer Nilus there breeds another Serpent called Scincos, like in forme and proportion ſomewhat to the Crocodile, but not all ſo big as the Ichneumon: the fleſh whereof ſerueth for a ſingular Antidote or countre-poiſon; as alſo for to prouoke the heat of luſt in men.

C But to returne againe to the Crocodile: the miſchiefe that he doth is ſo great, that Nature is not content to haue giuen him one mortal enemy & no more; & therefore the dolphins alſo enter the riuer Nilus in deſpight of the Crocodiles, that take themſelues for kings there, as if this riuer were their peculiar kingdome: but ſeeing they be otherwiſe inferiour to the Crocodiles in ſtrength, who alwaies driue them away from preiding or feeding there, they deuiſe to ouermatch him in ſlie craft and ſubtilty, and ſo kill him. And in truth they haue certain fins or wings as it were vpon their backe, as trenchant & keene as kniues, properly made as it were, for this porpoſe. For ſurely all creatures are herein naturally very skilfull and cunning, to know not only their owne good, and what is for them, but alſo what may hurt and annoy their enemies. Ware they be what offenſiue weapons they haue, and of what force they are: they are not ignoD rant of fit occaſions and opportunities to take their vantage, ne yet of the weak parts of their occurrents, by which they may aſſaile and conquer them the ſooner. Thus the Dolphins knowing full well, that the skin of the Crocodiles belly is thin and ſoft, make as though they were afraid of them as he comes, and ſo diue vnder the water, vntill he be gotten vnder his belly, & then punch and cut it with the foreſaid ſharp-pointed finnes. Moreouer, there is a kind of people that cary a deadly hatred to the Crocodile, and they be called Tentyrites, of a certaine Iſle euen within Nilus, which they inhabite. The men are but ſmall of ſtature, but in this quarrell againſt the Crocodiles, they haue hearts of Lions, and it is wondrous to ſee how reſolute and courageous they are in this behalfe. Indeed, this Crocodile is a terrible beaſt to them that flie from him: but contrary, let men purſue him or make head againe, he runnes away moſt cowardly. Now, theſe Iſlanders be the only men that dare encountre him affront. Ouer and beſides,
E they will take the riuer, and ſwim after them, nay they wil mount vpon their backs, and ſet them like horſmen: and as they turne their heads, with their mouth wide open to bite or deuour them they will thruſt a club or great cudgell into it croſſe ouerthwart, and ſo holding hard with both hands each end thereof, the one with the right, and the other with the left, and ruling them perforce (as it were) with a bit and bridle, bring them to land like priſoners: when they haue them there, they will ſo fright them only with their words and ſpeech, that they compel them to caſt vp and vomit thoſe bodies againe to be enterred, which they had ſwallowed but newly before. And therefore it is, that this is the only Iſle which the Crocodiles wil not ſwim to: for the very ſmell and ſent of theſe Tentyrites is able to driue them away, like as the Pſelli with their ſauour put Serpents to flight. By report, this beaſt ſeeth but badly in the water: but be they
F once without, they are moſt quick ſighted. All the 4 winter months they liue in a caue, and eat nothing at all. Some are of opinion, that this creature alone groweth all his life: and ſurely a great time he liueth.

The ſame riuer Nilus bringeth forth another beaſt called Hippopotamus, a Riuer-horſe. Taller he is from the ground than the Crocodile: he hath a clouen foot like a bœufe: the back,

maine and haire of an horſe,and he hath his neying alſo. His muzzle or ſnout turneth vp: his G
taile twineth like the Bores,and his teeth likewiſe are crooked and bending downward as the Bores tusks,but not ſo hurtfull: the skin or hide of his backe vnpenetrable [whereof are made targuets and head-pieces of doubty proof that no weapon wil pierce] vnleſſe it be ſoked in water or ſome liquor. He eateth downe the ſtanding corne in the field: and folke ſay that he ſetteth downe beforehand where he will paſture and feed day by day: and when hee ſets forward to any field for his reliefe hee goeth alwaies backeward, and his tracts are ſeene leading from thence,to the end that againſt his return he ſhould not be forelaid nor followed by his footing

Chap. XXVI.

¶ *Who firſt ſhewed the riuer-Horſe and Crocodiles at Rome. Alſo the medicinable means found out by the ſaid dumbe creatures.* H

MArcus Scaurus was the firſt man,who in his plaies and games that he ſet out in his Ædileſhip,made a ſhew of one water-Horſe and foure Crocodiles, ſwimming in a poole or mote made for the time during thoſe ſolemnities.

The riuer-Horſe hath taught phyſitions one deuice in that part of their profeſſion called Surgerie: for he finding himſelf ouer-groſſe & fat by reaſon of his high feeding ſo continually,gets forth of the water to the ſhore,hauing ſpied afore where the reeds and ruſhes haue bin newly cut: and where he ſeeth the ſharpeſt cane and beſt pointed, hee ſets his body hard vnto it,to pricke a certaine veine in one of his legs, and thus by letting himſelfe bloud maketh euacuation: whereby his body, otherwiſe inclining to diſeaſes and maladies, is well eaſed of the ſuperfluous humor: and hauing thus done, hee ſtoppeth the orifice againe with mud, and ſo ſtancheth the bloud,and healeth the wound. I

Chap. XXVII.

¶ *What phyſicall Herbes certaine creatures haue ſhewed vs,to wit,the harts and ſtags,the Lizards,Swallowes,Torteiſes,the Weaſell,the Storke,the Bore,the Snake,Dragon, Panther,Elephant,Beares,ſtocke-Doues,houſe Doues, Cranes,and Rauens.*

K

THe like deuice to this,namely of cliſters, we learned firſt of a Fowle in the ſame Egypt, called Ibis [or the blacke Storke.] This bird hauing a crooked and hooked bill, vſeth it in ſtead of a ſyringe or pipe to ſquirt water into that part, whereby it is moſt kinde and wholſome to auoid the doung and excrements of meat,and ſo purgeth and clenſeth her body. Neither hath dumbe creatures directed vs to theſe feats onely practiſed by the hand, which might ſerue for our vſe,to the preſeruation of our health,and cure of diſeaſes: for the hart firſt ſhewed vs the vertue of the herbe Dictamnus or Dittanie, to draw arrowes forth of the bodie. Perceiuing themſelues ſhot with a ſhaft, they haue recourſe preſently to that herbe,and with eating thereof it is driuen out again. Moreouer, being ſtung with the Phalangium, a kinde of ſpider,or ſome ſuch venomous vermin, they cure themſelues with eating Crai-fiſhes, or freſh water crabs. L

There is a certain herbe called Calaminth, moſt ſoueraigne and ſingular againſt the biting of ſerpents:wherewith the Lizards,whenſoeuer they haue fought with them,cure their wounds by applying it thereto.

Celendine[the greater]a moſt wholſome herbe for the eie ſight, Swallowes taught vs how to vſe: for with it they helpe their yong ones when their eies be ſore and put them to griefe.

The land Torteiſe by eating of a kinde of Sauorie or Marjerome,called *Cunila bubula*, armes himſelfe againſt poyſon when he ſhould fight with ſerpents.

The Weaſell vſeth Rue as a preſeruatiue when hee purpoſeth to hunt for Rats, in caſe hee ſhould fight with any of them. M

The Storke feeling himſelfe amiſſe, goeth to the herbe Organ for remedy. And the Bore when he is ſicke is his owne phyſition,by eating iuy and crab fiſhes, ſuch eſpecially as the ſea caſteth vp to ſhore.

The Snake by reſtineſſe and lying ſtill all Winter,hath a certain membrane or filme growing

20030
copy 1

A ing ouer her whole body;but hauing recourſe to Fennel,with the iuice thereof ſhe caſteth that old coat that cloggeth her,and appeareth freſh,ſlick,and yong again. Now the manner of this her vncaſing,is this;ſhe beginneth firſt at the head,and turneth the skin ouer it, and thus ſhe is a whole day and a night a folding it backward,before the inſide of that membrane can be turned outward,and ſo ſhe is clean rid of it. Moreouer, when by lying ſtil & keeping cloſe all the Winter time,her ſight is become dim and dark,ſhe rubbeth and ſcoureth her ſelf with the ſaid herbe Fennell,and therewith annointeth and comforteth her eies. But if the ſcales that are ouergrowne her skin be hard and ſtiffe, not willing to part and be remoued,ſhe maketh no more adoe,but ſcratcheth them with ſharp juniper pricks.

The Dragon finding a certain lothing of meat,and ouerturning of her ſtomack in the ſpring time,cureth and helps the ſame with the iuice of the wild Lectuce.

B The barbarous people when they hunt the Panthers,rub the gobbets of fleſh,which they lay as a bait for them,with Aconitum(a kind of poiſon-ful herbe.) The beaſts haue no ſooner touched the fleſh,but preſently their throat ſwelleth,and they are ready to be ſtifled and choked: whereupon ſome haue called this venomous herbe Pardalianches,*i.* Libard baine,or choke Libard. But the wilde beaſt hath a remedy againſt this,namely, the ordure and excrements of a man:yea,and at other times alſo,when he is not thus poiſoned, ſo eager he is thereof, that when the ſhepheards for the nonce haue hanged them vp aloft in ſome veſſell aboue their reach, although they leap vp at them,he is ready to faint with mounting on high,& ſtraining to get the ſame,and in the end killeth himſelfe therwith,& lieth dead on the ground. And yet otherwiſe
C he is too vntoward for to be killed,and ſo long it is ere he will die,that when he is panched,and his very guts come forth of his belly,he wil liue ſtil,and fight.

The Elephant if he chance to let the [Lizard] Chameleon go downe his throat amongſt other herbes or leaues(which this Lizard alwaies is like vnto in colour) he goeth ſtraightwaies to the wild Oliue,the only remedy he hath of this poiſon.

Beares,when they haue eaten Mandrage apples,licke vp piſmires to cure themſelues withal.

The Stag and Hind feeling themſelues poiſoned with ſome venomous weed among graſſe where they paſture,go by and by to the Artichoke,and therewith cure themſelues.

The Stock-doues,the Iais,Merles,Blackbirds,Ouſels,recouer their appetite to meat,which once in a yeare they loſe,with eating Bay-leaues that purge their ſtomack. Partridges,Houſe-
D doues,Turtledoues,and all Pullein,as Hens,Cocks,and Capons,do the like with Parietarie of the wall. Ducks,Geeſe,and other water fouls purge with the herb Endiue or Cichory. Cranes and ſuch like help themſelues that way with the Mariſh reed.

The Rauen when he hath killed the Chameleon,and yet perceiuing that he is hurt and poiſoned by him,flieth for remedy to the Laurell,and with it repreſſeth and extinguiſheth the venom that he is infected withall.

Chap. XXVIII.

¶ *The Prognoſtication of weather, taken by the obſeruation of dumbe creatures.*

E MOreouer, the ſame vniuerſall Nature hath giuen a thouſand properties beſides vnto beaſts: and namely,hath endued very many of them with the knowledge and obſeruation of the aire aboue,giuing vs good meanes by them diuers waies,to fore-ſee what weather we ſhall haue,what winds,what raine, what tempeſt will follow:which to decipher in particular,it is not poſſible,no more than to diſcourſe throughly of their other qualities they haue reſpectiue to the ſociety with euery man. For they aduertiſe & warn vs before-hand of dangers to come,not only by their fibres and bowels (about the skill and preſage wherof,the moſt part of the world is amaſed)but alſo by other manner of tokens and ſignifications. When an houſe is readie to tumble downe,the mice goe out of it before: and firſt of all, the ſpiders with their
F webs fall down. As for the flight of birds & their fore-tokening,called Augurie,there is an Art of it, and the knowledge thereof is reduced into a method, in ſo much as at Rome there was a colledge of Augurus inſtituted:by which it may appeare in what account & regard that ſacerdotall dignitie and profeſſion was. In Thracia, which is a cold and frozen countrie, the Fox alſo will not paſſe ouer any riuer or poole that is frozen, before he trie the thickeneſſe of the yce

by

by his eare,and otherwiſe it is a beaſt moſt quicke of hearing. And obſerued it is,that men neuer venture thereupon,but when he goes to reliefe,or returneth from thence, and then he layes his eare cloſe to the yce, and gueſſeth thereby how thicke the water is frozen. G

Chap. XXIX.

¶ *What cities and nations haue been vtterly deſtroyed by little beaſts.*

NOthing is more certain and notorious than this,that much hurt and dammage hath been known to come from ſmall contemptible creatures,which otherwiſe are of no reckoning and account. *M. Varro* writes,That there was a towne in Spaine vndermined by Connies: and another likewiſe in Theſſalie,by the Moldwarpes. In France the inhabitants of one citie H were driuen out and forced to leaue it,by Frogs. Alſo in Affrick the people were compelled by Locuſts to void their habitations:and out of Gyaros an Iſland, one of the Cyclades, the Iſlanders were forced by Rats and Mice to flee away. Moreouer, in Italie the citie Amycle was deſtroied by ſerpents. In Æthiopia, on this ſide the Cynamolgi, there is a great country lieth waſt and deſart,by reaſon that it was diſpeopled ſometime by Scorpions, and a kinde of Piſmires called Solpugæ. And if it be true that *Theophraſtus* reporteth, the Treriens were chaſed by certaine wormes called Scolopendres. But now let vs returne to other kinds of wild beaſts.

Chap. XXX.

¶ *Of the Hyæna, Crocuta, Mantichora, Bieuers, and Otters.* I

AS touching Hyænes,it is commonly beleeued,that they haue two natures,and that euery ſecond yeere they change their ſexe,being this yeere males, and the next yeere females. Howbeit, *Ariſtotle* denieth it. Their necke and the mane therewith, together with the backe,are one entire bone without any ioint at all,ſo as they cannot bend their necke without turning the whole body about. Many ſtrange mattes are reported of this beaſt,and aboue all other,that he will counterfeit mans ſpeech,and comming to the ſheepheards cottages, will call one of them forth,whoſe name he hath learned,and when he hath him without,al to worrie and teare him in peeces. Alſo it is ſaid that he will vomit like a man,thereby to train dogs to come vnto him,and then will deuoure them. Alſo,this beaſt alone of all others,will ſearch for mens K bodies within their graues and ſepulchres,and rake them forth. The female is ſeldome taken. He changeth his eies into 1000 diuers colours. Moreouer, if a dog come within his ſhadow,he preſently loſeth his barking and is quite dumbe. Againe by a kind of magicall charme or enchantment,if he goe round about any other liuing creature but three times, it ſhall not haue the power to ſtir a foot and remooue out of the place. The Lioneſſes of Æthiopia, if they be couered with any of this kinde, bring forth another beaſt called Leocrocuta, which likewiſe knowes how to counterfeit the voice both of man,and of other beaſts. He ſees continually with both eies:he hath one entire bone in ſtead of teeth in either iaw (and no gombs at all) wherwith he cuts as with a knife. Now theſe bones,becauſe they ſhould not wax dul and blunt with continuall grating one againſt the other, they are encloſed each of them with.n a caſe or ſheath. L

Iuba reports that the Mantichora alſo in Æthiopia reſembles mens language. Great ſtore of Hyenes be found in Affricke: which alſo yeelds a multitude of wild Aſſes. And one of the males is able to rule and leade a whole flocke of the female aſſes. This beaſt is ſo iealous, that they looke narrowly to the females great with young: for ſo ſoone as they haue foled,they bite off the cods of the little ones that be males,and ſo gueld them. But contrariwiſe,the ſhee aſſes when they be big,ſeeke corners, and keepe out of their way, that they might bring forth their young ſecretly without the knowledge of the Stallons:for deſirous they are to haue many males: ſo lecherous they be,and glad euermore to be couered.

The Bieuers in Pontus gueld themſelues,when they ſee how neer they are driuen,and be in danger of the hunters:as knowing full well,that chaſed they be for their genetoires: and theſe M their ſtones, Phyſitians call Caſtoreum. And otherwiſe, this is a dangerous and terrible beaſt with his teeth. For verily,he will bite down the trees growing by the riuer ſides,as if they were cut with an axe. Looke where he catcheth hold of a man once, he neuer leaues nor lets looſe vntill he haue knapped the bone in ſunder,and heard it cracke againe. Tailed hee is like a fiſh,

otherwiſe

20030
copy 1

A otherwiſe he reſembleth the Otter. Both theſe beaſts liue in the water altogether, and cary an haire ſofter than any plume or downe of feathers.

Chap. XXXI.

¶ *Of Frogs, Sea-calues, and ſtar-Liſards called Stelliones:*

THe venomous frogs and todes called Rubetæ, which liue both on land, and alſo in the wa-
ter, yeeld many good things medicinable. It is ſaid, that their manner is to let goe & caſt
from them all that is good within them, reſeruing only to themſelues all the poiſon: and
when they haue bin at their food, take the ſame vp againe. The ſea calfe likewiſe liueth both in
B the ſea, and vpon the land: and hath the ſame nature and qualitie that the beiuer is, for hee ca-
ſteth vp his gall, which is good for many medicines: & ſo he doth the runnet in his maw, which
is a ſingular remedy for the falling ſicknes: for wel he is ware, that men ſeek after him for theſe
two things. *Theophraſtus* writeth, That the Liſards called Stelliones, caſt their old coat, like as
Snakes do; but when they haue ſo done, they eat it vp againe, and ſo preuent men of the helpe
thereby for the ſaid falling euill. He reporteth beſides, that their ſtings and bitings in Greece
be venomous and deadly: but in Sicily harmleſſe.

Chap. XXXII.

¶ *Of red and fallow Deere.*

C THe Bucke or Stag, albeit that he be the moſt gentle and mild beaſt in the world, yet is he
as enuious as the reſt, & loth to part with that which is good for others. Howbeit, if he
chance to be ouerlaied with hounds, then gently of himſelfe hee hath recourſe to a man.
Likewiſe, the Hinds when they are to calue, chuſe rather ſome place neere to the pathes and
waies that are beaten with many ſteps, than ſecret corners; for feare of other wilde beaſts. They
begin to goe to rut after the riſing of the ſtar Arcturus, which is much about the 5 of Septem-
ber: they goe 8 months: and otherwhiles bring 2 calues at once. Finding themſelues rhat they
are ſped, they part companie with the Stags. But they againe ſeeing themſelues forſaken, fall
into a kinde of rage for heate of luſt, and dig pits in the ground where they lie hidden. Then
D begin their muzzles to looke blacke, and ſo continue, vntill ſuch time as ſome raine waſh away
that colour. The Hinds before they calue, purge themſelues with the herbe Seſelis or Siler-
monntaine, whereby they haue leſſe paine in their bearing, and more ſpeedy and eaſie deliue-
rance. After they are lightened of their burden, they know where two herbes be, which they
haue preſently recourſe vnto, Wake-Robin, and the foreſaid Siler-mountain. When they haue
eaten well thereof, they return preſently to their yong. And (for what ſecret reaſon in Nature,
God knowes) their firſt milke muſt haue a taſte & talang of thoſe two herbs. Their little ones
they practiſe and exerciſe to vſe their legs from the very beginning ſo ſoon as they be come in-
to the world: teaching them euen then how they ſhould run away and flie. To high and ſteepe
cragged rockes they bring them and there ſhew them how to leape, and withall acquaint them
E with their dens and places of harborough. And now by this time, the ſtags being paſt the heat
of the rut, feed apace. But ſo ſoone as they be growne very fat, they ſeeke lurking places, and
there abide, confeſſing as it were how heauie and vnweldie they be for fatneſſe, aud how vncom-
modious it is vnto them. At other times they vſe in their flight to make ſtaies, and take their
breath, and as they ſtand ſtill, to looke behinde them. But when they eſpie once the hounds
and hunters to be neer vnto them then they fall to running afreſh. And this rhey doe for a pain
that they haue in their guts, which are ſo weak & tender, that with a ſmall blow or ſtripe giuen
vnto them they will burſt within their bellies. When they perceiue the hunt is vp, & heare the
hounds crie, they preſently run but euer downe the winde, to the end that the ſent of their feet
ſhould paſſe away with them. They take much pleaſure & delight in the ſound of ſheepheards
F pipes, and their ſong withall. When they ſet vp their eares, they are moſt quicke of hearing:
when they let them hang downe, they be as deafe. Moreouer, they are very ſimple and fooliſh
creatures: amuſed, yea, and amaſed they will be at euery thing, and keepe a wondring at it, inſo-
much, as if an horſe, a cow, or an haifer approach neere vnto them, they will ſtand gazing at
them, and neuer regard the hunters neere by: or if they happen to ſpie him, they will looke at
his

his very bow, and ſheine of arrows, as at ſtrange and wondrous things. They paſſe the ſeas, ſwimming by flocks and whole heards in a long row, each one reſting his head vpon the buttockes of his fellow next before him: and this they do in courſe, ſo as the foremoſt retireth behinde to the hindmoſt, by turnes one after another: and this is ordinarily obſerued by thoſe ſaylers that paſſe from Cilicia to Cypres. And yet in their ſwimming they deſcry no land by the eye, but only by their ſmelling haue an aime thereat. The males of this kind are horned, and they (aboue all other liuing creatures) caſt them euery yeare once, at a certaine time of the Spring: and to that purpoſe a little before the very day of their mewing, they ſeek the moſt ſecret corners and moſt out of the way, in the whole forreſt. When they are pollards, they keep cloſe hidden, as if they were diſarmed: and all this they do, as if they enuied that men ſhould haue good of any thing that they had. And in very truth, the right horn (they ſay) can neuer be found, as if it had ſome rare and ſingular vertue in Phyſicke. A ſtrange and maruellous thing, conſidering that in the parks they change them euery yere, inſomuch as it is thought verily, that they hide them within the earth. But burne whether of them ye will, the left as well as the right, this is certain, That the ſmell and perfume thereof driueth ſerpents away, and diſcouereth them that are ſubiect to the fits of the falling diſeaſe. A man may alſo know their age by their heads, for euery yeare they haue one knag or branch more in their horns than before, vntill they come to ſix: after which time, they come new euer alike; ſo as their age cannot be diſcerned any more by the head, but the marke is taken by their mouth and teeth; for as they grow in age, they haue few or no teeth at all, ne yet grow the branches out at the root, whereas all the while they were yonger, they vſed to haue them breake forth and ſtanding out at the very forehead. After they be guelded once, neither caſt they their hornes which they had before, neither grow there any if they had none when they were libbed. At the firſt when they breake out againe, like they be to the glandules or kernels of dry skin, that new put forth: then grow they with tender ſtalks, into certain round and long knobs of the reed mace, couered all ouer with a certaine ſoft plume downe like veluet. So long as they be deſtitute of their hornes, and perceiue their heads naked, they go forth to relieſe by night; and as they grow bigger and bigger, they harden them in the hot ſun, eftſoons making proofe of them againſt trees; and when they perceiue once that they be tough and ſtrong enough, then they go abroad boldly. And certainly ſome of them haue been taken with green Iuie ſticking faſt and growing in their hornes, remaining there ſince the time that they ran them (when they were but tender) againſt ſome trees, for triall whether they were good or no, and ſo chanced to race the Iuie from the wood of the tree. You ſhall haue them ſomtime white of colour, and ſuch an one was the hind that *Q. Sertorius* had about, which he perſuaded the people of Spaine to be his Sooth-ſayer, & to tel him of things to come. This kind of Deere maintaine fight with ſerpents, and are their mortall enemies: they will follow them to their very holes, and there (by the ſtrength of drawing and ſnuffing vp their wind at the noſtrils) force them out whether they wil or no: and therfore there is not ſo good a thing again to chaſe away ſerpents, as is the ſmoke and ſmel of an Harts horn burnt. But againſt their ſting or biting, there is a ſingular remedy, with the runnet in the maw of a fawne or Hind-calfe killed in the dams belly. It is generally held and confeſſed, that the Stag or hind liues long: for an hundred yeres after *Alexander* the great, ſome were taken with golden collars about their necks, ouergrowne now with haire and growne within the skin: which collars, the ſaid king had done vpon them. This creature of all diſeaſes is not ſubiect to the feuer, but he is good to cure it. I haue known great ladies and dames of ſtate, vſe euery morning to eat the veniſon of red Deere, and thereby to haue liued a great age and neuer had the ague: but it is thought this is a certain remedy and neuer faileth, in caſe the ſtag be ſtrucken ſtarke dead at once with one wound and no more.

Chap. XXXIII.

¶ *Of the ſhag-haired and bearded Stagge like to a Goat: as alſo of the Chamæleon.*

OF the ſame kind is the Goat hart, and differing only in the beard and long ſhag about the ſhoulders, which they call Tragelaphis: and this breedeth no where but about the riuer Phaſis. Africke in a manner is the onely countrey that breedeth no ſtags and hinds: but contrari-

20030
copy 1

A contrariwiſe,it bringeth Chamæleons, although India hath them ordinarily in greater number. In ſhape and quantitie it is made like a Liſard,but that it ſtandeth higher and ſtreighter than the Liſards do,vpon his legs. The ſides,flank,and belly,meet together,as in fiſhes: it hath likewiſe ſharp prickles,bearing out vpon the back as they haue: ſnouted it is, for the bigneſſe not vnlike to a ſwine,with a very long taile thin and pointed at the end, winding round and entangled like to vipers: hooked clawes it hath,and goeth ſlow, as doth the Tortoiſe: his body and skin is rough and ſcaly,as the crocodiles: his eies ſtanding hollow within his head,& thoſe be exceeding great,one neere vnto the other,with a very ſmall portion betweene, of the ſame colour that the reſt of the body is: he is alwaies open eied,and neuer cloſeth them: he looketh about him not by mouing the ball of his eie,but by turning the whole body thereof: he gapes
B euermore aloft into the aire, and is the onely creature aliue that feedeth neither of meat nor drinke,but hath his nouriſhment of aire onely: about wilde fig-trees he is fell and dangerous, otherwiſe harmleſſe. But his colour naturally is very ſtrange and wonderful, for euer and anon he changeth it,as well in his eie,as taile and whole body beſides: and looke what colour he toucheth next,the ſame alwaies he reſembleth,vnleſſe it be red and white. When he is dead, hee looketh pale and wan: very little fleſh he hath in head and chawes, and about the ioint where his taile is graffed to his rump; but in all the body beſides, none at all. All his bloud is in his heart,and about his eies: among other his bowels,he is without a ſpleen. Hidden hee lieth all winter long,as Liſards do.

Chap. XXXIIII.

C ¶ *Of the Buffe,or Tarandus: the Lycaon,and the Thos.*

IN Scythia there is a beaſt called Tarandus,which changeth likewiſe colour as the Chamæleon: and no other creature bearing haire doth the ſame, vnleſſe it be the Lycaon of India, which (by report) hath a maned necke. As for the Thoes (which are a kinde of wolues ſomewhat longer than the other common wolues,and ſhorter legged, quicke and ſwift in leaping, liuing altogether of the veniſon that they hunt & take,without doing any harme at all to men) they may be ſaid not ſo much to change their hew,as their habit and apparell: for all winter time they be ſhag-haired,but in ſummer bare and naked. The Tarandus is as big as an oxe,with an head not vnlike to a ſtags,but that it is greater, namely carrying branched hornes: clouen
D hooſed,and his haire as deep as is the Beares. The hide of his backe is ſo tough and hard, that thereof they make breſt-plates. He taketh the colour of all trees,ſhrubs,plants,floures,and places wherein he lieth when he retireth for feare; and therefore ſeldome is he caught. But when he liſt to looke like himſelfe and be in his owne colour,he reſembleth an Aſſe. To conclude, ſtrange it is that the bare body of a beaſt ſhould alter into ſo many colours: but much more ſtrange it is and wonderfull,that the haire alſo ſhould ſo change.

Chap. XXXV.

¶ *Of the Pork-pen.*

E THe Porkpens come out of India and Africke: a kind of Vrchin or hedge-hog they be: armed with pricks they be both; but the Porkpen hath the longer ſharp pointed quilles,and thoſe,when he ſtretcheth his skin,he ſendeth and ſhooteth from him: when the hounds preſſeth hard vpon him,he flieth from their mouthes, and then takes vantage to launce at them ſomwhat farther off. In the Winter he lieth hidden,as the nature is of many beaſts to doe,and the Beares aboue the reſt.

Chap. XXXVI.

¶ *Of the Beares,and how they breed and bring forth their young.*

F THey ingender in the beginning of winter, not after the common manner of other foure-footed beaſts,but lying both along,claſping and embracing one another: then they goe apart into their dennes and caues, where the ſhe beare thirtie daies after is diſcharged of her burden,and bringeth forth commonly fiue whelps at a time. At the firſt, they ſeem to be a lumpe

lump of white flesh without all form, little bigger than rattons, without eies, & wanting haire: only there is some shew and apparance of claws that put forth. This rude lumpe, with licking they fashion by little & little into some shape; & nothing is more rare to be seen in the world, than a she beare bringing forth her yong: and this is one cause that the male beares are not to be seen in 40 daies, nor the femall for 4 moneths. If they haue no holes and dens for the purpose, they build themselues cabbins of wood, gathering together a deale of boughes & bushes, which they couch and lay artificially together, to beare off any shower, so as no raine is able to enter; and those they strew vpon the floore with as soft leaues as they can meet withall. For the first 14 daies (after they haue taken vp their lodging in this manner) they sleep so soundly, that they cannot possibly be wakened, if a man should lay on and wound them. In this drowsinesse of theirs, they grow wondrous fat. This their grease and fat thus gotten, is it that is so medicineable, and good for those that shed their haire. These 14 days once past, they sit vpon their rump or buttocks, and fall to sucking of their fore-feet, and this is all their food wherof they liue for the time. Their yong whelpes, when they are starke and stiffe for cold, they huggle in their bosom and keep close to their warm breast, much like to birds that sit vpon their egs. A strange and wonderful thing it is to be told, and yet *Theophrastus* beleeueth it, That if a man take bears flesh during those daies, and seeth or bake the same, if it be set vp and kept safe it will grow neuertheless. All this time they dung not, neither doth there appeare any token or excrement of meat that they haue eaten: and very little water or aquositie it found within their belly. As for bloud, some few small drops lie about the heart only, and none at all in the whole body besides Now when spring is come, forth they go out of their den, but by that time the males are exceeding ouergrown with fat: and the reason therof cannot be readily rendred: for as we said before, they had no more but that fortnights sleep to fat them withall. Being now gotten abroad, the first thing that they do, is to deuoure a certain herbe named Aron, *i.* Wake-robin, and that they do to open their guts, which otherwise were clunged and grown together: and for to prepare their mouths and teeth again to eat, they whet and set the edge of them with the yong shoots and tendrons of the briers and brambles. Subiect they are many times to dimnesse of sight: for which cause especially they seek after hony combs, that the bees might settle vpon them, and with their stings make them bleed about the head, and by that means discharge them of that heauinesse which troubleth their eies. The Lions are not so strong in the head, but beares bee as weak and tender there: and therfore when they be chased hard by hunters, & put to a plunge, ready to cast themselues headlong from a rocke, they couer and arme their heads with their fore-feet and pawes, as it were with hands, and so jump downe: yea and many times, when they are baited in the open shew-place, we haue known them laid streaking for dead with one cuffe or box of the eare giuen them with a mans fist. In Spain it is held for certain, that in their brain there is a venomous qualitie; and if it be taken in drinke, drieth men into a kind of madnesse, so as they will rage as if they were bears: in token whereof, whensoeuer any of them be killed with baiting, they make sure work and burn their heads all whole. When they list, they wil go on their two hinder feet vpright; they creep down from trees backward: when they fight with buls, their manner is to hang with all their foure feet, about their head and hornes, and so with the very weight of their bodies wearie them. There is not a liuing creature more craftie and foolish withall, when it doth a shrewd turne. We finde it recorded in the Annales of the Romans, that when *M. Piso* and *M. Messala* were Consuls, *Domitius Ænobarbus* an Ædile Curule, vpon the 14 day before the Calends of October, exhibited 100 Numidian beares to be baited & chased in the great Cirque, and as many Æthiopian hunters. And I maruell much, that the Chronicle nameth Numidian, since it is certain, that no beares come out of Africke.

Chap. XXXVII.

¶ *Of the Rats of Pontus, and the Alps: also of Vrchins and Hedge-hogs.*

THe Rats of Pontus, which be onely white, come not abroad all winter: they haue a most fine and exquisit taste in their feeding; but I wonder how the authours that haue written this, should come to the knowledge of so much. Those of the Alpes likewise, *i.* Marmottanes, which are as bigge as Brocks or Badgers, keepe in, during winter: but they are prouided of

20030
copy 1

A of victuals before hand which they gather together and carry into their holes. And ſome ſay, when the male or female is loden with graſſe and herbs, as much as it can comprehend within all the foure legges, it lieth vpon the backe with the ſaid prouiſion vpon their bellies, and then commeth the other, and taketh hold by the taile with the mouth, and draweth the fellow into the earth: thus doe they one by the other in turnes: and hereupon it is, that all that time their backes are bare and the haire worne off. Such like Marmotaines there be in Ægypt; and in the ſame manner thay ſit ordinarily vpon their buttocks, and vpon their two hinder feet they goe, vſing their fore-feet in ſtead of hands.

Hedgehogs alſo make their prouiſion before-hand of meat for winter, in this wiſe. They wallow and roll themſelues vpon apples and ſuch fruit lying vnder foot, and ſo catch them vp with their prickles, & one more beſides they take in their mouth, & ſo carry them into hollow trees.
B By ſtopping one or other of their holes, men know when the wind turneth, and is changed from North to South. When they perceiue one hunting of them, they draw their mouth and feet cloſe together with all their belly part, where the skin hath a thin downe and no pricks at all to do harme, and ſo roll themſelues as round as a foot-ball, that neither dog not man can come by any thing but their ſharpe-pointed prickles. So ſoon as they ſee themſelues paſt all hope to eſcape, they let their water go & piſſe vpon themſelues. Now this vrine of theirs hath a poiſonous qualitie to rot their skin and prickles, for which they know well enough that they be chaſed and taken. And therefore it is a ſecret and ſpeciall policie, not to hunt them before they haue let their vrine go; and then their skin is very good, for which chiefly they are hunted:
C otherwiſe it is nought euer after, and ſo rotten, that it will not hang together, but fall in pieces: al the pricks ſhed off, as being putrified, yea although they ſhould eſcape away from the dogs and liue ſtill: and this is the cauſe that they neuer bepiſſe and drench themſelues with this peſtilent excrement, but in extremitie & vtter deſpaire: for they cannot abide themſelues their owne vrine, of ſo venomous a qualitie it is, & ſo hurtfull to their own body; and do what they can to ſpare themſelues, attending the vtmoſt time of extremitie, inſomuch as they are ready to be taken before they do it. When the Vrchen is caught aliue, the deuiſe to make him open again in length, is to beſprinkle him with hot water; and then by hanging at one of their hinfeet without meat they die with famine: otherwiſe it it not poſſible to kill them and ſaue their caſe or skin. There be writers who baſh not to ſay, That this kinde of beaſt (where not thoſe
D pricks) is good for nothing, and may well be miſſed of men: and that the ſoft fleece of wooll that ſheepe bear, but for theſe prickes were ſuperfluous & to no purpoſe beſtowed vpon mankind: for which the rough skin of theſe Vrchins, are bruſhes & rubbers made to bruſh & make cleane our garments. And in very truth, many haue gotten great gain & profit by this commoditie & merchandiſe, and namely, with their crafty deuiſe of monopolies, that all might paſſe through their hands only: notwithſtanding there hath not bin any one diſorder more repreſſed and reformation ſought by ſundry edicts and acts of the Senate in that behalfe: euery prince hath been continually troubled hereabout with grieuous complaints out of all prouinces.

Or rather inſtead of tazels that ſhare-men vſe.

Chap. XXXVIII.

E ¶ *Of the Leontophone, the Once, Badgers, and Squirrils.*

TWo other kinds there be of beaſts, whoſe vrine worketh ſtrange and wonderfull effects. The one is called Leontophonos, and he breedes in no country but where there be lions: a little creature it is, but ſo venomous, that the lion (king of beaſts, before whom al others tremble) for all his might and puiſſance, dieth preſently if he taſte neuer ſo little thereof. And therfore they that chaſe the lion, get all the Leontophones that they can come by, burne their bodies, and with the powder of them beſtrew & ſeaſon as it were the pieces of other fleſh that they lay for a bait in the forreſt, and thus with the very aſhes (I ſay) of his enemie, kill him: and deadly and pernicious is it to the lion. No marueile therefore if the lion abhor & hate him, for
F ſo ſoon as he eſpieth him, he cruſhes him with his pawes, and ſo killeth him without ſetting tooth to his body. The Leontophone for his part againe, is as ready to bedrench him with his vrine, knowing right well that his piſſe is a very poiſon to the Lion.

In thoſe countries were the Onces breed, their urine (after it is made) congealeth into a certain yeie ſubſtance, & waxes drie, & ſo it comes to be a certain pretious ſtone like a carbuncle,

glittering and ſhining as red as fire,and called it is Lyncurium. And vpon this occaſion many haue written,that Amber is ingendred after the ſame maner. The Onces knowing thus much, for very ſpight and enuie,couer their vrine with mold or earth,and this maketh it ſo much the ſooner to harden and congeale.

The Grayes,Polcats, or Brocks, haue a caſt by themſelues,when they be affraid of hunters: for they will draw in their breath ſo hard,that their skin being ſtretched and puffed vp withall, they will auoid the biting of the hounds tooth,and checke the wounding of the hunter; ſo as neither the one nor the other can take hold of them.

The Squirrils alſo foreſee a tempeſt comming, and where the wind will blow: for looke in what corner the wind is like to ſtand, on that ſide they ſtop vp the mouth of their holes, and make an ouerture on the other ſide againſt it. Moreouer, a goodly broad buſh taile they haue, wherewith they couer their whole body. Thus you ſee how ſome creatures prouide victuals againſt winter,others battle and feed with ſleepe onely.

Chap. XXXIX.

¶ *Of the Viper, Land-winkles or Snailes, and Lizards.*

OF all other ſerpents,it is ſaid,that the Viper alone lies hidden in the ground during winter,whereas the reſt keepe within cranies and clifts of trees,or elſe in the hollow chinkes of ſtones: and otherwiſe they are able to endure hunger a whole yeere, ſo they be kept from extreame cold: All the while during their retreat and lying cloſe within,they ſleepe as if they were dead and depriued of their power to poyſon.

In like manner do Perwinkles and Snailes;but not only in the winter ſeaſon,but in Summer againe they lie ſtill,cleauing ſo hard to rocks & ſtones,that although by force they be plucked off and turned with their bellies vpward, yet they will not out of their ſhell. In the Baleare Iſlands there be a kinde of them called Cauaticæ,which neuer creepe out of their holes within the ground,neither liue they of any graſſe or greene herbe,but hang together like cluſters of grapes. Another ſort there is of them,but not ſo common,hiding themſelues within the couer of their ſhell,ſticking euer faſt vnto them:theſe lie alwaies vnder the ground,and were in times paſt digged vp onely about the Alpes, along the maritime coaſts:but now of late they be diſcouered in Veliternum alſo, where men begin to get them out of the earth. But the beſt of them all and moſt commendable,are thoſe in the Iſland Aſtypelæa.

As touching Liſards (deadly enemies to the Snailes or Winkles aboue-named) men ſay they liue not aboue ſix moneths. In Arabia, the Lizards be a cubit in length:and in the mountain Niſa of India,they be foure and twenty foot long; ſome tawnie,ſome light red,and others blew of colour.

Chap. XL.

¶ *Of Dogges.*

AMong thoſe domeſticall creatures that conuerſe with vs, there be many things worth the knowledge:and namely, as touching dogges (the moſt faithfull and truſtie companions of all others to a man)and alſo horſes. And in very truth, I haue heard it credibly reported,of a dogge, that in defence of his maſter, fought hard againſt theeues robbing by the high way ſide:& albeit he were ſore wounded euen to death,yet would he not abandon the dead body of his maſter,but draue away both wild foule and ſauage beaſt, from ſeizing of his carkaſſe. Alſo of another in Epirus,who in a great aſſembly of people knowing the man that had murdered his Mr. flew vpon him with open mouth, barking and ſnapping at him ſo furiouſly, that he was ready to take him by the throat, vntill he at length confeſſed the fact that ſhould cauſe the dog thus to rage and fome againſt him. There was a king of the Garamants exiled,and recouered his royall ſtate againe by the meanes of 200 dogs that fought for him againſt al thoſe that made reſiſtance,and brought him home maugre his enemies, The Colophonians and Caſtabaleans,maintained certain ſquadrons of maſtiue dogs, for their war ſeruice:and thoſe were put in the vaward to make the head and front of the battell, and were neuer knowne to draw back and refuſe fight. Theſe were their truſtieſt auxiliaries and aid-ſoldiers,and neuer ſo needy as

20030
copy 1

A as to call for pay. In a battell when the Cimbrians were defeated and put all to the ſword, their dogges defended the baggage, yea, and their houſes (ſuch as they were) carried ordinarily vpon charriots. *Iaſon* the Lycian had a dogge, who after his maſter was ſlaine, would neuer eat meat, but pined himſelfe to death. *Duris* maketh mention of another dogge, which he named Hircanus, that ſo ſoone as the funerall fire of king *Lyſimachus* his maſter was ſet a burning, leapt into the flame. And ſo did another at the funerals of king *Hiero*. Moreouer, *Phyliſtus* reporteth as ſtrange a ſtory of king *Pyrrhus* his dogge: as alſo of another belonging to the tyrant *Gelo*. The Chronicles report of a dog that *Nicomedes* king of Numidia kept, which flew vpon the queene *Conſingis* his wife, & al to mangled and worried her, for toying and dallying ouerwantonly with the king her husband. And to goe no farther for examples, euen with vs here at Rome, *Volcatius*
B a noble gentleman (who tought *Cecelius* the ciuile law) as he returned home one euening late, riding vpon an hackney from a village neere the citie, was aſſailed by a theefe on the high way, but he had a dog with him that ſaued him out of his hands. *Cælius* likewiſe, a Senator of Rome, lying ſicke at Plaiſance, chanced to be aſſailed by his enemies, well appointed and armed; but they were not able to hurt and wound him, by reaſon of a dog that he had about him, vntill ſuch time as they had killed the ſaid dog. But this paſſeth al, which happened in our time, and ſtandeth vpon record in the publicke regiſters, namely, in the yeere that *Appius Iunius* and *P. Silus* were Conſuls, at what time as *T. Sabinus* and his ſeruants were executed for an outrage committed vpon the perſon of *Nero*, ſonne of *Germanicus*: one of them that died had a dog which could not be kept from the priſon dore, and when his maſter was throwne down the ſtaires (cal-
C led Scalæ Gemoniæ) would not depart from his dead corps, but kept a moſt pitteous howling and lamentation about it, in the ſight of a great multitude of Romanes that ſtood round about to ſee the execution and the manner of it: and when one of the companie threw the dogge a piece of meat, he ſtraightwaies carried to the mouth of his maſter lying dead. Moreouer, when the carkaſſe was thrown into the riuer Tiberis, the ſame dog ſwam after, & made all the means he could to beare it vp aflote that it ſhould not ſink: and to the ſight of this ſpectacle and fidelitie of the poore dogge to his maſter, a number of people ran forth by heapes out of the citie to the water ſide. They be the onely beaſts of all others that know their maſters; and let a ſtranger vnknown be come neuer ſo ſuddenly, they are ware of his comming, and will giue warning.
D They alone know their owne names, and all thoſe of the houſe by their ſpeech. Be the way neuer ſo long, and the place from whence they came neuer ſo farre, they remember it, and can go thither againe. And ſurely, ſetting man aſide, I know not what creature hath a better memorie. As furious and raging as they be otherwhiles, yet appeaſed they will be and quieted, by a man ſitting down vpon the ground. Certes, the longer we liue, the more things we obſerue & marke ſtill in theſe dogges. As for hunting there is not a beaſt ſo ſubtle, ſo quick, & ſo fine of ſent, as is the hound: he hunteth and followeth the beſt by the foot, training the hunter that leads him by the coller and leaſh, to the very place where the beaſt lieth. Hauing once gotten an eie of his game, how ſilent & ſecret are they notwithſtanding? and yet how ſignificant is their diſcouerie of the beaſt vnto the hunter? firſt with wagging their taile, and afterwards with their noſe and ſnout, ſnuffing as they doe. And therefore it is no maruell, if when hounds or beagles be ouer
E old, wearie, and blind, men carry them in their armes to hunt, for to wind the beaſt, and by the verie ſent of the noſe to ſhew and declare where the beaſt is at harbour. The Indians take great pleaſure to haue their ſalt bitches to be lined with tygres: and for this purpoſe, when they goe proud, they couple and tie them together, and ſo leaue them in the woods for the male tygres: howbeit they rere neither the firſt nor ſecond litter of them, ſuppoſing that the dogs thus bred, will be too fierce and eger; but the third they nouriſh and bring vp. Semblably, thus doe the Gaules by their dogges that are ingendred of wolues: and in euerie chace and forreſt there be whole flockes of them thus ingendred, that haue for their guide, leader, and captain, one dogge or other: him they accompanie when they hunt; him they obey and are directed by: for ſurely, they keepe an order among themſelues, of gouernment and maſterſhip. This is knowne for cer-
F taine, that the dogges which be neere vnto Nilus, lap of the riuer, running ſtill and neuer ſtay while they are drinking, becauſe they will giue no vantage at all to be a prey vnto the greedie Crocodiles. In the voiage that *Alexander* the Great made into India, the king of Albania gaue him a dogge of an huge and extraordinarie bigneſſe. And *Alexander* taking great delight and contentment to ſee ſo goodly and ſo faire a dogge, let looſe vnto him firſt Beares, afterwards

wild Bores; and laſt of all, fallow Deere. But this dog making no reckoning of all this game, G
lay ſtill couchant, and neuer ſtirred nor made at them. This great Commander *Alexander*, a
man of mighty ſpirit and high mind, offended at the lazineſſe and cowardiſe of ſo great a bo-
die, commanded that he ſhould be killed, and ſo he was. Newes hereof went preſently to the
king of Albanie. Wherupon he ſent vnto him a ſecond dog, with this meſſage, That he ſhould
not make triall of this too againſt ſuch little beaſts, but either ſet a Lion or an Elephant at
him: ſaying moreouer, that hee had in all but thoſe two of his kinde: and if hee were killed
likewiſe, hee were like to haue no more of that race and breed. *Alexander* made no ſtay, but
preſently put out a Lion, and immediately he ſaw his backe broken and all to rent and torne
by the dog. Afterwards he commanded to bring forth an Elephant, and in no ſight tooke he
greater pleaſure, than in this. For the dog at the firſt with his long rough ſhagged haire, that H
ouerſpread his whole bodie, came with ful mouth thundering (as it were) and barking terribly
againſt the Elephant. Soon after he leapeth and flieth vpon him, riſing and mounting againſt
the great beaſt, now of one ſide, then of another: maintaining combate right artificially, one
while aſſailing, another while auoiding his enemie: and ſo nimbly he beſtirreth him from ſide
to ſide, that with continuall turning about to and fro, the Elephant grew giddie in the head,
inſomuch as he came tumbling downe, and made the ground to ſhake vnder him with his fal.
Bitches breed and beare young euery yeere lightly once: and the due time for them to be with
whelpes is when they are full a yeere old. They goe with young threeſcore daies. Their pup-
pies come blinde into the world: and the more milke they ſucke, the later it is ere they receiue
their ſight: but as it is neuer aboue twenty daies ere they ſee, ſo they open not their eies vnder
ſeuen daies old. Some ſay, that if a bitch bring but one at a litter, it will ſee by nine daies: if I
twaine, it will be ten daies firſt: and the more puppies ſhe hath, the more daies it will be in that
proportion ere they ſee. Moreouer, that the bitch-whelpe that commeth of the firſt litter, ſee
ſtrange bugs and goblins. The beſt of the whole litter is that whelpe that is laſt ere it begin to
ſee: or elſe that which the bitch carries firſt into her kennell. The biting of mad dogs are moſt
dangerous to a man, as we haue ſaid before, eſpecially during the dog-daies, while the dog ſtar
Syrius is ſo hot: for they that are ſo bitten, lightly are affraid of water, which is a deadly ſigne.
To preuent therefore that dogs fall not mad, it is good for thirtie or fortie daies ſpace, to min-
gle hens or pullins dung eſpecially with their meat: againe, if they be growing into that rage,
or tainted already, to giue them Ellebor with their meat. K

Chap. XLI.

¶ *Againſt the biting of a mad Dog.*

THe ſure and ſoueraigne remedy for them that are bitten with a mad dog, was reuealed lately by way of Oracle: to wit, the root of a wild roſe, called the ſweet brier or Eglantine. *Columella* writeth, That when a whelpe is iuſt fortie daies old, if his taile be bitten off at the nethermoſt joint, and the ſinew or ſtring that commeth after, be likewiſe taken away, neither the taile will grow any more, nor the dog fall euer to be mad. I haue my ſelfe obſerued, L
that among the prodigies it is reported, how a dog ſometime ſpake, as alſo that a ſerpent barked, that yeere when *Tarquine* the prowd was depoſed and driuen out of Rome.

Chap. XLII.

¶ *Of Horſes, and their nature.*

THe ſame *Alexander* the Great, of whom ere-while we ſpake, had a very ſtrange and rare horſe, whom men called Bucephalus, either for his crabbed and grim looke, or elſe of the marke or brand of a buls head, which was imprinted vpon his ſhoulder. It is reported, that
Alexander being but a child, ſeeing this faire horſe, was in loue with him, and bought out of M
the breed and race of *Philonicus* the Pharſalian, and for him paied ſixteene talents. He would ſuffer no man to ſit him, nor come vpon his backe, but *Alexander*; and namely, when he had the kings ſaddle on, and was alſo trapped with roiall furniture: for otherwiſe he would admit any whomſoeuer. The ſame horſe was of a paſſing good and memorable ſeruice in the warres: and namely, being wounded vpon a time at the aſſault of Thebes, he would not ſuffer *Alexander* to

alight

20030
copy 1

A alight from his back, and mount vpon another, Many other ſtrange and wonderfull things hee did: in regard whereof, when he was dead, the king ſolemnized his funerals moſt ſumptuouſly; erected a tombe for him, and about it built a city that bare his name, Bucephalia. *Cæſar* Dictator likwiſe had another horſe that would ſuffer no man to ride him but his maiſter: & the ſame horſe had his forefeet reſembling thoſe of a man: and in that manner he ſtands pourtraied before the temple of *Venus*, Mother. Moreouer, *Auguſtus Cæſar*, late Emperour of famous memory, made a ſumptuous tombe for an horſe that he had, wherof *Germanicus Cæſar* compiled a poeme. At Agrigentum there be ſeen Pyramides ouer many places were horſes were entombed. *Iuba* reporteth, That queene *Semiramis* loued a great horſe that ſhe had, ſo far forth, that ſhe was content he ſhould doe his kind with her. The Scythians verily take a great pride and glorie much in the goodnes of their horſes and Cauallerie. A king of theirs happened in combat and
B ſingle fight vpon a challenge to be ſlain by his enemie, and when he came to deſpoile him of his armes and roiall habit, the kings horſe came vpon him with ſuch furie, flinging and laying about him with his heeles, and biting withall, that he made an end of the conquerour champion. There was another great horſe hoodwinked becauſe he ſhould couer a mare: but perceiuing after that he was vnhooded that he ſerued as a ſtalion to his own dam that foled him, ran vp to a ſteep rock with a downfall, and there for griefe caſt himſelfe down and died. We find alſo in record, That in the territorie of Reate there was a mare killed & all to rent an horſekeeper vpon the ſame occaſion. For ſurely theſe beaſts know their parentage, & thoſe that are next to them in bloud. And therefore we ſee that the colts will in the flocke more willingly keep company
C and ſort with their ſiſters of the former yere, than with the mare their mother. Horſes are ſo docile, and apt to learne, what we find in hiſtories, how in the army of *Sibaritanes*, the whole troup of horſemen had their horſes vnder them, and vſed to leap and daunce to certaine muſicke that they were wonted and accuſtomed vnto. They haue a fore-knowledge when battell is toward, they will mourne for the loſſe of their maiſters: yea, and other whiles ſhed teares and weep pitiouſly for loue of them. When king *Nicomedes* was ſlaine, the horſe for his owne ſaddle, would neuer eat meat after, but for very anguiſh died with famine. *Philarchus* reporteth, That king *Antiochus* hauing in battaile ſlaine one *Centaretus*, a brave horſman of the Gallogreeks or Galatians, became maiſter of his horſe, and mounted vpon him in triumphant wiſe: But the horſe of him that lay dead in the place, and vpon whom *Antiochus* was mounted, for very anger and in-
D dignation at this indignitie, paſſed neither for bit nor bridle, ſo as he could not be ruled; and ſo ran furiouſly among the cragges and rocks, where both horſe and man came downe headlong, and periſhed both together. *Philiſtus* writeth, That *Dyoniſius* was forced to leaue his horſe ſticking faſt in a quaue-mire, and got away: but the horſe after he had recouered himſelfe, and was gotten forth, followed the tracts of his maſter, with a ſwarm or caſt of bees ſetling in his mane: and this was the firſt preſage of good fortune that induced *Denis* to vſurp the kingdome of Sicilie. Of what perceiuance and vnderſtanding they be, it cannot be expreſt: & that know thoſe light horſmen full well that vſe to launce darts and iauelines from horſeback, by the hard ſeruice that they put their horſes to; which they doe with great dexteritie & reſolution in ſtraining, winding, and turning their bodies nimbly euery way. Nay, ye ſhall haue of them to gather
E vp darts and iauelines from the ground, and reach them againe to the horſman. And commonly we ſee it to be an ordinary matter with them in the great race or ſhew place, when they are ſet in their geirs to draw the chariots, how they ioy when they are encouraged and praiſed; giuing no doubt a great proofe, and confeſſing that they are deſirous of glorie. At the ſecular ſolemnities, exhibited by *Claudius Cæſar*, in the Circenſian games, the horſes with the white liuery (notwithſtanding their driuer and gouernour, the charioter, was caſt and flung to the ground euen within the bars) wan the beſt prize & went away with the honour of that day. For of themſelues they brake and bare down whatſoeuer might impeach them of running the race thoroughout: they did all that euer was to be done againſt their concurrents and aduerſaries of the contrarie ſide, as well as if a moſt expert chariot-man had been ouer their backes to direct and inſtruct
F them. At the ſight wherof, men were aſhamed ta ſee their skill & art to be ouermatched & ſurmounted by horſes. And to conclude, when they had performed their race, as much as by law of the game was required, they ſtood ſtil at the very goale, and would no farther. A greater wonder and preſage was this in old time, that in the Circenſian games exhibited by the people, the horſes after they had flung and caſt their gouernour, ran directly vp to the Capitol, as well as if he had

had ſtood ſtill in his place,and conducted them; and there fetcht three turnes round about the G
temple of *Iupiter*. But the greateſt of all was this which I ſhall now tell,That the horſes of *Ratumenus*,who had woon the price in the horſe-running at Veij,threw their Mr. down;and came from thence,euen out of Tuſcane,as far as to the foreſaid Capitoll,carrying thither the Palme branch and chaplet of *Victory* woon by *Ratumenas* their Mr. of whom the gate Ratumena took afterwards the name at Rome. The Sarmatians minding to take a great iournie,prepare their horſes two daies before,and giue them no meat at all,only a little drinke they allow them, and thus they will ride them gallop 150 miles an end,and neuer draw bridle. Horſes liue many of them 50 yeres,but the mares not ſo long. In fiue yeres they come to their full growth,whereas ſtone horſes grow one yere longer. The making of good horſes indeed, and their beautie, ſuch as a man will chuſe for the beſt,hath bin moſt elegantly and abſolutely deſcribed by the Poet *Virgill*. And ſomewhat alſo haue I written of that argument, in my booke which I lately put H
forth,as touching Tournois and ſhooting from horſebacke: and in thoſe points required,and there ſet downe,I ſee all writers in manner to agree. But for horſes that muſt be trained to run the race,ſome conſiderations are to be had and obſerued,different from horſes of other vſe and ſeruice. For whereas to other affaires and imploiments they may be brought when they are two yeeres old colts,and not vpward; to the Liſts they muſt not be brought to enter into any maſtries there,before they be full fiue yeres of age. The female in this kind go eleuen months compleat with young,and in the twelfth they fole:commonly the ſtalion and the mare are put together,when both of of them are full two yeeres old:and that about the Spring Equinoctiall,that is to ſay,in mid-March:but if they be kept aſunder vntill they are full 3 yeeres of age, they breed ſtronger colts. The Stalion is able to get colts vntil he be three and thirtie yers old. I
for commonly when they haue ſerued in the race,and run ful twenty yeres,they are diſcharged from thence,& let go abroad for to ſerue mares. And men ſay that they will hold to 40 yeeres with a little helpe put to the forepart of his body,that he may be lifted vp handſomly to couer the mare. Few beaſts beſides are leſſe able to ingender and leape the female often, nor ſooner haue enough of them. For which cauſe they be allowed ſome ſpace between euery time that they do their kind. And in one yeere the moſt that the Stallion is able to do that way,is to couer 15 mares,and that is ſomewhat with the ofteneſt. If ye would coole the courage,& quench the luſt of a mare,ſhare and clipher mane. And yet are mares ſufficient to beare euery yeere, vntill they came to fortie. It is reported that an horſe hath liued 75 yeeres. Mares only of all K
other females,are deliuered of their foles, ſtanding on their feet:but loue them more than any other doe their young. Theſe foles verily, by report, haue growing on their forehead, when they be newly come into the world,a little blacke thing of the bigneſſe of a fig,called Hippomanes,& it is thought to haue an effectuall vertue to procure and win loue. The dam hath not ſo ſoon foled,but ſhe bites it off, and eats it her ſelfe: and if it chance that any bodie preuents her of it,and catcheth it from her,ſhe will neuer let the fole ſucke her. The verie ſmell and ſent thereof,if it be ſtollen away,will driue them into a fit of rage and madneſſe. If peraduenture a young fole loſe the damme,the other mares of the common heard that are milch nurſes, giue their teates to this poore orphane, and reare it vp in common. They ſay that for 3 daies after L
they be newly foled,the yong colts canot lay their mouth to the ground,and touch it. Moreouer,the hotter ſtomacked that a horſe is,the deeper he thruſteth his noſe into the water as he drinkes. The Scythians chuſe rather to vſe their mares in war-ſeruice than their ſtone-horſes: the reaſon is this,that their ſtaling is no hinderance to their pace in running their carriere, as it doth the horſe,who muſt needs then ſtand ſtill. In Portugall, along the riuer Tagus,& about Lisbon,certaine it is, that when the weſt-wind blowes, the mares ſet vp their tailes, and turne them full againſt it,and ſo conceiue that genitall aire in ſteed of naturall ſeed: in ſuch ſort, as they become great withall,and quicken in their time,& bring forth foles as ſwift as the wind, but they liue not aboue three yeres. Out of the ſame Spain,from the parts called Gallicia and Aſturia,certaine ambling iennets or nags are bred, which wee call Thieldones: and others of M
leſſe ſtature & proportion euery way,named Aſturcones. Theſe horſes haue a pleaſant pace by themſelues differing from others. For albeit they be put to their full pace,a man ſhall ſe them ſet one foot before another ſo deftly and roundly in order by turnes,that it would do one good to ſee it:and hereupon horſe-breakers(maſters)haue an art by cords to bring a horſe to the like amble. A horſe is ſubiect to the ſame diſeaſes in maner that a man is:& beſides, to the running

A of the bladder: like as all other beaſts that labour either in draught or cariage.

Chap. XLIII.

¶ *Of Aſſes.*

Varro writes, That *Q. Axius* a Roman Senator bought an Aſſe which bought him 400000 Seſterces, a price in my conceit aboue the worth of any beaſt whatſoeuer: & yet (doubtleſſe) he was able to do wondrous good ſeruice in carrying burdens, plowing of ground, and principally in getting of mules. The chapmen that vſe to buy theſe Aſſes haue a ſpeciall
B regard to the place from whence they come, and where they be bred: for in Achaia or Greece thoſe of Arcadia be in greateſt requeſt: and in Italy thoſe of Reate. This creature of all things can worſt away with cold; which is the cauſe that none of them are bred in Pontus. Neither do they ingender as other ſuch like beaſts, in the Spring Æquinoctiall, *i.* about mid-March, but in mid-Iune, about the time of the Sun-ſtead, when daies be at the longeſt. He Aſſes, the more you ſpare them in their worke, the worſe they are for it. The females are at the leaſt 30 months or two yeares and halfe old before they bring any yong; but 3 yeares is the ordinarie and due time indeed. They go as long as mares, and iuſt ſo many moneths, and after the ſame maner do they fole. But after they be couered, they muſt be forced to run preſently, with beating & laying on them, or elſe they will let go their ſeed again, ſo ſlippery is their wombe, and ſo vnapt to keep that which once it hath conceiued. They are ſeldome ſeene to bring forth two at once.
C The ſhe Aſſe when ſhe is about to fole ſeeketh ſome ſecret blinde corner to hide her ſelfe, that ſhe might not be ſeen of any man. She breeds all her life time, which commonly is vntill ſhee be 30 yeares old. They loue their yong foles exceeding well, but as ill or rather worſe can they abide any water. To their little ones they will go through fire, but if there be the leaſt brooke or rill between, they are ſo afraid of it, that they dare not once dip their feet therein. And verily drinke they will not, but of their accuſtomed fountaines within the paſtures where they vſe to go: but they will be ſure to chuſe their way, and go dry-foot to their drinke, and not wet their hooſe: neither will they go ouer any bridges, where the planks are not ſo cloſe drawn together and ioynted, but that they may ſee the water through vnder their feet; or the railes of each ſide ſo open that the riuer is ſeen. A ſtrange nature they haue by themſelues. Thirſty they are: but
D be they neuer ſo dry, if you change their watering place (as in trauelling vpon the way) they muſt be forced to drinke with cudgels, or elſe vnloden of their burdens. Whereſoeuer they be ſtabled, they loue to lie at large and haue roome enough. For in their ſleep they dream, & haue a thouſand phanſies appearing to them; inſomuch as they fling about them with their heeles euery way: now if they were not at libertie, and had not void ſpace enough, but ſhould beat againſt ſome hard thing in their way, they would ſoone be lame and halt withall. They be very gainfull and profitable to their maſters, yeelding more commoditie than the reuenues of good farme. It is well knowne, that in Celtiberia a ſhe Aſſe ordinarily with very breeding may be worth vnto them 400000 Seſterces. For the foling and bringing forth of the mules, the chief thing to be regarded in the ſhe Aſſe, is the haire about the eares and eie lids. For how ſoeuer
E the whole body beſides be of one and the ſame colour, yet ſhall the mules foled haue as many colours as were there, all ouer the skin. *Mecænas* was the firſt, that at feaſts made a daintie diſh of yong Aſſe foles, and preferred their fleſh in his time before the veniſon of wild Aſſes. But he being dead, they were not thought ſo good meat, nor accepted at all. If an Aſſe be ſeene to die, looke ſoon after that the whole race and kind of them will follow to the very laſt.

Chap. XLIV.

¶ *Of Mules.*

F BEtween the he Aſſe and a Mare is a Mule ingendred, and foled in the 12 moneth; a beaſt of exceeding ſtrength to beare out all labor and trauell. For breeding of ſuch Mules, Mares are choſen that are not vnder foure yeres old, nor aboue ten. Men ſay, that they will driue away one another in both kinds, and not accompany together, vnleſſe they taſted the milk and ſucked the damme when they were yong, of that kinde which they would couer. And for this purpoſe

purpoſe they vſe to ſteale away either the yong Aſſe foles,and ſet them in the dark to the teats G
of the Mare,or els the yong colts to ſuck of the ſhe Aſſe. For there is a kind of Mule alſo that
comes of a ſtone horſe and a female Aſſe: but of all others they be vntoward and vnruly, and
ſo ſlow withall, that it is vnpoſſible to bring them to any good ſeruice: and much more (as all
things elſe) if they be far in age when they ingender. If when a ſhe Aſſe hath taken the horſe
and be ſped,there come an Aſſe and couer her againe, ſhe will caſt her fruit vntimely, and loſe
all: but it is not ſo if an horſe couer her after an Aſſe. It is noted & found by experience,that
ſeuen daies after an Aſſe hath foled, is the beſt time to put the male vnto her, and then ſooneſt
will ſhe be ſped: as alſo,that the he Aſſes being wearie with trauel,wil better couer the femals
than otherwiſe being reſty. That Aſſe is held for barren, which is not couered, nor conceiueth,
before ſhe haue caſt her ſucking or foles teeth,whereby the age is known: as alſo ſhe that ſtan- H
deth not to the firſt couering, but loſeth it. In old time they vſed to call thoſe Hinuli which
were begotten betweene a horſe and an Aſſe: and contrariwiſe Mules, ſuch as were ingendred
of an Aſſe and a Mare. Moreouer this is obſerued, that if two beaſts of diuers kindes ingender,
they bring forth one of a third ſort,and reſembling none of the parents: alſo, that ſuch begot-
ten in this maner,what kind of creatures ſoeuer they be,are themſelues barren and fruitles,vna-
ble either to beare or beget yong. And this is the cauſe that ſhe mules neuer breed. We finde
verily in our Chronicles,that oft times Mules brought forth yong foles,but it was alwaies ta-
ken for a monſtrous and prodigious ſigne. And yet *Theophraſtus* ſaith, that in Cappadocia or-
dinarily they do beare and bring forth foles: but they are a kind by themſelues. Mules are bro-
ken of their flinging and wincing,if they vſe often to drinke wine. It is found written in many I
Greeke authors,that if an he Mule couer a Mare,there is ingendred that which the Latins call
Hinnus,that is to ſay,a little Mule. Between Mares and wild Aſſes made tame,there is ingen-
dred a kind of Mules very ſwift in running,and exceeding hard hoofed,lanke and ſlender of bo-
die,but fierce and couragious,and vnneth or hardly to be broken. But the Mule that comes of
a wild Aſſe and a female tame Aſſe,paſſeth all the reſt. As for wild aſſes,the very beſt & floure
of them be in Phrygia and Lycaonia. In Africke the fleſh of their foles is held for excellent
good meat,and ſuch they cal Laliſiones. It appeares in the Chronicles of Athens,That a mule
liued 80 yeares. And reported thus much there is of it,That when they built the temple within
the citadel thereof,this old Mule being for age able to do nothing els, would yet accompanie
other Mules that laboured and caried ſtones thither, and if any were ready to fall vnder their K
lode,would ſeeme to relieue and hold them vp,and as it were incourage them to his power: in-
ſomuch as the people tooke ſo great delight and pleaſure therein, that they made a decree and
took order,that no corn-maſters that bought and ſold graine ſhould beat this mule from their
ranging ſiues,when they clenſed or winnowed their corne,but that he might eat vnder them.

Chap. XLV.

¶ *Of Buls, Kine, and Oxen.*

THe Bœufs of India are as high by report as Camels,and foure foot broad they are betwixt
the horns. In our part of the world thoſe that come out of Epirus are moſt commended, L
and beare the greateſt price aboue all others,and namely thoſe which they ſay are of the
race & breed of king *Pyrrhus*,who that way was very curious. For this prince becauſe he would
haue a principall good breed,would not ſuffer the Buls to come vnto the kine and ſeaſon them
before they were both foure yeares old. Mighty big they were therefore, and ſo they continue
of that kind vnto this day. Howbeit,now when they be but heifers of one yeare, or two yeres at
the moſt(which is more tolerable)they are let go to the fellow and breed. Buls may wel ingen-
der and ſerue kine when they be 4 yeares old; and one of them is able all the yeare long to goe
with ten kine and ſerue their turne. They ſay moreouer,that a Bull after he hath leapt a Cow,
and done his kind,if he go his way toward the right hand,he hath gotten an oxe calfe,but con-
trariwiſe a cow calfe if he take the left hand. Kine commonly take at their firſt ſeaſoning, but M
if it chance that they miſſe and ſtand not to it,the 20 day after they ſeeke the fellow, and goe a
bulling againe. In the tenth moneth they calue, and whatſoeuer falleth before that terme, ne-
ver proueth nor commeth to good. Some write, That they calue iuſt vpon the laſt day of the
tenth moneth complete. Seldome bring they forth two calues at a time. Their ſeaſoning time
commonly

20030
copy 1

A commonly continueth 30 daies, namely from the riſing of the Dolphin ſtarre, vnto the day before the Nones of Ianuarie: howbeit ſome there be that go to fellow in Autumne. Certes in thoſe countries where the people liue altogether of milke, they order the matter ſo, that their kine calue at all times, ſo as they are not without their food of freſh milke all the yeare long. Bulls willingly leape not aboue two kine at moſt in one day. Bœufes alone of all liuing Creatures can graſe going backeward, and verily among the Gamarants they neuer feed otherwiſe. Kine liue not aboue 15 yeares at the vtmoſt: bulls and oxen come to 20: they be at their full ſtrength when they are 5 yeres old. It is ſaid that they will grow fat if they be bathed with hot water, or if a man ſlit their hide, and with a reed or pipe blow wind betweene the fleſh and the skin, euen into their intrals. Kine, Buls, and Oxen are not to be deſpiſed as vnkindely, although
B they look but ilfauoredly, and be not ſo faire to the eie; for in the Alpes the leaſt of bodie are the beſt milch kine: and the beſt laboring oxen are they which are yoked by the head, and not the neck. In Syria they haue no dewlaps at all hanging vnder the necke, but bunches ſtanding vp on their backs in ſtead thereof. They of Caria alſo, a country of Aſia, are ilfauored to ſight, hauing betweene their neckes and ſhoulders a tumor or ſwelling hanging ouer; beſides, their horns are looſe, and as it were out of joint; and yet by report they are paſſing good of deed, and labor moſt ſtourly. Furthermore, it is generally held for certain, that the black or white in this kind are ſimply the worſt for work, and condemned. Buls haue leſſer and thinner horns than either Kine or Oxen. The beſt time to bring the Oxe or Bull to the yoke, and make him draw, is at 3 yeres of age; after, it is too late; and before, with the ſooneſt. A yong Stere is ſooneſt trained and taught to draw, if he be coupled in one yoke with another that hath bin wrought al-
C readie, and beaten to his work: for this beaſt is our companion, and labors together with vs, in earing and plowing the ground: and ſo highly regarded was the Oxe in old time of our forefathers, that we find it regiſtred vpon record, That a certain Roman was judicially endited, accuſed, and condemned by the people of Rome, for that (to ſatisfie the minde of a wanton minion and catamite of his, who ſaid he had not eaten any tripes all the while he was in the Countrie) he had killed an Oxe, yea although he was his one; and for this fact was baniſhed, as if he had ſlain his Grangier, or Bailif of his husbandry. Buls are known to be of a good kind & couragious, by their fierce and grim countenance, for they alwaies looke crabbed and frowning; their eares are ouergrowne with ſtiffe haires, and their hornes ſo ſtanding, as if they were euer
D diſpoſed and ready to fight: but all his threatning and menaces appeare in his fore-feet; with them he giues warning, and as he is more and more angry, he beſtirs himſelfe now with the one foot, then with another, in courſe and by turnes, ſtamping and pawing with them againſt the ground, raiſing and flinging the duſt about him aloft into the aire: and of all other beaſts, hee alone after this maner inchafeth himſelfe, and giues an edge vnto his anger. I my ſelf haue ſeen them fight one with another for the maſtrie: I haue ſeen them, being turned and ſwong round about in their fal, caught vp with the horns of others, and yet riſe again & recouer themſelues: I haue ſeene them lying along to be raiſed aloft from the ground; and when they haue run all amain with full pace, gallopping in their chariots, yet ſtaid and ſtood ſtill when they ſhould, as if the charioters had cauſed them to reſt. The Theſſalians were they who deuiſed with praun-
E cing horſe to ride gallop cloſe to the Buls head to take them by the horne, wryth their neckes down, and ſo kil them. The firſt that exhibited this pleaſant ſhew to the people at Rome was *Cæſar* Dictator. The Bull yeeldeth the principal and moſt ſumptuous ſacrifice of all other vnto the gods, and therewith are they beſt pleaſed. This beaſt alone, of all that are long tailed, when it firſt comes into the world, hath not the taile of the full meaſure and perfect length as others, but it growes ſtil, till it reach down to the very heels, and touch the ground. And hereupon it is, that in chuſing calues for ſacrifice, thoſe are allowed for good and ſufficient, whoſe taile reacheth to the joint of the haugh or gambrill: for if it be ſhorter, they will not be receiued & accepted of the gods. This alſo is noted by experience, that calues ſo little, that they be brought on mens ſhoulders to the altars to be killed, lightly are not ſufficient to appeaſe the gods. Nei-
F ther are they pacified & well pleaſed with a beaſt that is lame or maimed; nor with that which is not appropriat vnto them, but to ſome other gods; ne yet with it that recules from the altar, and is loth to come to it. In the prodigies that we reade of antient times, we find very oft, that Kine and Oxen haue ſpoken: vpon report of which ſtrange token, the Senat was euer wont to aſſemble in ſome open place abroad, and not to ſit either in hall or chamber.

CHAP.

Chap. XLVI.

¶ *Of the Bœufe or Oxe named Apis.*

In Ægypt alſo they had an Oxe which the people of that country adored and worſhipped as a god, vnder the name of Apis. This beaſt was marked in this manner; with a white ſpot on his right ſide, like to the horns or tips of the new moon croiſſant; a knot or bunch vnder the tongue, which they called Cantharus: by their religion it was not lawfull to ſuffer him to liue aboue a certain number of yeres, at the end of which term they drown him in a certain Wel or fountain of their prieſts, and ſo ſhorten his life: and then with great ſorrow fall to ſeek another to ſubſtitute in his place; vntil they find him they mourne and waile, and in token of grief and ſorrow, they ſhaue their heads. But long they neuer are before they meet with another, & when they haue him, he is by the prieſts brought to Memphis, where he hath 2 Temples, which they call Thalami, *i.* bed-chambers; out of which all the people of Ægypt, as from an Oracle, are informed truly of things to come. For if this Oxe enter into the one of them it is a good luckie ſigne; but if he go into the other, then it portendeth great miſhap and infortunitie. And theſe be generall preſages to the whole nation. As for priuat perſons, he foretelleth them of things to come by the maner of taking meat at their hands, who come to know what fortune they ſhal haue. He turned away his head from the hand of *Germanicus Cæſar*, and would eat no meat when he offered it him; but he died for it, and that not long after. He is kept ſecret and cloſe for the moſt part: but if at any time he get forth and come abroad to be ſeen of the multitude of people, he goeth with a gard of tip ſtaues to make way for him, and then a company of prety boies go chanting before him canticles and ſongs in his honour and praiſe: for it ſeemeth that he taketh heed to what they ſing, and is well pleaſed and contented thus to be worſhipped. Now theſe Choriſters beforeſaid preſently fall into a kinde of furious rage, and withall are inſpired with the gift of propheſie, and ſo foretell what will enſue. Once a yeare there is preſented vnto him a Cow, which hath marks likewiſe as he hath, but differing from his: and alwaies on what day this cow is found, the ſame day, by report, it dies. At Memphis there is a place within Nilus, which the inhabitants name Phiola, becauſe it is made in faſhion of a pot or boll; & therein duly euery yere the Ægyptians drowne two cups, one of ſiluer, another of gold, during ſeuen daies, dedicated to ſolemniſe the natiuitie of their god *Apis*. And this is one thing to be wondred at, that in that ſeuen-night ſpace there is not one that taketh hurt by Crocodiles: but let the eighth day come once, within ſix houres they returne to their former miſchieuous cruelty

Chap. XLVII.

¶ *The nature of Sheepe, and their breeding.*

Sheepe likewiſe are in great requeſt, both in regard they ſerue as ſacrifices to pacifie the gods; and alſo by reaſon their fleece yeelds ſo profitable an vſe: for euen as men are beholden to the bœufe for their principall food and nouriſhment which they labour for, ſo they muſt acknowledge, that they haue their cloathing and couerture for their bodies from the poore ſheep. The ram and ewe both are fit for generation from two yeres of age vpward, vntill they come to nine, and ſome alſo vntill they be ten yeares old. The lambes they yeane firſt are but little ones. They go all generally to rut about the ſetting of Arcturus, *viz.* vpon the third day before the Ides of May; and their heat laſteth vnto the full of the Ægle ſtarre, namely the tenth day before the Calends of Auguſt. They be with yong 150 daies: if any take the Ram after that time, the fruit they beare comes to no good, but proues weake. And ſuch lambes as fall after that ſeaſon they called in old time *Cordos*, *i.* later lambs. Many men do preferre theſe winter lambes before thoſe that come in ſpring: the reaſon is, becauſe it is much better they ſhould be ſtrong before the heat of ſummer and the long daies, than againſt the cold of winter and the ſhorteſt daies: and they think that this creature only taketh good by being yeaned in the midſt of winter. It is kinde and and naturall for Rams to make no account of young Hogrels, but to loath them: for they had rather follow after old ewes. Himſelfe alſo is better when he is old, and more luſty to leape the Ewes. To make him more milde and gentle they vſe to bore

20030
copy 1

A bore his horne about the root neere vnto his eares. If his right cullion orſtone be tied vp, hee getteth ewe lambes; but if the left be taken vp, he getteth ramme lambes. If ewes be alone by themſelues without the flocke when it thundreth, they caſt their lambes. The only remedie is to gather them together, that by company and fellowſhip they may haue help. They ſay, that if the North winds blow when they take the ram, they will bring forth males; but if the South winds be vp, females. Moreouer, great regard there is had in this kind, to the mouthes of the rams: for look what colour the veines be vnder their tongue, of the ſame will the fleece be of the lambes, that is to ſay, of ſundrie colours, in caſe the veines were diuers coloured. Alſo the change of water and drinkes maketh them to alter their hew. In ſumme, two principall kinds there be of ſheep, that is to ſay, the one reared within houſe, and the other abroad in the field:
B the firſt is the tenderer, but the other more pleaſant meat and delicat in taſt; for thoſe within-houſe feed vpon briers and brambles. The clothes and couerings made of the Arabick wooll, are chiefe of all.

Chap. XLVIII.

¶ *Diuers kinds of wooll and clothes.*

THe beſt wooll of all other, is that of Apulia: then, that which in Italy is named the Greek ſheepes wooll, but in other countries is named Italian. In the third ranke, the Mileſian ſheepe and their wooll, carrie the prize. The wooll of Apulia is of a ſhort ſtaple, and ſpecially in requeſt for cloaks and mantles, and nothing elſe. About Tarentum and Canuſium, the
C richeſt of this kind are found: as alſo at Laodicea in Aſia. As for whiteneſſe, there is none better than that which groweth along the Po, namely, about Piemount and Lombardie: and yet neuer to this day, a pound of it hath exceeded the price of an hundred ſeſterces. In all places they vſe not to ſheare ſheepe: for the manner of plucking their fells continueth ſtill in ſome countries. Sundry ſorts of colours there be in wooll, and ſo many, that we are not able to giue ſeuerall names ſo much as to thoſe that we call Natiue, *i.* growing vpon the ſheeps backe. For black fleeces, Spaine is chiefe; Pollentia for white; and Galey, the tract of Piemont neere to the Alpes: Aſia for red hath no fellow, and ſuch kind of wools are called Erythrææ, In Bœtia likewiſe, that is to ſay, in the kingdome of Granade and Andaluſia, the ſame colour is to be found. Neere to Canuſia, the ſheepe be deepe yellow or tawnie: and about Tarentum, they are of a
D browne and duskiſh colour. Generally, all kind of wools newly ſhorne or plucked, vnwaſht and greaſy ſtill, be good and medicinable. About Iſtria and Liburnia, the ſheeps fleece reſembleth haire rather than wooll, nothing at all good for to make frized clothes with a high nap: but ſerueth only for the Artizan or workman in Portugall, whoſe artificial weauing in net or ſcutcheon work with ſquares, commends this wooll. The like wooll is common about Piſſenæ in the prouince Narbonenſis, *i.* Languedoc in Fraunce: and ſuch is found in Ægypt: the cloth made thereof, after it is worne bare, is then died and ſerueth new againe, and will weare ſtill and laſt a mans life. The courſe rough wooll with the round great haire, hath been of ancient time highly commended and accounted of in tapeſtrie worke: for euen *Homer* himſelfe witneſſeth, that they of the old world vſed the ſame much, and tooke great delight therein. But this tapeſtry is
E ſet out with colours in Fraunce, after one ſort, and among the Parthians after another. Moreouer, wooll of it ſelfe driuen together into a felt without ſpinning or weauing, ſerueth to make garments with: and if vinegre be vſed in the working of it, ſuch felts are of good proof to bear off the edge and point of the ſword, yea and more than that, they wil check the force of the fire. And the laſt clenſing and refuſe thereof (when it is taken out of the coppers and leads of thoſe that haue the fulling and dreſſing thereof) ſerues for flock-worke and to ſtuffe mattreſſes: an inuention (as I ſuppoſe) which came firſt out of France: for ſurely theſe flocks and quilted mattreſſes, are at this day diſtinguiſhed and knowne one from another by French names. But I am not able eaſily to ſet downe at what time firſt this workmanſhip began: for certaine it is that in old time men made them pallets and beds of ſtraw, or elſe lay vpon bare mats, like as now adays
F ſouldiers in the camp make ſhift with hairy rugges. As for our mantles, frized deep both without and within, they were inuented & came to vſe firſt, no longer ſince than in my fathers daies: as alſo theſe hairy counterpoints and carpets. For the ſtudded caſſocks that Senatours and noble men of Rome do weare, begin but now for to be wouen after the manner of deep frieze rugges. Wooll that is blacke, will take no other hew, nor be dyed into any colour.

As

As touching the manner how to die other wools, we wil ſpeake in conuenient place, namely, G
when we ſhall treat of the purples and ſea ſhell fiſhes, and of certain hearbs good for that purpoſe. *M. Varro* writeth, That within the temple of *Sangus*, there continued vnto the time that he wrote his booke, the wooll that ladie *Tanaquil*, otherwiſe named *Cata Cæcilia*, ſpun: together with her diſtaffe and ſpindle: as alſo, within the chappell of Fortune, the very roiall robe or mantle of Eſtate, made with her owne hands after the manner of water-chamlot in waue worke, which *Seruius Tullus* vſed to weare. And ſtom hence came the faſhion & cuſtome at Rome, that when maidens were to be wedded, their attended vpon them a diſtaffe, dreſt and trimmed with kembed wool, as alſo a ſpindle and yearn vpon it. The ſaid *Tanaquil* was the firſt that made the coat or caſſock wouen right out all thorough, ſuch as new beginners (namely, young ſouldiers, barriſters, & freſh brides) put on vnder their white plaine gownes, without any guard of purple. H
The waued water Chamelot, was from the beginning eſteemed the richeſt and braueſt wearing. And from thence came the branched damaske in broad workes. *Feneſtella* writeth, That in the latter time of *Auguſtus Cæſar* they began at Rome to vſe their gownes of cloth ſhorne, as alſo with a curled nap. As for thoſe robes which are called Crebræ and Papaueratæ, wrought thick with floure-worke, reſembling poppies; or preſſed euen and ſmooth; they be of greater antiquitie: for euen in the time of *Lucilius* the Poet, *Torquatus* was noted and reproued for wearing them. The long robes embrodered before, called Prætextæ, were deuiſed firſt by the Tuſcanes. The Trabeæ ware roiall robes, and I find that kings & princes only ware them. In *Homers* time alſo they vſed garments embrodered with imagerie and floure worke: & from thence came the triumphant robes. As for embroderie it felfe and needle-work, it was the Phrygians inuention: I
and hereupon embroderers be called in Latine *Phrygiones*. And in the ſame Aſia, king *Attalus* was the firſt that deuiſed cloth of gold: and thence come ſuch clothes to be called Attalica. In Babylon they vſed much to weaue their cloth of diuers colours, and this was a great wearing among them, & clothes ſo wrought were called *Babylonica*. To weaue cloth of tiſſue with twiſted threeds both in woofe and warp, and the ſame of ſundry colours, was the inuention of Alexandria, and ſuch clothes and garments were named Polymita. But France deuiſed the ſcutchion, ſquare, or lozenge damask-worke. *Metellus Scipio*, among other challenges and imputations laid againſt *Capito*, reptoched and accuſed him for this, That his hangings and furniture of his dining chamber, being Babylonian worke or cloth of Arras, were ſold for 800000 ſeſterces: and
ſuch like of late daies ſtood prince *Nero* in 400 hundred thouſand ſeſterces, *i.* 40 millions. The K
embrodered long robes of *Seruius Tullus*, wherewith he couered and arraied all ouer the Image of *Fortune*, by him dedicated, remained whole and ſound vnto the end of *Seianus*. And a wonder it was, that they neither fell from the image, nor were moth-eaten in 560 yeares. I haue my ſelfe ſeen the ſheeps fleeces vpon their backs while they be aliue, died with purple, with ſcarlet in grain, and the violet liquor of the fiſh Murex: by the means of certaine barks of a foot and a halfe long dipped in theſe colors, and ſo imprinted and ſet vpon their fleeces: as if riotous wantonnes and ſuperfluitie ſhould force Natures work, and make wooll to grow of that colour. As for the ſheep it ſelfe, ſhe is knowne to be kindly enough by theſe marks, If ſhe be ſhort legged,
and wel woolled vnder the bellie; for ſuch as were naked there and pilled, they condemned and
held for naught, and thoſe they called Apicæ. In Syria, ſheep haue tailes a cubit long, and they L
beare moſt wooll there. To lib lambs before they be fiue moneths old, it is thought to be with the ſooneſt, and daungerous.

Chap. XLIX.

¶ *Of a beaſt called Muſmon.*

THere is in Spaine, but eſpecially in the Iſle Corſica, a kind of Muſmones, not altogether vnlike to ſheep, hauing a ſhag more like the haire of goats, than a fleece with ſheepes wooll. That kind which is engendred between them and ſheepe, they called in old time
Vmbri. This beaſt hath a moſt tender head, and therefore in his paſture he is forced to feed M
with his taile to the ſunne. Of all liuing creatures, thoſe that bare wooll are moſt fooliſh: for take but one of them by the horne and lead him any whither, all the reſt will follow, though otherwiſe they were afraid to go that way. The longeſt that they liue in thoſe parts, is 9 yeares; howſoeuer in Æthiopia they come to 13. In which country, goats alſo liue 11 yeres, whereas in other

20030
copy 1

A other countries of the world, for the moſt part, they paſſe not eight. And both ſorts, as well the one as the other, be ſped within foure leapings.

Chap. L.

¶ *Of Goats, and their breeding.*

GOats bring forth foure kids otherwhiles, but that is very ſeldome. They goe with young fiue months as ewes do. Shee goats waxe barren with fatneſſe. When they be come once to be three yeares old, they are not ſo good to breed: ne yet when they be elder, and namely, being paſt foure yeares of age. They begin at the ſeuenth month, euen whiles they ſucke their dammes. And as well the bucke as the Doe are held the better for breed, if they be nott,
B and haue no hornes. The firſt time that the ſhee goats are leaped, they ſtand not to it: the ſecond leaping ſpeedeth better, and ſo forward. They chuſe willingly to take the buck in the month of Nouember, that they might bring kids in March following, when all ſhrubs put forth and begin to ſprout and bud, for them to brouze. And this is ſometime when they be a yeare old, but they neuer faile at two yeares: yea and when they be full three, they are not vtterly decayed and done, but are good ſtill: for they beare 8 yeares. Subject they be in cold weather, to caſt their young and yeane vntimely. The Doe, when ſhe perceiueth her eies dimme and ouer-caſt either with pin and web or catarract, pricketh them with the ſharp point of ſome bulruſh, and ſo letteth them blood: but the bucke goeth to the brier and doth the like. *Mutianus* reporteth, that
C he had occaſion vpon a time to mark the wit of this creature: It happened, that vpon a narrow thinne plank that lay for a bridge, that one goat met another comming both from diuers parts: now by reaſon that the place was ſo narrow that they could not paſſe by nor turne about, ne yet retire backwards blindly, conſidering how long the plank was & ſo ſlender withall; moreouer, the water that ran vnderneath ran with a ſwift ſtreame, and threatned preſent death if they failed and went beſides: *Mutianus* (I ſay) affirmeth, that he ſaw one of them to lie flat down, and the other to goe ouer his backe. As for the male goats, they are held for the beſt which are moſt camoiſe or ſnout noſed, haue long eares, and the ſame ſlit in, with great ſtore of ſhag haire about their ſhoulders. But the mark to know the kindeſt female is this, they haue two lappets, locks, or plaits as it were of haire, hanging downe along their bodie on either ſide from their
D neck. They haue not al of them hornes, but ſome are nott; but in thoſe which are horned, a man may know their age by the number of the knots therein more or leſſe: and in very truth the nott ſhee goats are more free of milke. *Archelaus* writeth, that they take their breath at the eares, and not at the noſtrils: alſo that they be neuer cleare of the ague. And this haply is the cauſe, that they are hotter mouthed, and haue a ſtronger breath than ſheepe, and more egre in their rut. Men ſay moreouer, that they ſee by night as well as by day: therefore they that when euening is come ſee nothing at all, recouer their perfect ſight again by eating ordinarily the liuer of goats. In Cilicia and about the Syrtes, the people clad themſelues with goats haire, for there they ſhere them as ſheep. Furthermore it is ſaid, that goats toward the Sun-ſetting, cannot in their paſture ſee directly one another, but by turning taile to taile: as for other houres of the day,
E they keep head to head, & range together with the reſt of their fellowes. They haue all of them a tuft of haire like a beard hanging vnder their chin, which they call Aruncus. If a man take one of them by this beard and draw it forth of the ſtock, all the reſt will ſtand ſtill gazing thereat, as if they were aſtonied, and ſo wil they doe if any of them chaunce to bite of a certaine hearb. Their teeth kill trees. As for an oliue tree, if they doe but lick it, they ſpoile it for euer bearing after: and for this cauſe they be not killed in ſacrifice to *Minerua*.

Chap. LI.

¶ *Of Swine, and their natures.*

F SWine goe a brimming from the time that the Weſterne wind Fauonius beginnes to blow, vntill the ſpring Æquinoctiall: and they take the bore when they be eight months old: yea in ſome places at the fourth month of their age, and continue breeding vnto the ſeuenth yeare. They farrow commonly twice a yeare: they be with pig foure months. One ſow may bring at one farrow twenty pigges, but reare ſo many ſhe cannot. *Nigidius* ſaith, that thoſe pigs

which are farrowed ten daies vnder or ten daies ouer the ſhorteſt day in the yeare, when the ſun entreth into Capricorn, haue teeth immediatly. They ſtand lightly to the firſt brimming, but by reaſon that they are ſubject to caſt their pigs, they had need to be brimmed a ſecond time. Howbeit the beſt way to preuent that they doe not ſlip their young, is to keepe the bore from them at their firſt grunting and ſeeking after him, nor to let them be brimmed before their ears hang downe. Bores be not good to brim ſwine after they be three yeres old. Sowes when they be wearie for age that they cannot ſtand, take the bore lying along. That a ſow ſhould eat her own pigs, it is no prodigious wonder. A pig is pure & good for ſacrifice, 5 daies after it is farrowed; a lamb, when it hath been yeaned 8 daies; and a calfe, being 30 daies old. But *Gornucanus* ſaith, That all beaſts for ſacrifice which chew cud, are not pure and right for that purpoſe, vntill they haue teeth. Swine hauing loſt on eie, are not thought to liue long after; otherwiſe they may continue vntill they be fifteen yeares old, yea & ſome to twenty. But they grow to be wood and raging otherwhiles: and beſides are ſubject to many maladies more, & moſt of all to the ſquinancie, and wen or ſwelling of the kernels in the neck. Will ye know when a ſwine is ſick or vnſound, pluck a briſtle from the back and it will be bloudie at the root: alſo he will cary his neck atone ſide, as he goeth, A ſow, if ſhe be ouer-fat, ſoone wanteth milke; and at her firſt farrow bringeth feweſt pigs. All the kind of them loue to wallow in dirt and mire. They wrinkle their taile; wherin this alſo is obſerued, that they be more likely to appeaſe the gods in ſacrifice, that rather writh & turn their tailes to the right hand, than the left. Swine wil be fat and wel larded in ſixtie daies; and the rather, if before you begin to frank them vp, they be kept altogether from meat three daies. Of all other beaſts, they are moſt brutiſh; inſomuch as there goes a pleaſant by-word of them, and fitteth them well, *That their life is giuen them in ſtead of ſalt*. This is known for a truth, that when certaine theeues had ſtolne and driuen away a companie of them, the ſwinheard hauing followed them to the water ſide (for by that time were the theeues imbarged with them) cried aloud vnto the ſwine, as his manner was: whereupon they knowing his voice, learned all to one ſide of the veſſel, turned it ouer and ſunke it, tooke the water, and ſo ſwam againe to land vnto their keeper. Moreouer, the hogs that vſe to lead and goe before the heard, are ſo well trained, that they wil of themſelues goe to the ſwine-market place within the citie, & from thence home againe to their maiſters, without any guid to direct them. The wild bores in this kind, haue the wit to couer their tracks with mire, and for the nones to run ouer mariſh ground where the prints of their footing will not be ſene; yea and to be more light in running, to void their vrine firſt. Sowes alſo are ſplaied as well as camels, but two daies before, they be kept from meat: then hang they by the fore-legs, for to make inciſion into their matrice, and to take forth their ſtones: and by this means they will ſooner grow to be fat. There is an Art alſo in cookerie, to make the liuer of a ſow, as alſo of a gooſe, more daintie (and it was the deuiſe of *M. Apicius*) namely, to feed them with drie figges, and when they haue eaten till they bee full, preſently to giue them mead or honied wine to drink, vntill they die with being ouercharged. There is not the fleſh of any other liuing creature, that yeeldeth more ſtore of diſhes to the maintenance of gluttonie, than this; for fiftie ſundrie ſorts of taſtes it affordeth, whereas other haue but one a peece. From hence came ſo many edicts and proclamations publiſhed by the Cenſors, forbidding and prohibiting to ſerue vp at any feaſt or ſupper, the belly and paps of a ſow, the kernels about the neck, the brizen, the ſtones, the womb, and the fore-part of the bores head: and yet for all that, *Publius* the Poet and maker of wanton ſongs, after that he was come to his freedom, neuer (by report) had ſupper without an hogs belly with the paps: who alſo to that diſh gaue the name, and called it Sumen. Moreouer, the fleſh of wild bores came to be in great requeſt and was much ſet by: in ſuch ſort, as *Cato* the Cenſor in his inuectiue orations, challenged men for brawne. And yet when they made three kinds of meat of the wild bore, the loine was alwaies ſerued vp in the mids. The firſt Romane that brought to the table a whole bore at once was *P. Seruilius Rullus*, father of that *Rullus*, who in the time that *Cicero* was Conſull, publiſhed the law Agraria, as touching the diuiſion of lands. See how little while ago it is ſince theſe ſuperfluities began, which now are taken vp ſo ordinarily euerie day. And yet the thing was noted and recorded in the Annals, as ſtrange and rare; no doubt for this intent, To repreſſe theſe inordinate enormities. One ſupper then or feaſt was taxed and reprooued therein at the beginning: but now, two and three bores at a time are ſerued vp whole and eaten together.

CHAP.

20030

Chap. LII.

¶ *Of Parks for wild beaſts.*

THe firſt man of the long robe that deuiſed parks as well for theſe bores, as for other deere and ſauage beaſts, was *Fulvius Lippinus*, who in the territorie of *Tarquinij* began to keepe and feed wild beaſts for his game. And long it was not but others followed his ſteps, to wit, *L. Lucullus* and *Q. Hortenſius*. Sowes of the wild kind bring forth pigs but once a yere; and the bores in briming time are exceeding fierce and fel: then they fight one with another, they harden their ſides, rubbing them againſt the bodies of trees, and all to wallow themſelues in the mire, coating their backs with dirt. But they are not ſo raging then, but the ſowes in their farrowing are much worſe, and lightly it is ſo in all other kind of beaſts. Wild bores are not fit for generation before they be a yeare old. The wild bores of India haue two bowing fangs or tusks of a cubit length, growing out of their mouth, and as many out of their foreheads like to calues horns. The briſtly haire of the wild ſort is like to braſſe: but of others black. In Arabia ſwine will not liue.

Chap. LIII.

¶ *Of Beaſts halfe ſauage.*

THere is no creature ingenders ſo ſoon with wild of the kind, as doth ſwine: & verily ſuch hogs in old time they called Hybrides, as a man would ſay, halfe wild; inſomuch as this terme by a tranſlation hath bin attributed to mankind. For ſo was *C. Antonius*, collegue with *Cicero* in the Conſulſhip, nicknamed. And not in ſwine onely, but alſo in all other liuing creatures, looke where there be any tame and domeſtical, you may find alſo wild and ſauage of the ſame kind: ſeeing that euen of wild men there be alſo many ſorts in diuers places, as wee haue before ſaid. As for the goats kind, how many & how ſundry reſemblances are to be found in them of other beaſts? for among them you ſhall haue the roe bucke, the ſhamois, the wilde goat called the Eveck, wonderfull ſwift, albeit his head be loden with huge hornes like ſword ſcabberds: by theſe they hang and poiſe themſelues from rockes, namely, when they minde to leap from one to another, for by ſwinging to and fro they skip and jump the more nimbly, and fetch a jerk out to what place they liſt, as it were forth of an engin. Of this kind be the Origes, the only beaſts, as ſome thinke, of all others, that are ſaid to haue their haire growing contrariwiſe and turning toward the head. To theſe belong the Does, and a kinde of fallow Deere called Pygargi, as alſo thoſe that are named Strepſicerotes, and many other not far vnlike. As for the former ſort they come out of the Alps. Theſe laſt rehearſed are ſent from other parts beyond-ſea.

Chap. LIV.

¶ *Of Apes and Monkies.*

ALl the kinde of theſe Apes approch neereſt of all beaſts to the reſemblance of a mans ſhape: but they differ one from another in the taile. Maruellous crafty and ſubtill they be to beguile themſelues: for by report, as they ſee hunters doe before them, they will imitate them in euery point, euen to beſmeare themſelues with glew & birdlime, & ſhoo their feet within grins and ſnares, and by that means are caught. *Mutianus* ſaith, that he hath ſeene Apes play at cheſſe and table: and that at firſt ſight they could know nuts made of waxe from others. He affirmes alſo, that when the moon is in the wain, the monkies & Marmoſets (which in this kinde haue tailes) are ſad and heauy, but the new moone they adore and ioy at, which they teſtifie by hopping and dancing. As for the eclipſe of Sun or Moone, all other foure footed beaſts alſo do greatly dread and feare. The ſhe Apes of all ſorts are wondrous fond of their little ones: and ſuch as are made tame within houſe will carry them in their armes all about ſo ſoone as they haue brought them into the world, keepe a ſhewing of them to euery bodie, and they take pleaſure to haue them dandled by others, as if thereby they tooke knowledge that folke ioyed for their ſafe deliuerance: but ſuch a culling and hugging of them they keep, that

in the end with very claſping and clipping they kill them many times. Apes that be headed G
and long ſnouted like dogs, and thereof called Cynocephali, are of all other moſt curſt, ſhrewd and vnhappy: like as the Marmozets and Monkies called Sphinges & Satyri, are gentleſt and moſt familiar: as for thoſe called Callitriches, they be clean of another form & ſhape all ouer in a maner; they haue a beard on their viſage, & the forepart of their taile ſpredeth broad. But this creature is ſaid to liue in no other climat but Æthiopia, where it breedeth.

Chap. LV.

¶ *Of Hares and Connies.*

OF Hares alſo there be many ſorts: vpon the Alps & ſuch high mountains they be white H
of colour ſo long as the ſnow lieth; and it is verily thought, that all Winter long they liue with eating of ſnow: for ſurely when it is thawed and melted, all the yere after they be brown and reddiſh as before: and a creature it is otherwiſe bred in extreme and intolerable cold. Of the Hares kind are they alſo which in Spain they call Connies, which are exceeding fruitfull, and of wonderfull increaſe: inſomuch, as hauing deuoured all the corn in the field before harueſt, in the Baleare Iſlands, they brought thereby a famine vpon the people. There is a moſt daintie diſh ſerued vp at the table, made of Leuerets or rabbets, either cut out of the dams bellies, or taken from them when they are ſuckers, without clenſing them at all of the garbage, and ſuch the Latines call Laurices. It is know for certain, that the Iſlanders of Majorca & Minorca made means to the Emperor *Auguſtus Cæſar*, for a power of ſoldiers to deſtroy the infinit increaſe of Connies among them. Ferrets are in great account for chaſing and hunting theſe I
Connies: the manner is to put them into their earths, which within the ground haue many waies and holes like mines, and thereupon theſe creatures are called *Cuniculi*: and when they are within, they ſo courſe the poore Connies out of their earth, that they are ſoon taken aboue ground at the mouth of their holes. *Archelaus* writes, that looke how many receptacles & waies of paſſage the Hare hath for his dung and excrements, ſo many yeares old he is iuſt. And verily ſome haue more than others. The ſame writer is of opinion, that euery hare is both male and female, and that any of them can breed without the bucke. Certes herein Nature hath ſhewed her bounty and goodneſſe, in that ſhe hath giuen this creature (ſo good to eat, and ſo harmleſſe otherwiſe) the gift of fertilitie and fruitfull wombe. The Hare, naturally expoſed to be a prey K
and game for all men, is the only creature, vnles it be the Connie again called Daſipus, which after it be once with yong, conceiueth again vpon it: inſomuch as at one time ſhee hath ſome Leuerets ſucking of her, others in her belly; and thoſe not of the ſame forwardneſſe, for ſome of them are couered with haire, others are naked without any downe; and there be againe of them that as yet are not ſhapen at all, but without all forme. Moreouer, men haue aſſaied to make cloath of Hares and Connies haire: but in the hand they are not ſo ſoft as is the fur vpon the skin or caſe: neither will they laſt, by reaſon that the haire is ſhort and will ſoon ſhed.

Chap. LVI. L

¶ *Of Beaſts halfe tame.*

AS for Hares, ſeldome be they made tame and to come to hand; and yet iuſtly they cannot be ſimply called wild: for many other ſuch creatures there be beſides, that neither are ſauage, nor tame and gentle, but of a middle nature betwixt both: as namely among flying fowles in the aire, the Swallow: likewiſe the Bee: and among fiſhes the Dolphin in the ſea.

Chap. LVII.

¶ *Of Mice and Rats, Dormice, Reer-mice, and Bats.*

M
IN the rank of thoſe that be neither tame nor wild, many haue ranged the Mice and rats that haunt our houſes. A creature this is of no ſmal reckoning for preſaging ſomwhat to a ſtate, by ſome ſtrange and prodigious tokens. By gnawing the ſiluer ſhields & bucklers at Lauinium, they portended and foreſhewed the Marſian war. Vnto *Carbo* the L. Generall, by eating of his hoſe garters and ſhooe-ſtrings at Cluſium they prognoſticated his death. Many ſorts

there

20030
copy 1

A there be of them in the country of Cyrene, ſome with a broad flat forehead, others with a ſharp pointed: and there be of them ſeen to haue ſharp prickles like to vrchins or hedge-hogs. *Theophraſtus* reporteth, That theſe vermin hauing diſpeopled the Iſle Gyaros, and driuen away the inhabitants, gnawed and deuoured euery thing they could meet withal, euen to their very iron. And ſurely it ſeemes that is their nature ſo to doe: for euen amongſt the Chalybes they ſerue them ſo, in eating their iron and ſteele within their very forges: yea, & in gold mines they play the like part: & therefore being caught, their bellies be ript by the pioners in the mine, where they euermore find their ſtollen gold again. See what delight this creature takes in theeuing. We reade in the Chronicles, that whiles *Annibal* lay in ſiege before the towne Caſilinum, a rat was ſold within the town for 200 Seſterces: the man who bought it at that price liued; but the party who ſold it through greedines of mony died for hunger. By the learning of Sooth ſayers
B obſerued it is, that if there be ſtore of white ones bred, it is a good ſigne and preſageth proſperitie. And in truth our ſtories are full of the like examples, and namely, that if rats be heard to cry or ſqueak in the time of ceremoniall taking the Auſpices and ſignes of birds, all is marred, and that buſineſſe clean daſht. *Nigidius* ſaith, that rats lie cloſe hidden all winter, like as Dormice. By the Edicts of the Cenſors, and principally by an Act of *M. Scaurus* in his Conſulſhip, prouided it was, & ſtreight order taken, that no Rats, Mice, or Dormice ſhould be ſerued vp to the table at their great ſuppers and feaſts: like as all ſhell fiſh or fowle fet out of forrein countries far remote. Counted are Dormice betweene tame and wilde: and verily he that firſt deuiſed to keepe wilde bores in parkes, found means alſo to nouriſh and feed theſe creatures in great tuns, pipes, and drifats. In the experiment and triall whereof this hath bin found & obſer-
C ued, That willingly theſe little creatures will not ſort together vnleſſe they were countrimen as it were, and bred in one & the ſame forreſt: and if it chance that there be intermingled among them any ſtrangers, to wit, ſuch as had either ſome riuer or mountain between the places where they were bred, they kil one another with fighting. The yong Dormice are exceeding kind and louing to their ſires that begat them; for when they be old and feeble, full tenderly will they feed and nouriſh them. They renew their age euery yere by ſleeping all winter; for they lie by it cloſe ſnug all the while, and are not to be ſeen: but come the ſommer once they be yong and freſh againe. And thus the field mice likewiſe take their reſt, and do the ſame.

D

Chap. LVIII.

¶ *What Creatures liue not but in certaine places.*

A Wonderfull thing it is to ſee, that Nature hath not only brought forth diuers creatures in ſundrie Countries, but alſo in one region vnder the ſame climate hath denied ſome of them to liue in euery corner thereof. And namely in the forreſt of Mœſia in Italie, theſe Dormice are found but only in one part thereof. And in Lycia, the wild goats, roe-buckes, and Does neuer paſſe the mountaines that confine vpon the Syrians: no more than the wilde Aſſes tranſmount that hil which diuides Cappadocia from Cilicia. Within Helleſpont the Stags
E and Hinds neuer go forth and enter into the marches of other countries: and thoſe about Arginuſſa paſſe not the mountaine Elatus: which may be knowne by this, that all vpon that hill haue their eares marked and ſlit. In the Iſland Poroſelenum the weezels will not croſſe ouer the highway. And about Lebadia in Bœotia, thoſe moldwarpes or wants that are brought thither from other parts, will not abide the very ſoile, but flie from it; which neere-by in Orchomenus, vndermine and hollow all their corn fields: and ſuch ſtore there is of them, that I haue ſeen all the hangings, carpets, counterpoints, and couerlets of chambers made of their skinnes. See how men for no religion and feare of the gods wil be kept from taking their pleaſures and making their delights of theſe creatures, otherwiſe prodigious & portending things to come. The ſtrange Hares that be brought into Ithaca will not liue there, but ſeeking to eſcape, are
F found dead vpon the very banks of the ſea ſide. In the Iſland Ebuſus be no Connies at all: and yet in Spain and the Baleare Iſles there are ſo many, that they peſter the whole country. Frogs were euer in Cyrenæ naturally mute, and would not cry: but brought there were thither out of the continent ſuch as would crie in the water: and that whole kind ſtill remaineth vocal. In the Iſland Seriphos you ſhall not yet heare a Frogge to cry: let the ſame be carried forth to

other places, they will keep a ſinging as well as the reſt. And (by report) the like hapned in a lake of Theſſaly named Sicendus. In Italy the hardy ſhrews are venomous in their biting: but paſſe ouer the Apennine once there are no more ſuch to be found. In what country ſoeuer they be, let them go ouer the tract of a cart wheele they die preſently. In Olympus a mountaine of Macedony there are no wolues, ne yet in the Iſle of Candy: and there verily are to be found no Foxes nor Beares, and in one word, no hurtfull or noiſome beaſt, vnleſſe it be a kinde of ſpider called *Phalangium*, whereof we will ſpeake more in due time and place. And that which is more wonderfull, in the ſame Iſle there are no ſtags or hinds, ſaue only in the region and quarter of the Cydoniates: no wild bores likewiſe, nor the fowle called the Godwit or Attagene, ne yet Vrchins. To conclude, in Africk ye ſhall find no wild bores, no Stags and Hinds, no roe-bucks and Does, ne yet Beares.

Chap. LIX.

¶ *What Creatures are hurtfull to ſtrangers.*

NOw, ſome liuing creatures there be that do no harm at all to the inhabitants of the ſame countries, but kill all ſtrangers. Namely, certain ſerpents in Tirinthe, which are ſuppoſed to breed of themſelues out of the very earth. Semblably, in Syria there be ſnakes, and ſpecially along the banks of Euphrates, that will not touch the Sirians lying along aſleep: nay, if a man that leans vpon them be ſtung or bitten by them, he ſhal find no hurt or miſchief thereby. But to men of all other nations whatſoeuer they are moſt ſpightfully bent, them they will with great greedineſſe eagerly aſſaile and fly vpon, yea, and kill them with extreme paine and anguiſh: and therefore it is that the Sirians deſtroy them not. Contrariwiſe *Ariſtotle* reporteth, That in Latmos (a mountain in Caria) the Scorpions will do no harm to ſtrangers, marie the inhabitants of the ſame country they will ſting to death. Now let vs proceed to other liuing creatures beſides thoſe of the land, and diſcourſe of their ſundry ſorts and kinds.

THE NINTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

Chap. I.

¶ *The nature of water Creatures.*

I Haue thus ſhewed the nature of thoſe beaſts that liue vpon the land, and therein haue ſome ſocietie & fellowſhip with men. And conſidering, that of all others beſides in the world, they that flie be the leaſt, we will firſt treat of thoſe fiſh that keep in the ſea, not forgetting thoſe alſo either in running freſh riuers or ſtanding lakes.

Chap. II.

¶ *What the reaſon is why the ſea ſhould breed the greateſt liuing creatures.*

THe waters bring forth more ſtore of liuing creatures, and the ſame greater than the land. The cauſe wherof is euident, euen the exceſſiue abundance of moiſture. As for the fouls & birds, who liue hanging, as it were, & houering in the aire, their caſe is otherwiſe. Now

A in the ſea, being ſo wide, ſo large and open, readie to receiue from heauen aboue the genitall ſeeds and cauſes of generation; being ſo ſoft and pliable, ſo proper & fit to yeeld nouriſhment and encreaſe; aſſiſted alſo by Nature, which is neuer idle, but alwaies framing one new creature or other: no maruell it is if there are found ſo many ſtrange and monſtrous things as there be. For the ſeeds and vniuerſall elements of the world are ſo interlaced ſundry waies, and mingled one within another, partly by the blowing of the winds, and partly with the rolling and agation of the waues, inſomuch as it may truly be ſaid, according to the vulgar opinion, that whatſoeuer is engendred and bred in any part of the world beſides, is to be found in the ſea: and many more things in it, which no where elſe are to be ſeen. For there ſhall ye meet with fiſhes, reſembling not onely the forme and ſhape of land creatures liuing, but alſo the figure and fa-
B ſhion of many things without life: there may one ſee bunches of grapes, ſwords, and ſawes, repreſented; yea, and alſo cowcumbers, which for colour, ſmell, and taſte, reſembleth thoſe growing vpon the earth. And therefore we need the leſſe to wonder, if in ſo little ſhell fiſhes as are cockles, there be ſomewhat ſtanding out like horſe-heads.

Chap. III.

¶ *Of the monſtrous fiſhes in the Indian ſea.*

THe Indian ſea breedeth the moſt and biggeſt fiſhes that are: among which, the Whales and Whirlepooles called Balænæ, take vp in length as much as foure acres or arpens of land: likewiſe the Priſtes are two hundred cubits long: and no maruell, ſince Locuſts are
C there to be found of foure cubits in length: and yeeles within the riuer Ganges of thirtie foot in length. But theſe monſtrous fiſhes in the ſea, are moſt to be ſeen about the middeſt of Summer, & when the daies be at the longeſt with vs. For then by the means of whirlewinds, ſtorms, winds, and bluſtering tempeſts which come with violence down from the mountains and promontories, the ſeas are troubled from the very bottome, and turned vpſide downe: whereupon the ſurging billowes thereof, raiſe theſe monſters out of the deep, and roll them vp to be ſeen. For in that manner ſo great a multitude of Tunnies were diſcouered and aroſe, that the whole armada of king *Alexander* the great, ſeeing them comming like to an armie of enemies in order of battell, was driuen to range & make head againſt them, cloſe vnited together: for otherwiſe, if they had failed ſcattering aſunder, there had bin no way to eſcape, but ouerturned they had
D bin, with ſuch a force and ſway came theſe Tunnies in a skull vpon them. And verily, no voice, crie, hollaing and houting, no nor any blowes and raps affrighted this kind of fiſh, only at ſome cracke or craſhing noiſe they be terrified: and neuer are they troubled and diſquieted ſo much as when they perceiue ſome huge thing ready to fall vpon them.

In the red ſea there lies a great demie Iſland named Cadara, ſo farre out into the ſea, that it maketh a huge gulfe vnder the wind, which king *Ptolomæus* was 12 daies and 12 nights a rowing through: foraſmuch as there is no wind at all vſes to blow there. In this creeke ſo cloſe and quiet, there be fiſh and Whales grow to that bignes, that for their very weight and vnweldines of their bodie, they are not able to ſtirre. The Admirals and other captaines of the fleet of the foreſaid *Alexander* the great, made report, That the Gedroſi, a people dwelling vpon the riuer
E Arbis, vſe to make of ſuch fiſhes chawes, the dores of their houſes; alſo that they lay their bones ouerthwart from one ſide of the houſe to another, in ſtead of beames, joiſts and rafters to beare vp their floores and roufes: and that ſome of them were found to be fortie cubits long.

In thoſe parts there be found in the ſea certaine ſtrange beaſts like ſheep, which goe forth to land, feed vpon the roots of plants and herbes, and then returne againe into the ſea. Others alſo which are headed like Horſes, Aſſes, and Buls: and thoſe many times eat downe the ſtanding corne vpon the ground.

Chap. IIII.

F ¶ *Which be the greateſt fiſhes in any coaſt of the Ocean ſea.*

THe biggeſt and moſt monſtrous creature in the Indiſh Ocean, are the whales called Priſtis & Balæna. In the French Ocean there is diſcouered a mighty fiſh called Phyſeter, [*i.* a Whirlepoole] riſing vp aloft out of the ſea in manner of a columne or pillar, higher than the

the very ſailes of the ſhips: and then he ſpouteth and caſteth forth a mightie deale of water, as it were out of a conduit, enough to drowne and ſinke a ſhip. In the Ocean of Gades, betweene Portugale and Andaluſia, there is a monſtrous fiſh to be ſeen like a mightie great tree, ſpreading abroad with ſo mightie armes, that in regard thereof onely, it is thought verily it neuer entred into the ſtreights or narrow ſea there by of Gibraltar. There ſhew themſelues otherwhiles fiſhes made like two great wheeles, and thereupon ſo they be called: framed diſtinctly with foure armes, repreſenting as many ſpokes: and with their eies they ſeem to couer cloſe the naues from one ſide to the other, wherein the ſaid ſpokes are faſtened. G

Chap. V.

¶ *Of Tritons, Nereides, and ſea-Elephants, and their formes.* H

IN the time that *Tiberius* was Emperour, there came vnto him an Embaſſador from *Vliſſipon*, ſent of purpoſe to make relation, That vpon their ſea-coaſt there was diſcouered within a certain hole, a certain ſea goblin, called Triton, ſounding a ſhell like a trumpet or cornet: and that he was in forme and ſhape like thoſe that are commonly painted for Tritons. And as for the Meremaids called Nereides, it is no fabulous tale that goes of them: for look how painters draw them, ſo they are indeed: onely their bodie is rough & skaled all ouer, euen in thoſe parts wherein they reſemble a woman. For ſuch a Meremaid was ſeen and beheld plainly vpon the ſame coaſt neere to the ſhore: and the inhabitants dwelling neere, heard it a far off when it was a dying, to make pitteous mone, crying & chattering very heauily. Moreouer, a lieutenant or I gouernor vnder *Auguſtus Cæſar* in Gaule, aduertiſed him by his letters, That many of theſe Nereides or Mearmaids were ſeen caſt vpon the ſands, and lying dead. I am able to bring forth for mine authors diuers knights of Rome, right worſhipfull perſons and of good credit, who teſtifie, that in the coaſt of the Spaniſh Ocean neer vnto Gades, they haue ſeen a Mere-man, in euery reſpect reſembling a man as perfectly in all parts of the bodie as might be. And they report moreouer, that in the night ſeaſon he would come out of the ſea abord their ſhips: but look vpon what part ſoeuer he ſetled, he waied the ſame downe, & if he reſted and continued there any long time, he would ſinke it cleane. In the daies of *Tiberius* the Emperor, in a certain Iſland vpon the coaſt of the prouince of Lions, the ſea after an ebbe left vpon the bare ſands 300 ſea-monſters and aboue, at one flote together, of a wonderfull varietie and bigneſſe, differing aſunder. K And there were no fewer found vpon the coaſt of the Santones. And among the reſt there were ſea-Elephants and rams, with teeth ſtanding out; & hornes alſo, like to thoſe of the land, but that they were white like as the fore-ſaid teeth: ouer & beſides, many Meremaids. *Turanius* hath reported, That a monſter was driuen and caſt vpon the coaſt of Gades, betweene the two hindmoſt fins whereof in the taile, were 16 cubits: it had 122 teeth, whereof the biggeſt were a ſpan or nine inches in meaſure, and the leaſt halfe a foot. *M. Scaurus* among other ſtrange and wonderfull ſights that he exhibited to the people of Rome, to doe them peaſure in his Ædileſhip, ſhewed openly the bones of that ſea-monſter, before which ladie *Andromeda* (by report) was caſt to be deuoured: which were brought to Rome from Ioppe, a towne in Iudæa: and they caried in length fortie foot: deeper were the ribs than any Indian Elephant is high, and the L ridge-bone a foot and halfe thicke.

Chap. VI.

¶ *Of the Balænes and Orcæ.*

THeſe monſtrous Whales named Balænæ, otherwhiles come into our ſeas alſo. They ſay that in the coaſt of the Spaniſh Ocean by Gades, they are not ſeen before midwinter when the daies be ſhorteſt: for at their ſet times they lie cloſe in a certain calme deep and large creeke, which they chuſe to caſt their ſpawn in, and their delight aboue all places to breed. The Orcæ, other monſtrous fiſhes, know this full well, and deadly enemies they be vnto the foreſaid M whales. And verily, if I ſhould pourtrait them, I can reſemble them to nothing elſe but a mightie maſſe and lumpe of fleſh withour all faſhion, armed with moſt terrible, ſharpe, and cutting teeth. Well, theſe being ware that the Whales are there, breake into this ſecret by-creek out of the way, ſeeke them out, and if they meet either with the youug ones, or the dammes that haue newly

20030
copy 1

A newly ſpawn'd, or yet great with ſpawn, they all to cut & hack them with their trenchant teeth: yea, they run againſt them as it were a foiſt or ſhip of warre armed with ſharp brazen pikes in the beake-head. But contrariwiſe, the Balænes or Whales aforeſaid, that cannot wind and turne aſide for defence, and much leſſe make head and reſiſt, ſo vnweldie as they bee by reaſon of their owne weightie and heauie bodie, (and as then either big bellied, or elſe weakened lately with the paines of trauell and caluing their young ones) haue no other meanes of helpe and ſuccor but to ſhoot into the deepe, and gaine ſea-roome to defend themſelues from the enemie. On the other ſide, the Orcæ labour (to cut them ſhort of their purpoſe) to lie betweene them and home in their very way, and otherwhiles kill them vnawares in the ſtreights, or driue them vpon the ſhelues and ſhallows, or elſe force them againſt the very rocks, & ſo bruiſe them.
B When theſe combats and fights are ſeen, the ſea ſeemes as if it were angry with it ſelfe: for albeit no winds are vp, but all calme in that creek and gulfe, yet ye ſhall haue waues in that place where they encounter (with the blaſts of their breath, and the blowes giuen by the aſſailant) ſo great, as no tempeſtuous whirle windes whatſoeuer are able to raiſe. In the hauen of Oſtia likewiſe there was diſcouered one of theſe Orcæs, and the ſame aſſailed by *Claudius* the Emperour. It chanced to come as he was making the ſaid harbour or pere, drawne and trained thither with the ſweetnes of certaine beaſts hides that were brought out of Gaule, and were caſt away and periſhed by the way. Of them for certaine daies ſhe had fed, and ſtill following them, with the weight of her heauie bodie had made a furrow and channel (as it were) with her bellie in the bottome among the ſhelues: and by reaſon of the flowing of the ſea ſhe was ſo inueſted and compaſſed in with the ſands, that by no means poſſible ſhe could turn about: but ſtil while
C ſhe goes after theſe hides whereof ſhe fed, ſhe was by the billows of the ſea caſt aflote on the ſhore, ſo as her back was to be ſeene a great deale aboue the water, much like to the bottome or keele of a ſhip turned vpſide downe. Then the Emperour commanded to draw great nets and cords with many folds along the mouth of the hauen on euery ſide behind the fiſh, himſelfe accompanied with certaine Pretorian cohorts, for to ſhew a pleaſant ſight vnto the people of Rome, came againſt this monſtrous fiſh, and out of many hoies and barks the ſouldiers launced darts and iauelines thicke. And one of them I ſaw my ſelfe ſunke downe right with the abundance of water that this monſtrous fiſh ſpouted and filled it withall. The Whales called Balenæ haue a certaine mouth or great hole in their forehead, and therefore as they ſwim aflore a-
D loft on the water, they ſend vp on high (as it were) with a mighty ſtrong breath a great quantity of water when they liſt, like ſtormes of raine.

Chap. VII.

¶ *Whether fiſh do breath and ſleep, or no.*

ALl writers are fully reſolued in this, That the Whales aboueſaid, as well the Balænæ as the Orcæ, and ſome few other fiſhes bred & nouriſhed in the ſea, which among other inward bowels haue lights, doe breath. For otherwiſe it were not poſſible, that either they or any other beaſt, without lights or lungs ſhould blow: and they that be of this opinion, ſuppoſe likewiſe, that no fiſhes hauing guils, do draw in and deliuer their wind again to and fro: nor ma-
E ny other kinds beſides, although they want the foreſaid gils. Among others, I ſee that *Ariſtotle* was of that mind, and by many profound and learned reaſons perſuaded & induced many more to hold the ſame. For mine owne part, if I ſhould ſpeake frankely what I think, I profeſſe that I am not of their judgment. For why? Nature if ſhe be ſo diſpoſed, may giue in ſteed of light ſome other organs and inſtruments of breath: to this creature one, to that another: like as many other creatures haue another kind of moiſt humor in lieu of blood. And who would maruel, that this vitall ſpirit ſhould pierce within the waters, conſidering that he ſeeth euidently how it riſeth againe and is deliuered from thence: alſo how the aire entreth euen into the earth, which is the groſeſt & hardeſt of al the elements? As we may perceiue by this good argument, that ſome
F creatures, which albeit they be alwaies couered within the ground, yet liue and breath neuertheleſſe, and namely, the Wants or Mold-warpes. Moreouer, I haue diuers pregnant & effectuall reaſons inducing me to beleeue, that all water creatures breathe each one after their maner, as Nature hath ordained. Firſt and principally, I haue obſerued oftentimes by experience, That fiſhes evidently breath and pant for wind (after a ſort) in the great heat of Summer: as alſo that they

they yawne and gape when the weather is calme & the ſea ſtill. And they themſelues alſo who G
hold the contrarie, confeſſe plainly, that fiſhes doe ſleepe. And if that be true, How, I pray you, can they ſleep if they take not their wind? Moreouer, whence come thoſe bubbles which continually are breathed forth from vnder the water? and what ſhall we ſay to thoſe ſhell fiſhes which wax and decay in ſubſtance of bodie, according to the effect of the Moones encreaſe or decreaſe? But aboue all, fiſhes haue hearing and ſmelling, and no doubt both theſe ſenſes are performed and maintained by the benefit and matter of the aire: for what is ſmell and ſent, but the verie aire, either infected with a bad, or perfumed with a good ſauour? Howbeit I leaue euery man free to his own opinion, as touching theſe points. But to returne againe to our purpoſe: this is certaine, that neither the Whales called Balænæ, nor the Dolphins, haue any guills: and yet do both theſe fiſhes breathe at certaine pipes and conduits, as it were reaching downe into H
their lights: from the forehead, in the Balænes; and in the Dolphins, from the backe. Furthermore, the Sea-calues or Seales, which the Latines call *Phocæ*, doe both breath and ſleepe vpon the drie land. So do the ſea Tortoiſes alſo, whereof we will write more anon.

Chap. VIII.

¶ *Of Dolphins.*

THe ſwifteſt of al other liuing creatures whatſoeuer, & not of ſea-fiſh only, is the Dolphin; quicker than the flying fowle, ſwifter than the arrow ſhot out of a bow. And but that this
fiſh is mouthed far beneath his ſnout, and in manner towards the mids of his belly, there I
were not a fiſh could eſcape from him, ſo light and nimble he is. But nature in great prouidence fore-ſeeing ſo much, hath giuen theſe fiſhes ſome let & hinderance, for vnleſſe they turned vpright much vpon their backe, catch they can no other fiſh: and euen therein appeareth moſt of all their wonderfull ſwiftneſſe and agilitie. For when the Dolphins are driuen for very hunger to courſe and purſue other fiſhes down into the bottom of the ſea, and therby are forced a long while to hold their breath, for to take their wind again, they lance themſelues aloft from vnder the water as if they were ſhot out of a bow; and with ſuch a force rhey ſpring vp again, that many times they mount ouer the very ſailes and maſtes of ſhips. This is to be noted in them, that for the moſt part they ſort themſelues by couples like man and wife. They are with yong nine
moneths, and in the tenth bring forth their little ones, and lightly in Summer time; and other- K
whiles they haue two little dolphins at once. They ſuckle them at their teats, like as the whales or the Balænes do: yea, & ſo long as their little ones are ſo yong that they be feeble, they carry them too and fro about them: nay when they are growne to be good big ones, yet they beare them companie ſtill a long time, ſo kind and louing be they to their young. Young Dolphins come very ſpeedily to their growth, for in ten yeres they are thought to haue their full bignes: but they liue thirtie yeres, as hath bin known by the experience and triall in many of them, that had their taile cut for a marke when they were yong, and let go again. They lie cloſe euery yere for the ſpace of thirty daies, about the riſing of the Dog-ſtarre; but it is ſtrange how they be hidden, for no man knowes how: and in very deed a wonder it were, if they could not breath vnder the water. Their manner is, to breake forth of the ſea and come aland, and why they ſhould L
ſo do, it is not known: for preſently aſſoon as they touch the dry ground, they die: and ſo much the ſooner, for that their pipe or conduit aboue-ſaid incontinently cloſeth vp and is ſtopped. Their tongue ſtirreth within their heads, contrary to the nature of all other creatures liuing in the waters: the ſame is ſhort and broad faſhioned like vnto that of a ſwine. Their voice reſembleth the pittifull groning of a man: they are ſaddle-backed, & their ſnout is camoiſe and flat, turning vp. And this is the cauſe that all of them (after a wonderfull ſort) know the name *Simo*, and take great pleaſure that men ſhould ſo call them. The Dolphin is a creature that carries a louing affection not only vnto man, but alſo to muſicke: delighted he is with harmony in ſong, but eſpecially with the ſound of the water inſtrument, or ſuch kind of pipes. Of a man he is nothing affraid, neither auoides from him as a ſtranger: but of himſelfe meeteth their ſhips, plai- M
eth and diſportes himſelfe, and fetcheth a thouſand friskes and gamboles before them. He will ſwim along by the mariners, as it were for a wager, who ſhould make way moſt ſpeedily, and alwaies outgoeth them, ſaile they with neuer ſo good a fore-wind.

In the daies of *Auguſtus Cæſar* the Emperour, there was a Dolphin entred the gulfe or poole Lucrinus,

20030
copy 1

A Lucrinus,which loued wondrous well a certain boy a poore mans ſon: who vſing to goe euery day to ſchoole from Baianum to Puteoli,was woont alſo about noone-tide to ſtay at the water ſide, and to call vnto the Dolphin, *Simo, Simo*, and many times would giue him fragments of bread,which of purpoſe he euer brought with him,and by this meanes allured the Dolphin to come ordinarily vnto him at his call. [I would make ſcruple and baſh to inſert this tale in my ſtorie and to tell it out,but that *Mecenas Fabianus*, *Flauius Alſius*, and many others haue ſet it downe for a truth in their chronicles.] Well in proceſſe of time, at what houre ſoeuer of the day,this boy lured for him & called *Simo*,were the Dolphin neuer ſo cloſe hidden in any ſecret and blind corner, out he would and come abroad, yea and skud amaine to this lad: and taking bread and other victuals at his hand,would gently offer him his back to mount vpon,and then downe went the ſharpe pointed prickles of his fins, which he would put vp as it were within a B ſheath for fear of hurting the boy. Thus when he had him once on his back,he would carry him ouer the broad arme of the ſea as farre as Puteoli to ſchoole; and in like manner conuey him backe again home:and thus he continued for many yeeres together, ſo long as the child liued. But when the boy was fallen ſicke & dead,yet the Dolphin gaue not ouer his haunt,but vſually came to the wonted place,& miſſing the lad,ſeemed to be heauie and mourne againe,vntill for very griefe & ſorrow (as it is doubtles to be preſumed) he alſo was found dead vpon the ſhore.

Another Dolphin there was not many yeeres ſince vpon the coaſt of Affricke, neere to the citie Hippo,called alſo Diarrhytus,which in like manner would take meat at a mans hand,ſuffer himſelfe gently to be handled,play with them that ſwom and bathed in the ſea, and carrie on his backe whoſoeuer would get vpon it. Now it fell out ſo,that *Flauianus* the Proconſull or C lieutenant Generall in Affrick vnder the Romans,perfumed and beſmeered this Dolphin vpon a time with a ſweet ointment:but the fiſh (as it ſhould ſeem) ſmelling this new & ſtrange ſmel fell to be drowſie and ſleepie,and hulled to and fro with the waues, as if it had bin halfe dead: and as though ſome iniurie had bin offered vnto him,went his way and kept alouſe,and would not conuerſe any more for certaine moneths with men, as before-time. Howbeit in the end he came again to Hippo,to the great wonder & aſtoniſhment of all that ſaw him. But the wrongs that ſome great perſons and lords did vnto the citizens of Hippo, ſuch I mean as vſed to come for to ſee this ſight: and namely, the hard meaſure offered to thoſe townesmen, who to their great coſt gaue them entertainement,cauſed the men of Hippo to kill the poore Dolphin.

D The like is reported in the citie Iaſſos, long before this time: for there was ſeene a Dolphin many a day to affect a certaine boy,ſo as he would come vnto him whereſoeuer he chanced to eſpy him. But whiles at one time aboue the reſt he followed egerly after the lad going toward the towne,he ſhot himſelfe vpon the dry ſands before he was aware, and died forthwith. In regard hereof, *Alexander* the Great ordained that the ſaid young boy ſhould afterwards be the chiefe prieſt and ſacrificer to Neptune in Babylon:collecting by the ſingular fancie that this Dolphin caſt vnto him, That it was a great ſigne of the ſpeciall loue of that god of the ſea vnto him, and that he would be good and gracious to men for his ſake.

Egeſidemus writeth,that in the ſame Iaſſus there was another boy named *Hermias*,who hauing vſed likewiſe to ride vpon a Dolphin ouer the ſea,chanced at the laſt in a ſodaine ſtorme to be E ouer-whelmed with waues as he ſat vpon his backe, and ſo died, and was brought backe dead by the Dolphin:who confeſſing as it were that he was the cauſe of his death,would neuer retire againe into the ſea,but launced himſelfe vpon the ſands, and there died on the drie land.

The ſemblable happened at Naupactum,by the report of *Theophraſtus*. But there is no end of examples in this kinde: for the Amphilochians and Tarentines teſtifie as much, as touching Dolphins which haue bin enamoured of little boies: which induceth me the rather to beleeue the tale that goes of *Arion*. This *Arion* being a notable muſition & plaier of the harpe,chanced to fall into the hands of certain mariners in the ſhip where he was,who ſuppoſing that he had good ſtore of mony about him, which he had gotten with his inſtrument, were in hand to kill him and caſt him ouer boord for the ſaid monie, and ſo to intercept all his gaines: he, ſeeing F himſelfe at their deuotion and mercie, beſought them in the beſt manner that he could deuiſe, to ſuffer him yet before he died, to play one fit of mirth with his harpe; which they granted: (at his muſicke and ſound of harpe, a number of Dolphins came flocking about him:) which done,they turned him ouer ſhipbord into the ſea; where one of the Dolphins tooke him vpon his backe,and carried him ſafe to the bay of Tænarus.

To

To conclude and knit vp this matter: In Languedoc within the prouince of Narbon, and in G
the territorie of Næmauſium, there is a ſtanding poole or dead water called Laterra, wherein
men and Dolphins together, vſe to fiſh: for at one certain time of the yeare, an infinite number
of fiſhes called Mullets, taking the vantage of the tide when the water doth ebbe, at certain nar-
row weares and paſſages with great force break forth of the ſaid poole into the ſea: and by rea-
ſon of that violence, no nets can be ſet and pitched againſt them ſtrong enough to abide and
beare their huge weight, and the ſtreame of the water together, if ſo be men were not cunning
and craftie to wait and eſpie their time to lay for them, and to entrap them. In like manner the
Mullets for their part, immediately make ſpeed to recouer the deepe, which they do very ſoon
by reaſon that the channell is neere at hand: and their onely haſt is for this, to eſcape and paſſe
that narrow place which affordeth opportunitie to the fiſhers to ſtretch out and ſpread their H
nets. The fiſher-men being ware thereof, and all the people beſides (for the multitude knowing
when fiſhing time is come, run thither, and the rather for to ſee the pleaſant ſport) crie as lowd
as euer they can to the Dolphins for aid, & call *Simo, Simo*, to help to make an end of this their
game and paſtime of fiſhing. The Dolphins ſoon get the eare of their crie, and know what they
would haue; and the better, if the North-winds blow and carrie the ſound vnto them: for if it be
a Southerne wind, it is later ere the voice be heard, becauſe it is againſt them. Howbeit, be the
wind in what corner ſoeuer, the Dolphins reſort thither flock-meale, ſooner than a man would
thinke, for to aſſiſt them in their fiſhing. And a wondrous pleaſant ſight it is to behold the
ſquadrons as it were of thoſe Dolphins, how quickly they take their places and be araunged in
battell array euen againſt the very mouth of the ſaid poole, where the Mullets vſe to ſhoot in- I
to the ſea: to ſee (I ſay) how from the ſea, they oppoſe themſelues and fight againſt them; and
driue the Mullets (once affrighted and skared) from the deep, vpon the ſhelues. Then come the
fiſhers and beſet them with net and toile, which they beare vp and fortifie with ſtrong forkes:
howbeit for all that, the Mullets are ſo quicke & nimble, that a number of them whip ouer, get
away, and eſcape the nets. But the Dolphins then are readie to receiue them: who contenting
themſelues for the preſent to kill only, make foule worke and hauocke among them; & put off
the time of preying and feeding vpon, vntil they haue ended the battel & atchieued the victo-
rie. And now the skirmiſh is hot, for the Dolphins alſo perceiuing alſo the men at worke, are
the more egre and couragious in fight, taking pleaſure to be encloſed within the nets, and ſo
moſt valiantly charge vpon the Mullets: but for feare leſt the ſame ſhould giue an occaſion K
vnto the enemies & prouoke them to retire and flie backe; between the boats, the nets, and the
men there ſwimming, they glide by ſo gently and eaſily, that it cannot be ſeen where they gat
out. And albeit they take great delight in leaping, & haue the caſt of it, yet none aſſaieth to
get forth, but where the nets lie vnder them: but no ſooner are they out, but preſently a man
ſhall ſee braue paſtime between them, as they ſcuffle & skirmiſh as it were vnder the rampier.
And ſo the conflict being ended, and all the fiſhing ſport done, the Dolphins fal to ſpoile and
eat thoſe which they killed in the firſt ſhock and encounter. But after this ſeruice performed,
the Dolphins retire not preſently into the deep againe, from whence they were called, but ſtay
vntil the morrow, as if they knew very well that they had ſo carried themſelues, as that they de-
ſerued a better reward than one daies refection and victuals: and therefore contented they are L
not and ſatisfied, vnleſſe to their fiſh they haue ſome ſops and crums of bread giuen them ſoa-
ked in wine, & that their bellies ful. *Mutianus* makes mention of the ſemblable maner of fiſhing
in the gulfe of Iaſſos: but herein is the difference, for that the Dolphins come of their own ac-
cord without calling, take their part of the bootie at the fiſhers hands: and euery boat hath a
Dolphin attending vpon it as a companion, although it be in the night ſeaſon & at torch light

Ouer and beſides, the Dolphins haue a kind of common-wealth and publick ſociety among
themſelues: for it chanced vpon a time, that a king of Caria had taken a Dolphin, and kept him
faſt as a priſoner within the harbor: whereupon a mighty multitude of other Dolphins reſorted
thither, and by certain ſignes of ſorrow and mourning that they made, euident to be perceiued
and vnderſtood, ſeemed to craue pardon and mercie for the priſoner: and neuer gaue ouer vntill M
the king had giuen commandement that he ſhould be enlarged and let goe. Alſo the little
ones are euermore accompanied with ſome one of the bigger ſort, as a guide to guard & keep
him. To conlcude, they haue beene ſeene to carry one of their fellowes when he is dead, into
ſome place of ſecuritie, that he ſhould not be deuoured and torne of other ſea-monſters.

A

Chap. IX.

¶ *Of Porpuiſſes.*

THe Porpuiſſes,which the Latines cal *Turſiones*,are made like the Dolphins:howbeit they differ, in that they haue a more ſad and heauie countenance: for they are nothing ſo gameſome,playfull,and wanton,as be the Dolphins: but eſpecially they are ſnouted like dogges when they ſnarle,grin,and are readie to doe a ſhewd turne.

Chap. X.

B ¶ *Of ſea Tortoiſes,and how they are taken,*

THere be found Tortoiſes in the Indian ſea ſo great,that one only ſhel of them is ſufficient for the roufe of a dwelling houſe. And among the Iſlands principally in the red ſea, they vſe Tortoiſe ſhells ordinarily for boats and wherries vpon the water.

Many waies the fiſher-men haue to catch them; but eſpecially in this manner: They vſe in the mornings when the weather is calm and ſtill,to flote aloft vpon the water,with their backs to be ſeen all ouer:and then they take ſuch pleaſure in breathing freely & at libertie,that they forget themſelues altogether: inſomuch as their ſhell in this time is ſo hardened and baked with the ſun, that when they would they cannot diue and ſinke vnder the water againe,but are C forced againſt their wills to flote aboue,and by that meanes are expoſed as a prey vnto the fiſhermen. Some ſay that they go forth in the night to land for to feed, where, with eating greedily,they qe wearie; ſo that in the morning,when they are returned again,they fall ſoon aſleep aboue the water,and keepe ſuch a ſnorting and routing in their ſleepe,that they bewray where they be,and ſo are eaſily taken:and yet there muſt be three men about euery one of them: and when they haue ſwom vnto the Tortoiſe,two of them turne him vpon his backe,the third caſts a cord or halter about him, as hee lyeth with his belly vpward, and then is he haled by many more together,to the land. In the Phœnician ſea,they make no great ado to take them;for why, at a certaine time of the yeere they reſort of themſelues by great multitudes in skulls vp into the riuer Eleutherius.

D The Tortoiſe hath no teeth, but the ſides and brimmes of his neb or becke, are ſharpe and keene:whereof the vpper part or chaw ſhutteth cloſe vpon the nether,like to the lid of a boxe. In the ſea they liue of muſcles,cockles,and ſuch ſmall ſhell-fiſhes,for their mouths are ſo hard that they be able to cruſh and break ſtones therewith. Their manner is to goe aland, where among the graſſe they lay egges as bigge as birds egs, to the number commonly of a hundred. When they haue ſo done, they hide them within the earth in ſome little hole or gutter, ſure enough from any place where the water commeth, they couer them with mould, beat it hard downe with their breſt, and ſo pat it ſmooth, and in the night time ſit vpon them: they couie a whole yeare before they hatch. Some ſay,that the looking wiſtly vpon their egs with their eies ſerueth in ſtead of ſitting. The female flieth from the male,and will not abide to en-E gender,vntill ſuch time as he pricke her behind and ſticke ſomewhat in her taile for running away from him ſo faſt.

The Troglodites haue among them certaine Tortoiſes,with broad hornes like the pegs in a Lute or Harpe,and the ſame will wagge and ſtirre ſo,as in ſwimming they helpe themſelues therewith,and are guided and directed by them. And this kind of Tortoiſe is called Celtium: of exceeding great bigneſſe,but rare to be found,and hard to come by: for their exceeding ſharpe prickes like rockes,among which they keepe,fright the Chelonophagi(who delight to feed vpon them)that they dare not ſearch after them. And the Troglodites,vnto whom theſe Tortoiſes vſe to ſwim,adore them as holy and ſacred things.

There be alſo land Tortoiſes(called thereupon in the workes that are made of them in pan-F nell wiſe, Cherſinæ) found in the deſerts and wilderneſſe of Affrick, and principally in that part which is drie and full of ſands:and they are thought to liue on nothing elſe but the moiſt dew. And in very truth, no other liuing creature there breedeth beſides them.

Chap. XI.

¶ *Who first deuiſed the cleauing of Tortoiſe ſhells into thin plates like pannell.*

THe firſt man that inuented the cutting of Tortoiſe ſhells into thin plates, therewith to ſeele beds, tables, cupbords, and preſſes, was *Carbilius Pollio*, a man very ingenious and inuentiue of of ſuch toies, ſeruing to riot and ſuperfluous expenſe.

Chap. XII.

¶ *A diuiſion of water beaſts into their ſeuerall kindes.*

THe creatures that breed and liue in the water, be not all couered and clad alike: for ſome haue a skin ouer them, and the ſame hairie, as the Seales and Water horſes. Others haue but a bare skin, as the Dolphins. There be again that haue a ſhell like a barke, as the Tortoiſes: and in others, the ſhell is as hard as the flint, and ſuch be the oyſters, muſcles, cockles, and winkles. Some be couered ouer with cruſts or hard pills, as the locuſts: others haue beſides them, ſharpe prickles, as the vrchins. Some be ſcaled, as fiſhes: others are rough coated, as the Soles, and with their skins folke vſe to poliſh and ſmooth wood and yuorie. Some haue a tender and ſoft skin, as Lampreys: others none at all, as the Pourcuttle or Pourcontrell.

Chap. XIII.

¶ *Of the Sea-calfe or Seale.*

THe great Whales, called Priſtis and Balæna, bring forth their young aliue, and perfect liuing creatures: likewiſe all thoſe that are couered with haire, as the Sea-calfe or Seale. She calueth on the drie land as other cattell, and whenſoeuer ſhe calues, ſhe gleans afterwards as kine do. The female is tied and lined to the male, like as bitches to dogges: ſhe neuer bringeth more than two at once, and ſhe giueth milke at her dugs and paps, to her young. Shee bringeth them to the ſea not before they be twelue daies old, and then ſhe traines and acquainteth them to ſwim and keepe the water ordinarily. Theſe Seales be hardly killed, vnleſſe a man daſh out their braines. In their ſleepe, they ſeeme to low or blea, and thereupon they be called Sea-calues. Docible they be & apt to learn whatſoeuer is taught them. They will ſalute folke with a kind of countenance and regard: alſo with a voice ſuch as it is, reſembling a certain rude and rumbling noiſe. If a man cal them by their name, they wil turn again, and in their language anſwere. There is no liuing creature ſleepeth more ſoundly than they. The fins which they vſe to ſwim withall in the ſea, ſerue their turnes in ſtead of feet to go vpon, when they be on land. Their skins, after they be flaied from their bodies, retaine ſtill a proprietie and nature of the ſeas; for euer as the water doth ebbe, they are more rugged, and the haires or briſtles ſtand vp. Moreouer, their right finnes or legs are thought to haue a power and vertue to prouoke ſleep, if they be laid vnder ones beds head.

Chap. XIIII.

¶ *Of fiſhes that be without haire, how they breed, and how many, ſorts there be of them.*

OF ſuch creatures as want haire, two only there be that bring forth their young with life: and namely, the Dolphin and the Viper. Of fiſhes, properly ſo called, there be 74 kinds: beſides thoſe that haue rough cruſtie skins, which I count not; wherof there be 30 ſorts. Of euery one of them in particular, we will ſpeake elſe-where, and at another time: for now we are to treat of the natures of the chiefe and principall.

Chap. XV.

¶ *Of the names and natures of many fiſhes.*

THe Tunies are exceeding great fiſhes: we haue ſeene ſome of them to weigh 15 talents. and the taile to be 2 cubits broad and a ſpan. In ſome freſh riuers alſo, there be fiſh found full

20030
copy 1

A full as bigge: and namely, the riuer-Whale called Silurus, in Nilus; the Lax, in the Rhene; the Attilus, in the Po. This fiſh growes ſo fat with eaſe & lying ſtill, that otherwhiles it weigheth 1000 pounds, and being taken with a great hooke faſtened and linked to a chaine, cannot be drawne forth of the riuer but with certaine yokes of oxen. And yet as big as he is, there is one little fiſh in compariſon of him called Clupea, that killeth him: for vpon a maruellous deſire that he hath to a certain vein that he hath within his iawes, he bites it in ſunder with his teeth, and ſo diſpatcheth the forenamed great fiſh Attilus.

As for the Silurus, a cut-throat he is where ſoeuer he goeth, a great deuourer, and maketh foule worke: for no liuing creatures come amiſſe vnto him; he ſetteth vp all indifferently. The very horſes oftentimes as they ſwim, he deuoures, and ſpecially in Mœnus, a riuer of Germany
B neere to Lisboa or Erlisbornis.

Moreouer, in the riuer Donow, there is taken the Mario, a fiſh much like to a ruffe or Porpuis, Alſo in the riuer Boryſthenes, there is found a fiſh by report, exceeding great, with no chine nor bone at all betweene; and yet the meat thereof is paſſing ſweet and pleaſant.

Within Ganges a riuer of India, there be fiſhes ſnouted and tailed as Dolphins, 15 cubits long, which they call Plataniſtæ. And *Statius Sebosus* reports as ſtrange a thing beſides, namely, that in the ſaid riuer there be certain wormes or ſerpents with two finnes of a ſide, ſixtie cubits long, of color blew, and of that hew take their name [and be called Cyonoeides.] He ſaith moreouer, that they be ſo ſtrong, that when the Elephants come into the riuer for drinke, they catch faſt hold with their teeth by their trunks or muzzles, and mauger their hearts force them
C downe vnder the water; of ſuch power and force they are.

The male Tunies haue no finnes vnder their bellies. In the ſpring time they goe out of the great [Mediterranean] ſea, and by whole flotes and troupes enter into Pontus; for in no other ſea doe they bring forth their young. Their young frie, which accompanie their dams (when they are lightened of their burden) into the ſea againe in the autumne, are called Cordylæ. Afterwards, they begin to call them Pelamides, and in Latine *Limoſæ*, of the mud wherein they are kept: and when they be aboue one yere old, then they be Tunies indeed, & ſo called. Theſe Tunies are cut into pieces, whereof the nape of the necke, the belly, and the fleſh about the canell bone of the throat, are moſt commendable for meat, but theſe parcels only when they be freſh and new killed, and yet then will they riſe in a mans ſtomacke, and make him belch ſower. The
D other parts being full of good meat and oleous withall, are laid in ſalt, and ſo put vp in barrels and kept. And theſe pieces of the Tunie thus conduit and powdred, are called Melandrya, cut in ſlices like to oke ſhingles for all the world. The worſt pieces of all others, be thoſe that are next the taile, becauſe they are not fat: but the beſt is that which is toward the throat: how ſoeuer in other fiſhes the taile-peece is in greateſt requeſt, as being moſt ſtirred & exerciſed. As for the yong Tunies called Pelamides, they are diuided & cut into parcels, that be named Apoleæti: but when they be cut peece-meale into certain ſquares, thoſe pieces are named Cybia.

All kind of fiſhes grow exceeding ſoon to their bigneſſe, and eſpecially in the ſea Pontus: the reaſon is, becauſe a number of riuers bring freſh water into it, & in ſome ſort make it ſweet: and namely in it, there is one called Amia, which grows ſo faſt & ſo euidently, that a man may
E perceiue how it waxeth from day to day. Theſe fiſhes, together with the old Tunies and the young, called Pelamides, enter into great flotes & skuls into the ſea Pontus, for the ſweet food that they there find: and euery companie of them hath their ſeuerall leaders and captaines: and before them al, the Maquerels lead the way; which, while they be in the water, haue a colour of brimſtone; but without, like they be to the reſt. The Maquerels ſerue the market well in Spaine, and furniſh the fiſh ſhambles: namely, when as the Tunies repaire not into their ſeas. As for the ſea Pontus, there enter into it few or no rauenours that haunt and deuoure fiſhes, vnleſſe it be the Seales & little Dolphins. The old Tunies, when they come into it, chuſe the right ſide (vpon the coaſt of Aſia) but go forth at the left. And this is the reaſon therof, as it is thought, For that they ſee better with their right eie; & yet the ſight of either of them is very good. With-
F in the channell of the Thracian Boſphorus, by which Propontis ioyneth to the ſea Euxinus, in the very ſtreight of the Firth that diuides Aſia from Europe, neer to Chalcedon vpon the coaſt of Aſia, there ſtandeth a rocke, exceeding white and bright withall, which is ſo tranſparent and ſhining from the verie bottome of the ſea to the top of the water, that the Tunies (affrighted at the ſodaine ſight thereof) to auoid it, goe alwaies amaine in whole flotes, toward the cape

ouer againſt Bizantium, which cape therupon beareth the name of Auricorum. And therefore it is, that the Bizantines make great gaine by fiſhing for them: whereas the Chalcedonians haue a great miſſe of that commoditie, and yet the arme of the ſea or frith betweene them, is not paſt halfe a mile, or a mile at the moſt, ouer. Noſt they euer wait for the North wind, that (together with the tide) they might with more eaſe paſſe out of Pontus. Howbeit, the onely taking of them at Bizantium, is when they return again into Pontus. In Winter the Tunnies ſtirre not nor raunge abroad: but looke, whereſoeuer they are then found to be, there they take vp their Winter herbour, and make their abode vntill the ſpring Æquinoctiall about mid-March. Many times they will accompanie the ſhips that ſaile thereby with full winde, and it is a wonderfull pleaſant ſight for the ſailers to ſee them from the ſterne, how for certaine houres together, and for the ſpace of ſome miles, they will follow and attend vpon the poupe, be the wind neuer ſo good, nay, although they ſtrike at them with the trout-ſpear ſundry times, or lance at them ſome three-tined inſtrumenr, yet will they not be chaſed away, nor skared. Theſe Tunnies that thus wait vpon the ſhips vnder ſaile, ſome cal Pompili. Many of them paſſe the Summer-time in Propontis, and neuer enter into Pontus. Soles likewiſe vſe the ſame manner, and yet yee ſhall haue many Turbots there. Neither ſhall a man finde the Cuttil there, although there be good ſtore of Sea-cuts or Calamaries. Moreouer, of ſtone fiſhes, ſuch as liue among rocks, the ſea Thruſh, the ſea Merle, and the purple ſhel-fiſhes are not to be found, where Oyſters notwithſtanding are in great abundance. For all ſuch Winter in the Ægæan ſea, called now Archipelago. Of them that enter into the ſea Pontus, there is none ſtaies there, but goes forth again, ſaue only the ſhell fiſh called the Saredane, or Trichia: for I thinke it good, in ſuch diuerſitie of fiſhes names, ſeeing that one and the ſelf ſame fiſh is in many countries called diuerſly, to vſe the Greeke name for the moſt of them. Theſe fiſh, I ſay, alone go vp the riuer Iſter, and out of it they paſſe againe by certain iſſues and conduits vnder the ground, and ſo deſcend into the Adriatick ſea: and euermore a man ſhall ſee this kind of fiſh comming down thither, but neuer mounting vp again out of that ſea. The right fiſhing for the Tunnies, & the only taking of them is from the riſing of the ſtar* Vergiliæ, to the ſetting of Arcturus. All the winter time beſides they lie hidden in the deep, at the bottom of pits and gulfes within the ſea, vnleſſe they come forth to take their pleaſure in ſome warme ſeaſon, or otherwhiles when the Moon is at the full. They grow ſometime ſo fat, that their skins will not hold, but they are ready to cleaue and burſt withall. The longeſt time that they liue is 2 yeres and not aboue. Moreouer, there is a little creature or vermine, made ſomwhat like a Scorpion, & as big as a ſpider, which vſually will ſet her ſharpe ſting vnder the finne, both of the Tunnie and alſo of the ſword-fiſh (which many times is bigger than the Dolphin) and put them to ſuch pain, that to auoid them they oftentimes are driuen to lance themſelues, and skip into the very ſhips. Which propertie they haue alſo at other times, for feare of the violence of other fiſhes: & moſt of all, the Mullets haue this caſt with them; and this they doe with ſuch exceeding ſwiftneſſe and agilitie, that they will fling themſelues otherwhiles croſſe ouer the ſhips.

* 1. In the beginning of May.

Chap. XVI.

¶ *Of preſages and foretokenings by fiſhes, and of their diuerſitie.*

NAture willing to endue this Element alſo of the water with ſome Auguries, hath giuen to fiſhes likewiſe a kind of preſcience and foreknowledge of things ro come. And verily during the Sicilian war, as *Auguſtus Cæſar* walked along the ſhore vpon the ſands, there was a certain fiſh leapt forth of the ſea, and light at his very feet. The Soothſaiers and wiſards vpon this occurrent, being ſought vnto, gaue this conſtruction thereof, and preſaged thereby, That they who at that time were lords of the ſea, and held it in ſubiection, ſhould be ranged vnder the obedience of *Cæſar*, and at his deuotion. And yet at that preſent it is thought and ſaid, That god *Neptune* had adopted *Sex. Pompeius* for his ſon, ſo fortunate he was, and ſuch exploits had he atchieued vpon the ſea.

The female kind of fiſhes are commonly bigger than the males. And there are ſome ſorts of them, whereof there be no males at all, but all females, as the Erythini and the Chani. For they be taken alwaies ſpawners, and full of egs.

Fiſhes that be skaled, for the moſt part ſwim in troups, and ſort together. The beſt fiſhing is before the ſun be vp: for then fiſhes ſee leaſt or not at all. For if the nights be cleere and Moon-

ſhine

20030
copy 1

A ſhine, they ſee as well by night as day. Moreouer, they ſay that it is good fiſhing twiſe in one and the ſame hole: for commonly vpon the ſecond caſt, the draught is better than the firſt. Fiſhes loue paſſing well to taſt oile; they ioy alſo and like well in ſoft & gentle ſhewers, & therewith they wil feed and grow fat. And good reaſon there is of it: for why? we ſee by experience that canes & reeds, although they breed in meers and ſtanding waters, yet they grow not to the purpoſe without rain. Moreouer, it is obſerued, that fiſh keeping euermore in one dead poole and neuer remoued, wil die whereſoeuer it be, vnleſſe there fall rain water to refreſh them. All fiſhes feele the cold of a ſharpe and hard winter, but thoſe eſpecially, who are thought to haue a ſtone in their head, as the Pikes, the Chromes, Scienæ, & Pagri. If it be a bitter ſeaſon in winter, many of them are taken vp blind. And therefore during thoſe cold moneths, they lurk hid-
B den in holes, and within rocks, like as we haue ſaid, certain land creatures doe. But aboue all o-
H thers the Lobſtars called Hippuri, and the Coracini, cannot abide extremity of cold, & therefore be neuer caught in winter, vnles it be at certain times when they come forth of their holes, which they keep duly, and neuer ſtir but then. In like ſort, the Lamproie, the Orphe, the Conger, Perches, and all Stone-fiſhes that loue rocks and grauell. Men ſay verily, that the crampe-fiſh, the Plaice, and the Sole lie hidden all winter in the ground, that is to ſay, in certain creuiſes and chinks which they make in the bottome of the ſea. Contrariwiſe, ſome again be as impatient of heat, and can as ill away with hot weather; and therefore about Mid-ſummer for 60 daies they lie hidden and are not to be ſeen: as the fiſh Glaucus, the Cod, and the Gilthead. Of
C riuer fiſhes, the Silurus or Sturgeon in the beginning of the dog-daies is blaſted and ſtricken with a planet: at other times alſo in a thunder & lightening he is ſmitten, ſo as therewith he is
I aſtonied and lieth for dead. And ſome thinke that the like accident befalleth to the ſea Bream Cyprinus. And verily, all quarters of the ſea throughout, feele the riſing of the dog-ſtarre: but moſt of all the influence and power thereof is to be ſeen in the ſtreight of Boſphorus: for then may a man perceiue ordinarily the reits of the ſea, and the fiſhes flote aloft, and the ſea ſo troubled, that euery thing is caſt vp from the bottome to the vpper part of the water.

Chap. XVII.

¶ *Of the Mullet and other fiſhes: and that the ſame in all places are not of like requeſt.*

D

THe Mullets haue a naturall ridiculous qualitie by themſelues, to be laughed at: for when they be afraid to be caught, they wil hide their head, and then they think they be ſure enough, weening that all their body is likewiſe hidden. Theſe Mullets neuertheleſſe are ſo lecherous, that in the ſeaſon when they vſe to ingender, in the coaſts of Phœnice & Languedock, if they take a milter out of their ſtews or pooles where they vſe to keep them, and draw a long ſtring or line through the mouth and gils, and ſo tie it faſt, and then put him into the ſea, holding the other end of the line ſtill in their hands, if they pul him again vnto them, they ſhal haue a number of ſpawners or femals follow him hard at taile to the bank ſide. Semblably, if a man do the ſame with a female in ſpawning time, hee ſhall haue as many milters follow after
E her. And in this manner they take an infinit number of Mullets.

In old time our anceſtors ſet more ſtore by the Sturgeon, & it carried the name aboue all other fiſhes. He is the only fiſh that hath the ſcales growing ouer the head: hee ſwims againſt the ſtreame. But now adaies there is no ſuch reckoning & account made of him: wherat I maruell much, conſidering he is ſo hard and ſeldome to be found. Some call him Elops: afterwards *Cornelius Nepos*, and *Laberius* the Poet and maker of mery rimes haue written, that the ſea Pikes and the cods got away all the credit from the Sturgeon, & were of greateſt requeſt. As for the Pikes aforeſaid, the beſt and moſt commendable of all others be they which are called Lanati, as a man would ſay cotton Pikes, for the whiteneſſe & tenderneſſe of their fleſh. Of cods there be two ſorts, Callariæ, or Haddocks, which be the leſſe: and Bacchi, which are neuer taken but
M F in the deep, and therfore they are preferred before the former. But the Pikes that are caught in the riuer be better than all others. The fiſh called Scarus now carrieth the price & praiſe of all others, & this fiſh alone is ſaid to chew cud, to liue of graſſe and weeds, and not to prey vpon other fiſhes. In the Carpathian ſea great ſtore of them is found: & by their good will they neuer paſſe the cape or promontorie Lectos in Troas. In the daies of *Tiberius Claudius* the Emperor,

Optatius his freed man (who sometime had bin a slaue of his) and then Admiral and Lieutenant generall of a fleet vnder him, brought them first out of that sea, and with them stored the whole coast of our seas betweene Ostia and Campania. Order was taken by straight inhibitions for the first fiue yeares, to kill none that were put into those seas, but if any were taken, that they should be cast in againe. In processe of time many of them came to be found and taken vp all along the coast of Italy, whereas before, they were not to be had in those parts. See how gluttonie, and the desire to please a dainty tooth, hath deuised means forsooth to sow fish, & to transplant them as it were, so to store the sea with strange breed: so that now we need no more maruell, that forraine birds and foules, fet out of far countries, haue their airies at Rome, and breed there. Next to those fishes aboue named, the table is serued with a kinde of Lamprels or Elepouts like to sea Lampreis, which are bred in certain lakes about the Alps, and namely, in that of Rhœtia called Brigantinus: & a strange thing it is, that they should be so like in proportion to those of the sea. Of all other fishes of any good account, the Barbell is next, both in request, and also in plenty. Great in quantity they are not: for hardly shall you find any of them weigh aboue two pound, neither wil they feed & grow in stews and ponds. They are bred only in the Northern sea: and neuer shall you see them in the coast of the West Ocean. Moreouer, of this Fish there be sundry sorts. And they liue all of Reits and Seawds, of Oysters, of the fat mud, & of the flesh of other Fishes. They haue all of them 2 beards, as it were, hanging down euidently from their nether jaw. The worst of all this kind, is that which is called Lutarius: & this fish hath another named Sargus, that willingly euermore beareth him company: for whiles hee is rooting into the mud (wherof he taketh his name) then commeth the Sargus, and deuoures the food that is raised therewith. Neither are the Barbels much accepted that keep neere the shore and in the riuer within land. But the best simply are those that taste like vnto the shel-fish Conchylium: *Fenestella* gaue them the name Mulli, of certaine moyles or fine shooes, which in colour they do resemble. They cast spawn thrice in one yere at the least: for so often their young Fry is seen. Our great belligods say, that a Barbell when he is dying, changeth his hue, and turneth into an hundred colours: the proofe and experience whereof may be seen if he be put into a glasse: for through it, it is a prety sport to see how he altereth and changeth his skales beeing ready to die, one way into a pale and wan colour, otherwhiles into a reddish hue, one after another for many times together. *M. Apicius* (who was a man of all others most inuentiue and wonderful for his witty deuises to maintain riot and excesse) thought it was a singular way to stride and kill these Barbels in a certain pickle, called the Roman Allies sauce (see how euen such a thing as that, hath found a syrname forsooth & a proper addition.) And he also went about to prouoke men to deuise a certain manger or broth made of their liuers, like to that dripping or grauie called Alec, that commeth of Fishes when they pine and corrupt. For surely it is more easie for me to say who set men a work that way first, than set down who woon the best game in the end, and was the greatest glutton. *Asturius Celer*, a man of great calling and high place, who sometime had bin Consull, shewed his prodigalitie in this Fish, & it was when *C. Caligula* was Emperor: for he gaue for one Barbell eight thousand Sesterces. Certes, the consideration hereof rauisheth my mind, and carrieth it away to behold & wonder at those, who in their reproofs of gluttonie and gourmandise, complained that a cooke carried a greater price in the market than a good horse of seruice. For now adaies a cooke will cost as much as the charge of a triumph: and one Fish as deare as a cook. And to conclude, no man is better esteemed and regarded more, than he that hath the most cunning cast to wast the goods, & consume the substance of his lord and master.

Chap. XVIII.

¶ *Of the Barbil, the fish Coracinus, Stock-fish, and Salmon.*

Licinius Mutianus reporteth, That in the red sea there was taken a Barbell that weighed 80 pounds. Oh, what a price would he haue borne among our gluttons here with vs! What would he haue cost our prodigall spendthrifts, if hee had bin taken vpon our coasts neere Rome? Moreouer, this is the nature of fish, that some are chiefe in one place, and some in another. As for example, the Coracinus in Egypt carieth the name for the best fish. At Gades in Spain, the Doree or Gold fish, called Zeus and Faber. About the Isle Ebusus, the Stock-fish is much

20030
copy 1

A much called for; whereas in other places it is counted but a baſe muddy and filthy fiſh; and which no where elſe they know how to ſeeth perfectly, vnleſſe it be firſt well beaten with cudgels. In the country of Aquitaine or Guienne in France, the riuer Salmon paſſeth all other ſea Salmons whatſoeuer.

Of fiſh, ſome haue many folds of guils, ſome ſingle, others double. At theſe guils they deliuer again and put forth the water that they take in at the mouth. You may know when fiſh be old by their hard ſcales: and yet all fiſhes are not ſcaled alike. There be two lakes in Italy at the foot of the Alps, named Larius and Verbanus, wherein fiſhes are to be ſeen euery yeare at the riſing of the ſtar Vergiliæ, thicke of ſcales, and the ſame ſharp pointed like to the tongues of buckles, wherwith horſemen or men at arms do faſten their greiues: and neuer els but about that moneth do they appeare.

B

CHAP. XIX.

¶ *Of the fiſh Exocœtus.*

THe Arcadians make wonderous great account of their Exocœtus; ſo called, for that hee goeth abroad and taketh vp his lodging on the dry land to ſleep. This fiſh (by report) about the coaſt Clitorius hath a kind of voice, and yet is without guils. And of ſome he is named Adonis. But beſides him, the ſea Tortoiſes alſo, (called Mures Marini) the Polypes & Lampreies vſe to go forth to land. Moreouer, in the riuers of India there is one certaine fiſh doth ſo, but it leaps back again into the water: for whereas many other fiſhes paſſe out of the
C ſea into riuers and lakes, there is great and euident reaſon thereof, namely, for that they are in more ſafetie there, both to caſt their ſpawn vnder the wind where the water is not ſo rough, and full of waues: and alſo to bring forth their little ones, becauſe there be no great fiſhes to deuour them. That theſe dumb creatures ſhould haue the ſence herof, thus to know theſe cauſes, and obſerue duly their times, is very ſtrange and wonderfull, if a man would ſound the depth thereof: but more he would maruell to conſider, how few men there be that know which is the beſt ſeaſon for fiſhing, while the Sun paſſeth through the ſigne Piſces.

CHAP. XX.

D ### ¶ *A diuiſion of fiſhes according to the forme and ſhape of their bodies.*

OF ſea fiſhes ſome be plain and flat, as Byrts or Turbots, Solds, Plaice, & Flounders. And theſe differ from the Turbots onely in the making of their body: for in a Turbot the right ſide turns vpward, and in a Plaice the left. Others again be long and round, as the Lamprey and Congre. And hereupon it is that they haue a difference in their fins, which Nature hath giuen to fiſh in ſtead of feet. None haue aboue foure, ſome two, ſome three, others none at all. Only in the lake Fucinus there is a fiſh which in ſwimming vſeth 8 fins. All that be long and ſlipperie, as Eeles and Congres, haue ordinarily two in all, and no more. Lampries haue none to ſwim with, ne yet perfect guils: all of this kind winde and wriggle with their bodies within the water, and ſo erche forward like as ſerpents doe vpon the earth. They creepe alſo when they are vpon dry land, and therefore ſuch liue longer than the reſt out of the water. Alſo of the foreſaid flat fiſhes ſome haue no finnes, as the puffin or fork-fiſh: for their bredth ſerueth them ſufficiently to beare them vp, and to ſwim. And amongſt thoſe that are counted ſoft, the Pourcuttell hath no fins, for his feet ſtandeth him in ſtead of fins to ſwim with.

CHAP. XXI.

¶ *Of Yeeles.*

F YEeles liue 8 yeares. And if the North wind blow, they abide aliue without water 6 daies, but not ſo long in a Southern wind. But yet in Winter time they may not endure to be in a little water, nor if it be thick and muddy: wherupon, about the riſing of the ſtar Virgiliæ they be commonly taken, for that the riuers about that time vſe to be troubled. Their feeding moſt commonly is in the night. Of all fiſh, they alone, if they be dead, flote not aboue the water.

CHAP.

Chap. XXII.

¶ *The manner of taking them in the lake Benacus.*

There is a lake in Italy called Benacus, within the territorie of Verona, through which the riuer Mincius runs: at the iſſue whereof euerie yere about the moneth of October, when the Autumne ſtar Arcturus ariſeth, whereby (as it euidently appeareth) the lake is troubled as it were with a winter ſtorme and tempeſt, a man ſhall ſee rolling amongſt the waues a wonderfull number of theſe Yeels wound & tangled one within another: inſomuch as in the leapweeles and weernets deuiſed for the nonce to catch them in this riuer, there be found ſometime a thouſand of them wrapped together in one ball.

Chap. XXIII.

¶ *Of the Lamprey.*

The Lamprey ſpawneth at all times of the yeare, whereas all other fiſhes are deliuered of their yong at one certain ſeaſon or other. The egs or ſpawne grow to a great paſſe exceeding ſoon. If they chance to ſlip out of the water to dry land, the common ſort is of opinion that they ingender with ſerpents. The male or milter of this kinde *Ariſtotle* calls Myrus. And herein is the difference, that the ſpawner, properly called Muræna, is of ſundry colors, and withall but weake: but the Mylter or Myrus is of one hue, & withall very ſtrong, hauing teeth ſtanding without his mouth. In the North parts of France all the Lampreis haue in their right jaw ſeuen ſpots, reſembling the ſeuen ſtars about the North pole, called *Charlemaines* Waine. They be of a yellow colour, and glitter like gold ſo long as the Lampreies be aliue; but with their life they vaniſh away, and be no more ſeene after they be dead. *Vedius Pollio*, a gentleman of Rome by calling, and one of the great fauorits and followers of *Auguſtus Caſar*, deuiſed experiments of cruelty by means of this creature: for hee cauſed certain ſlaues condemned to die, to be put into the ſtewes where theſe Lampreies or Murænes were kept, to be eaten and deuoured by them: not for that there were not wilde beaſts ynow vpon the land for this feat, but becauſe he tooke pleaſure to behold a man torne and pluckt in pieces all at once: which pleaſant ſight he could not ſee by any other beaſt vpon the land. It is ſaid, if they taſte vineger, of all things, they become inraged and mad. They haue a very thin and tender skinne: contrariwiſe, Yeels haue as thick & tough. And *Verrius* writeth, that boyes vnder 17 yeres of age were wont to be ſwinged and whipped with Yeeles skinnes, and therefore they were freed from all other mulct and puniſhment.

Chap. XXIV.

¶ *Of flat and broad Fiſhes.*

Of flat and broad fiſhes there is another ſort, which in lieu of a chine or backe bone haue a griſtle. As the Ray or Skait, the Puffin like vnto it, the Maids or Thornbacke, and the Crampfiſh: moreouer, thoſe which the Greekes haue termed by the names of their ſea Cow, their Dog-fiſh, their Ægle and Frog of the ſea. In this rank are to be ranged the Squali alſo, albeit they are not ſo flat and broad. All this kind in general *Ariſtotle* hath called in Greek Selache, and he was the firſt that gaue them that name: we in Latine cannot diſtinguiſh them, vnleſſe we call them all Cartilaginea, that is to ſay, Griſtly fiſh. But all the ſort of them that deuoure fleſh are ſuch: and their manner is to feed lying backward, like as we obſerued in the dolphins. And wheras other fiſhes caſt ſpawn which reſemble knots of egs; theſe griſtly fiſhes only, as alſo thoſe great ones which we call Cete, *i.* Whales, bring forth their yong aliue. And yet I muſt except one kind of them which they call Rana, *i.* ſea Frogs.

Chap. XXV.

¶ *Of Echeneis* [i. *the Stay-ſhip.*]

There is a very little fiſh keeping vſually about rocks, named Echeneis: it is thought, that if it ſettle and ſtick to the keele of a ſhip vnder water, it goeth the ſlower by that means: whereupon

20030
copy 1

A whereupon it was ſo called: and for that cauſe alſo it hath but a bad name in matters of loue, for inchanting as it were both men and women, and bereauing them of their heat and affection that way: as alſo in law caſes, for delay of iſſues and iudicial trials. But both theſe imputations and ſlanders it recompenſeth again with one good vertue and commendable quality that it hath: for in great bellied women if it be applied outwardly it ſtayeth the dangerous flux of the womb, and holds the child vnto the full time of birth: howbeit it is not allowed for meat to be eaten. *Ariſtotle* thinketh, that it hath a number of feet, the fins ſtand ſo thick one by another.

As for the ſhell fiſh Murex, *Mutianus* ſaith it is broader than the Purple, hauing a mouth neither rough nor round, ne yet with a beck pointed cornered-wiſe, but plain and euen, hauing
B a ſhell on both ſides winding and turning inward. Theſe fiſhes chanced vpon a time to cleaue faſt vnto a ſhip, bringing meſſengers from *Periander*, with commiſſion to gueld all the Noblemens ſonnes in Gnidos, and ſtayed it a long time, notwithſtanding it was vnder ſaile, and had a ſtrong gale of a fore-winde at the poupe. And hereupon it is, that theſe Shell fiſhes for that good ſeruice are honoured with great reuerence in the Temple of *Venus* among the Gnidians.

But to returne again vnto our Stay-Ship Echeneis, *Trebius Niger* ſaith it is a foot long, and fiue fingers thicke, and that oftentimes it ſtayeth a ſhip. And moreouer, as he ſaith, it hath this vertue being kept in ſalt, to draw vp gold that is fallen into a pit or well being neuer ſo deep, if it be let downe and come to touch it.

CHAP. XXVI.

C

¶ *The changeable nature of Fiſhes.*

THe Cackarels change their colour: for theſe fiſhes being white all Winter, wax blacke when Summer comes. Likewiſe the Mole or Lepo called Phycis, doth alter her hue: for howſoeuer all the yeare beſides it be white, in the Spring it is ſpeckled. This is the only fiſh that builds vpon the reites and moſſe of the ſea, and layes her egs or ſpawneth in her neſt. The ſea Swallow flieth, and it reſembleth in all points the bird ſo called. The ſea Kite doth the ſame.

CHAP. XXVII.

D

¶ *Of the fiſh called the Lanterne, and the ſea Dragon.*

THere is a fiſh comes ordinarily aboue the water, called Lucerna, for the reſemblance that it hath of a light or lantern: for it lilleth forth the tongue out of the mouth, which ſeemeth to flame and burne like fire, and in calme and ſtill nights giues light and ſhineth. There is another fiſh that puts forth hornes aboue the water in the ſea, almoſt a foot and halfe long, which thereupon tooke the name Cornuta. Againe, the ſea Dragon if he be caught and let go vpon the ſand, worketh himſelfe an hollow trough with his ſnout incontinently, with wonderfull celeritie.

E

CHAP. XXVIII.

¶ *Of bloudleſſe fiſhes.*

SOme fiſhes there be which want bloud, whereof wee now will ſpeake. Of them are three ſorts: firſt, thoſe which be called Soft: ſecondly, ſuch as be couered within cruſts: & in the laſt place, they that are incloſed within hard ſhels. Of the firſt ſort, counted ſoft, be reckoned the ſea Cut or Calamarie, the Cuttle, the Polype, and the reſt of that ſort. Theſe haue their head betweene their feet and the belly, and euery one of them haue 8 feet. As for the Cuttil and Calamarie, they haue two feet apiece longer than the reſt, and the ſame rough,
F wherewith they conuey and reach meat to their mouths: and with thoſe they ſtay themſelues as it were with anchor hold againſt the ſurging waues: the reſt of their feet be ſmal like hairs, and with them they hunt and catch their prey.

CHAP.

Chap. XXIX.

¶ *Of the Calamaries, Cuttles, Polypes, and Boat-fiſhes called Nautili.*

ALſo the Calamarie lanceth himſelfe out of the water, as if he were an arrow; and euen ſo doth little Scalops. The male of the Cuttles kind are ſpotted with ſundry colors more dark and blackiſh, yea and more firme and ſteady than the female. If the female be ſmitten with a Trout-ſpeare, or ſuch like three-forked weapon, they wil come to aid & ſuccor her: but ſhe again is not ſo kind to them, for if the male be ſtricken ſhe will not ſtand to it, but runs away. But both of them, the one as wel as the other, if they perceiue that they be taken in ſuch ſtreights that they cannot eſcape, ſhed from them a certain black humor like to ink, and when the water therewith is troubled and made duskiſh, therein they hide themſelues and are no more ſeen.

Of Polypes or Pourcontrels there be ſundry kinds. They that keep neere the ſhore are bigger than thoſe that haunt the deep. All of them help themſelues with their fins and armes, like as we do with feet and hands: as for their taile, which is ſharp and two forked, it ſerueth them in the act of generation. Theſe Pourcontrels haue a pipe in their back, by the help wherof they ſwim all ouer the ſeas; and it they can ſhift one while to the right ſide, & another while to the left. They ſwim awry or ſidelong with their head aboue, which is very hard and as it were puſt vp ſo long as they be aliue. Moreouer, they haue certain hollow concauities diſperſed within their clawes or arms like to ventoſes or cupping glaſſes, whereby they will ſtick to, and cleaue faſt as it were by ſucking, to any thing, which they claſp & hold ſo faſt, lying vpward with their bellies, that it cannot be plucked from them. They neuer ſettle ſo low as the bottom of the water, and the greater that they be, the leſſe ſtrong they are to claſp or hold any thing. Of all ſoft fiſhes they only go out of the water to dry land, eſpecially into ſome rough place, for they cannot abide thoſe that are plaine and euen. They liue vpon Shell-fiſhes, and with their haires or ſtrings that they haue they will twine about their ſhels and crack them in pieces: wherefore a man may know where they lie and make their abode, by a number of ſhels that lie before their neſt. And albeit otherwiſe it be a very brutiſh and ſenſleſſe creature, ſo fooliſh withall, that it will ſwim and come to a mans hand; yet it ſeems after a ſort to be witty and wiſe, keeping of houſe and maintaining a familie: for all that they can take they carry home to their neſt. When they haue eaten the meat of the fiſhes, they throw the empty ſhels out of dores, and lie as it were in ambuſcado behind, to watch and catch fiſhes that ſwimme thither. They change their colour eftſoons, and reſemble the place where they be, & eſpecially when they be afraid. That they gnaw and eat their own clees and arms, is a meere tale; for they be the congres that do them that ſhrewd turn: but true it is that they will grow againe, like as the taile of ſnakes, adders, & lizards. But among the greateſt wonders of nature, is that fiſh which of ſome is called Nautilos, of others Pompilos. This fiſh, for to come aloft aboue the water turnes vpon his back, and raiſeth or heaueth himſelf vp by little and little: and to the end he might ſwim with more eaſe, as disburdened of a ſinke, hee diſchargeth all the water within him at a pipe. After this, turning vp his two foremoſt clawes or armes, he diſplaieth and ſtretcheth out betweene them a membrane or skin of a wonderfull thinneſſe: this ſerueth him in ſtead of a ſaile in the aire aboue water: with the reſt of his arms or claws he roweth and laboreth vnder water, & with his taile in the mids he directs his courſe, and ſteereth as it were with an helme. Thus holds he on and maketh way in the ſea, with a faire ſhew of a foiſt or gally vnder ſaile. Now if he be afraid of any thing in the way, he makes no more ado but drawes in water to ballace his body, and ſo plungeth himſelfe down, and ſinketh to the bottom.

Chap. XXX.

Of the many-foot fiſh called Ozæna, of the Nauplius, and Locuſts of the ſea, or Lobſter.

OF the Polypus or Pourcontrell kind with many feet, is the Ozæna, ſo called of the ſtrong ſauor of their heads, for which cauſe eſpecially, the Lampreys follow in chaſe after him.

As

20030
copy 1

A As for the Many-feet or Pourcuttels, they lie hidden for two months together: and aboue two yeares they liue not. They die alwaies of a conſumption or Phthyſicke: the female ſooner than the males, and ordinarily after that they haue brought forth their yong frie. I cannot ouerpaſſe but record the reports of *Trebius Niger*, one of the traine and retinue of *L. Lucullus* Proconſull in Bœtica, which he vpon his knowledge deliuered as touching theſe Many-feet fiſhes called Polypi, namely, That they are moſt deſirous and greedie of cockles, muſcles, and ſuch like ſhell-fiſhes: and they againe on the contrarie ſide, ſo ſoone as they feele themſelues touched of the Polypes, ſhut their ſhels hard, and therwith cut aſunder their clawes or armes, that were gotten within: and thus fall they to feed vpon thoſe, who ſought to make a prey of them. [Now in very truth theſe ſhel-fiſhes, all of them ſee not at all, neither haue they any other ſenſe, but taſting of their meat, & feeling of their drinke.] Theſe Polypi foreſeeing all this, lie in wait to ſpie when
B the ſaid cockles, &c. gape wide open, and put in a little ſtone between the ſhels, but yet beſide the fleſh & bodie of the fiſh, for feare leſt if it touched and felt it, ſhe would caſt it forth againe: thus they theeue, and without all daunger and in ſecuritie get out the fleſhie ſubſtance of the meat to deuoure it: the poore cockles draw their ſhels together for to claſp them between (as is aboue-ſaid) but all in vaine, for by reaſon of a wedg between, they will not meet cloſe nor come neere together. See how ſubtle and craftie in this point theſe creatures be, which otherwiſe are moſt ſottiſh and ſenſeleſſe. Moreouer, the ſaid *Trebius Niger* affirmeth, that there is not any o-ther beaſt nor fiſh in the ſea more daungerous to doe a man a miſchiefe within the water, than is this Pourcuttle or Many-feet Polypus: for if he chance to light on any of theſe diuers vnder
C the water, or any that haue ſuffered ſhipwracke and are caſt away, he aſſailes them in this manner: He catcheth faſt hold of them with his clawes or armes, as if he would wreſtle with them, and with the hollow concauities and noukes between, keepeth a ſucking of them; and ſo long he ſuckes and ſokes their bloud (as it were cupping-glaſſes ſet to their bodies in diuers places) that in the end he draweth them drie. But the only remedie is this, to turne them vpon their backe, and then they are ſoone done and their ſtrength gone: for let them lie ſo, they ſtretch out themſelues abroad, and haue not the power to claſp or comprehend any thing. And verily all li-uing creatures in the ſea loue the ſmell of them exceeding well, which is the cauſe that fiſhers beſmare and anoint their nets with them, to draw and allure fiſhes thither.

The reſt which mine author hath related as touching this fiſh, may ſeem rather monſtrous
D lies and incredible, than otherwiſe: for he affirmed, that at Carteia there was one of theſe Polypi, which vſed commonly to go forth of the ſea, and enter into ſome of their open ceſterns and vauts among their ponds and ſtewes, wherein they keep great ſea-fiſhes, and otherwhiles would rob them of their ſalt-fiſh, and ſo go his waies againe: which he practiſed ſo long, that in the end he gat himſelfe the anger and diſpleaſure of the maiſters and keepers of the ſaid ponds and ceſterns, with his continuall & immeaſurable filching: whereupon they ſtaked vp the place and empalled it round about, to ſtop all paſſage thither. But this thief gaue not ouer his acuſtomed haunt for all that, but made meanes by a certaine tree to clamber ouer and get to the fore-ſaid ſalt fiſh; and neuer could he be taken in the manner, nor diſcouered, but that the dogges by their quick ſent found him out and baied at him: for as he returned one night toward the ſea, they
E aſſailed and ſet vpon him on all ſides, and therwith raiſed the foreſaid keepers, who were afright-ted at this ſo ſudden an alarm, but more at the ſtrange ſight which they ſaw. For firſt and fore-moſt this Polype fiſh was of an vnmeaſurable and incredible bigneſſe: and beſides, he was be-ſmeared & beraied all ouer with the brine and pickle of the foreſaid ſalt-fiſh, which made him both hideous to ſee to, and to ſtinke withall moſt ſtrongly. Who would euer haue looked for a Polipe there, or taken knowledge of him by ſuch marks as theſe? Surely they thought no other, but that they had to deale and encounter with ſome monſter: for with his terrible blowing and breathing that he kept, he draue away the dogs, and otherwhiles with the end of his long ſtrin-ged winding feet, he would laſh and whip them; ſomtimes with his ſtronger clawes like armes he rapped and knoked them well and ſurely, as it were with clubs. In ſumme, he made ſuch good
F ſhift for himſelfe, that hardly and with much adoe they could kill him, albeit he receiued many a wound by trout-ſpears which they launced at him. Wel, in the end his head was brought and ſhewed to *Lucullus* for a wonder, & as big it was a as good round hogſhead or barrel that would take and containe 15 Amphores: and his beards (for ſo *Trebius* tearmed his clawes and long-ſtringed feet) carried ſuch a thickneſſe and bulke with them, that hardly a man could fathome

one

one of them about with both his armes, ſuch knockers they were knobbed and knotted like clubs, and withall 30 foot long. The concauities within them, and hollow veſſels like great baſons, would hold 4 or 5 gallons apeece: and his teeth were anſwerable in proportion to the bignes of his bodie. The reſt was ſaued for a wonder to be ſeene, and weighed 700 pound weight. This author of mine *Trchius* affirmeth, that Cuttels alſo and Calamaries haue been caſt vpon that ſhore, ful as big. Indeed in our ſea there be Calamaries taken of 5 cubits long, and Cuttels of twaine, in length: and theſe liue not aboue two yeares G

Mutianus reporteth, that himſelfe ſaw in Propontis another kind of fiſh carying as it were a ſhip of his owne, and making ſaile with it like to ſome galley: and a ſhel-fiſh it was faſhioned with a keele like to a barge or barke, with a poupe embowed and turned vp: yea and armed as it were in the proe with a three-forked pike. Within which lay hidden (as he ſaith) another liuing creature called Nauplius, reſembling a Cuttle fiſh; and for no other reaſon in the world, but to make ſport and play with it for companie. Now the manner of this paſtime and ſailing was in two ſorts: for if it were a calme ſea and the winds downe, the Nauplius afore-ſaid that went as a paſſenger in this ſhell, would put downe his feet into the water like ores, and row therewith; but if a gale of wind were aloft, he would ſtretch the ſame a length & make them ſerue in ſtead of an helme to ſteere withall; and then the Coquil or ſhel-fiſh would ſpread and diſplay it ſelfe like ſailes, to gather wind: ſo as the one of them tooke a pleaſure to carrie, in manner of the veſſell; the other had his delight to labour as a mariner, and to direct withall like a pilot. Thus theſe two fiſhes (otherwiſe ſenſeleſſe & blockiſh) take their pleaſure together, vnles peraduenture it fall out vnhappily (for certain it is that ſuch a ſight as this preſages no good to ſailers) that men marre their ſport, and either part them aſunder, or force them to ſinke vnder water. H I

The Lobſters (beeing of that kinde which wanteth bloud) haue a tender and brittle cruſt to couer and defend them. For fiue months they lie hidden. The Crabs likewiſe, who at the ſame time keep cloſe & ſecret: and both of them in the beginning of euery ſpring caſt their old coats or ſhels as ſnakes do their skins, & take them that be new & freſh. Al others of this kind ſwim within the water: but the Lobſters flote aloft, and creepe as it were vpon the water. So long as they are ſecure of any feare and danger, they go directly ſtraight, letting downe their hornes at length along their ſides, which naturally by themſelues haue a round point or bob at the end: but if they be in any feare, go vp thoſe hornes ſtraight, and then they creepe byas and goe ſidelong. With theſe horns they oftentimes maintaine battaile one with another. Of all creatures, this only hath a tender and ſhort kind of fleſh, which in the ſeething will not hang togerher, vnleſſe it be ſodden aliue in ſcalding water, and then it will be ſtiffe and callous as brawne. K

Chap. XXXI.

Of Sea-crabs, Vrchins of the ſea, and great Vrchins called Echinometra.

AS for the Lobſters, they loue rocks and ſtonie places: but Crabs delight in ſoft and delicate places. In winter, they ſeeke after the warme or ſun-ſhine ſhore: but when ſummer is come, they retire into the coole and deepe holes in the ſhade. All the ſort of them take harme and paire by winter: in autumne and ſpring, they battle and wax fat; and eſpecially when the moon is at the full: becauſe that planet is comfortable in the night time, & with her warme light mitigateth the cold of the night. Of theſe Crab-fiſhes, there be many kinds: to wit, Lobſters, Creyfiſhes of the ſea, crabs of Barbarie called Maiæ, Grampels, Grits or Pungiers, Crabs of Heraclea, yellow riuer Creyfiſhes, and diuers others of more baſe account. As for the Lobſters, they differ from the reſt in taile. In Phœnicia, there is a kind of Crabs called Hippœe, or rather Hippeis (that is to ſay, Horſes or Horſmen) which are ſo ſwift, that it is impoſſible to ouertake them. Crabs liue long: eight clees or feet they haue apeece, all crooked and hooked: the female hath the fore clee double, the male but ſingle. Moreouer, two of the legs or arms are forked and toothed like pincers. The vpper part of theſe foreclawes doth ſtir: the nether part moueth not. The right leg in them al is bigger than the left. When they come in skuls all together (as ſomtimes they doe) they are not able to paſſe one by another the ſtreights of the ſea Pontus about Conſtantinople, whereupon they are forced to returne back againe and fetch a compaſſe about, and the beaten way with their tracks may be ſeene. The leaſt of all theſe kind of Crabs, is L M called

20030
copy 1

A called Pinnnotheres [or Pinnoteres] and for his ſmalneſſe moſt ſubiect and expoſed to iniurie. But as ſubtill and crafty he is as he is little; for his maner is to ſhroud and hide himſelf within the ſhels of empty oiſters, and euer as he growes bigger and bigger, to go into thoſe that be wider. Crabs when they be afraid will recule backward as faſt as they went forward. They will fight one with another, and then ye ſhall ſee them jur and butt with their horns like rams. Singular good they are againſt the bitings and ſtingings of ſerpents. It is reported, that while the Sun is in the ſigne Cancer, the bodies within of dead crabs that lie without the water vpon drie land, wil turne to be ſcorpions. Of the ſame ſort that the crabs be are the vrchins of the ſea called Echini; and theſe in ſtead of feet haue certain pointed prickles. Their maner of going is to roll themſelues and tumble round; and therefore many times ſhall yee finde them with their
B pricks worne. And of this ſort be they that are called Echinometræ. The longeſt prickles they haue of all others, and the leaſt ſhels or caſes wherein they are. Neither are they all of the ſame colour of glaſſe; for about Torone they are found to be white, hauing ſmall pricks. They haue all of them fiue egs when they lay, but they are bitter. Their mouths ſtand in the mids of their bodies, bending down toward the earth. It is ſaid they haue a fore-knowledge of a ſea tempeſt: for by reaſon that they are ſo round, and therefore ſoone whirled and caried here and there, they fall then to labor and gather ſtones, wherewith they charge and peiſe their bodies as with ballaſt, that they may abide more ſtedfaſt, for that they are not willing to weate their pricks with rolling and turning ouer and ouer: which when the mariners and ſailers perceiue once, they preſently caſt many anchors and ſtay their ſhips.

C

Chap. XXXII.

¶ *Of Winckles and ſea Snailes.*

IN the ſame ranke are to be reckoned the Winkles as well of land as water. When they put themſelues out of their ſhels they thruſt out two hornes that they haue, and wil pluck them in again when they liſt. Eyes they haue none to ſee withall, and therefore theſe little hornes ſerue them in good ſtead to ſound, as it were, and try the way as they go.

Chap. XXXIII.

D ¶ *Of Scallops: of the greateſt Winkle called Murex, and other kinds of ſhell-fiſhes.*

THe great Scallops in the ſea are counted for the ſame race which lie hid alſo in the time as well of great heat as cold. They haue certaine nailes as it were ſhining like fire in the night ſeaſon; yea in their very mouthes that eat them. As for the Pourcelanes or Murices, they haue a ſtronger skaled ſhell; as alſo all the kind of Winkles great and ſmall. Wherin a man may ſee the wonderfull varietie of Nature in this play and paſtime of hers, giuing them ſo many and ſundry colours, with ſuch diuerſitie of formes and figures; for of them yee ſhall haue flat and plain, hollow, long, horned like the moon croiſſant, full round, halfe round, & cut as it were iuſt through the mids, bow-backt, and riſing vp, ſmooth, rough, toothed and indented
E like a ſaw, ridged and chamfered between, wrinkling and winding vpward to the top like Caltropes, bearing out ſharpe points in the edges, without-forth broad and ſpread at large, within rolled in pleits. Moreouer, there be other diſtinct ſhapes beſides all theſe: ſome be ſtriped and raied with long ſtreaks, others creſted and blaſing with a buſh of long haire: ſome againe criſped and curled, others made like an hollow gutter or pipe: ſome faſhioned as it were a comb, others waving with plaits one aboue another tile-wiſe, others framed in the manner of a net or lattiſe: ſome are wrought crooked and byas, others ſpred out directly in length. A man ſhall ſee of them thoſe that are made thick and moſſie thruſt together and compact, others ſtretcht forth at large: ye ſhall haue of them wrapt and lapt one within another: and to conclude, yee ſhall find them run round into a ſhort faſt knot, and all their ſides vnited together in one: ſome
F flat and plain good to giue a clap, others turning inward crooked like a cornet, made as it were to ſound and wind withall. Of all theſe ſorts, the Pourcelanes or Venus-Winkles ſwim aboue the water, and with their concauitie or hollow part which they ſet into the weather, help themſelues in ſtead of ſailes, and ſo gathering wind, ſaile as it were aloft vpon the ſea. The manner

of the Scalops is to skip, and otherwhiles they will leap forth of the water. They alſo can find the means to make a boat of themſelues, and ſo flote aboue and ſaile handſomly. G

Chap. XXXIV.

¶ *The riches of the ſea.*

BVt what meane I all this while to ſtand vpon theſe ſmall trifling matters, when as in very truth the ouerthrow of all honeſtie, the ruin of good maners, and in lieu thereof all riot and ſuperfluity proceeds from theſe ſhel-fiſhes, and from nothing ſo much? for now the world is grown to this paſſe, that there is nothing in it whatſoeuer ſo chargeable to mankind, nothing ſo hurtfull and dangerous as is the very ſea, and that ſo many waies; namely, in furniſhing the table with ſuch varietie of diſhes, in pleaſing and contenting the taſte with ſo many dainty and delicate fiſhes; and thoſe carry the higheſt price that be gotten with greateſt hazard and danger of thoſe that take them, otherwiſe they be of no regard and value to ſpeake of. H

Chap. XXXV.

¶ *Of Pearles, how and where they be found.*

HOwbett al that before named is nothing in compariſon of the Purples, pretious Coquils and Pearls that come from thence. It was not ſufficient belike to bring the ſeas into the kitchen, to let them down the throat into the belly, vnleſſe men and women both caried them about in their hands and eares, upon their head, and all ouer their body. And yet what ſocietie and affinitie is there betwixt the ſea and apparell? what proportion betwixt the waues and ſurging billowes thereof, and wooll? for ſurely this element naturally receiues vs not into her boſom vnleſſe we be ſtark naked: and ſet the caſe there were ſo great good fellowſhip with it and our bellies; how comes our backe and ſides to be acquainted with it? But wee were not contented to feed with the peril of ſo many men, vnleſſe we be clad and araied alſo therewith. O, the folly of vs men! ſee how there is nothing that goeth to the pampering and trimming of this our carcaſſe, of ſo great price and account, that is not bought with the vtmoſt haſard, and coſteth not the venture of a mans life! But now to the purpoſe. The richeſt merchandiſe of all, and the moſt ſoueraigne commoditie throughout the whole world are theſe Pearles. The Indian ocean is chief for ſending them: and yet to come by them, we muſt go and ſearch among thoſe huge & terrible monſters of the ſea, which we haue ſpoken of before: we muſt paſſe ouer ſo many ſeas, and ſaile into far countries ſo remote, and come into thoſe parts where the heate of the ſun is ſo exceſſiue and extreme; and when all is done we may perhaps miſſe of them: for euen the Indians themſelues are glad to ſeeke among the Iſlands for them, & when they haue done all they can, meet with very few. The greateſt plenty of them is to be found in the coaſt of Taprobane and Toidis, as hath bin ſaid before in our Coſmographie and deſcription of the world: and likewiſe about Perimula a promontorie and city of India. But the moſt perfect and exquiſite of all others be they that are gotten about Arabia, within the Perſian gulfe. This ſhell-fiſh which is the mother of Pearle, differs not much in the maner of breeding and generation from the Oyſters: for when the ſeaſon of the yeare requireth that they ſhould engender, they ſeeme to yawne and gape, and ſo do open wide; and then (by report) they conceiue a certaine moiſt dew as ſeed, wherewith they ſwell and grow big, and when time commeth labor to be deliuered hereof: and the fruit of theſe ſhell fiſhes are the Peares, better or worſe, great or ſmall, according to the qualitie and quantitie of the dew which they receiued. For if the dew were pure and cleare which went into them, then are the Pearles white, faire, and Orient: but if groſſe and troubled, the Pearles likewiſe are dimme, foule, and duskiſh; pale (I ſay) they are, if the weather were cloſe, darke, and threatning raine in the time of their conception. Whereby (no doubt) it is apparant and plaine, that they participate more of the aire and ſky, than of the water and the ſea; for according as the morning is faire, ſo are they cleere: but otherwiſe, if it were miſty and cloudy, they alſo will be thicke and muddy in colour. If they may haue their full time and ſeaſon to feed, the Pearles likewiſe will thriue and grow bigge; but if in the time it doth chance to lighten, then they cloſe their ſhells together, and for want of nouriſhment I M

20030
copy 1

A riſhment are kept hungrie and faſting, and ſo the pearles keepe at a ſtay and proſper not accordingly. But if it thunder withall, then ſuddenly they ſhut hard at once, and breed only thoſe excreſcences which be called Phyſemata, like vnto bladders putt vp and hooued with wind, & no corporal ſubſtance at all: and theſe are the abortiue & vntimely fruits of theſe ſhel fiſhes. Now thoſe that haue their ful perfection, and be ſound and good indeed, haue many folds and skins wherein they be lapt, not vnproperly as it may be thought, a thicke, hard, and callous rind of the body, which they that be skilfull do pill and cleanſe from them. Certes, I cannot chuſe but wonder how they ſhould ſo greatly be affected with the aire, and joy ſo much therein: for with the ſame they wax red, and loſe their natiue whiteneſſe and beauty, exen as the bodie of a man or woman that is caught and burnt with the ſun. And therefore thoſe ſhels that keep in the maine
B ſea, and lie deeper than that the ſun-beames can pierce vnto them, keep the fineſt and moſt delicate pearles. And yet they, as orient as they be, waxe yellow with age, become riueled, and looke dead without any liuely vigor: ſo as that commendable orient luſtre (ſo much ſought for of our great lords and coſtly dames) continueth but in their youth, and decaieth with yeares. When they be old, they will proue thicke and groſſe in the very ſhels, and ſticke faſt vnto their ſides, ſo as they cannot be parted from them, vnleſſe they be filed aſunder. Theſe haue no more but one faire face, and on that ſide are round, for the backe part is flat and plaine; and hereupon ſuch are called Tympania, as one would ſay, Bell bearles. We ſee daily of theſe ſhells which ſerue as boxes to carrie ſweet perfumes and precious ointments, and moſt commendable they are for this gift, that in them there be pearls of this ſort naturally growing together like twins. The pearle is ſoft and tender ſo long as it is in the water, take it forth once and preſently it har-
C deneth. As touching the ſhell that is the mother of Pearle, aſſoon as it perceiueth and feeleth a mans hand within it, by and by ſhe ſhutteth, and b that means hideth and couereth her riches within: for well woteth ſhe that therefore ſhe is ſought for. But let the fiſher looke well to his fingers, for if ſhe catch his hand between, off it goeth: ſo trenchant and ſharp an edge ſhe carrieth, that is able to cut it quite a two. And verily this is a juſt puniſhment for the theefe, and none more: albeit ſhe be furniſhed and armed with other means of reuenge. For they keep for the moſt part about craggie rocks, and are there found: and if they be in the deepe, accompanied lightly they are with curſt Sea-dogs. And yet all this will not ſerue to skar men away from fiſhing after them: for why? our dames and gentlewomen muſt haue their eares behanged with them, there is no remedie. Some ſay, that theſe mother-pearles haue their kings and captaines,
D as Bees haue: that as they haue their ſwarmes led by a maſter Bee, ſo euery troup and companie of theſe, haue one ſpeciall great and old one to conduct it; and ſuch commonly haue a ſingular dexteritie and wonderfull gift to preuent and auoid all daungers. Theſe they be that the dyvers after pearles are moſt carefull to come by: for if they be once caught, the reſt ſcatter aſunder and be ſoone taken vp within the nets. When they be thus gotten, it is ſaid that they be put vp into earthen pots and well couered with ſalt: and when the ſalt hath eaten and conſumed all the fleſh within, then certaine kernels that were within their bodies (and thoſe be the very pearles) fall down and ſettle to the bottome of thoſe pots. There is no doubt but with much vſe
L they will weare, yea and change colour thorough negligence, if they be not well looked vnto. Their chief reputation conſiſteth in theſe fiue properties, namely, if they be orient white, great,
E round, ſmooth, and weightie. Qualities I may tell you, not eaſily to be found all in one: inſomuch as it is impoſſible to find out two perfitly ſorted together in all theſe points. And hereupon it is, that our dainties and delicates here at Rome, haue deuiſed this name for them, and call them Vnions; as a man would ſay, Singular, and by themſelues alone. For ſurely the Greeks haue no ſuch tearmes for them, neither know they how to cal them: nor yet the Barbarians, who found them firſt out, otherwiſe than Margarit e. In the very whiteneſſe it ſelfe, there is a great difference among them. That which is found in the red ſea, is the clearer and more orient. As
M for the Indian pearle, it reſembleth the skales and plates of the ſtone called Specularis; howſoeuer otherwiſe it paſſeth all others in greatneſſe. The moſt commendation that they haue is
F in their colour, namely, if they may be truly called Exaluminati, i orient and cleare as Alume. They that be goodly great ones, are commendable in their degree. As for thoſe that are long and pointed vpward, growing downeward broader and broader like a peare, or after the manner of Alabaſter boxes, full and round in the bottome, they be called Elenchi. Our dames take a great pride in a braueric, to haue theſe not only hang dangling at their fingers, but alſo two or

three of them together pendant at their eares. And names they haue forſooth newly deuiſed G
for them, when they ſerue their turne in this their wanton exceſſe and ſuperfluitie of roiot: for
when they knocke one againſt another as they hang at their eares or fingers, they call them
Crotalia, *i.* Cymbals: as if they tooke delight to heare the ſound of their pearles ratling to-
gether. Now adayes alſo it is growne to this paſſe, that meane women and poore mens wiues af-
fect to weare them, becauſe they would be thought rich: and a by-word it is amongſt them,
That a faire pearle at a womans eare is as good in the ſtreet where ſhe goeth as an huiſher to
make way, for that euery one will giue ſuch the place. Nay, our gentlewomen are come now to
weare them vpon their feet, and not at their ſhoo latchets only, but alſo vpon their ſtartops and
fine buskins, which they garniſh all ouer with pearle. For it wil not ſuffice nor ſerue their turne
to carie pearles about them, but they muſt tread vpon pearles, goe among pearles, and walke as H
it were on a pauement of pearles.

Pearles were wont to be found in our ſeas of Italie, but they were ſmall & ruddie, in certain
little ſhell fiſhes which they call Myæ: but more plenty of ſuch were taken vp in the ſtreights
of Boſphorus neere Conſtantinople. Howbeit, in Acarnania there is a little Cochle called
Pinna, [*i.* a Nacre,] which engendreth ſuch. Whereby it may appeare, that there be more than
one ſort of Mother-pearles. For king *Iuba* likewiſe hath left in writing, that in Arabia there is
a kind of ſhell fiſh like vnto a Scallop, ſaue that it is not chamfered, but thick and rough like a
ſea Vrcheon, which beares Pearles within the very fleſh of the fiſh, like vnto haile ſtones. But
now adaies there be no ſuch mother-pearles come to our coaſts. Neither be there found in A-
carnania any of value and reputation. For why they are all in manner without proportion, nei-
ther round nor weighty, and of a marble colour. They rather about the cape of Actium are I
better, and yet they be but little ones: like as they alſo which are taken in the coaſts of Mauri-
tania. *Alexander Polyhiſtor*, and *Sudines*, are of opinion that they will age, and in the end loſe
their colour. That they bee ſollid and not hollow within, is euident by this, that with no fall
they will breake. But they be not alwaies found in the middeſt of the fleſh within the mother-
pearles, but here & there, ſomtime in one place, and ſomtime in another. Verily I haue ſeene of
them about the brim and edges of the ſhell, as if they were readie to goe forth: and in ſome 4,
in others fiue together. Vnto this day few of them haue been knowne to weigh aboue halfe an
*England. ounce and one ſcriptule. In * Brittaine it is certain that ſome do grow; but they be ſmall, dim
of colour, and nothing orient. For *Iulius Cæſar* (late Emperour of famous memorie) doth not K
diſſimule, that the cuirace or breaſt-plate which he dedicated to *Venus* mother within her tem-
ple, was made of Engliſh pearles.

Imy ſelfe haue ſeen *Lollia Paulina* (late wife, and after widdow, to *Caius Caligula* the emperor)
when ſhe was dreſſed and ſet out, not in ſtately wiſe, nor of purpoſe for ſome great ſolemnity,
but only when ſhe was to go to a wedding ſupper, or rather vnto a feaſt when the aſſurance was
made, & great perſons they were not that made the ſaid feaſt: I haue ſeen her, I ſay, ſo beſet and
bedeckt all ouer with hemeraulds and pearles, diſpoſed in rewes, ranks, and courſes one by ano-
ther: round about the attire of her head, her cawle, her borders, her peruk of hair, her bondgrace
and chaplet; at her ears pendant, about her neck in a carcanet, vpon her wreſt in bracelets, & on L
her fingers in rings; that ſhe glittered & ſhon again like the ſun as ſhe went. The value of theſe
*40 millions. ornaments, ſhe eſteemed and rated at * 400 hundred thouſand Seſtertij: and offered openly to
proue it out of hand by her bookes of accounts of reckonings. Yet were not theſe jewels the
gifts and preſents of the prodigall prince her husband, but the goo[illegible] and ornaments from her
owne houſe, fallen to her by way of inheritance from her grandfather, which he had gotten to-
gether euen by the robbing and ſpoiling of whole prouinces. See what the iſſue and end was of
thoſe extortions and outrageous exactions of his: this was it, That *M. Lollius* ſlandered and de-
famed for receiuing bribes & preſents of the kings in the Eaſt; and being out of fauor with *C.*
Cæſar, ſonne of *Auguſtus*, and hauing loſt his amitie, dranke a cup of poiſon, and preuented his iu-
diciall triall: that forſooth his neece *Lollia*, all to be hanged with jewels of 400 hundred thou- M
ſand Seſtertij, ſhould be ſeene glittering, and looked at of euery man by candle-light all a ſup-
per time.

If a man would now of the one ſide reckon what great treaſure either *Curius* or *Fabricius* car-
ried in the pompe of their triumphs; let him caſt a proffer and imagine what their ſhews were,
what their ſeruice at the table was: and on the other ſide, make an eſtimate of *Lollia*, one only
woman

20030
copy 1

A man,the dowager of an Emperor, in what glory ſhe ſitteth at the bourd,would not he wiſh rather,that they had been pulled out of their chariots,and neuer triumphed,than that by their victories the ſtate of Rome ſhould haue grown to this waſtfull exceſſe & intollerable pride? And yet this is not the greateſt example that can be produced of an exceſſiue riot and prodigalitie.

Two only pearles there were together,the faireſt and richeſt that euer haue beene knowne in the world:and thoſe poſſeſſed at one time by *Cleopatra* the laſt queen of Ægypt;which came into her hands by means of the great kings of the Eaſt,and were left vnto her by deſcent. This princeſſe,when *M. Antonius* had ſtrained himſelfe to doe her all the pleaſure he poſſibly could, & had feaſted her day by day moſt ſumptuouſly, & ſpared for no coſt:in the hight of her pride and wanton brauerie (as being a noble curtezan,and a queene withall) began to debaſe the expence and prouiſion of *Antonie*, and made no reckoning of all his coſtly fare. When he thereat
B demanded againe how it was poſſible to goe beyond this magnificence of his, ſhe anſwered againe,that ſhe would ſpend vpon him at one ſupper * 100 hundred thouſand Seſtertij. *Antonie*, who would needs know how that might bee (for he thought it was impoſſible) laid a great wager with her about it, and ſhee bound it againe, and made it good. The morrow after, when this was to be tried,and the wager either to be won or loſt, *Cleopatra* made *Antonie* a ſupper (becauſe ſhe would not make default,and let the day appointed to paſſe)which was ſumptuous and roial ynough:howbeit,there was no extraordinarie ſeruice ſeene vpon the board: whereat *Antonius* laughed her to ſcorne,and by way of mockerie required to ſee a bill with the account of the particulars. She again ſaid, that whatſoeuer had been ſerued vp alreadie, was but the ouerplus aboue the rate & proportion in queſtion,affirming ſtill that ſhe would yet in that ſupper make,
C vp the full ſumme that ſhe was ſeazed at:yea, her ſelfe alone would eat aboue that reckoning, and her owne ſupper ſhould coſt * 600 hundred thouſand Seſtertij, and with that commanded the ſecond ſeruice to be brought in. The ſeruitors that waited at her trencher (as they had in charge before) ſet before her one only crewet of ſharpe vineger,the ſtrength whereof is able to reſolue pearles. Now ſhe had at her eares hanging theſe two moſt precious pearles,the ſingular and only jewels of the world, and euen Natures wonder. As *Antonie* looked wiſtly vpon her, and expected what ſhee would doe, ſhee tooke one of them from her eare,ſteeped it in the vineger, and ſo ſoon as it was liquified,dranke it off. And as ſhee was about to doe the like to the other, *L. Plancius* the iudge of that wager,laid faſt hold vpon it with his hand,and pronounced withal,
D That *Antonie* had loſt the wager. Whereat the man fell into a paſſion of anger. There was an end of one pearle:but the fame of the fellow thereof may goe with it:for after that this braue queen the winner of ſo great a wager, was taken priſoner and depriued of her roiall eſtate, that other pearle was cut in twaine,that in memoriall of that one halfe ſupper of theirs,it ſhould remaine vnto poſteritie,hanging at both the eares of *Venus* at Rome, in the temple of Pantheon. And yet as prodigall as theſe were,they ſhall not go away with the prize in this kinde,bnt ſhall loſe the name of the chiefe and principall, in ſuperfluitie of expence. For long before their time, *Clodius* the ſonne of *Aeſope* the Tragedian Poet, the only heire of his father, who died exceeding wealthie, practiſed the ſemblable in two pearles of great price: ſo that *Antonie* needeth not to be ouer proud of his Triumuirate, ſeeing that he hath to match him in all his magnificence, one little better than a ſtage-plaier: who vpon no wager at all laid, (and that was more
E princely,and done like a king) but only in a brauerie,and to know what taſt pearles had,mortified them in venegre, and drunke them vp. And finding them to content his pallat wondrous well, becauſe he would not haue all the pleaſure by himſelfe,and know the goodneſſe thereof alone, he gaue to euery gueſt at his table one pearle apeece to drinke in like manner.

Feneſtella writeth, that after Alexandria was conquered and brought vnder obedience to the Romans,Pearles were rife at Rome,and commonly vſed of euery man:alſo,that about the troubleſome time of *Sylla* they began firſt to be in requeſt: and thoſe were but ſmall ones,and of no price. Howbeit, he is groſſely deceiued, and in a great error. For *Ælius Stilo* doth report in his Chronicle, that in the time of warre againſt *Iugurtha*, the faire and goodly great pearles began
F to be named Vniones.

Theſe Pearles (to ſay a truth) are of the nature (in a manner) of an inheritance to deſcend by perpetuitie. They follow commonly in right the next heires. When they paſſe in ſaile,they go with warrantize,in as ſolemne manner as a good lordſhip.

As for the rich Purples, and the precious Conchyles, euery coaſt is full of them. And yet to

that exceſſe and prodigalitie we are now growne, and out wanton roiot (the mother of all inordinate and waſtfull expence) hath made them well neere as deere as Pearles. G

Chap. XXXVI.

¶ *The nature of purple fiſhes, and the Murex or Burret.*

PVrples liue ordinarily ſeuen yeers. They lie hidden for 30 daies ſpace about the dogdaies, like as the Murices or Burrets do. They meet together by troupes in the ſpring, and with rubbing one againſt another, they gather and yeeld a certaine clammie ſubſtance and moiſture in manner of waxe. The Muribes doe the like. But that beautifull colour, ſo much in requeſt for dying of fine cloth, the Purples haue in the midſt of the neck and jawes. And nothing elſe it is, but a little thin liquor within a white veine: & that is it which maketh that rich, freſh, and bright colour of deepe red purple roſes. As for all the reſt of this fiſh, it yeeldeth nothing. Fiſhers ſtriue to get them aliue, for when they die, they caſt vp and ſhed that precious teinture and juice, together with their life. Now the Tyrians, when they light vpon any great Purples, they take the fleſh out of their ſhels, for to get the bloud out of the ſaid vein: but the leſſer, they preſſe and grind in certain milles, and ſo gather that rich humor which iſſueth from them. The beſt purple colour in Aſia is this, thus gotten at Tyros. But in Africke, within the Iſland Meninx, and the coaſt of the Ocean by Getulia. And in Europe, that of Laconica. This is that glorious colour, ſo full of ſtate and maieſtie, that the Roman Lictors with their rods, halbards, and axes make way for: this is it that graceth and ſetteth out the children of princes and noblemen: this maketh the diſtinction between a knight and a counſellor of ſtate: this is called for & put on when they offer ſacrifice to pacifie the gods: this giueth a luſtre to all ſorts of garments: to conclude, our great Generals of the field, and victorious captaines in their triumphs weare this purple in their mantels, enterlaced and embrodered with gold among. No maruell therefore if Purples be ſo much ſought for: and men are to be held excuſed, if they run a madding after Purples. But how ſhould the other ſhell-fiſhes called Conchylia, be ſo deere and high priſed, conſidering the teincture of them carries ſo ſtrong and ſtinking a ſauor, ſo ſullen and melancholie a colour, enclining to a blew or watchet, and reſembling rather the angrie and raging ſea in a tempeſt? But to come to the particular deſcription. The Purple hath a tongue of a finger long, pointed in the end ſo ſharpe, and hard withall, that it is able to bore an hole and pierce into other ſhell-fiſhes, and thereby ſhee feeds and gets her liuing. In freſh water they will die all, or if they be plunged and throwne in any riuer: otherwiſe, after they be taken, they will continue aliue 50 daies, euen with that viſcous and ſlimie humor of their owne. All ſhel-fiſh in general grow apace in a very ſmall time: but Purples ſooneſt of all others: for in one yere they wil come to their full bigneſſe. Now, if I ſhould lay a ſtraw here, and proceed no further in this diſcourſe of Purples and ſuch like, ſurely our luxurious and riotous ſpendthrifts would thinke they had great wrong, and were defrauded of their right: they might I ſay complaine of me, & condemne me of idleneſſe, and negligence. Therefore I care not much to put my head within the diers ſhops and work-houſes: that like as euery man for the neceſſity of this life, knows how the price of corne goes; euen ſo our fine folke and braue dainties, who take ſuch pleaſure and delight in theſe colors, may be perfect what is the reaſon of this their only life. In the firſt place, theſe ſhel-fiſhes that ſerue either for purple colors, or other lighter dies of the Conchylia, are all one in matter: the difference only is in temperature more or leſſe. And indeed, reduced they may all be into two principall ſorts. For the leſſe ſhell called Buccinum, faſhioned like vnto that horn or cornet, wherewith they vſe to wind and ſound, whereupon in tooke that name, hath a round back, and is cut like a ſaw in the edges. The other is named Purpura, ſhooteth out a long backe like a guttur, and within the one ſide it doth writhe and turne hollow in forme of a pipe, out of which the fiſh puts forth a tongue. Moreouer, this Purple is beſtudded (as it were) euen as far as to the ſharpe top or turbant thereof round about with ſharpe knobs pointed, lightly ſeuen in number: which the ſea-cornet Buccinum hath not. But this is common to both, that looke how many roundles they haue like tendrils claſping about them, ſo many yeares old they bee. As for the Cornet Buccinum, it ſticketh alwaies to great ſtones and rockes, and therefore is euer found and gathered about them. H I K L M

CHAP.

Chap. XXXVII.

¶ *How many ſorts there be of Purples.*

PVrples haue another name, and be called Pelagiæ, as one would ſay, Fiſhes of the deep ſea. But in truth there be many ſorts of them, & thoſe diffring either in place where they keep, or in food wherof they liue. The firſt Lutenſe, *i.* muddy, becauſe it is nouriſhed of the corrupt and rotten mud: the ſecond Algenſe (the worſt of all) feeding vpon reits or ſea weeds named Alga: the third, Tænienſe (better than the former twaine) for that it is gathered and taken vp about the brims & borders of the ſea, called for the reſemblance of fillets or liſts in a cloth, Tæniæ. And yet this kind ye eldeth but a light colour, and nothing deep: there be of them alſo, which they terme Calculoſæ, of the ſea grauell, which is wondrous good for all theſe kinde of wilkes and ſhell fiſhes. And laſt of all, which ſimply be the very beſt, the Purples Dialetæ, that is to ſay, wandring too and fro, changing their paſture, and feeding in ſundry ſoils of the ſea (the muddy, the weedie, and the grauelly.) Now theſe Purples are taken with ſmall nets, and thinne wrought, caſt into the deep. Within which, for a bait to bite at, there muſt be certain winckles and cockles, that will ſhut and open, & be ready to ſnap, ſuch as we ſee theſe limpins be, called Mituli. Halfe dead they ſhould be firſt, that being new put into the ſea again, & deſirous to reviue and liue, they might gape for water: and then the Purples make at them with their pointed tongue, which they thruſt out to annoy them: but the other feeling themſelues pricked therewith, preſently ſhut their ſhels together, & bite hard. Thus the Purples for their greedineſſe are caught and taken vp, hanging by their tongues.

Chap. XXXVIII.

¶ *The fiſhing time for Purples.*

THe beſt time to take Purples, is after the dog ſtar is riſen, & before the Spring: for, when they haue made that viſcous muſcilage in manner of wax, their iuice and humour for colour is ouer liquid, thin, & wateriſh. And yet the purple diers know not ſo much, nor take heed thereof, whereas indeed the skill thereof is a ſpeciall point of their art, and wherein lieth all in all. Well, when they are caught, as is aboueſaid, they take forth that vein before mentioned; and they lay it in ſalt, or elſe they do not well: with this proportion ordinarily, namely, to euery hundred weight of the Purple liquor, a Seſtier or pint and halfe of ſalt. Full three dayes and no more it muſt thus lie ſoking in powder. For the freſher that the colour is, ſo much is it counted richer and better. This don, they ſeeth it in leads, & to euery Amphore, (*i.* which containeth about eight wine gallons) they put one hundred pound and a halfe juſt, of the colour ſo prepared. Boile it ought with a ſoft and gentle fire, and therfore the tunnel or mouth of the furnace muſt be a good way off from the lead and caudron. During which time, the workemen that tend the lead, muſt eſtſoones skim off and clenſe away the fleſhie ſubſtance, which cannot chuſe but ſtick to the veines which containeth the iuice or liquour of purple beforeſaid. And thus they continue 10 daies, by which time ordinarily the lead or veſſell wil ſhew the liquour cleere, as if it were ſufficiently boiled. And to make a triall thereof, they dip into it a fleece of wool wel renſed & waſht out of one water into another: & till ſuch time, that they ſee it giue a perfect die, they ſtil ply the fire, & giue it a higher ſeething. That which ſtaineth red, is nothing ſo rich as that which giueth the deep & ſad blackiſh color. When it is come to the perfection, they let the wooll lie to take the liquor 5 houres: then they haue it forth, touſe and card it, and put it in againe, vntil it hath drunke vp all the colour, as much as it will. Now this is to be obſerued, that the ſea cornet Buccinum makes no good colour of it ſelfe: for their dye wil ſhed & loſe the luſtre. And therfore vſually they ioine to it the ſea Purple Pelagium, which maketh too deep and brown a colour: vnto which it giueth a freſh & liuely teinture, as it were in grain, and ſo maketh that ſad purple which they deſire. Thus by mixing & medling the force of both together, they mend one another, while the lightneſſe or ſadneſſe of the one doth quicken and raiſe, or els dorr and take downe the colour of the other. To the dying of a pound of wooll, they vſe this proportion of two hundred Buccina or ſea Cornets, ioined with a hundred and eleuen Pelagian Purples: & ſo commeth that rich Amethyſt or purple violet colour, ſo highly commended

mended aboue all other. But the Tyrians make their deep red purple, by dipping their wool firſt G
in the liquor of the Pelagian purples only, whiles it is not throughly boiled to the heigth, but as it were green yet and vnripe; and therof they let it take what it can drinke. Soone after they change it into another caudron or lead, where the colour of the ſea Cornets alone is boiled. And then it is thought to haue a moſt commendable and excellent dye, when it is as deep a red as bloud that is cold and ſetled, blackiſh at the firſt ſight, but looke between you and the light, it carieth a bright and ſhining luſtre. And hereupon it is, that *Homer* calleth bloud, Purple.

Chap. XXXIX.

¶ *When they began at Rome to weare Purple firſt.* H

I Find in Chronicles, that Purple hath bin vſed in Rome time out of mind. Howbeit, K. *Romulus* neuer ware it but in his roial habit or mantle of eſtate, called *Trabea*. And wel known it is, that *Tullus Hoſtilius* was the firſt Roman king, who after he had ſubdued the Tuſcanes, put on the long purple robe named *Pretexta*, and the caſſock broched & ſtudded with ſcarlet in broad guards. *Nepos Cornelius* who died in the daies of *Auguſtus Cæſar* the Emperor, When (quoth he) I was a yong man, the light violet purple was rife and in great requeſt, & a pound of it was ſold
*3 lib. 2 ſhil. 6. d. ſterl. for a * 100 deniers: and not long after the Tarentine red purple or skarlet was much called for, and of the ſame price. But after it, came the fine double died purple of Tyros, called Dibapha:
*31 lib. 5. ſhil. and a man could not buy a pound of it for a * 1000 deniers, which was the price of ten pound of the other. *P. Lentulus Spinther* in his Ædileſhip of the chaire, firſt ware a long robe embroi- I
dered with it, and was checked and blamed therefore. But now adaies (quoth *Nepos*) what is he that will not hang his parlour and dining chamber therewith, and haue carpets, cuſhins, & cupbord clothes thereof. And it is no longer ago when *Spinther* was Ædile, than in the ſeuen hundreth yeare after the foundation of Rome, euen when *Cicero* was Conſull. This purple in thoſe daies was called Dibapha, *i.* twice died: & that was counted a matter of great coſt, & very ſtately withall and magnificent. But now ye ſhall haue no purple cloths at all of any reckoning, but they haue their double die. As for the cloth died with the purple of the ſhel-fiſh Conchylia, the maner of making the colour, and dying in all reſpects is the ſame, ſaue that there be no ſea Cornets vſed thereto. Moreouer, the iuice or liquor for that colour, is tempered with water in K
ſtead of the filthy piſſe and vrine of a man, altogether vſed in the other: and therein is ſodden but the halfe proportion of colours to the foreſaid tinctures. And thus is made that light pale ſtammel ſo highly commended, for being ſhort of the deep rich colour: and the leſſe while that the wooll is ſuffered to drinke the fill, the more bright and freſh it ſeemeth.

Chap. XL.

¶ *The prices of wooll died with theſe colours.*

AS for theſe colours, they are valued dearer or cheaper, according to the coaſts where theſe fiſhes are gotten more or leſſe. Howbe it, it was neuer known that in any place, a pound of the right purple wooll, died with the Pelagian colour, or of the colour it ſelfe, was more L
*3 lib. 18 ſhil. 1. d. ob. worth than * 500 Seſterces: nor a pound of the Cornets purple coſt aboue one hundred. I would they knew ſo much that pay ſo deare for theſe wares by retaile here at home, and cannot haue them, but at an exceſſiue rate. But here is not all, neither is this an end of expence that way, for one ſtill draweth on another: and men haue a delight to ſpend and lay on ſtill one thing after another: to make mixtures and mixtures again, and ſo to ſophiſticate the ſophiſtications of Nature: as namely to paint and die their ſeelings, euen the very embowed roofs and arches in building: to mix and temper gold and ſiluer together, therewith to make an artificiall metall Electrum: and by adding braſſe or copper thereto, to haue another metall, counterfeiting the Corinthian veſſels.

Chap. XLI. M

¶ *The manner of dying the Amethyſt, Violet, or Purple, the Chrymſon and Scarlet in grain, and the light Stammell or Luſtie-gallant.*

It would not ſuffice our prodigal ſpendthrifts to rob the precious ſtone Amethyſt of his name, and to apply it to a colour; but when they had a perfect Amethyſt die, they muſt haue it to be drunken

20030
copy 1

A drunken againe with the Tyrean purple, that they might haue a ſuperfluous and double name compounded of both (Tyriamethiſtus) correſpondent to their two-fold coſt and duple ſuperfluitie. Moreouer, after they haue accompliſhed fully the colour of the Conchylium, they are not content vntill they haue a ſecond die in the Tyrian purple lead. It ſhould ſeeme, that theſe double dies and compounded colours, came firſt from the errour and repentance of the workeman when his hand miſſed: and ſo was forced to change and alter that which he had done before, and vtterly miſliked. And hereof forſooth is come now a pretty cunning and art thereof: and the monſtrous ſpirits of our waſtfull perſons are grown to wiſh and deſire that, which was a fault amended firſt: and ſeeing the two-fold way of a double charge and expence troden before them by the diers, haue found the meanes to lay colour vpon colour, and to ouercaſt and ſtrike
B a rich die with a weaker, ſo that it might be called a more pleaſant and delicate colour. Nay it will not ſerue their turn to mingle the aboue-ſaid tinctures of ſea fiſhes, but they muſt alſo do the like by the die of land-colours: for when a wooll or cloth hath taken a crimſon or skarlet in graine, it muſt be died againe in the Tyrian purple, to make (I would not elſe) the light, red, and freſh Luſtie-gallant.

Alluding to the word Amethyſt, which reſiſts drunkenneſſe.

As touching the Graine, ſeruing to this tincture, it is red, and commeth out of Galatia, (as we ſhall ſhew in our ſtory of earthly plants) or elſe about Emerita in Portugall, and that of all other is of moſt account. But to knit vp in one word theſe noble colours, note this, That when this Graine is but of one yeres age, it maketh but a weake tincture; but after foure yeeres, the ſtrength thereof is gone. So that neither young nor old it is of any great vertue. Thus I haue ſufficiently and at large treated of thoſe means which men and women both, ſo highly eſteem,
C and thinke to make moſt for their ſtate and honourable port, and ſetting out of themſelues in the beſt manner.

CHAP. XLII.

¶ *Of the Nacre, or his guide and keeper, Pinnoter: and the peregrinuance of fiſhes.*

THe Nacre alſo called Pinnæ, is of the kind of ſhell-fiſhes. It is alwaies found and caught in muddie places, but neuer without a companion, which they cal Pinnoter, or Pinnophylax. And it is no other but a little ſhrimpe, or in ſome places, the ſmalleſt crab; which beareth the Nacre companie, and waites vpon him for to get ſome victuals. The nature of the Nacre is to gape wide, and ſheweth vnto the little fiſhes her ſeelie body, without any eie at all. They come leaping by and by cloſe vnto her: and ſeeing they haue good leaue, grow ſo hardie and bold, as to skip into her ſhel & fill it ful. The ſhrimp lying in ſpiall, ſeeing this good time and opportunitie, giueth token thereof to the Nacre, ſecretly with a little pinch. She hath no ſooner this ſignall, but ſhe ſhuts her mouth, and what ſoeuer was within, cruſhes and kils it preſently: and then ſhe deuides the bootie with the little crab or ſhrimp, her ſentinell and companion. I maruell therefore ſo much the more at them who are of opinion, that fiſhes and beaſts in the water haue no ſence. Why, the very Cramp-fiſh Torpedo, knowes her own force & power, and being her ſelfe not benummed, is able to aſtoniſh others. She lieth hid ouer head and
E eares within the mud vnſeen, ready to catch thoſe fiſhes, which as they ſwim ouer her, be taken with a nummedneſſe, as if they were dead. There is no meat in delicate tenderneſſe, preferred before the liuer of this fiſh. Alſo the fiſh called the * ſea-Frog, (and of others the ſea-Fiſher) is as crafty euery whit as the other: It puddereth in the mud, and troubleth the water, that it might not be ſeen: and when the little ſeely fiſhes come skipping about her, then ſhe puts out her little hornes or Barbils which ſhe hath bearing forth vnder her eies, and by little and little tilleth and tolleth them ſo neere, that ſhe can eaſily ſeaze vpon them. In like manner the Skate and the Turbot lie ſecret vnder the mud, putting out their finnes, which ſtir and crawle as if it were ſome little wormes; and all to draw them neer, that ſhe might entrap them. Euen ſo doth the Ray-fiſh or Thorn-back. As for the Puffen or Fork-fiſh, he lieth in await like a theeſe in a
F corner, ready to ſtrike the fiſhes that paſſe by with a ſharpe rod or pricke that he hath, which is his weapon. In concluſion, that this fiſh is very ſubtill and crafty, this is a good proofe, That being of all others moſt heauie and ſlow, they are found to haue in their bellie the Mullets, which of all others be the ſwifteſt in ſwimming.

* *Diable de Mer.*

CHAP.

Chap. XLIII.

¶ *Of the Scolopendres, the ſea-Foxes, and the Glanis.*

THeſe Scolopendres of the ſea, are like to thoſe long earewigs of the land, which they call Centipedes, or many-feet. The maner of this fiſh is this, when ſhe hath ſwallowed an hook to caſt vp all her guts within, vntill ſhe hath diſcharged her ſelf of the ſaid hook, and then ſhe ſups them in againe. But the ſea-Foxes in the like danger haue this caſt with them, namely to gather in and let it go downe into the throat more and more ſtill of the line, vntill he come to the weakeſt part thereof, which he may eaſily fret and gnaw aſunder. The Glanis is more ſlie and warie than they both: for his propertie is to bite at the backe of the hooke, and not to goble it vp whole, but nibble away all the bait, and leaue the hooke bare.

Chap. XLIIII.

¶ *Of the Ram-fiſh.*

THis fiſh is a very ſtrong theef at ſea, and makes foule work where he comes: for one while he ſquats cloſe vnder the ſhade of big ſhips that ride at anker in the bay, where he lies in ambuſh to wait when any man for his pleaſure would ſwim and bath himſelfe, that ſo he might ſurpriſe them: otherwhiles he puts out his noſe aboue the water, to ſpie any ſmall fiſher boats comming, and then he ſwimmeth cloſe to them, ouerturneth and ſinketh them.

Chap. XLV.

¶ *Of thoſe that haue a third or middle nature, and are neither liuing creatures nor yet Plants: alſo of the ſea-Nettle-fiſhes, and Spunges.*

I Verily for my part am of opinion, that thoſe which properly are neither beaſts nor plants, but of a third nature between or compounded of both (the ſea-Nettles I mean, and Sponges) haue yet a kinde of ſenſe with them. As for thoſe Nettles, there be of them that in the night raunge too and fro, and likewiſe change their colour. Leaues they carry of a fleſhie ſubſtance, and of fleſh they feed. Their qualitie is to raiſe an itching ſmart, like for all the world to the weed on the land ſo called. His manner is, when he would prey, to gather in his body as cloſe, ſtreight and ſtiffe as poſſibly may be. He ſpieth not ſo ſoon a ſilly little fiſh ſwimming before him, but he ſpratdeth and diſplaieth thoſe leaues of his like wings; with them he claſpeth the poore fiſh, and ſo deuoures it. At other times, he lies as if he had no life at all in him, ſuffering himſelfe to be toſſed and caſt too and fro among the weeds, with the waues of the ſea: and look what fiſh ſoeuer he toucheth as he is thus floting, hee ſets a ſmart itch vpon them, and whiles they ſcratch and rub themſelues againſt the rockes for this itch, hee ſets vpon them and eates them. In the night ſeaſon he lieth for ſea-Vrchens and Scalops. When he feeleth ones hand to touch him, he changeth colour, and draweth himſelfe in cloſe together on a heape: and no ſooner toucheth he one, but the place will itch, ſting, and be ready to bliſter: make not good haſt to catch him quickly, he is hidden out of hand and gone. It is thought verily, that his mouth lyeth in his root, and that he voideth his excrements at a ſmall pipe or iſſue aboue, where thoſe fleſhie leaues are.

Of Spunges, we find three ſorts: the firſt thicke, exceeding hard, and rough; and this is called Tragos: a ſecond, not all ſo thicke, and ſomewhat ſofter; and that is named Manon: the third is fine and yet compact, wherewith they make ſponges to cleanſe and ſcourewithall, and this is tearmed Achilleum. They grow al vpon rocks: and are fed with wilkes or ſhel-fiſh, with naked fiſh and mud. That they are not ſenſleſſe, appeares hereby, for that when they feele that one would pluck them away, they draw in and retire back hard, ſo as with greater difficulty they are pulled from the rocke. The like doe they when they be beaten vpon with waues. That they liue vpon ſome food, it is manifeſt by the little coquill & muſcle ſhels that be found within them. And ſome ſay, that about Torone they continue ſtill aliue after they be pulcked frow the rocks: and that of the roots which are left behind, they grow againe. Moreouer, vpon thoſe rocks from whence they be pulled, there is to be ſeen as it were ſome bloud ſticking; & eſpecially in thoſe of Africke, which breed among the Syrtes. The Manæ, which otherwiſe be the leaſt, become very great & moſt ſoft withall, about Lycia. But they be more delicate which are nouriſhed in the

20030
copy 1

A the deep gulfes,where leaſt wind or none is ſtirring. The rough kind are in Helleſpont: and the fine and maſſie,about the cape Malea. In ſun-ſhine places they will corrupt and putrifie; and therefore the beſt are in the deep gulfs and creeks,not expoſed to the Sun. They be of the ſame dusk and blackiſh colour when they liue,as they are afterwards being ſoked & full of moiſture. They cleaue to rocks neither by any one part,nor yet entire and whole all ouer: for there are between,certain void pipes 4 or 5 commonly,by which they are ſuppoſed to receiue their food and nouriſhment. There be more of theſe pipes and concauities, but aboue they are grown together hard and not hollow. A certain pellicle or thin skin a man may perceiue them to haue at their roots. For certain it is knowne,that they liue long. The worſt kind of them all,be thoſe that are called Aplyſiæ,becauſe vnneth they may bee ſeparated, nor clenſed and made cleane, they are ſo foule,for great pipes they haue;thicke they are beſides throughout,and very maſſie.

B

Chap. XLVI.

¶ *Of Hound-fiſhes or Sea-dogs.*

THe dyuers that vſe to plunge into the ſea, are annoied very much with a number of Sea-hounds that come about them,and put them in great jeopardie. And they ſay, that theſe fiſhes haue a certain dim cloud or thin web, growing & hanging ouer their heads, reſembling broad,flat,and griſtly fiſhes,which clingeth them hard,and hindreth them from retiring backe and giuing way. For which cauſe the ſaid dyuers (as themſelues ſay) carry downe with them certaine ſharp pricks or goads faſtened to long poles: for vnleſſe they be proked at and
C pricked with them,they will not turn their backe;by reaſon(as I ſuppoſe)of a miſt before their eies,or rather of ſome feare & amazedneſſe that they be in. For I neuer heard of any man that found the like cloud or miſt(for this termthey giue vnto that vnhappie thing what-euer it be) in the range of liuing creatures. But yet much ado they haue and hard hold with theſe Hound-fiſhes notwithſtanding;for they lay at their bellies and groines,at their heeles, and ſnap at euery part of their bodies that they can perceiue to be white. The onely way and remedy is to make head directly affront them,and to begin with them firſt,and ſo to terrifie them: for they are not ſo terrible to a man,but they are as fraid of him againe. Thus within the deepe they are indifferently euen matched:but when the dyuers mount vp and riſe againe aboue water, then
D there is ſome odds betweene,and the man hath the diſaduantage,and is in more danger; by reaſon that whiles he laboureth to get out of the water,he faileth of means to encounter with the beaſt,againſt the ſtreame and ſourges of the water. And therefore his only recourſe is, to haue help and aid from his fellowes in the ſhip; for hauing a cord tied at one end about his ſhoulders,he ſhaketh it with his left hand,to giue ſigne what danger hee is, whiles hee maintaineth fight with the right,by taking into it the puncheon with the ſharpe point beforeſaid;and ſo at the other end they draw him to them: and they need otherwiſe to pull and hale him but ſoftly: mary when he is neere once to the ſhip,vnleſſe they giue him a ſudden jerke and ſnatch him vp quickly,they may be ſure to ſee him worried and deuoured before their face; yea and when they are at the point to be plucked vp, and euen now ready to go aboord, they are many times
E caught away out of their fellows hands,if they beſtir not themſelues the better, and put their owne good will to the help of them within the ſhip;namely, by plucking vp their legs and gathering their bodies nimbly together round as it were in a ball. Well may ſome from ſhipboord proke at the dogs aforeſaid with forks;others thruſt at them with Trout ſpeares & ſuch like weapons,and all neuer the neere, ſo craftie and cautelous is this foule beaſt, to get vnder the very belly of the barke,and ſo maintain combat in ſafety. And therefore all the care that theſe fiſhers haue,is to prouide for this miſchiefe,and to lie in wait for to entrap theſe fell,vnhappie,and ſhrewd monſters.

Chap. XLVII.

F ¶ *Of thoſe fiſhes that lie within a ſtonie and hard flintie ſhell: alſo of thoſe that haue no ſence: and of other naſtie and filthie creatures.*

THe greateſt ſecuritie that fiſhers and dyuers haue of ſafety, is when they ſee the broad flat griſtly fiſhes;for certain it is,that they be neuer in any place where hurtfull and noiſome

beaſts

beasts do haunt: which is the cause that these dyuers which ducke and plunge for sponges, call G
those fishes Sacred.

We must needs confesse, that fishes within stone shels, haue small or no sense, as namely oisters. Many are of the nature of very Plants, to wit, those that they cal Holothuria: also Pulmones, resembling the lungs of a beast: and Star-fishes, made in forme of stars (such stars I meane as it pleaseth the Painter to draw.) In sum, what is there not bred within the sea? Euen the very fleas that skip so merily in summer time within victualling houses and Ins, and bite so shroudly: as also lice that loue best to lie close vnder the haire of our heads, are there engendred & to be found: for many a time the fishers twitch vp their hooks, and see a number of these skippers and creepers setled thicke about their baits which they laied for fishes. And this vermine is thought to trouble the poore fishes in their sleep by night within the sea, as well as vs on the H
land. Last of all, some fishes there be, which of themselues are giuen to breed fleas and lice, among which the Chalcis, a kind of Turbot, is one.

Chap. XLVIII.

¶ *Of venomous Sea-fishes.*

MOreouer, the sea is not without her deadly poisons: for the Sea-hare, which keepeth in the Indish sea, is so venomous, that the very touching of him is pestiferous; & presently causeth vomiting and ouerturning of the stomacke, not without great danger. They which be found in our sea, seeme to be a peece or lump of flesh without all forme or fashion, in I
colour only resembling the land Hare. But with the Indians they be full as big, and resemble their Hare, only it is more stiffe and hard. And verily they cannot possibly be taken there aliue. The dragon or spider of the sea, is as dangerous & mischieuous a creature as the other: and with the pricks that stick forth of his chine and back-bone, hee doth much hurt. But in no place is there any more detestable and pernicious, than is the pike that standeth out vpon the taile of Trigonius, which we in Latine call *Pastinaca*, the Puffin or Forkfish of the sea; the which pike is fiue inches long. So venomous it is, that if it be strucke into the root of a tree, it killeth it: it is able to pierce a good cuirace or iacke of buffe, or such like, as if it were an arrow shot or a dart lanced: but besides the force and power that it hath that way answerable to yron & steele, K
the wound that it maketh is therewith poisoned.

Chap. XLIX.

¶ *Of Fishes diseases.*

WE do not heare or reade, that all sorts of fishes in generall be subiect to maladies and diseases, as other beasts, and euen those that are wilde and sauage. But that this or that fish in euery kinde may be sicke, it appeareth euidently, that some of them mislike and come to be carrion leane; whereas others of the same sort, be taken, not only in good plight, but exceeding fat. L

Chap. L.

¶ *The wonderfull manner of their generation.*

IN what sort fishes do engender, if I should not in this place shew, but put it off farther, I should do great wrong to mankind, who desire to know it, as much as they wonder how it should be. In one word, fishes ingender by the friction and rubbing of their bellies one against another: which they performe with such celeritie, that no eye is so quicke as to note and obserue it. Dolphins, and other great whales, haue no other way but that, mary they are longer somewhat about their businesse. The spawner, when the time serueth for generation, followeth M
after the male, and neuer linneth pecking and iobbing at his belly with her muzzle. Semblably a little before spawning time, the milters follow after the female, only for that they would eat their spawn when they haue cast it. But this is to be noted moreouer, that the foresaid mixture & ingendring of theirs is not sufficient to accomplish generation, vnlesse when their egs be laid or spawne cast, both male and female take it betweene them and keepe a turning of it, thereby

to

20030
copy 1

A to breath a liuely ſpirit into it,and as it were beſprinkle it with a vitall dew, as it floteth vpon the water. But turne they it and toſſe it,breath they vpon it as much as they will, yet all thoſe little egs of their ſpawne do not hit and come to proofe:for if they did,all ſeas and lakes,and al riuers and pools would be ſo peſtered ful with fiſhes,that a man would ſee nothing els:for there is not one of theſe females,but at once conceiueth an infinite number in her belly.

Chap. LI.

¶ *More as touching the generation of fiſhes,and which they be that do ſpawne in manner of egges.*

B THe ſpawne or egs of Fiſhes in the ſea,do grow vnto perfection,ſome of them exceeding ſcon,as that of the Lampreies:others are later ere they do ſo. All flat and broad Fiſhes, ſuch namely as haue no tails and ſharp pricks to hinder(as haue the Thorn-backe, Skate, and Tortoiſes)when they engender, leap one another. The many foot Pour-cuttles in this action faſten one of their winding clawes to the noſe of the female. The Cuttels and Calamaries do the feat with their tongues or pipes rather thruſt into their mouthes, claſping one another with their arms,and ſwimming one contrary to the other:and as they conceiue at the mouth,ſo they deliuer their fruit again at the mouth. This onely is the difference,that the ſhe Calamaries in this buſines,beare their heads downward to the earth. As for thoſe that are ſoft cruſted, they do it backward as dogs. Thus the Lobſters & Shrimpes ingender. Crabs at the mouth. Frogs leap one another:the male with the fore-feet claſps the arm-pits of the female, and with
C the hind-feet the hanches. That which is ingendred and brought forth,is as it were ſome little mites of blackiſh fleſh,which they call Tadpoles or Polwigs, ſhewing no good form, but that they haue ſome ſhew of eies only,and a taile. Some few daies after,their feet are framed,& then parts their taile in twain,which ſerueth for their feet behind. And a ſtrange thing it is of them: after they haue liued ſome 6 months,they reſolue into a ſlime or mud,no man ſeeth how:& afterward with the firſt rains in the Spring,returne again to their former ſtate, as they were firſt ſhapen,no man knows after what ſort,by a ſecret and vnknown way incomprehenſible:notwithſtanding it fals out ordinarily ſo euery yere. As for the Limpins, Muskles,and Scallops, they breed of themſelues in the mud and ſands of the ſea. Thoſe which are of an harder coat, as the
D Pourcelanes and Purples,of a certain viſcous and ſlimy ſubſtance like a muſcilage. As for that little fry,reſembling ſmall gnats and flies of the ſea, they come of a certaine putrifaction and ſowerneſſe of the water:as the Apuæ,which are the groundlings and Smies, of the ſome of the ſea ſet in an heat & chafed after ſome good ſhewer. They that are couered with a ſtony ſhell,as Oiſters,breed of the rotten and putrified ſlime & mud of the ſea:or of the ſome that hath ſtood long about ſhips or ſtakes and poſts ſet faſt in the water, and eſpecially if they bee of Holme wood. Howbeit,it hath bin found of late in Oiſter pits,that there paſſeth from them in ſtead of Sperm a certain whitiſh humor like milk. As for Yeels they rub themſelues againſt rocks and ſtones,and thoſe ſcrapings(as it were)which are fretted from them, in time come to take life and proue ſnigs, and no other generation haue they. Fiſhes of diuers kinds engender not one
E with another, vnleſſe it be the Skate and the Raifiſh:and of them there commeth a fiſh, which in the forepart reſembleth a Ray,& in Greek hath a name compounded of both[Rhinobatos.] Other fiſhes there be that breed indifferently on land and ſea, according to the warme ſeaſon of the yeare. In Spring time Scallops,Snailes, and Horſleeches do engender, and by the ſame warmth quicken and come to life;but in Autumne they turn to nothing. The Pike & Sardane breed twice a yere, like as al ſtone fiſh : the Barbels thrice,as alſo a kind of Turbit called Chalcis[*i.*the Shad:]the Carp 6 times:the Scorpenes and Sargi twice,namely, in Spring and Autumne. Of flat broad Fiſhes,the Skate only twice in the yere,to wit,in Autumne,and at the ſetting or occultation of the ſtar *Vergiliæ*. The greateſt number of Fiſhes ingender for 3 moneths,
F April,May,& Iune. The Cods or Stockfiſhes in Autumne. The Sargi,Crampfiſhes,& Squali about the equinoctiall. Soft skinned Fiſhes in the ſpring:and the Cuttel in euery month. The ſpawn of this Fiſh,which hangeth together like a cluſter of grapes,by the means of a certaine blacke glew or viſcoſitie like inke, the Milter doth blow and breath vpon before it can bee good,for otherwiſe it commeth to no proofe. The Pour-cuttles engender in Winter, and in the Spring, and then bring forth a ſpawne criſped and curled (as it were) like the wreathing

branches and tendrils of a vine branch; and that in ſuch plenty, that when they are killed they G
are not able to receiue and containe the multitude of their egs in the concauitie or ventricle of
their head and belly, which they bare when they were great. They hatch them in fifty daies,
but many of them proue addle and neuer come to good, there is ſuch a number of them. The
Lobſters and the reſt with thin ſhels, lay egge after egge, and ſit vpon them in that manner. The
female Pourcuttle, one while ſitteth ouer her egs, another while ſhe couereth the cranie or gut-
ter where ſhe hath laid them, with her clawes and arms enfolded croſſe one ouer another lattiſe
wiſe. The Cuttle laieth alſo vpon the dry land among the reeds, or els whereſoeuer ſhe can find
any ſea-weeds or reits to grow, & by the 15 day hatcheth. The Calamaries lay egs in the deep,
which hang cloſe and thick together, as the Cuttles do. The Purples, Burrets, and ſuch like, do
lay in the Spring. The ſea Vrchins are with egge euery full moone in the winter time: and the H
winkles or cocles are bred in the winter likewiſe. The Crampfiſh is found to haue 80 young at
once within her, and hatcheth her tender and ſoft egs within her bodie, ſhifting them from one
place of the wombe to another. In like manner do all they which are called Cartilagineus, or
griſtly. By which it commeth to paſſe, that fiſh alone both conceiue with egge, and yet bring
forth a liuing creature. The male ſheath-fiſh or riuer whale Silurus, of al others only is ſo kind
as to keep and looke to the egs of the female after they be laid, many times for fifty daies after,
for feare they ſhould be deuoured of others. Other females hatch in three daies, if the male
touch them. The Horne-beaks or Needle-fiſhes Belonæ, are the only fiſhes which haue within
them ſo great egs that their wombe cleaueth and openeth when they ſhould lay them: but af-
ter that they be diſcharged of them, it groweth together and vniteth againe. A thing vſuall (as I
they ſay) in Blind-wormes. The fiſh called Mus-Marinus, diggeth a gutter or ditch within
the ground, and there laieth her egs, and the ſame ſhe couereth ouer with earth, and ſo lets them
alone for 30 daies, then ſhe commeth and openeth the place again, findeth her egs hatched, and
leadeth her little ones to the water.

Chap. LII.

¶ *Of fiſhes wombes.*

THe ſhel-fiſhes Erythini & Chanæ, haue their wombs or matrices. As for that fiſh which
in Greeke is called Trochos [*i.* the top] is thought to get it ſelfe with yong. The frie of all K
water creatures, at the firſt ſee not.

Chap. LIII.

Of the exceeding long life of fiſhes.

IT is not long ſince that we heard of one fiſhes memorable example, which proued the long
life of fiſhes. There is a faire houſe of retreat and pleaſure called Pauſilupum, in Campaine
not far from Naples; where (as *Anneus Seneca* writeth) there died a fiſh in the fiſh-pooles of
Cæſar, 60 yeres after that it had bin put in by *Pollio Vedius*: and there remained two more of that L
age and of the ſame kind, which liued ſtill. And ſince wee are come to make mention of fiſh-
ponds, me thinks I ſhould do well to write ſomwhat more thereof, before I giue ouer this diſ-
courſe of fiſhes and water creatures.

Chap. LIV.

¶ *Of Oyſter pits, and who firſt deuiſed them.*

THe firſt that inuented ſtewes and pits to keep oyſters in, was *Sergius Orata*, who made ſuch
about his houſe in Baianum, in the daies of *L. Craſſus* that famous oratour, before the Mar-
ſians war. And this the man did not for his belly and to maintain gourmandiſe, but of a M
couetous mind for very gain. And by this and ſuch wittie deuiſes, he gathered great reuenues:
for he it was that inuented the hanging baines and pooles to bathe in aloft vpon the top of an
houſe: and thus when he had ſet out his manour houſe for the better ſale, he would make good
merchandiſe of them, and ſell them againe for commoditie and gaine. He was the firſt man that
brought the Lucrine Oyſters into name and credit for their excellent taſte. For ſo it is,

that

20030
copy 1

A that the ſame kinds of fiſhes, in one place are better than in another. As the Pikes in the riuer Tiberis, which are taken between the two bridges: the Turbot of Rauenna: the Lamprey in Sicilie: the Elops at Rhodes, and ſo forth of other ſorts of fiſhes: for I do not meane here to make a bill of all the dainty fiſh to ſerue the kitchin. There was no talk then of Engliſh oiſters, when *Orata* brought thoſe of the Lucrine lake into requeſt, for as yet the Brittiſh coaſts were not ours; which indeed haue the beſt oiſters of all other. But afterwards it was thought it would quit the coſt and pay for the pains, to fetch oiſters from the furtheſt part of Italy, euen as far as Brundiſium. And becauſe there ſhould grow no quarrell, nor controuerſie ariſe, whether theſe or the former had the more delicate and pleaſant taſte, it was of late deuiſed that the hungrie oiſters (which in the long cariage from Brundiſe were almoſt famiſhed) ſhould be fed with the
B reſt in the Lucrine Lake, and ſo taſte alike. In thoſe very daies, but ſomwhat before *Orata*, *Licinius Murena* deuiſed pools and ſtews for to keep and feed other fiſhes: whoſe example noblemen followed and did the like after them; namely, *Philip* and *Hortenſius*. *Lucullus* cut through a mountain neere vnto Naples for this purpoſe, namely, to let in an arm of the ſea into his fiſh pooles: the doing whereof coſt him more mony, than the houſe it ſelfe which he there had built. Hereupon *Pompey* the great gaue him the name of Roman *Xerxes*, in his long robe. The fiſhes of that poole of his, after his death, were ſold for thirty hundred thouſand Seſterces, *i*. three milions of Seſterces.

Chap. LV.

¶ *Who inuented the ſtewes for Lampreyes.*

C *Caius Hirtius* was the man by himſelfe, that before all others deuiſed a pond to keep Lampreys in. He it was that lent *Cæſar* Dictator for to furniſh his feaſts and great ſuppers during the time of his triumph, 600 Lampreys, to be paied againe by weight and tale in the ſame kind: for ſel them he would not right out for any mony, nor exchange them for other commodities. A houſe he had for his pleaſure in the country, and but a very little one, yet the ponds and fiſhes about it ſold the houſe for foure milions of Seſterces. In proceſſe of time folk grew to haue a loue and caſt a fancy to ſome one ſeuerall fiſh aboue the reſt. For the excellent Orator *Hortenſius* had an houſe at Bauli, vpon the ſide that lieth to Baiæ, & a fiſh-pond to it belonging: and he took ſuch an affection to one Lamprey in that poole, that when it was dead (by re-
D port) he could not hold but weep for loue of it. Within the ſame poole belonging to the ſaid houſe, *Antonia* the wife of *Druſus* (vnto whom they fell by inheritance) had ſo great a liking to another Lamprey, that ſhe could find in heart to decke it, and to hang a paire of golden earings about the guils thereof. And ſurely for the nouelty of this ſtrange ſight, and the name that went thereof, many folke had a deſire to ſee Bauli, and for nothing els.

Chap. LVI.

¶ *The ſtewes of Winkles, and who firſt was the deuiſer.*

E *Vlvius Hirpinus* was the firſt inuentor of warrens as it were for Winkles, which he cauſed to be made within the territory of *Tarquinij*, a little before the ciuil war with *Pompey* the great. And thoſe had their diſtinct partitions, for ſundry ſorts of them: that the white, which came from the parts about Reate, ſhould be kept apart by themſelues: the Illyrian (and thoſe were chiefe for greatneſſe) alone by their ſelues: the Africans (which were moſt fruitfull) in one ſeuerall: and the Solitanes (ſimply the beſt of all the reſt) in another. Nay more than that, he had a deuiſe in his head to feed them fat, namely, with a certain paſte made of cuit & wheat meale, and many other ſuch like: to the end forſooth, that the gluttons table might be ſerued plentifully with home-fed & franked great Winkles alſo. And in time, men grew to take ſuch a pride and glory in this artificial feat, and namely, in ſtriuing who ſhould haue the biggeſt, that in the end one of their ſhels ordinarily would containe * 80 meaſures called Quadrants, if *M. Varro* F ſay true, who is mine Author.

* 3 wine gallons and three quarts: for Quadrans is 3 Cyathi, *i*. the 4 part of Sextarius, & Sextarius is a wine pint & a halfe, or 18 ounces.

Chap. LVII.

¶ *Of Land-fiſhes.*

Theophraſtus alſo telleth ſtrange wonders of certain kinds of fiſhes, which are about Babylon, where there be many places ſubiect to the inundations of Euphrates and other riuers, and wherein the water ſtandeth, after that the riuers are returned within their bankes: in which the fiſh remain in certain holes & caues. Some of them, ſaith he, vſe to iſſue forth a land for food and releefe, going vpon their fins in lieu of feet, and wagging their tailes euer as they go. And if any chaſe them, or come to take them, they will retire back into their ditches aforeſaid, and there make head and ſtand againſt them. They are headed like to the * ſea Frog, made in other parts as Gudgeons, and guilled in manner of other fiſhes. Moreouer, that about Heraclea and Cromna, and namely neere the riuer Lycus, & in many other quarters of the kingdom of Pontus, there is one kind aboue the reſt that euer haunteth riuers ſides, and the vtmoſt edges of the water: making her ſelfe holes vnder the banks, and within the land wherin ſhe liueth, yea, euen when the banks are drie, and the riuers gathered into narrow channels. By reaſon whereof they are digged forth of the earth: and as they ſay that find them, aliue they be, as may appeare by mouing and ſtirring of their bodies. Neere vnto the aboueſaid Heraclea & the riuer Lycus, when it is falne and the water ebbe, there be fiſhes breed of the egges and ſpawne left vpon the mud and ſand, who in ſeeking for their food, do ſtir and pant with their little guils: which they vſe to do when they want no water, but euen then when as the riuer is full. Which is the reaſon alſo that yeeles liue a long time after they be taken forth of the water. He affirmeth moreouer, that the egs of fiſhes lying vpon the dry land, will come to their maturity and perfection, and namely thoſe of the Tortoiſes. Alſo, that in the ſame country of Pontus, there be taken fiſhes vpon the yce, and gudgeons eſpecially, which ſhew not that they be aliue, but by their ſtirring and leaping when they come to be ſodden in hot caudrons. Hereof may ſome reaſon yet be rendred, although the thing be ſtrange and wonderful. The ſame author auoucheth, that in Paphlagonia there be digged out of the ground certaine land fiſhes that be excellent good meat, and moſt delicate: but they be found in dry places remote from the riuer, & whither no waters flow, wherby they are forced to make the deeper trenches for to come by them. Himſelf maruelleth how they ſhould engender without the help of moiſture. Howbeit, hee ſuppoſeth that there is a certain minerall and naturall force therin, ſuch as we ſee to ſweat out in pits; foraſmuch as diuers of them haue fiſhes found within them. Whatſoeuer it is, ſurely leſſe wonderfull this is, conſidering how the Moldwarps liue (a creature naturally keeping vnder the ground) vnleſſe haply we would ſay that fiſhes were of the ſame nature that earth wormes be of.

* Or the ſea diuell.

Chap. LVIII.

¶ *Of the mice of Nilus:*

BVt the inundation of Nilus cleareth all theſe matters: the ouerflowing whereof is ſo admirable, and ſo far paſſeth all other wonders, that we may well beleeue theſe things. For when as this riuer falleth and returneth againe into his channell, a man may find vpon the mud yong Mice halfe made, proceeding from the generatiue vertue of water and earth together: hauing one part of their body liuing already, but the reſt as yet miſhapen, and no better than the very earth.

Chap. LIX.

¶ *Of the fiſh Anthias, and how he is taken.*

I Thinke it not meet to conceale that, which I perceiue many do beleeue & hold, as touching the fiſh Anthias. We haue in our Coſmographie made mention of the Iſles Cheldoniæ in Aſia, ſcituate in a ſea full of rocks vnder the promontory of Taurus; among which are found great ſtore of theſe fiſhes: and much fiſhing there is for them, but they are ſuddenly taken, and euer after one ſort. For when the time ſerueth, there goeth forth a fiſher in a ſmal boat or barge for certain daies together, a pretty way into the ſea, clad alwaies in apparel of one and the ſame colour, at one houre, and to the ſame place ſtil, where he caſteth forth a bait for the fiſh: but the fiſh

20030
copy 1

A fiſh Anthias is ſo craftie and warie, that whatſoeuer is thrown forth, he ſuſpecteth it euermore, that it is a means to ſurpriſe him. He feareth therefore and diſtruſteth: and as he feareth, ſo is he as warie: vntill at length, after much practiſe & often vſing this deuiſe of flinging meat into one place, one aboue the reſt groweth ſo hardy and bold, as to bite at it, for now by this time he is grown acquainted with the maner thereof, and ſecure. The fiſher takes good mark of this one fiſh, making ſure reckoning that he wil bring more thither, and be the means that he ſhall ſpeed his hand in the end. And that is no hard matter for him to do, becauſe for certain daies together, that fiſh, & none but he, dare aduenture to come alone vnto the bait. At length this hardy captaine meets with ſome other companions, and by little & little he commeth euery day better accompanied than other, vntil in the end he brings with him infinite troups and ſquadrons together, ſo as now the eldeſt of them all (as crafty as they be) be ſo well vſed to know the fi-
B ſher, that they will ſnatch meat out of his hands. Then hee eſpying his time putteth forth an hook with the bait, ſomwhat beyond his fingers ends, flieth and ſeizeth vpon them more truly, then catcheth them, and ſpeedily with a quick & nimble hand whippes them out of the water within the ſhadow of the ſhip, for feare leaſt the reſt ſhould perceiue, & giueth them one after another to his companion within; who euer as they be ſnatcht vp, latcheth them in a courſe twillie or couering, & keeps them ſure enough from ſtrugling or ſqueaking, that they ſhould not driue the reſt away. The ſpeciall thing that helpeth this game and pretty ſport, is to know the captain from the reſt, who brought his fellows to this feaſt, & to take heed in any hand that he be not twitcht vp and caught. And therfore the fiſher ſpareth him, that he may flie and goe
C to ſome other flock for to train them to the like banket. Thus you ſee the maner of fiſhing for theſe Anthæ. Now it is reported moreouer, that one fiſher vpon a time (of ſpightfull minde to do his fellow a ſhrewd turn) laid wait for the ſaid captain fiſh, the leader of the reſt (for he was very wel known from all others) and ſo caught him: but when the foreſaid fiſher eſpied him in the market to be ſold, and knew it was he: taking himſelf miſuſed & wronged, brought his action of the caſe againſt the other, and ſued him for the dammage, and in the end condemned him. *Mutianus* ſaith moreouer, That the plaintife was awarded to haue for recompence, 10 pounds of the defendant. The ſame fiſhes, if they chance to ſee one of their fellows caught with an hook, by report, with their ſharp fins which they haue vpon their backe like ſawes, cut the line in two: for he that hangeth at it, will of purpoſe ſtretch it out ſtreight, that it may be cut aſunder more
D eaſily. But the Sargots haue another trick for that: for he that finds himſelfe taken, fretteth the line in twaine, whereto the hooke hangeth, againſt a hard rocke.

Chap. LX.

¶ *Of the Sea fiſhes called Starres.*

OVer and beſides all theſe, I ſee that ſome deep clerks and great Philoſphers haue made a wonder at the Star in the ſea. And verily it is no other than a very little fiſh, made like a ſtar (as we ſee it painted.) A ſoft fleſh it hath within: but without forth an hard brawnie skin. Men ſay it is ſo fierie hot, that whatſoeuer it toucheth in the ſea, it burneth: and look what meat it receiueth, it makes a hand with it, & digeſteth it preſently. What proofe there is her-
E of, and how men ſhould come to the knowledge and experience of thus much, I cannot readily ſet downe. I would thinke that rather more memorable and worthy to be recorded, whereof we haue daily experience.

Chap. XLI.

¶ *Of the Dactyli, and their wonderfull qualities.*

OF the ſhell fiſh kind are the Dactyli, ſo called of the likeneſſe of mens nailes, which they reſemble. The nature of this fiſh is to ſhine by themſelues in the darke night, when all o-
F ther light is taken away. The more moiſture they haue within them, the more light they giue: inſomuch as they ſhine in mens mouths as they be chawing of them: they ſhine in their hands: vpon the floore on their garments, if any drops of their fattie liquor chance to fall by: ſo as it appeareth, that doubtleſſe it is the very iuice & humor of the fiſh which is of that nature, which we do ſo wonder at in the whole body.

Chap. LXII.

¶ *Of the enmitie and amitie which is between fiſhes and other water beaſts.*

SVch concord there is in ſome, and ſuch diſcord in others, as is wonderfull. The Mullet and the ſea-Pike hate one another, and be euer at deadly war: likewiſe the Congre & the Lamprey: inſomuch as they gnaw off one anothers taile. The Lobſter is ſo afraid of the Polype or Pourcuttell, that if he ſpie him neere, he euermore dieth for very woe. The Lobſters are ready to ſcratch and teare the * Congre: the Congres again do as much for the Polype. *Nigidius* writeth, That the ſea-Pike biteth off the Mullets taile: and yet the ſame fiſhes in certaine ſet moneths are good friends, and agree well enough. He ſaith moreouer, that thoſe Mullets liue all, notwithſtanding their tails be ſo curtold. On the other ſide, there be examples of friendſhip among fiſhes, beſides thoſe, of whoſe ſocietie and fellowſhip I haue already written: and namely, between the great whale Balæna, and the little Muſculus. For whereas the Whale aforeſaid hath no vſe of his eies (by reaſon of the heauy weight of his eie-browes that couer them) the other ſwimmeth before him, ſerueth him in ſtead of eies and lights, to ſhew when he is neere the ſhelues and ſhallowes, wherein he may be ſoone grounded, ſo big and huge he is.

* *Locuſtæ Congrum, ex* Ariſt. *lib. 8. c. 2. biſtor. animal.*

Thus much of fiſh. Hence forward will we write of Foules.

THE TENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

Chap. I.

¶ *The nature of Birds and Foules.*

IT followeth now that we ſhould diſcourſe of the nature of Foules. And firſt to begin with Oſtriches. They are the greateſt of all other foules, and in manner of the nature of feure footed beaſts: (namely, thoſe in Africke and Æthiopia) for higher they be than a man ſitting on horſebacke is from the ground: and as they be taller than the man, ſo are they ſwifter on foot than the very horſe: for to this end only hath Nature giuen them wings, euen to help and ſet them forward in their running: for otherwiſe, neither flie they in the aire, ne yet ſo much as riſe & mount from the ground. Clouen houfs they haue like red deere, and with them they fight; for good they be to catch vp ſtones withall, & with their legs they whurle them back as they run away, againſt thoſe that chaſe them. A wonder this is in their nature, that whatſoeuer they eat (and great deuourers they be of all things, without difference and choiſe) they concoct and digeſt it. But the verieſt fooles they be of all others. For as high as the reſt of their body is, yet if they thruſt their head and necke once into any ſhrub or buſh, and get it hidden, they thinke then they are ſafe enough, and that no man ſeeth them. Now two things they doe affoord, in recompence of mens pains that they take in hunting and chaſing them: to wit, their egs, which are ſo big, that ſome vſe them for veſſels in the houſe: and their feathers ſo faire, that they ſerue for pennaches to adorne and ſet out their creſts and morions of ſouldiers in the wars.

CHAP.

20030
copy 1

Chap. II.

¶ *Of the Phœnix.*

THe birds of Æthiopia and India, are for the moſt parr of diuerſe colours, and ſuch as a man is hardly able to decipher and deſcribe, But the Phœnix of Arabia paſſes all others. Howbeit, I cannot tell what to make of him: and firſt of all, whether it be a tale or no, that that there is neuer but one of them in all the world, & the ſame not commonly ſeen. By report he is as big as an Ægle: for colour, as yellow and bright as gold, (namely all about the necke;) the reſt of the bodie a deep red purple: the taile azure blew, intermingled with feathers among of roſe carnation color: and the head brauely adorned with a creſt and penach finely wrought; hauing a tuft and plume thereupon, right faire and goodly to be ſeen. *Manilius*, the noble Romane Senatour, right excellently ſeene in the beſt kind of learning and litterature, and yet neuer taught by any, was the firſt man of the long Robe, who wrot of this bird at large, & moſt exquiſitely He reporteth, that neuer man was known to ſee him feeding: that in Arabia he is held a ſacred bird, dedicated vnto the Sun: that he liueth 660 yeares: and when he groweth old, and begins to decay, he builds himſelfe with the twigs and branches of the Canell or Cinamon, and Frankincenſe trees: and when he hath filled it with all ſort of ſweet Aromaticall ſpices, yeeldeth vp his life thereupon. He ſaith moreouer, that of his bones and marrow there breedes at firſt as it were a little worme: which afterwards prooueth to be a prettie bird. And the firſt thing that this yong new Phœnix doth, is to perform the obſequies of the former Phœnix late de ceaſed: to tranſlate and cary away his whole neſt into the citie of the Sun neere Panchea, and to beſtow it full deuoutly there vpon the altar. The ſame *Manilius* affirmeth, that the reuolution of the great yeare ſo much ſpoken of, agreeth juſt with the life of this bird: in which yeare the ſtars returne againe to their firſt points, and giue ſignifications of times and ſeaſons, as at the beginning and withall, that this yeare ſhould begin at high noone that very day when the Sun entreth the ſigne *Aries*. And by his ſaying, the yeare of that reuolution was by him ſhewed, when *P. Licinius* and *M. Cornelius* were conſuls, *Cornelius Valerianus* writeth, That whiles *Q. Plautius* and *Sex. Papinius* were Conſuls, the Phœnix flew into Ægypt. Brought he was hither alſo to Rome in the time that *Claudius Cæſar* was Cenſor, to wit, in the eight hundreth yeare from the foundation of Rome: and ſhewed openly to be ſeen in a full hall and generall aſſembly of the people, as appeareth vpon the publick records: howbeit, no man euer made any doubt, but he was a counterfeit Phœnix, and no better.

Chap. III.

¶ *Of Ægles.*

OF all the birds which we know, the Ægles carie the price both for honor & ſtrength. Six kinds there be of them. The firſt named of the Greeks * *Melænaetos*, and in Latin, *Valeria*: the leaſt it is of all others, and ſtrongeſt withall, blacke alſo of colour: In all the whole race of the Ægles, ſhe alone nouriſheth her yong birds: for the reſt (as we ſhall hereafter declare) doe beat them away: ſhe only crieth not, nor keepeth a grumbling and huzzing as others doe: and euermore converſeth vpon the mountaines. Of the ſecond ſort is * *Pygargus*. It keepes about townes and plaines, and hath a whitiſh taile. The third is *Morphnos*, which *Homer* cals alſo *Percnos*: ſome name it *Plancus* and * *Anataria*: and ſhe is for bigneſſe and ſtrength, of a ſecond degree: louing to liue about lakes and meeres. Ladie *Phœnonæ*, who was ſuppoſed & ſaid to be the daughter of *Apollo*, hath reported, that rhis Ægle is toothed: otherwiſe mute, as not hauing any tongue: alſo, that of all other ſhe is the blackeſt, and hath the longeſt tail. With her accordeth *Boethus* likewiſe. Subtle ſhe is and wittie: for when ſhe hath ſeazed vpon Tortoiſes and caught them vp with her tallons, ſhe throweth them downe from aloft to breake their ſhells. And it was the fortune of the Poet *Æſchylus* to die by ſuch a meanes. For when he was foretold by wizards out of their learning, that it was his deſtinie to die on ſuch a day by ſome thing falling on his head: he thinking to preuent that, got him forth that day into a great open plain, far from houſe or tree, preſuming vpon the ſecuritie of the cleare and open skie. Howbeit, an Ægle let fall a Tortoiſe, which light on his head, daſht out his braines, and laid him aſleep for euer.

* The Saker as ſome thinke.

* A kinde of Faulcon.

For killing of Dunkes and Mallards.

Of

*The mountaine Storke.

Of the fourth knid is *Percnopterus*, the ſame that * *Oripelargus*, faſhioned like to a Geire or Vulture: it hath leaſt wings, a bodie bigger than the reſt: but a very coward, fearfull & of a baſtard and crauen kind, for a rauen will beat her. Beſides, ſhe hath a greedie and hungrie worm alwaies in her georg and craw, and neuer is content, but whining and grumbling. Of all Ægles ſhe only carrieth away with her the dead prey, & feedes thereupon in the aire: wheras others haue no ſooner killed, but they prey ouer them in the place. This baſtard buzzard kind maketh that the fifth, (which is the roiall Ægle) & is called in Greek *Gneſios*, as one wonld ſay, true and kindly, as deſcended from the gentle and right airie of Ægles. This Ægle roial, is of a middle bigneſſe and of a reddiſh colour, a rare bird to be ſeene. There remaineth now the ſixt and laſt ſort, and that is * *Haliartos*. This Ægle hath the quickeſt and cleareſt eie of all other, ſoaring & mounting on high: when ſhe ſpieth a fiſh in the ſea, downe ſhe comes with a power, plungeth into the water, and breaking the force thereof with her breſt, quickly ſhe catcheth vp the fiſh, and is gone. That Ægle which we named in the third place, haunting lakes, fens, and ſtanding waters for to prey vpon water-foule, who, to ſhift from her, are driuen otherwhile to diue vnder the water: but ſhe preſſeth ſo hard vpon them, that they be wearied and aſtonied in the end, and then ſhe catcheth them vp and carieth them away. A worthy ſport it is to ſee the maner of their ſcuffling: whiles the ſilly riuer bird makes means to gain the bank ſide for refuge (eſpecially if it be well grown with reeds) and the Ægle for her part driues her from thence with the clap and ſtroke of the wing, whiles, I ſay, as the Egle ſtriketh, and therewith plungeth her ſelfe down into the water, the poore fowle that ſwims vnderneath, ſeeing the ſhadow of the Egle houering about the bank ſide, riſeth vp again in another place far enough off from the Egle, and where ſhee imagined ſhe ſhould be leaſt looked for. Which is the cauſe that theſe wild fowle in the water commonly ſwim in flockes. For when they are many together they are not much troubled and annoied, by reaſon that with fluttering their pinnions, with daſhing and flapping the water with their wings, they dazle the ſight of their enemie. Oftentimes alſo the very Egles, not able to weld the prey that they haue ſeiſed on, are together with it drawne vnder the water, & ſo drowned. Now as touching the *Haliartos*, or the Oſprey, ſhe only before her little ones be feathered, will beat and ſtrike them with her wings, and thereby force them to looke full againſt the ſun beames: now if ſhe ſee any one of them to winke, or their eies to water at the raies of the Sun, ſhe turns it with the head forward out of the neſt, as a baſtard, and not right, nor none of hers; but bringeth vp and cheriſheth that whoſe eye will abide the light of the Sun, as ſhe looks directly vpon him. Moreouer, theſe Orfraies or Oſpreies are not thought to be a ſeuerall kind of Egles by themſelues, but to be mungrels, and ingendred of diuers ſorts. And their young Oſpraies be counted a kind of Oſſifragi: from them come the leſſer Geires; they again breed the greater, which ingender not at all. Some reckon yet another kind of Egle, which they cal Barbatæ; and the Tuſcanes, Oſſifrage.

*Some take it for the Oſpray

*The pretious ſtone Ætites.

But of the ſix kinds before rehearſed, the 3 firſt, and the fift, haue in their neſt a ſtone found named * Ætites, which ſome call Gagates, and it is therein ingendred. This ſtone is medicinable, and ſingular good for many diſeaſes, and if it be put into the fire it wil neuer a whit conſume. Now this ſtone, as they ſay, is alſo with child: for if a man ſhake it, he ſhall heare another to rattle and ſound within, as it were in the belly or wombe of it. But that vertue medicinable aboueſaid is not in theſe ſtones, if they be not ſtollen out of the very neſt from the airie. Build they do and make their neſts vpon rocks and trees. Three egs commonly they lay, whereof two only they vſe to hatch: howbeit ſomtimes they haue bin ſeen to haue 3 yong ones. But lightly one of them they turn out of the neſt, becauſe they would not be troubled with feeding & nouriſhing it. And verily Nature hath wel prouided, that at ſuch a time the old Egles ſhould not be able to purney ſufficient for meat: for otherwiſe, if they ſhould reare their birds, they were enough to deſtroy the yong breed of deere & wild beaſts in a whole country, that there ſhould be no veniſon nor game at all for gentlemen. Moreouer, by the ſame prouidence of Nature, all that while their tallons or clees hooke and turne inward very much: alſo for very hunger their feathers wax gray & white, ſo as they haue good cauſe not to abide their yong. But when they haue caſt them off, the Oſſifrages which are neere of kin vnto them, are ready to take them and bring them vp with their own birds. But the old Ægles their dammes not content therewith, perſecute them ſtill when they are growne to be bigge ones, beating and chaſing them away farre off, as their very concurrents, and who would intercommune with them, and rob them of

their

20030
copy 1

A their prey. And were it not ſo, certainly one airie of Egles needs the reach of a whole country to furniſh them with veniſon ſufficient to their full. They haue therefore their ſeuerall coaſts and walks, and without thoſe limits and vſuall haunts they rauen not. When they haue ſeiſed of any prey, they carry it not away preſently, but firſt lay it downe, peruſe and peiſe the weight of it, and then away they fly therewith amaine, but not before. They die not for age, nor vpon any ſickneſſe, but of very famine, by reaſon that the vpper beake of their bil is ſo far ouergrown and turns inward ſo much, that they are not able to open it to feed themſelues. Their maner is ordinarily to go to their buſines (namely to fly and ſeek their prey) after noon: for all the fore-noon they are perched vp, doing nothing, waiting the time when men be not ſtirring abroad, but about their markets within the cities and townes, or otherwiſe buſie in their ciuil affaires. The quils or feathers of Egles laid among thoſe of other foules, will deuour & conſume them.

B Men ſay, that of all flying Fowle the Egle onely is not ſmitten nor killed with lightening: whereupon folke are wont to ſay, that ſhee ſerues *Iupiter* in place of his ſquire or armor-bearer.

Chap. IV.

¶ *When Egles began to be the Enſignes and ſtandards of the Roman legions: and what fowles they be that war with Egles.*

Caius Marius in his ſecond Conſulſhip ordained, that the legions of Romane ſoldiers only ſhould haue the Egle for their ſtandard, and no other enſigne: for before-time the Egle marched formoſt indeed, but in a ranke of foure others, to wit, of * Wolues, Minotaures,

C Horſes, and Bores, which were borne each one before their own ſeuerall ſquadrons and companies. Not many yeares paſt, the ſtandard of the Egle alone began to be aduanced into the field to battell, and the reſt of the enſignes were left behind in the campe: but *Marius* reiected them altogether, and had no vſe of them at all. And euer ſince this is obſerued ordinarily, that there was no ſtanding campe or leaguer wintered at any time without a paire of Egle ſtandards.

* Names of Enſignes.

Of Egles, the firſt and ſecond kind prey not only vpon the leſſe foure footed beaſts, but alſo maintain battell with the red Deere, euen the ſtag and the hind. The maner of the Egle is, after ſhe hath wallowed in the duſt, and gathered a deale thereof among her feathers, to ſettle vpon the horns of the Deere aforeſaid, to ſhake the ſame off into his eies, to flap and beat him about

D the face with his wings, vntill ſhe driue him among the rocks, and there force him to fall down from thence headlong, and ſo to breake his neck. Moreouer, the Egle hath not enough of this one enemie, but ſhe muſt war with the dragon alſo; howbeit the fight betweene them is more ſharp and eager, yea, and putteth her to much more danger, albeit otherwhiles they combat in the aire. The Dragon of a naturall ſpight and greedy deſire to do miſchiefe to the Eagle, watcheth euermore where the airie is, for to deſtroy the egs, and ſo the race of the Egles. The Eagle again whereſoeuer ſhe can ſet an eye vpon him, catcheth him vp and carieth him away: but the ſerpent with his taile windeth about his wings, and ſo intangleth and tieth them faſt, that downe they fall both of them together.

Chap. V.

E

¶ *A ſtrange and wonderfull accident of an Egle.*

THere hapned a maruellous example about the city Seſtos, of an Egle: for which in thoſe parts there goes a great name of an Egle, and highly is ſhe honored there. A yong maid had brought vp a yong Egle by hand: the Egle again to requite her kindnes, would firſt when ſhee was but little, flie abroad a birding, and euer bring part of that ſhee had gotten vnto her ſaid nurſe. In proceſſe of time, being grown bigger and ſtronger, would ſet vpon wild beaſts alſo in the forreſt, and furniſh her yong miſtreſſe continually with ſtore of veniſon. At length it fortuned that the damoſell died: and when her funerall fire was ſet a burning, the Egle flew

F into the mids of it, and there was conſumed into aſhes with the corps of the ſaid virgin. For which cauſe and in memoriall thereof, the inhabitants of Seſtos and the parts there adioyning, erected in that very place a ſtately monument, ſuch as they cal Heroum, dedicated in the name of *Iupiter* and the virgin, for that the Egle is a bird conſecrated vnto that god.

CHAP.

Chap. VI.

¶ *Of Vultures or Geires.*

THe blacke Vultures are the beſt of that kind. No man euer could meet with their neſts: whereupon ſome haue thought, but vntruly, that they fly vnto vs out of another world, euen from the Antipodes, who are oppoſite vnto vs. But the very truth is, they build in the higheſt rocks they can find, and their yong ones haue many times bin ſeene, two together, and no more. *Vmbricius*, who was counted the moſt skilfull Aruſpex of our age, ſaith, they vſually lay three egs, whereof they take one of them to ſacre and bleſſe (as it were) the other eggs and the neſt, and then ſoon after they caſt it away. Alſo that the maner of the Geires is to foreſee a carnage, and to fly two or three daies before vnto the place where there wil be any carions or dead carkaſſes.

Chap. VII.

¶ *Of the Sangualis and Immuſſulus.*

AS touching the Sangualis and the Immuſſulus, our Augurs at Rome are in a great doubt and make much queſtion, what they ſhould be. Some are of opinion, that the Immuſſulus is the chicke of the Vulture; and the Sangualis likewiſe the yong Oſſifraga. *Maſſurius* ſaith, that the Sangualis and Oſſifraga be both one: and as for the Immuſſulus, it is the yong bird of the Egle before it come to haue a white taile. Some haue affirmed confidently, that after the death of *Mutius* the Augure there was neuer any of them ſeen at Rome. But I rather am of this mind (and me thinkes it ſounds more like a truth) ſuch is the ſupine negligence and careleſneſſe of men in all things elſe, that no maruell it is if they know them not although they ſee them.

Chap. VIII.

¶ *Of Hawkes.*

WE find in Faulconrie 16 kinds of Hawks or Fowles that prey. Of which the Circos (which is lame and limpeth of one leg) was held in antient time for the luckieſt Augurie in caſe of weddings and of cattell. Alſo the Hawke called Triorches (of three ſtones or cullions that it hath) is reputed a bird of good preſage: and in Augurie, lady *Phemonoe* hath giuen vnto it the honor of the beſt ſimply and moſt fortunate. The Romans call it Buteo, *i.* a Buzzard; and there is a worſhipfull houſe and family in Rome of that ſyrname, by occaſion that a Buzzard ſetled and perched himſelfe vpon the Admirall ſhip where *Fabius* himſelfe, one of that houſe, was, preſaging a boone-voyage and happy ſucceſſe, according as it fell out indeed. As for the Hauk which the Greeks name Æſalo, *i.* the Merlin, ſhe alone is euer ſeen at all times of the yeare, whereas the reſt are gon when winter commeth. In generall, Hawks are diuided into ſundry and diſtinct kinds, by their greedineſſe more or leſſe, and their manner in chaſe and preying: for ſome there be that neuer ſeiſe on a foule but vpon the ground: others againe neuer aſſaile any birds, but when they ſpy them flying about ſome tree. There be alſo, that take a bird perching and ſitting on high: and ye ſhal haue of them that ouertake them as they fly in the wide and open aire. The doues therefore and pigeons, knowing the danger of flying aloft, ſo ſoon as they eſpy them, either light vpon the ground and ſettle, or elſe fly neere the earth, and thus help themſelues by taking a contrarie courſe to the Hawks nature, to auoid their talons. There is in the ocean of Africke an Iſland called Cerne, wherein all the hawks of the coaſts of the Maſſeſyli, build vpon the very ground, and there breed, and be ſo accuſtomed to thoſe countries, you ſhall not find an airie of them elſewhere. In a part of Thrace, ſomewhat higher in the country beyond Amphipolis, men and hawks ioyn in fellowſhip and catch birds together; for the men driue the woods, beat the buſhes and reeds to ſpring the fowle; then the hawks flying ouer their heads, ſeiſe vpon them, and either ſtrike or beat them to the ground fit for their hands. On the other ſide, the hawkers and fowlers when they haue caught the Fowle, diuide the booty with the hawks; and by report they let ſuch birds fly againe at libertie aloft

into

20030
copy 1

A into the aire,and then are the hawkes ready to catch them for themſelues. Moreouer,when the time is of hawking,they will by their manner of crie and flying together,giue ſigne to the faulconers that there is good game abroad, and ſo draw them forth to hawking for to take the opportunitie. It is ſaid,that the wolues doe the like,about the lake Mœotis: for vnleſſe they may haue their part with the fiſhers, they will rend and teare their nets, when they find them ſtretched forth. Faulcons or Hawkes willingly eat not the heart of any bird. There is an hawke called Cymindis,which preyeth in the night: ſeldome is ſhe ſeene in the woods,and by day-light ſeeth little or nothing. There is deadly war between it and the Ægle; and oftentimes they be both taken, entangled one with another.

B

Chap. IX.

¶ *Of the Cuckow, which vſually is killed by birds of her owne kind.*

AS touching the Cuckow, it ſeemes that he comes of ſome hawke changed into his ſhape at one certaine time of the yeare: for then thoſe other hawkes are not to be ſeene, vnleſſe ſome very few daies. He ſheweth himſelfe alſo but for a ſmall ſeaſon in ſummer time, and afterwards appeareth no more. It is the only hawke that hath no talons hooked downward, neither is he headed as other hawkes,nor like vnto them,but in colour: and for bill, he reſembleth rather the doue. Nay more than that, the hawke will prey vpon him and deuoure him, if haply they be ſeen both together:and it is the only bird of all other that is killed by thoſe of the own kind. He altereth his voice alſo. In the ſpring,he commeth abroad,and by the beginning of the
C dog-daies,hides himſelfe. Theſe lay alwaies in other birds neaſts,and moſt of all in the Stock-doues,commonly one egge and no more (which no other bird doth beſides)and ſeldom twain. The reaſon why they would haue other birds to ſit vpon their eggs and hatch them, is becauſe they know how all birds hate them: for euen the very little birds are readie to war with them: for feare therefore that the whole race of them ſhould be vtterly be deſtroied by the furie of others of the ſame kind, they make no neſt of their owne (being otherwiſe timorous and fearefull naturally of themſelues) and ſo are forced by this craftie ſhift to auoid the danger. The Titling therefore that ſitteth,being thus deceiued, hatcheth the egge & bringeth vp the chick of another bird. And this yong Cuckow being greedy by kind,beguiling the other yong birds and intercepting the meat from them,groweth hereby fat and faire-liking: whereby it comes
D into ſpeciall grace and fauour with the dam of the reſt, and nource to it. She joieth to ſee ſo goodly a bird toward:and wonders at her ſelfe that ſhe hath hatched & reared ſo trim a chick. The reſt, which are her owne indeed, ſhe ſets no ſtore by, as if they werr changelings:but in regard of that one,counteth them all baſtards and misbegotten: yea,and ſuffereth them to be eaten and deuoured of the other euen before her face: and this ſhe doth ſo long, vntill the yong cuckow being once fledge & readie to flie abroad,is ſo bold as to ſeize on the old Titling,and to eat her vp that hatched her. And by that time there is not another bird againe for goodneſſe and ſweetneſſe of meat,comparable to the yong Cuckow.

Chap. X.

E

¶ *Of Gleedes, Kites, or Puttocks.*

THe Kites or Gleeds are of the ſame kind of Hawkes or birds of prey, only they be greater. This hath been noted & obſerued in them: that being a moſt rauenous bird, & euermore hungrie,yet were they neuer knowne to ſnatch any viands ordained at funerall feaſts for the dead,out of the platters;ne yet the fleſh of beaſts ſlaine in ſacrifice,from off the altar of *Iupiter* in Olympia. Nay,it was neuer ſeen that a Puttocke would catch fleſh out of their hands that ſerued at ſuch feaſts:but if it did,a great preſage it was of ſome dolefull & heauie misfortune which ſhould fall vpon the whole town,that made theſe ſolemne ſacrifices. Theſe Gleeds or Puttocks,ſeem by the winding and turning of their tails to & fro as they flie,to haue taught
F pilots the skil of ſteering,and vſe of the helme. See how Nature hath ſhewed that in the aire aboue,which is ſo neceſſary in the deep ſea beneath! Kites likewiſe are not often ſeen abroad in the dead time of winter:yet go they not away for altogether before the Swallows. Moreouer, it is ſaid,that after the Sunſteds,alway in ſummer,they be troubled with the gout in their feet.

CHAP.

G

Chap. XI.

¶ *A generall diuiſion of Foules.*

THe firſt & principall difference and diſtinction in birds, is taken from their feet: for they haue either hooked tallons, as Hawkes; or round long clawes, as Hennes; or elſe they be broad, flat, and whole-footed, as Geeſe and all the ſort in manner of water-foule. Thoſe that haue hooked tallons, for the moſt part feed vpon fleſh and nothing elſe.

Chap. XII.

H

¶ *Of vnluckie birds, and namely, the Crow, Rauen, and Scritch-owle.*

THe Crow liueth not altogether of carion, for the Rooke eateth of other food. The Crows and Rookes haue a caſt by themſelues: for when they meet with an hard nut which they be not able to cracke, nor breake their ſhales with their bills, they will flie aloft and fling it againſt ſome rock or tile houſe once or twice, yea & many times together, till it be ſo cruſhed and bruiſed, that they may eaſily breake it quite, and then they eat vp the kernell. Theſe birds all of them keep much pratling and are full of chat; which moſt men take for an vnluckie ſign and preſage of ill fortune: although ſome there be who think otherwiſe, that it is a good bird, and highly eſteem of her. Obſerued it is, that from the going down or occultation of the ſtarre Arcturus, vnto the comming of the Swallow, the Crow is not to be ſeene elſe-where but about the groues and temples of *Minerua* (and that is but very ſeldome) and namely, neere to Athens. Moreouer, this bird only feedeth her yong cadowes for a good while after they are able to flie. She is moſt vnluckie at breeding time and coouing, that is to ſay, after the Sunſted in ſummer. All other birds, which be as it were of the ſame race, driue their yong ones out of the neſt when they be once fledge, and put them to it, forcing them to flie abroad: like as the Rauens alſo, who likewiſe feed not on fleſh only: and they likewiſe when they perceiue their yong, once to be ſtrong, chaſe and driue them away farre off. Therefore about little villages and hamlets, there commonly be not aboue two paire of them at once. And about Cranon verily in Theſſalie, yee ſhall neuer ſee aboue one paire of them: for the old ones giue place to the yong, and fly away. There are ſome diuers and different properties in this bird, and that before-named: for the Rauens engender before the Sunſted, and fot ſixtie daies are ſomwhat ill at eaſe, and troubled with a kind of drought or thirſtines eſpecially, till ſuch time as the figges be ripe in Autumne: and then from that time forward, the Crow beginneth to be diſeaſed and ſick. Rauens for the moſt part lay fiue egges: and the common ſort are of opinion, that they conceiue and engender at the bill, or lay their egges by it: and therefore if women great with child chance to eat a Rauens egge, they ſhall be deliuered of their children at the mouth: and generally ſhall haue hard labour. if ſuch an egge be but brought into the houſe where ſuch a great bellied woman be. *Ariſtotle* denies this, and ſaith, that the Rauens conceiue by the mouth, no more than the Ægyptian Ibis: and he affirmeth, that it is nothing elſe but a wantonneſſe which they haue in billing and kiſſing one another, which we ſee them to doe oftentimes; like as the Doues and Pigeons alſo. The Rauens of all other foules, ſeeme to haue a knowledge of their owne ſignifications in preſages and fore-tokens: for when the mercinarie hired ſouldiers of Media were all maſſacred vnder a colour of entertainment and hoſpitalitie, the Rauens flew all away out of Peloponneſus and the region of Attica. The worſt token of ill lucke that they giue, is when in their crying they ſeeme to ſwallow in their voice as though they were choked.

I

K

L

The night birds haue alſo crooked tallons, as the Owles, Scritch-Owle, & Howlets. All theſe ſee but badly in the day time. The Scritch-Owle alwaies betokeneth ſome heauie newes and is moſt execrable and accurſed, and namely, in the preſages of publick affaires: he keepeth euer in deſarts: and loueth not only ſuch vnpeopled places, but alſo that are horrible and hard of acceſſe. In ſumme, he is the very monſter of the night, neither crying nor ſinging out cleare, but vttering a certaine heauy groane of dolefull mourning. And therefore if he be ſeen to fly either within cities, or otherwiſe abroad in any place, it is not for good, but prognoſticates ſome fearfull misfortune. Howbeit I my ſelfe know, that he hath ſitten vpon many houſes of priuat men,

M

and

20030
copy 1

A and yet no deadly accident followed thereupon. He neuer flieth directly at eaſe, as hee would himſelfe, but euermore ſidelong or byas, as if he were carried away with the wind or ſomewhat elſe. There fortuned one of them to enter the very ſecret ſanctuarie within the Capitoll at Rome, in that yeare when *Sex. Papellio Iſter*, and *L. Pedanius* were Conſuls: whereupon at the Nones of March, the city of Rome that yeare made generall proceſſions to appeaſe the wrath of the gods, and was ſolemnly purged by ſacrifices.

Chap. XIII.

¶ *Of the bird Incendiaria.*

B THis fire-bird Incendiaria is likewiſe vnlucky, and as our Chronicles and Annals doe witneſſe, in regard of her the city of Rome many a time hath made ſolemne ſupplications to pacifie the gods, and to auert their diſpleaſure by her portended. As for example, when *L. Caſſius* and *C. Marius* were Conſuls: in that very yeare when by occaſion of a Scritch-Owle ſeene, the city likewiſe was purged by ſacrifice, as is aboue ſaid, and the people fell to their prayers & deuotions. But what bird this ſhould be, neither do I know, nor yet finde in any writer. Some giue this interpretation of *Incendiaria*, to be any bird whatſoeuer, which hath beene ſeene carying fire either from altar or chappell of the gods. Others call this bird Spinturnix. But hitherto I haue not found any man that would ſay directly, That hee knew what bird this ſhould be.

Chap. XIV.

C ### ¶ *Of the bird Cliuina or Cluina.*

LIkewiſe the bird named in old time Clivina, or Cluina, which ſome call Clamatoria, and which *Labeo* deſcribeth by the name of Prohibitoria, I ſee is as little known as the other. *Nigidius* alſo maketh mention of a bird called Subis, which vſeth to ſquaſh Egles egs.

Chap. XV.

¶ *Of other vnknowne Birds.*

D IN the Augures bookes which the Tuſcanes haue compoſed, there be many birds deſcribed and ſet out in their colours, which haue not been ſeene ſome hundreds of yeares paſt. And I muſe and maruell much, that they ſhould be now extinct, and the race of them cleane gone, conſidering that the kind of thoſe fowles is not loſt, but continueth ſtill in great aboundance, which men eat daily at their tables, and conſume ſo ordinarily.

Chap. XVI.

¶ *Of night-flying Birds.*

OF ſtrangers and forrein writers, *Hylas* is thought to haue written beſt and moſt learnedly as touching Auguries and the nature of birds. He reports in his book, that the Howlet,
E Scritch-owle, the Spight that pecketh holes in trees, the Trogone, and the Chough or Crow, when they be hatched come forth of their ſhels with their taile firſt: and that by reaſon of their heads ſo heauy, the egs are turned with the wrong end downward, & ſo the hinder part of the body lieth next vnder the henne or the dam, to ſit vpon and cheriſh with the heat of her body.

Chap. XVII.

¶ *Of Owles or Howlets.*

F IT is a pretty ſight to ſee the wit and dexteritie of theſe Howlets when they fight with other birds: for when they are ouerlaid and beſet with a multitude of them, they lie vpon their backs, and with their feet make ſhift to reſiſt them: for gathering themſelues into a narrow compaſſe, there is nothing in a maner to be ſeen of them, ſaue only their bill and talons, which couer the whole body. The Faulcon, by a ſecret inſtinct and ſocietie of nature, ſeeing the poore Howlet thus diſtreſſed, commeth to ſuccor and taketh equal part with him, and ſo endeth the

fray. *Nigidius* writeth, that Howlets for ſixty daies in winter, keepe cloſe and remain in couert, G
and that they change their voice into nine tunes.

Chap. XVIII.

¶ *Of the Spight or Woodpecker.*

SOme little birds there are alſo that haue hooked clees, as the Spights, which are known by the ſirname of Martius, and be therefore called Pici Martij. Theſe are of great account in Auſpices and preſage good. They that job and pecke holes in trees, and will climbe vpright like cats, are of this race. As for them, they will rampe vp with their bellies to the tree, bending backward, & when they peck with their bils againſt the bark, they know by the ſound H
thereof, that there be worms within for them to feed vpon. Theſe birds alone of all others feed and nouriſh their yong ones in crannies and chinks of trees. And if it chance that a ſhepheard or ſome ſuch do pin or wedge vp their holes, it is thought commonly that they will vnſtop the ſame again by meanes of a certaine herbe, which no ſooner they touch the ſtopple with but it will out. *Trebius* writeth, that let a man driue a ſpike or great naile, or elſe a wedge or pinne of wood, as hard as euer he will, into that tree wherein this bird hath a neſt, incontinently as ſhee percheth and ſetleth vpon the tree, it will preſently fly out with ſuch a force, that the tree will giue a crack again therewith. Throughout all Latium theſe birds beare the name for effectual ſignification of good or bad fortune, by reaſon of that king or prince [i. *Picus*] who gaue them
that name. And one preſage of theirs aboue the reſt I cannot paſſe ouer: It fortuned that one of I
them light vpon the head of *L. Tubero* L. chiefe Iuſtice of the city of Rome, as hee was ſitting vpon the judgement ſeat in the open face of the Court miniſtring juſtice, and there reſted ſo gently, that it ſuffered him to take it with his hand. The Soothſayer being asked his aduice in this caſe, anſwered by booke, That if the bird were let go, it would portend the ruine and ouerthrow of the whole ſtate and empire: but if it were killed, it denounced the death of the ſayd Pretor or L. chiefe Iuſtice then in place. But the Pretor *Tubero* immediatly vpon this anſwer, plucked the bird in pieces. It was not long after but the preſage of this bird took effect indeed, and was fulfilled in his perſon. Moreouer there be of this kind many that feed on maſt, acorns, nuts, apples, and ſuch like fruits; but they be ſuch as liue in maner vpon fleſh onely. And yet I K
muſt except the Kite, for that propertie in him is noted to be in all Augurie an vnlucky ſigne, and preſage of ſome heauy and deadly misfortune.

Chap. XIX.

¶ *Of Birds that haue hooked talons and round long clawes like fingers.*

WHat fowles ſoeuer haue crooked clawes ſort not together in flocks, but prey each one apart for it ſelf; and lightly all ſuch fly aloft, vnleſſe it be the night birds aforeſaid: and the greater ſort eſpecially. They are all of them great winged, little bodied, and heauy in their gate vpon the ground. Seldom or neuer they ſit and perch vpon a rock: for why, L
their nails bowing and hooking inward will not giue them leaue. It remains now that we ſpeak of the ſecond kind or ranke of birds, which alſo is diuided into two ſorts; to wit, Oſcines that ſing, and Alites that fly only: for the ſinging of the one and the bignes of the other makes the difference and diſtinction between them. Theſe therefore that be greater bodied we wil by order treat firſt of.

Chap. XX.

¶ *Of Peacocks, and who was the firſt that killed them for the table.*

THe Peacock far ſurpaſſes all the reſt of this kind, as well for beauty, as alſo for the wit and M
vnderſtanding that he hath; but principally for the pride and glory he takes in himſelf. For perceiuing at any time that he is praiſed and well liked, he ſpreadeth his taile round, ſhewing and ſetting out his colours to the moſt, which ſhine againe like precious ſtones: and namely when he turnes them againſt the Sun, as his manner is; for ſo he giueth them a more radiant and glittering luſtre. And for the ſame purpoſe alſo with his taile, repreſenting fiſh

ſhels,

20030
copy 1

A ſhels,he giues a certain ſhadow to the reſt of his feathers,which ſeeme the brighter when they be a little ſhadowed: and withall,he ſets all thoſe eyes of his feathers together in a ranke, and gathererh them round,knowing full well that hee is the more looked on for them; and therein he taketh no ſmall ioy and pleaſure. On the other ſide,when he hath loſt this taile, which vſually he moulteth euery yere when trees ſhed their leaues,vntil ſuch time as trees bloſſom new; and his taile be grown again,he hath no delight to come abroad,but as if he were aſhamed,or mourned,ſeeketh corners to hide himſelfe in. The Peacocke ordinarily liueth 25 yeares. At 3 yeres of age he begins to put forth that varietie of colours in his feathers. Authors who haue written of him ſay,that he is not only a proud and vainglorious creature, but alſo as malicious and ſpightfull,as the Gooſe is baſhfull and modeſt: for ſo haue ſome of them obſerued theſe
B properties and qualities in theſe birds. But I for my part like not to make ſuch ſimilitudes.

The firſt that killed Peacocks to be ſerued vp as a diſh at the table,was *Hortenſius* that great Orator,in that ſolemne feaſt which he made when he was conſecrated high prieſt: and *M. Aufidius Lurco* deuiſed firſt to feed them fat:by which inuention of his,he might diſpend by yerely reuenue,60000 Seſterces. And this was about the time of the laſt Pirats war. 468 li. 15. ſh.

Chap. XXI.

¶ *Of Cocks,how they be cut and made Capons: alſo of a dunghill Cocke that ſpake.*

C NExt to Peacocks,theſe birds about our houſes which are our ſentinels by night,& whom Nature hath created to breake men of their ſleepe, to awaken and call them vp to their work,haue alſo a ſence and vnderſtanding of glory; they loue (I ſay) to be praiſed, and are proud in their kind. Moreouer,they are Aſtronomers,and know the courſe of the ſtars,they diuide the day by their crowing, from 3 houres to 3 houres: when the Sun goeth to reſt, they go to rooſt: and like ſentinels they keepe the reliefe of the fourth watch in the camp:they cal men vp to their carefull labour and trauell: they will not ſuffer the Sun to riſe and ſteale vpon vs,but they giue vs warning of it: by their crowing they tell vs that the day is comming, and they foretell their crowing likewiſe,by clapping their ſides with their wings. They are Commanders and rulers of their own kind,be they Hens or other Cocks; and in what houſe ſoeuer they be they will be maſters and kings ouer them. This ſoueraignty is gootten by plain fight one with another,as if they knew,that naturally they had ſpurs, as weapons, giuen them about
D their heeles,to try the quarrell: and many times the combat is ſo ſharp and hot,that they kill one another ere they giue ouer. But if one of them happen to be conqueror, preſently vpon victorie he croweth,and himſelfe ſoundeth the triumph. He that is beaten makes no words, nor croweth at all, but hideth his head in ſilence; and yet neuertheleſſe it goeth againſt his ſtomack to yeeld the gantlet and giue the bucklers. Hardly can he brook to be vnder another:and not only theſe cocks of game,but the very common ſort of the dunghill are as proud and high minded: ye ſhal ſee them to march ſtately, carying their neck bolt vpright, with a combe on their head like the creſt of a ſoldiers helmet. And there is not a bird beſides himſelf that ſo oft looketh aloft to the Sun and ſky; and then vp goeth the taile and all, which he beares on high, turning backward again on the top like a hook. And hereupon it is,that marching thus proud-
E ly as they do, the very Lions (which of all wilde beaſts be moſt couragious) ſtand in feare and awe of them,and will not abide the ſight of them.

Now of theſe Cocks,ſome of them are made for nothing els but war and fighting,and neuer are they well but in quarrels,brawles,and fraies; and theſe be cocks of kind: and the countries from whence they come are grown into name,being much renowned for their breed: as namely Rhodus and Tenagra in the firſt and higheſt degree. In a ſecond ranke and place be thoſe of Melos and Chalcis. Vnto theſe birds (for their worth & dignity) the purple robe at Rome,and all magiſtrats of ſtate diſdain not to giue honor. Theſe be they, that by their *tripudium ſoliſtimum* [*i.* hearty feeding] obſerued by the pullitiers, ſhew good ſucceſſe. Theſe rule our great ru-
F lers euery day: and there is not a mighty Lord or ſtate of Rome,that dare open or ſhut the dore of his houſe,before he knowes the good pleaſure of theſe fowles: and that which more is, the ſoueraigne magiſtrate in his majeſtie of the Roman empire, with the regall enſignes of rods and axes caried before him, neither ſets forward nor reculeth backe without direction from theſe birds: they giue order to whole armies to aduance forth to battel, & again command them to

ſtay and keep within the camp. Theſe were they that gaue the ſignall, and foretold the iſſue of all thoſe famous foughten fields, whereby we haue atchieued all our victories throughout the whole world: and in one word, theſe birds command thoſe great Commanders of all nations vpon the earth; as acceptable to the gods in ſacrifice with their ſmal fibres & filaments of their inwards, as the greateſt and fatteſt oxen that are killed for ſacrifice. Moreouer, their crowing out of order, too ſoon before their houre, or too late, and namely in the euening, portendeth alſo and preſageth ſomwhat by it ſelfe. For well known it is, that by their crowing at one time all night long, they fore-ſignified to the Bœotians that noble victorie of theirs atchieued ouer the Lacedæmonians. For this interpretation and coniecture was giuen thereupon of a fortunat day, becauſe that bird neuer croweth if he be beaten or ouercome. If they be once carued and made capons they crow no more. And this feat is practiſed vpon them two manner of waye; namely, either by burning their loines toward their kidnies with a red hot yron, or elſe by cauteriſing their legs beneath, and their ſpurs, and then preſently applying a plaiſter vnto the exulcerate and bliſtered place, made of potters white clay or chalky earth: and being thus ſerued they will ſooner feed and be fat. At Pergamus euery yeare there is a ſolemne ſhew exhibited openly to the people, of Cocke-fighting, as if ſword-fencers were brought within the liſts to fight at outterance. We finde in record among our Annales, that within the territorie of Ariminum, in that yeare when *Marcus Lepidus* and *Quintus Catulus* were Conſuls, there was a dunghill cocke did ſpeake: and it was about a ferme-houſe in the countrey belonging to one *Galerius*. But this hapned neuer but once, for ought that I could euer heare or learne.

Chap. XXII.

¶ *Of Geeſe, and who firſt eat the Gooſe liuer. Alſo of the leafe of a Gooſe of Comagena.*

THe Gooſe likewiſe is very vigilant and watchfull: witneſſe the Capitoll of Rome, which by the meanes of Geeſe was defended and ſaued: whereas at the ſame time, through the default of dogs (which ſhould haue giuen warning) all had like to haue bin loſt. Wherefore the firſt thing that the Cenſors do by vertue of their office, is to take order for the Geeſe of the Capitol, and to appoint ſome one man of purpoſe to ſee vnto them that they haue meat enough. Moreouer, they are ſaid to be giuen much to loue: for at Argos there was a Gooſe that was wonderouſly inamoured of a faire boy named *Olenus*: as alſo of a damoſel whoſe name was *Glauce*, who vſed to play on the lute before king *Ptolomæus*: and by report at the ſame time a Ram made court vnto the ſaid wench, and was in loue with her. It may be credibly thought alſo, that this creature hath ſome ſparks (as it were) of reaſon, vnderſtanding, and learning, for *Lacydes* the Philoſopher had one of them about him, which would neuer leaue him night nor day, neither in the open ſtreet abroad, nor in priuat houſe at home; but would follow him euen to his cloſe and ſecret baines where he vſed to bathe. But our countrimen and citiſens of Rome (beleeue me) are wiſer now adaies, who know, forſooth, how to make a dainty diſh of their Liuer. For in thoſe Geeſe that are kept vp and cram'd fat in coup, the liuer grows to be exceeding great; and when it is taken forth of the belly, it waxeth bigger ſtill, if it be ſteeped in milk and ſweet mede together. Good cauſe therefore it is, that there be ſome queſtion and controuerſie about the firſt inuentor of this great good and ſingular commoditie to mankind: whether it were *Scipio Metellus*, a man who lately was called to be Conſul: or *M. Seſtius*, who in thoſe daies was by his birth a gentleman of Rome. But to leaue that ſtil vndecided, this is certainly known that *Meſſalinus Cotta*, ſon to that *Meſſala* the Orator, found out the ſecret to broile & fry the flat broad feet of Geeſe, and together with cocks combs, to make a ſauory diſh of meat thereof between two platters. For ſurely I for my part will giue euery man his due and right, and will not defraud them of their ſingular praiſe and honour who haue bin benefactors to the kitchen, and proceeded maſters in cookerie. A maruellous thing of theſe birds that a flock of them ſhould come all the way bare foot, from * Terwin and Torney in France, as far as to Rome. Their order was who had the conduct of them in this large voyage, to bring thoſe forward that were weary and lagged behind, into the vaward & forefront: and ſo the reſt by a certain thick vnited ſquadron (which naturally they make going together) driue the others before them. A ſecond commo-

* Morins.

20030
copy 1

A commoditie that Geeſe yeeld, (eſpecially thoſe that be white) is their plume and downe. For in ſome places their ſoft feathers are pluckt twice a yeare: and yet they cary feathers again, and be as well couered with plume as before: and euermore the neerer to the skin and fleſh, the ſofter is the downe. But of all other, the fineſt and beſt is that which is brought out of Germanie. The Geeſe there, be all white; but leſſe of bodie than from other parts: and there they be called Ganzæ. And truly, a pound of ſuch feathers be worth * 5 deniers. Hereupon it is, that ſo many complaints are made of Colonels and Captaines ouer companies of auxiliarie ſouldiers for their diſorders. For wheras they ſhould keep them together in a ſtanding *corps de gard*, to watch and ward night and day: they licenſe many times whole bands to ſtraggle abroad, to hunt and chaſe Geeſe for their feathers and downe. And now forſooth the world is growne to be ſo delicate and daintie, that not only our fine ſmooth dames, but alſo our men, cannot take their re-
B poſe and ſleep without this ware; but complaine of a paine in their necks and heads, vnleſſe they may lay them vpon bolſters and pillowes of gooſe feathers, and their ſoft downe. * 3 *lb. i. Lob.*

Now, to that part of Syria called Comagena, we are beholden for another proper inuention of theirs. They take me the leaſe and greaſe of Geeſe and Cinnamon together, which they put into a brazen pot, and couer it all ouer with good ſtore of ſnow, wherein they let it lie in ſteepe; well infuſed in this cold humor, to vſe in that notable compoſition and ſweet ointment, which of that countrey is called Comagenum.

Of the Geeſe kind are the Bitganders named Chelanopeces: and (than which there is not a daintier diſh knowne in England) the Chenerotes, leſſe than wild Geeſe.

C As for the pheſant Buſtards, they haue a trim ſhining brightneſſe that becommeth and graceth them exceeding well in their perfect and abſolute black hew: and their eie-browes painted red as it were with deep Scarlet.

Another kind there is of them, bigger than Vultures, but in feather and colour much reſembling them. And there is not a Foule (ſetting the Oſtrich aſide) that poiſeth & weigheth more heauy than they: for they grow to that bignes, that a man can hardly lift them from the ground. Theſe breed in the Alpes and the North countries. If they be mued vp and kept in a pen, they loſe their pleaſant taſte, and are no good meat: nay, they grow ſo ſullen and ſelf-willed, that they will die with holding their breath. Next to theſe are thoſe which in Spaine they cal the Slow-birds, and in Greece Otides: but their meat is naught: for the marow in their bones, if it be let
D run out, hath ſuch a ſtinking ſmell, that a man cannot abide it, but ſhall be readie to vomite.

Chap. XXIII.

¶ *Of Cranes, Storkes, Swans, Quailes, the Glotis, and ſtrange birds of other countries.*

THe nation of the prettie Pigmies enjoy a truce and ceſſation from armes, euery yeare (as we haue ſaid before) when the Cranes, who vſe to wage war with them, be once departed & come into our countries. And verily, if a man conſider well how far it is from hence to the Leuant ſea, it is a mightie great journey that they take, & their flight exceeding long. They put not themſelues in their journey, nor ſet forward without a counſell called before, and a generall
E conſent. They flie aloft, becauſe they would haue a better proſpect to ſee before them: and for this purpoſe a captain they chuſe to guide them, whom the reſt follow. In the rereward behind there be certaine of them ſet and diſpoſed to giue ſignall by their manner of crie, for to raunge orderly in rankes, and keep cloſe together in array: and this they doe by turnes each one in his courſe. They maintaine a ſet watch all the night long, and haue their ſentinels. Theſe ſtand on one foot, and hold a little ſtone within the other, which by falling from it, if they ſhould chance to ſleepe, might awaken them, and reproue them for their negligence. Whiles theſe watch, all the reſt ſleep, couching their heads vnder their wings: and one while they reſt on the one foot, and otherwhiles they ſhift to the other. The captaine beareth vp his head aloft into the aire, and
F giueth ſignall to the reſt what is to be done. Theſe Cranes if they be made tame and gentle, are very playfull and wanton birds: and they will one by one dance (as it were) and run the round with their long ſhankes ſtalking ful vntowardly. This is ſurely known, that when they mind to take a flight ouer the ſea Pontus, they will fly directly at the firſt to the narrow ſtreights of the ſayd ſea, lying between the two capes Criu-Metophon and Carambis, and then preſently they ballaiſe

ballaiſe themſelues with ſtones in their feet, and ſand in their throats, that they flie more ſteadie and endure the wind. When they be halfe way ouer, down they fling theſe ſtones: but when they are come to the continent, the ſand alſo they diſgorge out of their craw. G

Cornelius Nepos, who died in the daies of *Auguſtus Cæſar* Emperor, in that chapter where he wrote, That a little before his time men began to feed and cram Blackbirds and Thruſhes in coupes, ſaith moreouer, That in his daies Storks were holden for a better diſh at the bourd than Cranes. And yet ſee, how in our age now, no man will touch a Storke if it be ſet before him vpon the bourd: but euery one is readie to reach vnto the Crane, and no diſh is in more requeſt. From whence theſe Storks ſhould come, or whither they go againe, is not yet known. No doubt from far remote countries they viſite vs, and in the ſame manner as the Cranes do: only this is the difference, that the cranes are our gueſts in Winter, and the Storks in Summer. When they be minded to part out of our coaſts, they aſſemble all together in one certain place appointed: there is not one left out nor abſent of their owne kind, vnleſſe it be ſome that are not at libertie, but captiue or in bondage. Thus (as if it had been publiſhed before by proclamation) they riſe all in one entire companie, and away they flie. And albeit well knowne it might be afore, that they were vpon their remoue and departure, yet was there neuer any man (watched he neuer ſo well) that could perceiue them in their flight: neither do we at any time ſee when they are comming to vs, before we know that they be alreadie come. The reaſon is, becauſe they doe the one and the other alwaies by night. And notwithſtanding that they flie too and fro from place to place, and make but one flight of it, yet be they ſuppoſed neuer to haue ariued at any coaſt but in the night. There is a place in the open plaines and champion countrey of Aſia, called Pithonos-Come: where (by report) they aſſemble all together, and being met, keepe a jangling one with another: but in the end, look which of them lagged behind and came tardie, him they reare in peeces, and then they depart. This alſo hath been noted, that after the Ides of Auguſt they be not lightly ſeene there. H I

Some affirme conſtantly, that Storkes haue no tongues. But ſo highly regarded they are for ſlaying of Serpents, that in Theſſalie it is accounted a capitall crime to kill a Storke, and by law he is puniſhed as a Fellon in the caſe of manſlaughter.

After the ſame maner wild Geeſe and Swans do ſort together, when they be paſſengers from countrey to countrey: but all theſe are ſeen when they flie. They make way forcibly in a pointed ſquadron, like as it were the ſtem of a foiſt at ſea, armed with a ſharp beakehead (for by this meanes they breake and cut the aire better, than if they draue it before with a ſtreight, euen, and ſquare front.) And thus wedg-wiſe by little and little they ſpread broader and broader behind, and beare a great length beſides with them: by which meanes alſo they gather more wind to heaue them vp and ſet them forward. In this their flight they reſt their heads vpon the former: and euer as one that leadeah the way is wearie with bearing his head, he retires behind to eaſe himſelf vpon him that flieth next before. Storks keep one neſt ſtil from yeare to yeare, and neuer chang: and of this kind nature they are, that the yong will keep and feed their parents when they be old, as they themſelues were by them nouriſhed in the beginning, K

Some ſay that the Swans ſing lamentably a little before their death, but vntruly, I ſuppoſe: for experience in many hath ſhewed the contrarie. Howbeit, theſe foules vſe to eat and deuour one another. L

But ſince we are entred into this diſcourſe of thoſe foules that make voiages by whole flocks ouer ſea and land to ſee ſtrange countries, I canot put off to ſpeak of leſſer birds alſo, which are of the like nature. For thoſe beforenamed may ſeeme in ſome ſort to be induced to ſuch great trauell, ſo bigge they are of bodie, and ſo ſtrong withall. As touching Quailes therefore, they alwaies come before the Cranes depart. A little bird it is, and whiles ſhe is among vs here, mounteth not aloft in the aire, but rather flieth below neere the ground. The manner of their flying is like the former, in troupes: but not without ſome danger of the ſailers when they approch neer to land. For oftentimes they ſettle in great number on their ſailes, and there perch, which they doe euermore in the night, and with their poiſe beare downe barkes and ſmall veſſels, and finally ſinke them. Theſe Quailes haue their ſet gifts, to wit, ordinarie reſting and baiting places. When the Southwind blowes, they neuer flie: for why? it is a moiſt, heauy, and cloggie wind, & that they know well ynough. And yet they willingly chuſe a gale whenſoeuer they flie, by reaſon that their bodies are too weightie (in compariſon of their wings) to beare M

them

20030
copy 1

A them vp:and beſides,their ſtrength is but ſmall. And hereupon it is, that as they flie,they ſeem by their manner of crie to complaine,as though they flew with paine. Commonly therefore they chuſe a Northerne wind to flie with:and they haue one mighty great Quaile called Ortygometra,to lead the way and conduct them,as their captain. The formoſt of them, as he approcheth neere to land,paieth toll for the reſt vnto the Hauke,who preſently for his welcome preieth vpon him. Whenſoeuer at any time they are vpon their remooue and departure out of theſe parts,they perſuade other birds to beare them company:and by their inducements, there go in their train the Glottis,* Otis,and the Cychramus. As for the Glottis, he putteth forth a long tongue,wherupon he hath that name. This bird is very forward at the firſt ſetting out(as B being deſirous to be a traueller,to ſee far countries,and to change the aire:) and the firſt daies iourny he vndertaketh with pleaſure:but ſoone finding the tediouſneſſe and paines in flying,he repents that euer he enterpriſed the voiage. To go backe again without company, hee is aſhamed:and to come lag behind he is as loth:howbeit,for that day he holdeth out ſo ſo, and neuer goeth farther; for at the next reſting place that they come vnto, hee faire leaueth the company and ſtaieth there;where lightly he meeteth with ſuch another as himſelfe, who the yere before was left behind. And thus they do from time to time,yere by yere. As for the Cychramus, he is more ſtaid and reſolute to indure the trauel:he maketh haſt and hath an earneſt longing to come into thoſe parts which he ſo much deſires:& therfore in the night ſeaſon he is as good as a trumpet to awake the reſt,& put them in mind of their iourny. The Otis is a bird leſſe than C the Like-Owle,bigger than the Howlet,hauing two plumed ears ſtanding vp aloft, whereupon he took that name Otis in Greek. But in Latine ſome haue called him Aſio. This bird beſides hath certain qualities by her ſelf,& is skilful to counterfeit and make geſtures like a flattering paraſite:ſhe can foot it,turn and trip,mount and capre,as if ſhe were a profeſſed dauncer: eaſie ſhe is to be taken like as the Howlet,for whiles ſhe is amuſed and looking wiſtly vpon one that goeth about her,another commeth behind and ſoon catcheth her. But to return to our Quailes aforeſaid. If a contrarie wind ſhould chance to ariſe and begin to driue againſt them, and hinder their flight:to preuent this inconuenience,they be well prouided. For they flie well ballaiſed either with ſmall weightie ſtones within their feet,or els with ſand ſtuffed in their craw:the ſeed or grain of the white Elebore(a very poiſon)they loue paſſing wel, & it is their beſt meat. D But hereupon it is,that they are not ſerued vp as a diſh to the table. Moreouer,they are wont to ſome and ſlauer at the mouth,by reaſon of the falling ſickneſſe, vnto which they onely of all other creatures,but man, again,are ſubiect.

* The Biſtard or Horn-owle

Chap. XXIV.

Of Swallowes,Ouſles,or Merles,Thruſhes,Stares or Sterlings,Turkies,and Stockedoues.

THe Swallowslikewiſe(the birds alone of all thoſe that haue not crooked claws,which feed vpon fleſh)are gone from vs all Winter time. Howbeit,they depart not far off, but ſeeke E only the Sun-ſhine noukes,betweene hils neere at hand, and follow the warmth. Where many times they are found naked,and without feathers altogether,as if they had moulted. It is ſaid,that they wil neuer build their neſts vnder any houſe in Thebes:becauſe that city had bin many times forced and taken by the enemy. Neither in Bizia,a city of Thrace,by reaſon of the deteſtable parts practiſed by *Tereus* there. *Cecina* of Volaterræ, a Gentleman of Rome by calling (gouernour and maſter of the coaches and coach-horſes that vſed to runne for the priſe and beſt game)was wont to bring with him into the city,a number of theſe Swallowes, which he had gotten in diuers places where he came,out of his friends houſes wherin they were bred. And when the horſes which hee had in charge obtained at any time victorie in the race, hee would take the birds,and paint them with that colour which betokened victorie, and ſo with F that liuerie (as it were) let them flie to his friends, for to carry tidings vnto them of the good ſucceſſe which hee had obtained: knowing right well,that euery one would home to the ſame neſt from whence they came. And thus in ſmall ſpace could hee enforme his conſorts and well-willers of his good ſpeed. Alſo *Fabius Pictor* reporteth in his Annales, That when a fort (which the Roman garriſon held) was beſieged by the Liguſtines; there was a ſhee Swallow newly taken out of her neſt within that fort, from her little ones as ſhee ſat ouer them, and brought

brought to him with this watchword, That by a linnen thred tied to her foot in ſtead of a letter,he ſhould aduertiſe them within the fort, by ſo many knots tied in the ſaid thred, as there would daies paſſe before aid could come from him vnto them, to the end that they alſo might be ready vpon that day to ſallie forth. G

Ouſles, Throſtles, Blackbirds, and Stares, after the ſame manner depart aſide from vs, but go not far. Howbeit, theſe caſt not their feathers, nor lie altogether hidden: but are ſeen oftentimes in places, from whence they fetch meat to ſerue them in the Winter. And therefore it is, that Blackbirds are common in Germany, and ſpecially in Winter time.

The Turtle more properly and truly is ſaid to hide her ſelf, and to ſhed her plume & moult.

Stockdoues likewiſe depart from vs, but whether they go no man knoweth.

As touching Sterlings, it is the property of the whole kind of them to flie by troups, and in their flight to gather round into a ring or bal, whiles euery one of them hath a deſire to be in the middeſt. H

Of all birds, the Swallow alone flieth bias, and windeth in and out in his flight: he is moſt ſwift of wing, and flieth with eaſe: and therefore not ſo ready to be ſurpriſed and taken by other birds. To conclude, he neuer feedeth but flying, and ſo doth no other bird beſides.

Chap. XXV.

¶ *What birds continue with vs all the yeare long: which be halfe yeares birds, and which be but for three moneths.*

GReat difference there is in the ſeaſons and times of birds. Some abide the whole yeare, as houſe-doues: others halfe the yere, as Swallows: and ſome again but a quarter, as blackbirds and Turtle-doues. And there be againe that are gone ſo ſoone as they haue hatched and trained their young abroad into the open aire. Such be the Hu-holes, and Houpes [or Lapwings as ſome thinke.] I

Chap. XXVI.

¶ *Strange ſtories of birds.*

WRiters there be who affirme, That euery yeare certain birds come flying out of Ethyopia to Ilium, and there, about the tombe or ſepulchre of *Memnon*, skirmiſh and fight a battell. For which cauſe men call them Memnonides. And *Cremutius* auoucheth vpon his owne knowledge, That euery fifth yere the ſame birds do the like in Æthyopia, euen before the roiall palace ſomtime of the ſaid king *Memnon*. K

Semblably, the birds named Maleagrides, do fight a field in Bœotia. Now are theſe Meleagrides a kind of Turky-cocks, and hens of Africk, hauing a bunch on their back, and beſpotted with feathers of ſundry colours. Of all ſtrange birds, comming out of forreine parts, theſe are laſt receiued and admitted to ſerue the table, by reaſon of a certain harſh and vnpleaſant ſtrong taſte that they haue. But it is the monument and tombe of *Meleager* which hath giuen them that name and credit which they haue. L

Chap. XXVII.

¶ *Of birds ſyrnamed Seleucides.*

THe birds called Seleucides, come to ſuccour the inhabitants of the mountaine Caſius, againſt the Locuſts. For when they make great waſte in their corne and other fruits, *Iupiter* at the inſtant praiers and ſupplications of the people, ſendeth theſe fouls among them to deſtroy the ſaid Locuſts. But from whence they come, or whether they go again, no man knoweth: for neuer are they ſeene but vpon this occaſion, namely, when there is ſuch need of their helpe. M

Chap. XXVIII.

¶ *Of the bird Ibis.*

THe Ægyptians likewiſe haue recourſe in their prayers & inuocations to their birds named Ibis, what time as they be troubled and annoied with ſerpents comming among them: and

in

20030
copy 1

A in like caſe the Eleans ſeeke vnto their god *Myiagros*, for to be rid of a multitude of flies which peſter them ſo, that they breed a peſtilence among them. But looke vpon what day they find that Idoll appeaſed and pacified by their ſacrifice, all the flies die forth-with.

Chap. XXIX.

¶ *What birds they be, which will not abide ſome places: alſo which be they that change colour and voice: and then of the Nightingale.*

B BVt that which wee ſhould haue ſaid when wee wrote of the departure and going aſide of birds: the Howlets alſo are reported to lie hidden ſome few daies. Moreouer, this is known for a truth, That in the Iſland Candy there be none at all of them: and in caſe that any one be thither brought, it will die there. A wonderful thing, that nature ſhould make difference of birds and other creatures in that reſpect. But ſure it is, ſhe hath not brought forth all creatures in al places, but hath priuiledged this country more than that: & denied that to one which ſhe hath giuen vnto another. And thus hath ſhee dealt not onely by fruits of the earth, trees, and plants, but alſo by liuing creatures. That in ſome parts this or that ſhould not grow or breed, is a thing commonly ſeen & known: but, that thoſe things ſhould die ſo ſoon as they are brought thither, is very ſtrange & wonderfull. What ſhould that be, which is ſo contrary vnto one kind and no more, as that it will not ſuffer it to liue? What enuie is this of Nature, thus to hinder C the breeding or life of any creature? or why ſhould birds be reſtrained within any limits and bounds in the whole earth? And yet ſee! In all the Iſland of Rhodes a man ſhall not find one Airie of Ægles. In that tract of Italy beyond the Po, and neere vnto the Alpes, there is a lake which they call there Larius; the place about it is right pleaſant and delectable, enriched with goodly trees that beare fruit, and faire fields for paſturage: and yet a man ſhall neuer ſee any Stork to come thither, no nor within 8 miles of it. And yet in the neighbor quarters of the* Inſubrians neer adioyning, ye ſhall haue infinite and innumerable flocks and flights of choughes and jack-dawes: the verieſt theeues, nay the only theeues of all other birds, eſpecially for ſiluer and gold, that it is a wonder to ſee what meanes they will make to ſteale and filtch it. Men ſay that in the territory of Tarentum there be no wood-pecks or tree-jobbers. It is but of late daies D ſince that from the mountaine Apennine toward the city of Rome there haue been ſeen Pyannets with long tailes, party coloured and flacked, wherupon they be called Variæ: and yet ſuch are not common, but very geaſon to be ſound. Their property is to be bald euery yeare, what time as men ſow rapes or nauewes. The Patridges in the territory of Attica, flie not ouer into the marches of Bœotia. And there is not a bird within the compaſſe of the ſea Pontus, & namely, in the Iſland wherein *Achilles* was buried, that will paſſe beyond the temple conſecrated vnto him. In the territory of Fidenæ neer to Rome, Storkes build no neſts, neither ſhall a man find a yong Storke there. But into the parts about Volaterræ, there is not a yeare but one ſhall ſee a world of Stockdoues flying from beyond ſea. At Rome ye ſhall not haue a fly or dog that will enter into the chappell of *Hercules* ſtanding in the beaſt market. In a word, I could alledge ma- E ny ſuch like examples, which of purpoſe I paſſe ouer, becauſe I would not be tedious in my diſcourſes: ſeeing that *Theophraſtus* reports, how all the Doues, Peacocks, and Rauens, which are in Aſia, hane been brought thither from other parts: like as all the Frogs in Cyrenaica, which do crie, whereas their owne be mute all.

* Lumbardie

As for ſinging birds, this is another ſtrange and wondrous thing obſerued in them. For at certain times of the yere they change their colour in feathers, and alter their voice in ſinging: and that in ſuch ſort, as of a ſuddaine a man would ſay they were other birds. A thing that happeneth not to the great foules aboue-ſaid, ſaue only vnto Cranes: for they with age wax black. And to begin with the Merle or black-bird, which naturally is blacke, he turnes to be reddiſh. In Summer he ſingeth cleare and tunably, in winter he ſtutteth and ſtammereth: but about the F ſun-ſtead in December he is mute and dumbe altogether. After they be once a yere old, I mean the cockes or males onely of that kinde, their bils turne to be white like yuorie. The Throſtles or Mauiſſes all Summer be painted about the necke with ſundry colours, but in Winter they be all of a colour.

The Nightingale for fifteene daies and nights together, neuer giueth ouer but chaunteth continually, namely, at that time as the trees begin to put out their leaues thicke. And ſurely this

this bird is not to be ſet in the laſt place of thoſe that deſerue admiration: for is it not a wonder G
that ſo loud and cleare a voice ſhould come from ſo little a body? Is it not as ſtrange that ſhee
ſhould hold her wind ſo long, and continue with it as ſhe doth? Moreouer, ſhe alone in her ſong
keepeth time and meaſure truly; ſhe riſeth and falleth in her note juſt with the rules of Muſick
and perfect harmony; for one while, in one entire breath ſhe drawes out her tune at length trea-
table; another while ſhe quauereth, and goeth away as faſt in her running points: ſometime ſhe
maketh ſtops and ſhort cuts in her notes, another time ſhe gathereth in her winde and ſingeth
deſcant between the plain ſong: ſhe fetcheth her breath againe, and then you ſhall haue her in
her catches and diuiſions: anon all on a ſudden, before a man would thinke it, ſhe drowneth
her voice, that one can ſcarce heare her: now and then ſhe ſeemeth to record to her ſelfe; and
then ſhe breaketh out to ſing voluntarie. In ſum, ſhe varieth and altereth her voice to all keies: H
one while, ful of her largs, longs, briefs, ſemibriefs, and minims; another while in her crotchets,
quauers, ſemiquauers, and double ſemiquauers: for at one time you ſhall heare her voice ful of
loud, another time as low; and anon ſhrill and on high: thick and ſhort when ſhe liſt; drawn out
at leiſure againe when ſhe is diſpoſed: and then (if ſhe be ſo pleaſed) ſhee riſeth and mounteth
vp aloft, as it were with a wind-organ. Thus ſhe altereth from one to another, & ſings all parts,
the Treble, the Mean, and the Baſe. To conclude, there is not a pipe or inſtrument againe in the
world (deuiſed with all the art and cunning of man ſo exquiſitely as poſſibly might be) that can
affoord more muſick than this pretty bird doth out of that little throat of hers. So as no doubt
there was fore-ſignified moſt excellent and melodious muſicke, by an excellent preſage of a
nightingale which ſetled vpon the mouth of *Steſichorus* the Poet, and there ſung full ſweetly:
who afterwards proued to be one of the moſt rare and admirable muſitians that euer was. And I
that no man ſhould make a doubt that there is great Art and cunning herein, do but marke, how
there is not one Nightingale but hath many notes and tunes. Againe, all of them haue not the
ſame, but euery one a ſpeciall kind of Muſick by her ſelfe: nay, they ſtriue who can do beſt, and
one laboreth to excell another in varietie of ſong and long continuance: yea, and euident it is,
that they contend in good earneſt with all their will and power: for oftentimes ſhee that hath
the worſe and is not able to hold out with another, dieth for it, and ſooner giueth ſhe vp her vi-
tall breath, than giueth ouer her ſong. Ye ſhall haue the yong Nightingales ſtudie and medi-
tate how to ſing, by themſelues; ye ſhal haue them liſten attentiuely to the old birds when they
ſing, and to take out leſſons as it were from them, whom they would ſeeme to imitate ſtaffe by K
ſtaffe. The ſcholler when ſhe hath giuen good eare vnto her miſtreſſe, preſently rehearſeth what
ſhe hath heard; and both of them keep ſilence for a time in their turns. A man ſhall euidently
perceiue when the yong bird hath learned well, & when again it muſt be taught how to correct
and amend wherein it did amiſſe; yea, and how the teacher will ſeeme to reproue and finde a
fault; no maruell therfore if one of theſe Nightingales carrie the price (in the market) of a bond-
ſlaue; yea and a higher too, than a man might in old time haue bought a good page & harneſſe-
bearer. I my ſelfe haue knowne one of them (mary it was white, which was a rare thing and not
commonly ſeen) to haue bin ſold for 6000 Seſterces, for to be giuen as a Preſent vnto the Em-
preſſe *Agrippina*, wife of *Claudius Cæſar* late Emperor of Rome. And now of late we haue known L
many of them taught to begin to ſing, only when a man would haue them: and keepe their re-
ſponds in courſe after others, in good conſent and harmony. As alſo there haue bin found men,
who by a deuiſe of a reed or cane had out of the water, put croſſe ouerthwart their mouth, and
by putting their tongue into an hole made of purpoſe in it, and blowing withal, could counter-
feit the Nightingale ſo perfectly, that one might not diſcern and diſtinguiſh the one from the
other. Well, theſe little Nightingales, ſo great chanters as they be, ſo cunning and full of their
conceits, after 15 daies begin to abate and ſlack their muſick; yet ſo, as a man cannot ſay, they
were either wearie, or ſatisfied with ſinging: for ſoone after, when the weather groweth hotter,
their voice is clean altered: for neither are they muſicall and tuneable in their meaſures with
varietie as before, but only ſing plain ſong and keep them to one tune. And more than ſo, they M
change their colour in proceſſe of time: and laſt of all, when winter comes, be no more ſeene.
Tongued they are not like other birds, with a thin tip before. They begin to breed with the firſt
in the prime of the Spring, and commonly lay ſix egs.

The Gnatſnapper, Ficedula, a bird ſomwhat like vnto the Nightingale, doth otherwiſe: for
at one time it changeth both colour, form, and ſong. They haue not that name Ficedulæ pro-

perly

20030
copy 1

A perly but in the Autumne,as one would ſay,fig-feeders:for when that ſeaſon is once paſt, they be called Melancoryphi,*i*. Black-heads.

In like ſort,the bird which is named Erithacus(*i*.Robin,or Redbreſt)in winter ; the ſame is Phœnicurus[*i*.Red-taile]all ſummer long.

The Houpe or Vpupa(as *Æſchilus* the Poet ſaith)changeth alſo her hew, voice, and ſhape. This is a * naſty and filthy bird otherwiſe,both in the manner of feeding, and alſo in neſtling: but a goodly faire creſt or comb it hath,that will eaſily fold and be plaited:for one while ſhee will draw it in,another while ſet it ſtiffe vpright along the head. * For as *Ariſt.* reporteth, it neſtleth in mans doung.

As for the bird Oenanthe,it alſo for certain daies lieth cloſe and vnſeen; & namely, when the Dog-ſtar ariſeth,it is hidden:but after the occultation therof, commeth abroad & ſheweth her ſelfe:a ſtrange thing,that in thoſe daies it ſhould do both. Laſt of all,the * Witwall or Lariot, * Chlorion.
B which is all ouer yellow,being not ſeen all winter time,appeareth about the Sun-ſteads.

Chap. XXX.

¶ *Of the Merles.*

ABout Cyllene in Arcadia,and no where els,ye ſhall find white Merles or Ouſles. And Ibis, about Peluſium only in Egypt,is blacke; in all places elſe of Ægypt,white.

Chap. XXXI.

¶ *The kind of birds breeding and hatching.*

C ALl ſinging birds,ſaue only thoſe that are excepted before,lightly breed not nor lay their egs before the ſpring Æquinoctiall in mid-March, or after the Autumnall, in mid-September. And thoſe that they hatch before the Summer Sunſtead (*i*, Mid-Iune) hardly come to any perfection:but after that time,they do well enough and liue.

Chap. XXXII.

¶ *Of the Halcyones,or Kings-fiſhers : and the daies good for nauigation which they ſhew. Of the Sea-guls and Cormorants.*

D AND in this regard eſpecially,namely for breeding after the ſummer Sunſtead, the Halcyones are of great name and much marked. The very ſeas, and they that ſaile thereupon, know well when they ſit and breed. This very bird ſo notable,is little bigger than a ſparrow:for the more part of her pennage,blew,intermingled yet among with white and purple feathers,hauing a thin ſmal neck and long withall. There is a ſecond kind of them breeding about the ſea ſide,differing both in quantitie and alſo in voice ; for it ſingeth not as the former doe which are leſſer;for they haunt riuers, & ſing among the flags & reeds. It is a very great chance to ſee one of theſe Halcyones,& neuer are they ſeen but about the ſetting of the ſtar Virgiliæ, [*i*. the Brood-hen:] or els neere Mid-ſummer or Mid-winter : for otherwhiles they will flie about a ſhip, but ſoone are they gone againe and hidden. They lay and ſit about Mid-winter when daies be ſhorteſt:& the time whiles they are broody,is called the Halcyon daies: for du-
E ring that ſeaſon,the ſea is calme and nauigable,eſpecially in the coaſt of Sicilie. In other ports alſo the ſea is not ſo boiſterous,but more quiet than at other times : but ſurely the Sicilian ſea is very gentle,both in the Streights and alſo in the open Ocean. Now about ſeuen daies before Mid-winter,that is to ſay,in the beginning of December,they build; and within as many after they haue hatched. Their neſts are wonderouſly made,in faſhion of a round ball : the mouth or entrie thereof ſtandeth ſomwhat out,and is very narrow, much like vnto great ſpunges. A man cannot cut and pierce their neſt, with ſword or hatchet ; but breake they wil with ſome ſtrong knock, like as the dry ſome of the ſea:and no man could euer find of what they be made. Some thinke they are framed of the ſharpe pointed prickes of ſome fiſhes,for of fiſh theſe birds liue.
F They come vp alſo into freſh riuers within-land : and there do lay ordinarily fiue egges.

As touching the Guls or Sea-cobs,they build in rocks:and the Cormorants both in them, and alſo in trees. They vſually lay foure egs apiece. The Guls in ſummer time,but the Cormorants in the beginning of the ſpring.

CHAP.

Chap. XXXIII.

¶ *The industrie and wit of birds in building their nests. Of the Swallow, the Argatilis, Cinnamologi, and Partridges.*

THe Architecture and building of the Halcyones nest, hath put me in mind of other birds dexteritie in that behalfe: and surely in no one thing is the wit of silly birds more admirable. The swallows frame their nests of clay & earth, but they strengthen and make them fast with straw. In case at any time they cannot meet with soft and tough clay, for want thereof they drench and wet their feathers with good store of water, and then bestrew them ouer with dust. Now when they haue made and trimmed their bare nest, they floore it in the bottom within, and dresse it all ouer with downe feathers or fine flox, as well to keep their egs warm, as also that their yong birds should lie soft. In feeding of their little ones, they keepe a very good order and euen hand, giuing them their pittance and allowance by course one after another. Notable is their care in keeping them neat and cleane; for euer as they meut, they turne the excrements out of the nest: but be they once growne to any strength and bigneſſe, they teach them to turne about and lay their tailes without.

Another kinde there is of Swallowes, that keep in the country villages and the fields, which seldom nestle vnder mens houses: and they likewise build of the same matter as the former do, namely, of clay and straw, but after another fashion: for their nests are made turning all vpward, with the hole or mouth that leadeth vnto it, stretched out in length streight and narrow, but the capacitie within is very large, in such sort, as it is a wonder to see how prouident & skilful they should be to frame them in this manner, so handsome & conuenient to couer their yong ones; so soft again for their couch and bed. In the mouth of Nilus neere Heraclea in Ægypt, there is a mightie banke or causey raised only of a continuall ranke and course of Swallows nests, piled one vpon and by another thicke, for the length almost of halfe a quarter of a mile; which is so firme and strong, that being opposed against the inundations of Nilus, it is able to breake the force of that riuer when it swelleth, and is it selfe inexpugnable: a piece of work that no man is able to turne his hand vnto. In the same Egypt neere vnto the towne Coptos, there is an Island consecrated vnto the goddesse *Isis*, which euery yere these Swallows do rampier and fortifie, for feare lest the same Nilus should eat the banks thereof and break ouer into it. In the beginning of the Spring, for three nights together, they bring to the cape of that Island, straw, chaffe, and such like stuffe, to strengthen the front therof: and for the time, they ply their businesse so hard, that for certaine it is knowne, many of them haue died with taking such paines and moiling about this worke. And verily euery yeare they go as daily to this taske againe, as the Spring is sure to come about; and they faile not, no more than souldiers that by vertue of their militarie oath and obligation, go forth to seruice and warfare.

A third sort there is of these Swallows and Martinets, which hollow the banks of riuers, and so nestle within between. The yong birds of these Martins, if they be burnt into ashes, are a singular and soueraigne remedy for the deadly squinancy, and helpe many other diseases of mans body. These build not at all, but if they perceiue that the riuer Nilus when it swelleth, will rise as high as their holes, they are gone many daies before.

There be certaine birds of the kind of Parræ, which of drie mosse make a nest, resembling so perfectly a round ball, that vnneth or hardly a man can see which way they should goe in. And another there is called Argatilis, which contriueth her nest after the same forme, but it is of hurds and flaxe.

There is a kind of Woodpecker, maketh a nest in manner of a cup or goblet, and hangeth it at a twig vpon the vppermost boughs and branches of a tree, that no foure footed beast should reach it. And as for the birds called Galguli, men say for a truth, that they take their sleep hanging all by their legges to some branch, thinking by that means they are in more safety. True it is indeed and commonly known, that all these birds in great forecast & prouidence, chuse some crosse boughes in stead of rafters, to suphort and beare vp their nests; and then to saue them from the raine, either vaut them ouer with an arched roofe, or else couer them close and thicke with leaues.

A bird there is in Arabia called Cinnamologus, which with the twigs and branches of the

Cinnamon

20030
copy 1

A Cinamon tree buildeth her neſt. The inhabitants of that country being ware thereof, ſhake the ſame downe by ſhooting arrowes headed with lead, for to make a commoditie therby. In Scythia, there is a bird of the bigneſſe of an Otis, which commonly laieth two egs, and when they are lapped within a hares skin, alwaies hangeth them vpon the top of tree boughes. The Pyannets, when they perceiue (by a watching eie that they haue) that a man hath ſpied their neſt, preſently build in another place, and remoue their egs thither. Now for thoſe birds which haue no hooked nailes, how they ſhould tranſlate their egs from one place to another, conſidering their feet are not made to claſpe them, it is a wonderful thing, and reported after a ſtrange maner; for they lay a ſtick ouer two egs, and ſouder it faſt to them with a certain viſcoſitie which
B commeth forth of their own guts when they meut: which done, they put their neckes vnder the ſticke between both egs, which hanging equally poiſed of either ſide, they carry eaſily whither they would.

No leſſe induſtrious are they that make their neſts in the ground, as being not able to fly into the aire by reaſon of their weightie bodies. Among which there is one called Merops, that vſeth to feed her parents, lying hidden within the earth. The inſide of her feathers in the wing is pale, the outſide blew; and yet thoſe aboue about their neck, are ſomwhat red. She makes her neſt in an hole ſix foot deep within the ground. Again, the Partridges do ſo fortifie and impale their neſts with thornes and twigs of ſhrubs and buſhes, that they be ſufficiently fenced againſt the inuaſion of wilde beaſts. They couer their egs with a ſoft carpet or hilling as it were of fine
C duſt: neither do they ſit where they laid them firſt, nor yet in a place which they ſuſpect to bee much frequented with reſort of paſſengers, but conuey them to ſome other place. The hennes verily of this kind, hide themſelues from their males the cocks; for ſo lecherous they be and giuen to intemperate luſt, that they would ſquaſh their egs, becauſe they ſhould not be amuſed and occupied about ſitting. Then, for want of the females, the males go together by the eares: and (as they ſay) he that is ouercome, ſuffereth himſelfe to be troden like an hen. *Trogus* verily reporteth the very ſame of the Quailes, yea and of dounghill cocks otherwhiles. He ſaith moreouer, that tame Partridges vſe to tread the wild: alſo that thoſe which are new taken or beaten, be troden of others indifferently one with another. This libidinous heat of theirs is ſuch, and maketh them ſo quarrelſome, that oftentimes they are taken by that meanes. For when the fou-
D ler commeth with his pipe or call (reſembling the female) to allure and traine them forth, out goeth the captain of the whole flocke directly againſt him: and when he is caught, another followeth after, and ſo the reſt one after another, one by one. In like manner, they vſe to take the females, at what time as they ſeeke the male to tread them: for then, forth they goe againſt the foulers chantetell or watch which calleth them out, that with their quarrelling and brawling which they make, they might chace and driue it away. In ſum, there is not to be found in any other liuing creature, the like againe for luſt and leacherie in the act of generation. If the hens do but ſtand directly ouer againſt the cocks, the very wind and aire that paſſeth from them, will cauſe them to conceiue as wel as if they were troden. For ſo hot they be in that ſeaſon, that they gape again for aire, and hang the tongue out of their heads. And if the males do but flie ouer
E them, with the very breath and aire that commeth from them, they will be ready to conceiue: yea and many times, if they do but heare their call. And that which more is, ſo lecherous they are, that ſetting aſide their naturall affection and loue to their yong couie, when they are brooody (and in which regard they ſteale from the cocke, and ſit apart in ſome ſecret and blind corner) yet if they heare once the Foulers chanterell comming toward the male, and that he doth call, preſently they will leaue the neſt and ſuffer the egs to chil, and for very iealouſie cry again and call backe the males, and offer themſelues to be troden, for feare they would goe to others. Nay more than that, their fury and rage that way many times is ſuch, that otherwhiles in this blind fit and fearfull luſt, not knowing where they are nor what they do, they will light and ſettle vpon the very head of the fouler. Alſo, if he chance to approch the neſt of the brood-hen, ſhe
F will run forth and be about his feet, ſhe wil counterfeit that ſhe is very heauy and cannot ſcarſe go, that ſhe is weake and enfeebliſhed: and either in her running, or ſhort flight that ſhe taketh, ſhe wil catch a fall, and make ſemblance as if ſhe had broken a leg or a wing: then will ſhe run out againe another way, and when he is ready to take her vp, yet will ſhe ſhift away and eſcape, and ſo put him beſides his hope. And all this doth ſhee to amuſe the Fouler after her, vntill ſhe haue trained him a contrary way from the couey. Now by that time that ſhee is paſt that

feare,and freed of the motherly care ſhe had of her yong ones,then will ſhe get into the furrow of ſome land,lie along on her back,catch a clot of earth vp with her feet, and therewith hide her whole body,and ſo ſaue both her ſelfe and her couey. To conclude,Partridges (by report) liue 16 yeres.

Chap. XXXIV.

¶ *Of Houſe-doues.*

NExt after Partridges,the nature of Doues would be conſidered, ſince that they haue in a manner the ſame qualities in that reſpect: howbeit, they be paſſing chaſte, and neither male nor female change their mate,but keep together one true vnto the other. They liue (I ſay)as coupled by the bond of mariage:neuer play they falſe one by the other,but keep home ſtill,and neuer viſit the holes of others. They abandon not their owne neſts, vnleſſe they bee in ſtate of ſingle life or widdowhead by the death of their fellow. The females are very meek and patient;they wil indure and abide their emperious males,notwithſtanding otherwhiles they be very churliſh vnto them,offering them wrong and hard meaſure;ſo jealous be they of the hens, and ſuſpicious,though without any cauſe and occaſion giuen: for paſſing chaſte and continent by nature they are. Then ſhall ye heare the cocks grumble in the throat,quarrell and complain, and all to rate the hens:then ſhall ye ſee them peck and job at them cruelly with their beakes; and yet ſoone after,by way of ſatisfaction,and to make amends again for their curſt vſage,they will fall to billing and kiſſing them louingly, they will make court vnto them and wooe them kindly,they will turne round about many times together by way of flatterie, and as it were by praiers ſeeke vnto them for their loue. As well the male as the female be careful of their yong pigeons,and loue them alike;nay ye ſhall haue the cocke oftentimes to rebuke,yea chaſtiſe the hen,if ſhe keep not the neſt well;or hauing bin abroad,for comming no ſooner home againe to her yong. And yet,kind they be to them,when they are about to build,lay,and ſit. A man ſhall ſee how ready they be,to helpe,to comfort and miniſter vnto them in this caſe. So ſoon as the egs be hatched,ye ſhall ſee them at the very firſt,ſpit into the mouths of the yong pigeons ſalt brackiſh earth,which they haue gathered in their throat, thereby to prepare their appetite to meat,and to ſeaſon their ſtomacks againſt the time that they ſhould eat. Doues and Turtles haue this property,in their drinking not to hold vp their bils between-whiles, and draw their necks backe,but to take a large draught at once,as horſes and kine do.

Chap. XXXV.

¶ *Of Stockedoues.*

SOme authors we haue,who affirme that Stockdoues liue ordinarily 30 yeres, and ſome vntill they be 40 yeares old. In which time they find no infirmitie nor diſcommodity at all but only this,That their clawes be ouergrowne,which is a ſigne of their age: howbeit they may be pared without danger. They haue all of them one and the ſame manner of tune in their ſinging;and commonly they make three reſts in their ſong, beſides the ſa-burden in the end, which is a kind of grone. All winter they be ſilent:in ſpring they are loud enough,& the woods reſound with them. *Nigidius* is of opinion,that if a man call vnto a Stockdoue within-houſe as ſhe is ſitting vpon her egs,ſhe will leaue her neſt,and come at the call. They doe lay after Midſommer. Theſe doues and Turtles liue eight yeres.

Chap. XXXVI.

¶ *Of Sparrowes.*

COntrariwiſe,the Sparrow is but ſhort liued, howbeit as lecherous as the beſt. The cocke Sparrow (by report) liueth but one yeare;the reaſon why men ſo thinke, is, becauſe in the ſpring there is not one of them found with a blacke bill,and yet in ſummer before, it began to be blacke. The hens liue ſomwhat longer. But to come againe to Doues, it is generally held,that they haue a certaine ſenſe and feeling of glory: and a man would verily thinke, that they haue a knowledge of their gay feathers,and how they are changeably coloured as a man looketh

20030
copy 1

looketh vpon them & as they ſtand. Moreouer, they ſeem to take a pride in their flying, whiles they keep a clapping of their wings and cutting of the aire euery way, as if they had a pleaſure to be flying abroad. In which brauerie of theirs, whiles they flap with their wings and keepe a glorious noiſe (which cannot be without the beating of their very pinions together) they are expoſed to the Faulcon and other hauks, as priſoners faſt bound and tied: for otherwiſe if they would flie at liberty and eaſe, without keeping ſuch ado with their clapping, they were much more ſwift of wing, than the very hawks that prey vpon them. But the haiwke like a very theefe, lieth hidden among the boughes and branches of trees, marketh the Doue how he fetcheth his flight and taketh his pleaſure in the aire, and when he ſeeth his time (in all this glory of his and the mids of his brauery) ſeizeth vpon him and carieth him away.

Chap. XXXVII.

¶ *Of the Keſtrell.*

TO preuent this danger therefore, the Doues need to haue with them the bird which is called Tinnunculus, *i.* a Keſtrill, or Stannell: for ſhe defendeth them, and (by a certaine naturall power that ſhe hath) skareth and terrifieth all other haukes: inſomuch, as they cannot abide either to ſee her, or to heare her cry. Wherupon Doues aboue all others, loue theſe birds. And (as men ſay) pigeons wil not leaue their own douecoat to flie to another, if in the foure corners thereof there be enterred foure Keſtrils aboueſaid, in foure new earthen pots well nealed, and neuer vſed before. But others haue vſed means to keep pigeons in their douehouſe (for otherwiſe they be birds that loue to be ranging and wandring abroad) namely, by ſlitting and cutting the ioints of their wings with ſome thin ſharp piece of gold: for if you do not ſo, their wounds will feſter and be dangerous. And in very truth, theſe birds be ſoon ſeduced and trained away from their owne homes: and they haue a caſt with them to flatter and entiſe one another: they take a great delight to inueagle others, and to ſteale away ſome pigeons from their owne flocks, and euermore to come home better accompanied than they went forth. Moreouer, Doues haue ſerued for poſts and courriers between, and bin imploied in great affairs: and namely, at the ſiege of Modenna, *Decimus Brutus* ſent out of the town letters tyed to their feet, as far as to the camp where the Conſuls lay, and thereby acquainted them with newes, and in what eſtate they were within. What good then did the rampier and trench which *Antonius* caſt before the towne? To what purpoſe ſerued the ſtreight ſiege, the narrow watch and ward that he kept? wherefore ſerued the riuer Po betweene, where all paſſages are ſtopped vp as it were with net and toile, ſo long as *Brutus* had his poſts to flie in the aire ouer all their heads? To be ſhort, many men are growne now to caſt a ſpeciall affection and loue to theſe birds: they build Turrets aboue the tops of their houſes for doue-coats. Nay they are come to this paſſe, that they can reckon vp their pedigree and race, yea they can tel the very places from whence this or that pigeon firſt came. And indeed one old example they follow of *L. Axius* a Gentleman ſometime of Rome, who before the ciuill war with *Pompey*, ſold euery paire of pigeons for * 400 deniers, as *M. Varro* doth report. True it is, that there goeth a great name of certaine countries where ſome of theſe pigeons are bred: for Campanie is voiced to yeeld the greateſt and faireſt bodied of all other places. To conclude, their manner of flying inuiteth and traineth me to thinke and write of the flight of other foules.

* 12. lib. 19 ſb.

Chap. XXXVIII.

¶ *Of the gate and flight of birds.*

ALl other liuing creatures haue one certaine manner of marching and going, according to their ſeuerall kind, vnto which they keep and alter not. Birds only vary their courſe, whether they go vpon the ground or flie in the aire. Some walke their ſtations, as Crowes and Choughs; others hop and skip, as Sparrows and Ouſels: ſome run, as Partridges, Woodcocks, and Snites: others again caſt out their feet before them, ſtaulk and jet as they go, as Storks and cranes: now for flying, ſome ſpread their wings abroad, ſtirring or ſhaking them but now & then,

hanging and houering with them all the while[as Kites:]others again ply them as faſt;but the ends only of their wings,or the vtmoſt feathers are ſeen to moue [as the Chaffinch.] Yee ſhall haue ſome birds to ſtretch out their whole wings & ſides,mouing them as they flie[as Rauens] and others a man ſhal ſee in their flight to keep them in,for the moſt part cloſe [as the Woodpeckers.] Some of them are known to giue one or two claps with their wings at firſt, and then glide ſmoothly away,as if they were carried and born vp with the aire [as Linnets:] and others are ſeen(as if they kept ſtil the aire within their wings)to ſhoot vp aloft & mount on high, to flie ſtreight forward; & to fal down again flat[as Swallows.] Ye would think and ſay that ſome were hurled out of a mans hand with violence [as the Partridge:] and others again to fal down plumbe from on high [as Larks,]or els to leap & jump[as the Quailes.]Ducks,Mallards,and ſuch like,ſpring preſently from the ground vp aloft,and ſuddenly mount vp into the skie, euen out of the very water:which is the cauſe,that if any chance to fall into thoſe pits wherein wee take wild beaſts,they alone wil make good ſhift to get forth and eſcape.The Geirs or Vulturs, and for the moſt part all weightie and heauy foules,cannot take their flight & flie,vnleſſe they fetch their run and biere before,or els riſe from ſome ſteepe place with the vantage. And ſuch are directed in the aire by their tails.Some looke about them euery way,others bend and turne their necks in flying:and ſome fly with their prey within their talons,& eat it as they fly.Moſt birds cry and ſing as they flie,yet ſome there be contrariwiſe,that in their flight are euer ſilent. In one word,ſome flying carry their breſts and bellies halfe vpright:others again beare them as much downward. Some flie ſide-long and bias:others directly forward, and follow their bills: and laſt of all there be that bend backward as they flie,or els bolt vpright.In ſuch ſort, that if a man ſaw them all together, he would take them not to be one kind of creature,ſo diuers & different are they in their motions.

Chap. XXXIX.

¶ *Of Martinets.*

MArtinets,which the Greeks call Apodes(becauſe they haue little or no vſe of their feet) and others,Cypſeli;are very good of wing,and flie moſt of all others without reſt. And in very truth,a kind of Swallows they be.They build in rocks & ſtony cliffes.And theſe be they and no other,that are ſeen euermore in the ſea: for be the ſhips neuer ſo remote from the land,ſaile they neuer ſo faſt and far off, ye ſhall haue theſe Martinets alwaies flying about them.All kinds els of Swallowes and other birds,do ſomtime light,ſettle,and perch: theſe neuer reſt,but when they be in their neſt.For either they ſeem to hang,or els lie along:and a number of ſhifts and deuiſes by themſelues they haue beſides, and namely when they feed.

Chap. XL.

¶ *Of the bird Caprimulgus,and the Shouelar.*

THe Caprimulgi(ſo called of milking goats)are like the bigger kind of Owſels.They bee night-theeues;for all the day long they ſee not.Their manner is to come into the ſheep-heards coats and goat-pens,and to the goats vdders preſently they go, and ſuck the milke at their teats.And looke what vdder is ſo milked,it giueth no more milke, but miſliketh and falleth away afterwards,and the goats become blind withall.

There be other birds named Plateæ,*i*.Shouelars.Their manner is to flie at thoſe foule that vſe to diue vnder the water for fiſh: and ſo long will they peck and bite them by the heads, vntil they let go their hold of the fiſh they haue gotten,and ſo they wring it perforce from them. This bird when his belly is full of ſhell fiſhes that he hath greedily deuoured, and hath by the naturall heat of his craw and gorge in ſome ſort concocted them,caſteth vp all vp again:and at leaſure picketh out the meat,and eateth it again,leauing the ſhels behind.

Chap. XLI.

¶ *The naturall wit of ſome birds.*

THe Hens of country houſes haue a certaine ceremonious religion. When they haue laied an egge,they fall a trembling & quaking,and all to ſhake themſelues. They turne about alſo

20030
copy 1

A alſo,as in proceſſion,to be purified,& with ſome feſtue or ſuch like thing,they keep a ceremonie of hallowing,as well themſelues as their egs.

Chap. XLII.

¶ *Of the Linnet,Poppinjay or Parrat,and other birds that can ſpeake.*

THe Linnets be in manner the leaſt birds of all others: howbeit they be very docible. Doe they will whatſoeuer they are taught & bidden,not only in their voice,but alſo with their feet and bils,as if they were hands. In the territorie about Arelate, there is a bird called Taurus(becauſe it loweth like a bull or cow,for otherwiſe a ſmall bird it is.) There is another
B alſo named Anthus,which likewiſe reſembleth the neighing of horſes:and if haply by the approch of horſes they be driuen from their graſſe wherof they feed,they will ſeem to neigh; and flying vnto them,chaſe them away,and ſo be reuenged of them again. But aboue all other birds of the aire,the Parrats paſſe,for counterfeiting a mans voice: inſomuch, as they will ſeeme to parle and prate our very ſpeech. This foule commeth out of the Indies, where they call it Sittace. It is all the body ouer greene, onely it hath a collar about the necke of vermilion red,different from the reſt of her feathers. The Parrat can skil to ſalute Emperors,and bid †good mor- † vel.
row: yea,and to pronounce what words ſhe heareth. She loueth wine well, and when ſhee hath drunk freely,is very pleaſant,plaifull,and wanton. She hath an head as hard as is her beak: when ſhe learns to ſpeak,ſhe muſt be beaten about the head with a rod of yron: for otherwiſe ſhe careth for no blowes. When ſhe taketh her flight down from any place,ſhe lighteth vpon her bil,
C and reſteth therupon,and by that means fauoreth her feet, which by nature are but weake and feeble,and ſo carrieth her owne weight more lightly.

There is a certain Pie,of nothing ſo great reckoning and account as the Parrat,becauſe ſhee is not far fet,but here-by neere at hand: howbeit,ſhe pronounces that which is taught her more plainly and diſtinctly than the other. Theſe take a loue to the words that they ſpeak: for they not only learn them as a leſſon,but they learn them with a delight and pleaſure. Inſomuch that a man ſhall find them ſtudying thereupon, and conning the ſaid leſſon: and by their carefull thinking vpon that which they learn,they ſhew plainly how mindfull and intentiue they be thereto. It is for certain knowne that they haue died for very anger and griefe that they could not learn to pronounce ſome hard words: as alſo,vnleſſe they heare the ſame words repeated of-
D ten vnto them,their memory is ſo ſhittle,they will ſoone forget the ſame againe. If they miſſe a word,and haue loſt it,they wil ſeeke to call it againe to remembrance; and if they fortune to heare the ſame word in the mean time,they will wonderfully ioy thereat. As for their beautie, it is not ordinary,although it be not very louely. But ſurely amiable enough they are in this, that they can ſo well reſemble mans ſpeech. It is ſaid,that none of their kinde are good to bee made ſcholers,but ſuch only as feed vpon maſt: and among them, thoſe that haue fiue toes to their feet. But euen theſe alſo are not fit for that purpoſe,after the firſt two yeares of their age. And their tongue is broader than ordinarie: like as they be all that counterfeit mans voice,each one in their kind; although it be in maner general to all birds whatſoeuer to be broad tongued.
Agrippina the Empreſſe,wife to *Claudius Cæſar*,had a Black-bird or a Throſtle, at what time as I
E compiled this boook,which could counterfeit mans ſpeech; a thing neuer ſeen nor knowne before. The two *Cæſars* alſo,the yong princes(to wit,*Germanicus* & *Druſus*) had one Stare,& ſundry Nightingales,taught to parle Greeke and Latine. Moreouer,they would ſtudie vpon their leſſons,and meditate all day long: and from day to day come out with new words ſtill,yea,and were able to continue a long ſpeech & diſcourſe. Now for to teach them the better,theſe birds muſt be in a ſecret place apart by themſelues,where they can heare no other voice: and one is to ſit ouer them,who muſt repeat often that which he would haue them to learn; yea, and pleaſe them alſo with giuing them ſuch meat as they beſt loue.

Chap. XLIII.

F ¶ *The vnderſtanding and wit that Rauens haue.*

LEt vs not defraud the Rauens alſo of their due praiſe in this behalfe, conſidering,that the whole people of Rome hath teſtified the ſame not only by taking knowledge,but alſo by a publick reuenge & exemplarie puniſhment. And thus ſtood the caſe. In the daies of *Tiberius*

berius the emperor, there was a yong Rauen hatched in a neſt vpon the church of *Caſtor & Pollux*; G
which, to make a triall how he could flie, took his firſt flight into a ſhoomakers ſhop juſt ouer-
againſt the ſaid church. The maſter of the ſhop was well enough content to receiue this bird,
as commended to him from ſo ſacred a place, and in that regard ſet great ſtore by it. This Ra-
uen in ſhort time being acquainted to mans ſpeech, began to ſpeak, & euery morning would fly
vp to the top of the Roſtra or publick pulpit for Orations, where, turning to the open Forum &
market place, he would ſalute and bid good morrow to *Tiberius Cæſar*, and after him, to *Germa-
nicus* and *Druſus* the yong princes, both *Cæſars*, euery one by their names: and anon the people
of Rome alſo that paſſed by. And when he had ſo don, afterwards would flie again to the ſhoo-
makers ſhop aforeſaid. This duty practiſed, yea and continued for many yeres together, to the
great wonder and admiration of all men. Now it fell out ſo, that another ſhoomaker who had H
taken the next coruiners ſhop vnto him, either vpon a malicious enuie that he occupied ſo neer
him, or ſome ſudden ſpleene and paſſion of choler (as he would ſeeme to plead for his excuſe)
for that the Rauen chanced to meut a little, and ſet ſome ſpot vpon a paire of his ſhooes, killed
the ſaid Rauen. Whereat the people tooke ſuch indignation, that they riſing in an vptore, firſt
droue him out of that ſtreet, and made that quarter of the city too hot for him: and not long af-
ter murdered him for it. But contrariwiſe the carkaſſe of the dead Rauen was ſolemnly enter-
red, and the funerals performed with all ceremoniall obſequies that could be deuiſed. For the
corps of this bird was beſtowed in a coffin, couch or bed, and the ſame bedecked with chaplets
and garlands of freſh floures of all ſorts, carried vpon the ſhoulders of two blacke-Mores, with
minſtrels before, ſounding the Haut-boies, and playing on the Fife, as far as to the Funeral fire; I
which was piled and made in the right hand of the cauſey Appia, two miles without the city in
a certain plain or open field called Rediculi. So highly reputed the people of Rome that ready
wit and apt diſpoſition in a bird, as they thought it a ſufficient cauſe to ordaine a ſumptuous
buriall therefore: yea, and to reuenge the death thereof, by murdering a citizen of Rome in that
city, wherein many a braue man and noble perſon died, and no man euer ſolemnized their fune-
rals: in that city I ſay which affoorded not one man to reuenge the vnworthy death of that re-
nowned *Scipio Æmylianus*, after he had woon both Carthage and Numantia. This happened the
fifth day before the Calends of Aprill, in the yeare when *M. Seruilius*, and *C. Ceſtius* were Con-
ſuls of Rome. Moreouer, euen at this very preſent, when I wrote this hiſtorie, I ſaw my ſelfe a K
Crow belonging to a certain knight of Rome, who brought him out of the realm of Grenado
in Spaine, which was a very ſtrange and admirable bird, not only for the exceeding blacke co-
lour of his feathers, but alſo for that he could pronounce and expreſſe ſo perfectly many words
and ſentences together, and learned ſtill new leſſons euery day more than other. It is not long
ſince that there went a great bruit and fame of a notable hunter in Erizena a countrey of Aſia,
whoſe name was *Craterus Monoceros:* that vſed to hunt by the meanes and helpe of Rauens. His
manner was to carry with him theſe Rauens into the Forreſt, perching vpon his ſhoulders & his
hunting hornes: and theſe would ſeeke out and put vp other wilde ones, and bring them to him.
Thus by cuſtom & vſe he brought his hunting to this good paſſe, that when he returned home-
ward out of the foreſt, the wild as well as the tame would accompany him. Some haue thought L
it worth the ſetting downe vpon record, how there was a Rauen ſeene in time of great drought
when water was hard to come by, for to caſt ſtones into the bucket belonging to a ſepulchre,
wherein there was ſome rain water remaining toward the bottome, but ſo deepe, that he could
not reach vnto it: and being afraid to go downe into it, by heaping vp many ſtones, hee brought
the water to riſe ſo high, as he might drinke ſufficient with eaſe.

Chap. XLIV.

¶ *Of Diomedes his birds.*

NEither will I ouerpaſſe the birds called Diomedeæ, which K. *Iuba* nameth Cataractæ. M
Toothed they are, as he ſaith; and they haue eies as red and bright as the fire: otherwiſe
their feathers be all white. Who alſo affirmes, that they euermore haue two captains, the
one for to lead the vaward, and the other for the reregard. With their bils they dig little tren-
ches & gutters in the ground: ouer which from ſide to ſide they lay ſticks, acroſſe like hurdles,
arti-

20030
copy 1

A artificially, and then couer the ſame ouer with the earth they caſt forth before, vnder which they breed. Euery of theſe trenches hath two dores, the one regarding the Eaſt, at which they go forth to their meat: and the other looking toward the Weſt, by which they come in againe after their returne. Whenſoeuer theſe birds would meut, they flie euer full into the winde, becauſe they would not file themſelues. Found they be in one place of the world, and but in one, namely in a certaine Iſland, inmobled, as we haue written before, for the tombe and Temple of *Diomedes*, and it lieth vpon the coaſt of Apulia. Theſe birds are like vnto the white ſea Mewes with a blacke cop. Their manner is to cry with open mouth vnceſſantly at any ſtrangers that come aland, ſaue only Grecians, vpon whom they wil ſeem to fawn and make ſignes of loue and amitie in all flattering wiſe. A wonderfull thing that they ſhould diſcerne one from another, and giue ſuch friendly welcome to them, as diſcended from the race of *Diomedes*. Their manner
B is euery day to charge their throat and wings full of water, and all to drench therewith the ſaid temple of *Diomedes*, in token of purification. Whereupon aroſe the fable, That the companions of *Diomedes* were turned into theſe birds.

Chap. XLV.

¶ *What Birds are not apt to learne, and will not be taught.*

AND now that we are in this diſcourſe of wit and capacitie, I muſt not omit to note, That of birds the Swallow; and of land beaſts the Mouſe and the Rat, are very vntoward, and
C cannot be brought to learn. Whereas we ſee great Elephants ready to do whateuer they are commanded: the furious Lions brought to draw vnder the yoke: the Seals within the ſea, and ſo many ſorts of fiſhes grow to be tame and gentle.

Chap. XLVI.

¶ *The manner of Birds in their drinking.*

BIrds drinke ſucking, and thoſe that haue long necks make ſtayes betweene, and euery while hold vp their bil from the water, as if they would poure the water down their throat. The bird Porphyrio alone ſeems to bite the water as he drinketh. And this bird hath this pro-
D pertie by himſelfe, to dip and wet all his meat euer and anon in water, and then with his foot in lieu of an hand to reach it vnto his bil. The beſt of this kind are in Comagene. Their bils and long ſhanks that they haue be red.

Chap. XLVII.

¶ *Of the Foule Himantipus, the Onocrotali, and other ſtrange fowles.*

LIke in that reſpect vnto the Porphyrio, is the Himantipus, a bird far leſſe in body, but full as long legged, and ſtalking as high. They are bred in Ægypt, and go vpon three toes to a foot. Their moſt feeding is vpon flies. In Italy they liue not many daies. All great & hea-
E uie birds liue on ſeeds and corn: they that fly on high prey vpon fleſh. Among water fouls the Cormorants vſe to deuoure that which other birds either diſgorge or meute. The Onocrotali much reſemble ſwans, and ſurely they might be thought the very ſame and no other, but that they haue within their throat another kind of gizzar beſides their craw, in which, theſe fowles being vnſatiable, beſtow all that euer they can get; whereby it is of a wonderfull great capacitie, and will receiue very much. Now when they haue done the rauening, and filled this poke, ſoon after they conuey it from thence by little and little into their mouth, and there chew the cud, vntill after it be well prepared, they ſwallow it downe into the very craw and belly indeed. Theſe fowles are to be found in the parts of Picardie and Normandy in France, lying vpon the North Ocean. In Hircinia, a forreſt of Germanie, we haue heard that there be ſtrange kinds of
F birds, with feathers ſhining like fire in the night ſeaſon. In other reſpects I haue nothing to ſay of them worth the writing, ſaue only they are of ſome name for being far fetched.

CHAP.

Chap. XLVIII.

¶ *The names and natures of many Birds.*

OF water fowls, the Phalerides are thought in Seleucia of the Parthians, and alſo in Aſia, to be the daintieſt. Likewiſe the Feſant hens of Colchis, which haue two ears as it were conſiſting of feathers, which they will ſet vp and lay down as they liſt. The Ginnie or Turkey hens in a part of Africke called Numidia, be in great requeſt, as alſo throughout all Italy now adaies. *Apicius*, the moſt riotous glutton and belly-god of his time, taught men firſt, that the tongue of Phœnicopterus was a moſt ſweet and delicat piece of meat. The Moore-hen of Ionia is much commended and highly eſteemed. This bird ſo ſoon as ſhe is taken priſoner, loſeth her voice and is mute; for otherwiſe ſhe is vocal and loud enough, and in old time was reputed a rare and ſingular bird. But now there be caught of them in Fraunce and Spain, yea and among the Alps: where alſo the Plungeons or bald Rauens be, which heretofore were thought proper and peculiar to the Baleare Iſlands: like as the Pyrrhocorax [*i.* the red Rauen] with the yellow bill, was ſuppoſed to breed onely among the Alps: and with it the Lagopus, a daintie bird, and moſt pleaſant in the diſh. And this name it took in Greek, becauſe it is rough footed and haired like the haires foot: otherwiſe all ouer white, and as big as a pigeon. Haue her out of the ground, vnder which ſhe breedeth, you ſhall hardly get her to feed, neither will ſhee be made tame, liue ſhe neuer ſo long: kill her once, the body preſently wil rot and putrifie. There is another beſides of that name, and differeth from Quailes onely in bigneſſe, for it is greater than the Quaile; and with a yellow ſauce of ſaffron it is a moſt delicate piece of meat. *M. Egnatius Calvinus* gouernor of the parts about the Alps, reporteth, that he hath ſeen there the Ibis a bird proper to the land of Ægypt.

Chap. XLIX.

¶ *Of new Birds, and ſuch as are holden for fabulous.*

DVring the ciuil wars between *Otho* and *Vitellius*, and namely about the time of the journy or battell of Bebriacum beyond the Po, there were theſe new birds (for ſo they be called ſtill at this day) brought into Italy. Like they be to Thruſhes or Maviſſes, ſomewhat leſſe than houſe doues, pleaſant in the eating. The Baleare Iſles ſend vs another Porphyrio, better than that before named, *cap.* 46. Where the Buzards alſo a kind of Hawk are held for excellent meat, and ſerued vp at the table. Likewiſe the Vipio, for ſo they call the leſſer Crane. As for the fowles called Pegaſi, headed like horſes; and the Griffons, which are ſuppoſed to haue long eares and a hooked bill, I take them to be meere fables: and yet they ſay that the Pegaſi ſhould be in Scythia, and the Griffons in Ethyopia. Moreouer, I thinke the ſame of the Tragopanades, which many men affirm to be greater than the Egle, hauing crooked horns like a ram on either ſide of the head, of the colour of iron, and the head only red. As touching the Birds Syrenes, I wil neuer beleeue there be any ſuch, let *Dino* the father of *Clitarchus* that renowmed writer ſay what he wil: who auoucheth for a truth, that they be in India, and that with their ſinging they wil bring folk aſleep, and then fly vpon them and teare them in pieces. He that will giue credit to theſe fables, may euen as well beleeue, that dragons forſooth taught *Melampus* by licking his eares, how to vnderſtand the language of birds when they chaunt and ſing vpon trees, or cry and chirp in the aire. Likewiſe the tales that *Democritus* telleth, who nameth certain birds, of whoſe bloud mingled together and ſuffered to corrupt, there is ingendred a Serpent, which whoſoeuer eateth ſhall know what birds ſay one to another in their ſpeech: and namely the ſtrange things he telleth of the Lark aboue the reſt. For verily without theſe fabulous lies, mens heads be occupied enough, and too much to, about the Auguries onely and preſages of birds, that they haue no need to buſie & trouble their brains about thoſe toies. *Homer* makes mention of certain birds called Scopes: but I canot conceiue thoſe ſatyrical geſticulations of theirs like Antikes when they are perched, which ſo many men talke of, neither doe I think otherwiſe, but that theſe birds are out of knowledge now a daies. And therefore far better it is to write of thoſe we know.

CHAP.

20030
copy 1

Chap. L.

¶ *Who firſt deuiſed to cram Hens. Who inuented Mues and Coupes to keepe foule in.*

THey of the Iſland Delos began the cramming of Hens and Pullein firſt. And from them aroſe that deteſtable gourmandiſe and glutronie to eat Hens and Capons ſo fat & enterlarded with their owne greaſe. Among the old ſtatutes ordained for to repreſſe inordinate feaſts, I find in one act made by *C. Fannius*, a Conſul of Rome, eleuen yeres before the third Punick war, an expreſſe prohibition and reſtraint, That no man ſhould haue his table ſerued with any foule, vnleſſe it were one hen, and no more, and the ſame a runner only, and not fed vp and crammed fat. The branch of this one ſtatute was afterwards taken forth and inſerted in al other acts prouided in that behalfe, & went currant thorough all. Howbeit, for all the law ſo well ſet down, there was a ſtarting hole found to delude and eſcape the meaning therof, namely, to feed Cocks & Capons alſo with a paſt ſoked in milk & mead togither, for to make their fleſh more tender, delicate, and of ſweeter taſt: for that the letter of the ſtatute reached no farther than to Hens or Pullets. As for the Hens, they only be thought good and well ynough cramm'd, which are fat about the neck, and haue their skin plumpe and ſoft there. Howbeit, afterwards our fine cookes began to looke to their hind-parts about the rumpe, and chuſe them thereby. And that they ſhould make a greater ſhew in the platter, they ſlit them along the chine: and lay their legs out at large, that they might take vp the whole dreſſer bourd. The Parthians alſo haue taught our cooks their own faſhions. And yet for all this fine dreſſing and ſetting out of meat, there is nothing that pleaſeth and contenteth the tooth of man in all reſpects; while one loues nothing but the leg, another likes and praiſes the white brawne alone, about the breaſt bone. The firſt that deuiſed a Barton & Mue to keepe foule in, was *M. Lenius Strabo*, a gentleman of Rome, who made ſuch an one at Brindis, where he had encloſed birds of all kinds. And by his example we began to keepe foules within narrow coups and cages as priſoners, to which creatures Nature had allowed the wide aire for their ſcope and habitation.

Chap. LI.

¶ *Of Æſopes proud platter.*

BVt in the relation and report of this argument, notorious aboue all the reſt in our memorie is that platter of *Clodius Æſopus*, the plaier of Tragedies, which was eſteemed worth * ſix hundred Seſtertia. In this one charger he ſerued vp at the table all kind of birds that either could ſing or ſay after a man; and they coſt him ſix hundred Seſterces apeece. And ſurely it was no delight & pleaſure that he ſought herein to content the tooth, but only that he would haue the name to eat the reſemblers of mans voice: without any conſideration & regard that he had of all that great riches and reuenues of his owne, which himſelfe had gotten by his tongue, and by counterfeiting the ſpeech of others. A father verily worthie ſuch a ſonne, who as we ſaid before, deuoured thoſe precious pearles. And to ſpeake a truth, it is hard to judge whether of them twaine plaied the beaſt more, the father or the ſonne. But that it ſeemeth leſſe pride and prodigalitie to ſwallow down the throat the greateſt riches of Nature, than to chew and eat at a ſupper mens tongues, that is to ſay, thoſe birds that could pronounce our language.

* i. 600000 Seſtertij, 15000 dg. nieris.

Chap. LII.

¶ *The engendring of birds: and what foure-footed beaſts lay egges as well as they.*

THe generation of birds ſeemes alwaies to be after one & the ſame manner. And yet therein is to be found ſome ſtrange & extraordinarie worke. Like as there be four footed beaſts known alſo to haue eggs, namely, the Chamæleons, Lizards, and ſuch as we named among Serpents. Of foules, thoſe that haue hooked clawes and tallons, are but barren that way, and lay few eggs. Only the Keſtrell laieth foure at a time. And verily Nature hath well prouided in all the kind of foules, That the mightier ſhould be leſſe fruitfull than the weaker and thoſe that flie from the other. The Oſtriches, Hens, Partridges, and Linnets, are great laiers. As touching the

the manner of their engendring, it is performed two waies: for either the female couche th G
downe, as doe our hens; or elſe ſtand vpon their feet, as doe the cranes. Of eggs, ſome be white,
as thoſe of Doues and Partridges; others, be pale and yellowiſh, as thoſe of water-foule: ſome
be ſpotted, as thoſe of the Turkie-hens: others againe red; and ſuch egs Feaſants lay, and Ke-
ſtrils.

All birds egges within the ſhell, are of two colours. In water-foules, the yolke is more than
the white, and the ſame is more wan and duskiſh than in others. The egges of fiſhes are of one
colour, and therein is no white at all. Birds eggs are brittle ſhelled, by reaſon of their heat. Ser-
pents eggs are more tough becauſe of cold: but they of fiſhes are more ſoft and tender, for that
they be ſo liquid. Thoſe of fiſhes and ſuch creatures as liue in water, haue round eggs ordinari-
ly: others be long and pointed at one end in the top. Birds lay their egges with the rounder end H
comming forward: their ſhell is ſoft whiles they be warm and a laying, but preſently they har-
den by piecemeale as they come forth. *Horatius Flaccus* is of opinion, that the longer the egge
is, the better taſt it hath. The rounder egge prooues to be the hen commonly, the reſt will be
cockes. There is found in the * top or ſharper end of an egge within the ſhell, a certaine round
knot reſembling a drop or a nauil, riſing aboue the reſt, which they call a Kinning.

* Or rather in the crown and broader end, as our Wiues ſay.

CHAP. LIII.

¶ *The engendring of egges: the ſitting of birds: and their manner of generation.* I

SOme birds there be, that tread all times of the yeare; and lay egs but only two moneths in
mid winter: and of thoſe, pullets lay more than old hens, but they be leſſe, eſpecially the firſt
and laſt of one laiter. So fruitfull they be, that ſome of them wil lay threeſcore egs ere they
giue ouer: ſome euerie day; others, twice in one day: and ſome will ouer-lay, vntill they be ſo
weary and feeble withall, that they will neuer lay more, but die withall. The little ſhort legged
grig hens, called Hadrianæ (that came from Hadria) are counted beſt. Doues lay & conuey ten
times in the yeare, ſome of them eleuen: and in Ægypt there are found that giue not ouer in the
twelue months, euen at mid-winter in December. Swallowes, Ouſels, Quoiſts or Ringdoues and
Turtles, lay and ſit twice in the yeare: other birds ordinarily but once. Thruſhes and Blackbirds K
build their neſts of mud and clay, in trees and buſhes one by another, ſo neere as if they were
linked together: and lightly they engender in ſome corner out of the way. After the hen is tro-
den, within ten daies the egs commonly knit within her bellie, are come to perfection & readie
to be laid. Howbeit if hens haue ſome wrong done vnto them, or if a man chance to pluck a fea-
ther or quill from a pigeon at that time, or do them ſome ſuch iniurie, it will be longer ere they
lay.

All egs haue within them in the mids of the yolk, a certaine drop as it were of bloud, which
ſome thinke to be the heart of the chicken, imagining that, to be the firſt that in euerie bodie
is formed and made: and certainly a man ſhall ſee it within the verie egge to pant and leape. As
for the chick, it taketh the corporall ſubſtance, and the bodie of it is made of the white wateriſh
liquor in the egge, the yellow yolke ſerues for nouriſhment: whiles the chick is vnhatched and L
within the egge, the head is bigger than all the bodie beſides: and the eies that be compact and
thruſt together, be more than the verie head. As the chick within growes bigger, the white tur-
neth into the middeſt, and is encloſed within the yolke. By the 20 day (if the eggs be ſtirred) ye
ſhall heare the chick to peepe within the verie ſhell: from that time forward, it beginneth to
plume and gather feathers: and in this manner lies it within the ſhell, the head reſting on the
right foot, and the ſame head vnder the right wing, and ſo the yolke by little and little decrea-
ſeth and faileth. All birds are hatched with the feet forward, contrarie to other creatures. Some
hens there be, that lay all their egs with two yolkes; and of them be hatched two chickens o-
therwhiles, as *Cornelius Celſus* writeth, but the one of them is bigger than the other. Howbeit, o- M
thers ſay, it is impoſſible that one egge ſhould come to two chickens. Moreouer, it is held for a
rule, that there ſhould not be put vnder a brood-hen aboue 25 egs at one time to ſit vpon. Af-
ter the mid-winter, hens begin to lay and ſit. The beſt brood is before the ſpring Æquinoctiall.
Thoſe that be hatched after mid-ſummer, neuer come to their full and kind bigneſſe: and euer-
more the later the leſſer.

CHAP.

20030

A

Chap. LIV.

¶ *The infirmities and impediments incident to brood hens, and the remedies.*

THe beſt egs that can be put vnder hens when they ſit, are they that were laid ten daies before at the vtmoſt; for neither old eggs, nor yet very new laid are good for that purpoſe. After that a hen hath ſitten 4 daies, take an eg from vnder her, hold it in one hand by the narrow end, and look between you and the light, with the other ouer it; if it be cleare through and of one colour, it is ſuppoſed to be naught, and will neuer proue a chicke, and therefore put another in place thereof. Another experiment there is by water: the addle egg wil flote aboue
B as empty, the ſound and good will ſinke to the bottom: and ſuch therefore being full are to be ſet vnder the hen. We ye would try whether an egg be good or bad in this caſe, our countrey wiues ſay, you muſt not ſhake them in any hand, for if the vital veins & parts be broken & blended together, they will neuer proue. Moreouer, this is alwaies to be looked vnto, that ye begin to ſet an hen after the change of the moon, for if you ſet her in the wain, the eggs will be addle, and neuer come to be chickens. The warmer the weather is, the ſooner will ſhe hatch, & therefore it falleth out, that in ſummer ye ſhal haue her abroad with her brood vpon the nineteenth day; in winter many times it will be 25 daies firſt. If it thunder while ſhe is broody the eggs will be addle; yea and if the hen chance but to heare an hawke cry they will be marred. The remedie againſt thunder, is to put an iron nail vnder the ſtraw of the hens neſt, or els ſome earth
C newly turned vp with the plow. Ouer and beſides, there be ſome egs that will come to be birds without ſitting of the hen, euen by the worke of Nature only, as a man may ſee the experience in the dunghills of Egypt. There goeth a pretty jeaſt of a notable drunkard of Syracuſa, whoſe manner was when hee went into the Tauerne to drinke, to lay certaine egges in the earth, and couer them with mould, and he would not riſe nor giue ouer bibbing vntill they were hatched. To conclude, a man or woman may hatch eggs with the very heate only of their body.

Chap. LV.

D ¶ *The Auguries and preſages of Egges.*

LIuia Auguſta the Empreſſe, wife ſomtime of *Nero*, when ſhe was conceiued by him, & went with that child [who afterwards proued to be *Tiberius Caſar*] being very deſirous (like a yong fine lady as ſhe was) to haue a jolly boy, practiſed this girliſh experiment to foreknow what ſhe ſhould haue in the end: ſhe tooke an egge, and euer carried it about her in her warme boſome; and if at any time ſhe had occaſion to lay it away, ſhe would conuey it cloſely out of her owne warme lap into her nurſes, for feare it ſhould chill. And verily this preſage proued true, the egge became a cocke chicken, and ſhe was deliuered of a ſonne. And hereof it may well became the deuice of late, to lay egges in ſome warme place, and to make a ſoft fire
E vnderneath of ſmall ſtraw or light chaffe to giue a kinde of moderate heate: but euermore the eggs muſt be turned with a mans or womans hand, both night and day; and ſo at the ſet time they looked for chickens and had them. It is reported beſides of a certaine Poulter, who had a ſecret by himſelfe, whereby he could tell ſurely and neuer miſſe, which egge would be a cocke chicke, which a hen: alſo of many hennes that he kept, which was euery hens egge, if hee did but ſee it. We haue heard moreouer, that when a brood hen chanced to die, the cocks that vſed to tread her, were ſeen to go about with the chickens one after another by turnes, and to do euerie thing like to the very hen indeed that hatched them: and all that while to forbeare once to crow. But aboue all it is ſport alone to ſee the maner of an hen that hath ſitten vpon ducks egs and hatched them, how at the firſt ſhe will wonder to haue a teem of ducklings about her, and
F not acknowledge them for her owne; but ſoone after ſhee will clucke and call this doubtfull brood to her very carefully and diligently: but at the laſt, when ſhe perceiues them, according to their kind, to take the water and ſwim, how ſhe will mourn and lament about the fiſh-poole, that it would pitty ones heart to ſee them what moane they will make.

CHAP.

Chap. LVI.

¶ *Which be the beſt hens.*

A Man ſhall know a good and kindly hen by her comb, when it is ſtrait and vpright: otherwhiles alſo double creſted: alſo by the pinion feathers blacke, the vpper plume reddiſh. Such a hen will be red alſo about her head and bill, and haue an odde toe to her feet, yea and ſomtime that od one to lie croſſe ouerthwart the other foure. In caſe of ſacrifices and religious vſe they are not thought good nor allowable that haue beck and feet yellow. For diuine ſeruice and ſecret myſteries celebrated in couert to the goddeſſe *Ops*, the black are allowed for good. There is alſo a dwarfiſh kind of hens, [*i.* grig hens] that are extraordinarie little, and yet fruitful, a thing not ſeen in any other kind of fowle: they lay and miſſe not, but ſeldom ſit they on any egs, and if they do it is hurtfull for them.

Chap. LVII.

¶ *The maladies that hens be ſubiect vnto, and the remedies.*

THat which troubleth all the kind of them is a certain diſtillation of a phlegmaticke humor, which cauſeth the pip, the moſt of all between harueſt time and vintage. The cure is, to keep them hungry & long faſting: alſo to let them lie or perch in a ſmoky place, eſpecially where the fume is made of Bay leaues and the herb Sauin. It is good moreouer, to draw a little quill or feather through their noſthrils acroſſe, and to remoue or ſhift it euery day. As for their meat, let it be ſome cloues of garlicke ſhred among their corne, or elſe let their meat be well infuſed or ſteeped in water, wherein an owle hath waſhed and bathed her ſelfe; or elſe ſodden with the ſeed of Bryonie or the wilde white Vine: beſides ſnch other medicines as are daily in vſe.

Chap. LVIII.

¶ *The manner how fowles do conceiue, and what number of yong ones commonly they hatch.*

DOues haue this propertie by themſelues, to bill one another and kiſſe before they tread. They lay for the moſt part two egs. Thus Nature hath diſpoſed, that ſome ſhould breed often and few: others ſhould hatch many together at once. The Ringdoues or Quoiſts, and Turtles, ordinarily lay three egs; and lightly they ſit and hatch but twice a yere: and that is, if their firſt brood come not to perfection, but miſcarried and was not reared vp. And albeit they lay three egs, yet they neuer hatch but twain: the third that is addle, they call in Latine *Vrinum*. The female Ringdoue ſits euer from noon vntil the next morning; the male makes vp the reſt of the day. Houſe-doues breed euermore one cock pigeon, and another hen. The male is hatched to day, and the female tomorrow. In that kind they ſit both, the cock all day, and the hen by night: and vſually vpon the 20 day they hatch. They lay within fiue daies after they be troden, and in ſummer time verily you ſhall haue them in the ſpace of two months bring three paire of pigeons; for then they vſe to hatch by the 18 day: and preſently they conceiue again. So that a man ſhall oftentimes find new laid egs euen amongſt the young pigeons: and otherwhiles it is ſeen, that whiles ſome are ready to fly, others peep newly out of their ſhel: and theſe yong birds within fiue moneths will lay themſelues. Now the nature of theſe hen doues is (if they want a cock) to tread one another, and hereof they come to lay barren egs, wherof nothing will be ingendred: and ſuch the Greeks call Hypenemia, *i.* wind-egs.

Chap. LIX.

¶ *Of the Peacocke and Geeſe.*

THe Pea-hen falls to lay and breed after ſhe is 3 yeres old. In the firſt yere ſhe begins with one or two egs: the yeare following ſhe riſeth to foure or fiue: in the reſt ſhee reacheth to twelue and no more. When ſhe layeth, her manner is to reſt two or three dayes betweene euery egge. And thrice a yeare ſhe keepeth this order, namely, if her egges be taken from

20030
copy 1

A from her, and put vnder hens to be ſitten vpon: for why, the Peacocks wil breake them if they can meet with them, becauſe they canot miſſe and ſpare the Peahens company while they are broody and ſitting: which is the cauſe they are wont to lay by night, or in ſome ſecret corner out of the way, and that from an high place where they perch: and then, vnleſſe there be good heed taken that the eggs be latched in ſome ſoft bed vnderneath, they are ſoone broken. One Peacock is ſufficient to go with fiue wiues: for when there is but twain [the villaine is ſo lecherous] with ouermuch treading he hindereth their laying, and marreth the knot of eggs ingendred within them. The Peahen hatcheth in 28 daies, or in thirty at the fartheſt.

Ganders and Geeſe ingender together in the very water. Geeſe lay ordinarily in the ſpring:
B or if they were troden about mid-winter, then ye ſhall haue them lay after the Winter Sunneſtead ſome forty daies or very neere. They haue vſually two laiters in the yeare, namely, if hens hatched their former egs. The moſt that they hatch at one ſitting is ſixteene, and the feweſt ſeuen. If a man ſteale their egs from them they lay ſtill, and neuer giue ouer till they be readie to burſt with laying. No birds egs but their own will they hatch. The moſt profitable way, is to ſet them vpon nine or eleuen. The females only ſit, and that for the ſpace of 30 daies, vnleſſe it be warme weather, and then they will haue done by 25. If one of their Goſlings be ſtung neuer ſo little with a nettle, it will die of it. Their owne greedy feeding alſo is their bane, for one while they will eat vntill they burſt again; another whiles kill themſelues with ſtraining their own ſelues: for if they chance to catch hold of a root with their bill, they will bite and pul ſtil hard for to haue it, that many times they breake their owne neckes withall, before they leaue their hold. Againſt the ſtinging of nettles the remedie is, that ſo ſoone as they be hathed there be ſome nettle roots laid vnder their neſt of ſtraw.

Chap. LX.

¶ *Of Herons and Bittours, and the beſt way to keepe egs long.*

D OF Herons be three ſorts, * Leucon, * Aſterias, * and Pellon: theſe laſt ingender with much paine and difficultie; as for the males verily they cry againe for anguiſh, and the bloud ſtarts out of their eies in the act of treading. And with as much ado and trouble do the females lay, after they be knit with eg. The Egle and the moſt part of the greater fouls ſit 30 daies, whereas the leſſe continue but 20, as the Kite and the Hawk. The Kite vſually hatcheth but one at a time, and neuer aboue three: but that kind called Ægolios ſomtimes foure. The Rauen alſo now and then fiue: and thoſe cooue as many daies. While the female crow ſits the male feeds her. The Piot ordinarily brings forth nine Piannets. the fig-pecker Melancoryphus aboue 20, but euermore an od one: and there is not a bird that goeth therein aboue her. Lo how Nature is willing to multiply the race of little birds! The yong Swallowes are at the firſt blind, and ſo are all ſuch as are hatched many in number. Wind-egs, which we call Hypenemia, come either by the mutuall treading of hens one another, by an imaginarie conceit of
E the male, or elſe by duſt. And ſuch egs not only Doues doe bring, but houſe Hens alſo, Partridges, Peahens, Geeſe, and Brants, or the female Barganders. Now theſe egs are barren as it were, and neuer proue birds, leſſe than others, not ſo pleaſant in taſte, and beſides more moiſt. Some are of opinion that the wind will ingender them, for which cauſe alſo they are called Zephyria [*i.* Weſt-wind egs.] And verily ſuch egs are ſeen only in the ſpring, when that wind blows. Addle egs, which ſome called Cynoſura, are they that chill vpon the reſt, when the hen is gone and giueth ouer ſitting. Egs ſteeped in ſtrong vineger will come to be ſo ſoft, that they will paſſe and be drawn through the ring of a mans finger. The beſt way to keep egges is in beane meale or floure; and during winter in chaffe, but for ſummer time in bran. It is thought if they
F lie in ſalt their ſubſtance will waſte and conſume to nothing within the ſhell.

* A Criell, or dwarfe Heron.
* Bittor.
* A Carion Heron

Chap. LXI.

¶ *What Bird alone bringeth forth a liuing creature, and feedeth it with milke.*

THe Rere-mouſe or Bat alone of all creatures that fly, bringeth forth yong aliue, and none but ſhe of that kind hath wings made of pannicles or thin skins. She is the only bird that

ſuckleth her little ones with her paps,and giues them milk: and thoſe ſhe wil carry about her two at once,embracing them as ſhe flieth. It is ſaid alſo that ſhe hath no more but one ioynt of the hanch,without any in the knee or feet: and that they take greateſt delight to feed vpon gnats. G

Chap. LXII.

¶ *Of Vipers: their manner of generation and bringing forth yong: and what land beaſts do lay egges.*

MOreouer,among creatures of the land,ſerpents lay egs: whereof as yet we haue not written. As they ingender together they clip and embrace,and ſo intangled they be and inwrapped one about the other, that a man who ſaw them would think they were one ſerpent with two heads. In the very act of generation the male Viper thruſteth his head into the mouth of the female; which ſhe (for the pleaſure and delectation that ſhe hath) gnaweth and biteth off. No land creature els but ſhe hath egs within her belly,of one colour and ſoft,like as fiſhes haue. Now after three daies they be quicke,and then come forth as they be hatched,but no more than one at once euery day: and ſo commonly ſhe hath. When ſhe is deliuered of the firſt,the reſt(impatient of ſo long delay)eat through their dams ſides,and kil her. As for other ſerpents they lay their egs linked and chained together,and ſo ſit vpon them on the land: but they hatch them not vntill the yeare following. Crocodiles ſit by turnes, the male as well as the female. But I thinke it good to treat alſo of the generation of other land creatures. H I

Chap. LXIII.

¶ *The generation of liuing creatures vpon the land.*

OF all liuing creatures two footed,a woman onely bringeth forth her yong quicke. Men and women both,and none but they,repent at firſt the loſſe of their maidenhead. A very preſage(no doubt) of a life to enſue full of trouble and miſerie, that thus ſhould begin with repentance. All other creatures haue their ſet times and certain ſeaſons in the yeare when they ingender,as hath bin ſhewed before: but all is one with vs, and no houre of day or night comes amiſſe. Other creatures know when they haue enough,and reſt ſatisfied: we only are inſatiable that way,and cannot ſee to make an end. The Empreſſe *Meſſalina*, wife of *Claudius Ceſar*,thinking it the only victorie for a lady and queen to excell in this feat,choſe the moſt gallant curtiſan and commonneſt ſtrumpet in all Rome,to try maſteries and to contend with for the beſt game: and in very truth ſhe won the prize; for in the ſpace of 24 houres ſhe out-went her [a beaſtly thing to be written]no fewer than 25 times. As for men,they haue deuiſed in the practiſe of this filthy act,euen to abuſe ſome parts againſt kind: and women (vnnatural as they be)haue the caſt to deſtroy within them the vnripe and vntimely fruit of their own body. Certes in this behalfe how much worſe are we than the wild and ſauage beaſts of the field. *Heſiod* writeth,that men are more giuen to luſt in winter than in ſummer,and women contrariwiſe. Elephants,Camels,Tigers,Onces,Rhinoceros, Lions, Hares, Connies, and generally all beaſts which haue their genitall parts from-ward,turn taile to taile to the female in the act of generation. As for Camels,they go into the deſart,or at leſtwiſe ſeeke ſome corner when they would ingender; and dangerous it is for one to take them in the maner. They continue in this action one whole day together,and ſo do none els that are whole hoofed. In foure footed beaſts the males are ſet into the heat of luſt by ſenting and ſmelling. Dogs and Bitches,Seales & wolues likewiſe turn away,and in the mids of the action be tied one to another euen againſt their wils, and cannot help it. The females of moſt of theſe before named begin to ride the males firſt,for to prouoke their luſt: but of the reſt,the males leap the females at the firſt. Beares(as we ſayd before) lie along both as man and woman. Hedge-hogs ſtand both vpright,and claſpe one another when they ingender. The he Cat ſtandeth on his feet,and the ſhe lieth vnder him. Foxes ly vpon their ſides, and ſo the Bitch embraceth the male Fox. Kine and Hindes cannot well endure the violence of the Bulls and the Stagges in this buſineſſe, and therefore they are euer going when they doe engender. Stagges goe from one Hinde to another, and then come againe to the firſt; and this doe they in courſe. Lizards, as all other creeping creatures that haue no feet, wind one about another as they ingender. The greater that any beaſts be,the leſſe K L M

fruitfull

20030
copy 1

A fruitfull they are of their bodie. Elephants, Camels, and Horſes, get but one at once, neither do the females beare any more at a time: whereas the Goldfinch or Linnet, a verie little bird, bringeth forth a dozen commonly at once. Such as bring moſt, are leaſt while in breeding. The greater that any creature is, the longer time it requireth to be formed in the mothers wombe. And ſuch as liue long, be longer alſo ere they haue their perfection and come abroad into the world. The growing age is not meet for generation. Beaſts that are whole hoofed, neuer bring but one at a time: ſuch as be clouen footed in twaine, may alſo haue twins. But as many as haue their feet parted and deuided into many toes, are fit to beare many at ones. And wheras all the former rehearſed, bring forth perfect creatures with all parts, ſome haue their young ones imperfect and but halfe made: in which number Lioneſſes, ſhe Beares, bitch Foxes, are to bee rec-
B koned: but eſpecially the ſhee Beares, whoſe whelpes are more vnſhapen than the reſt: and a rare thing it is to ſee them a whelping. Howbeit ſuch females when they be deliuered of them, with their licking do chafe and heat them, and ſo by little and little bring them to ſome forme and faſhion by this meanes. Such for the moſt part beare foure whelpes. As for bitches, Wolues, Panthers, and Thoes, kindle their young before they can ſee.

Of Dogges and Bitches there be many kinds. They of * Laconia, as well the male as the female, be apt to engender after they be eight months old. They be with whelp threeſcore daies and three ordinarily. As for other Bitches, they goe proud at ſixe moneths, and may be lined. They be all the ſort of them, ſped at the firſt lining, Bitches that go aſſaut and take the dog before the full time, namely when they be verie young, ſuch bring a litter that will be longer ere they ſee: neither goe they: but all the whelps will not be blind ſo many daies. Dogs commonly
C when they be halfe yeare old, are thought to lift vp their leg when they piſſe; and that is a ſigne they are come to their full ſtrength and perfection: but bitches all that time piſſe ſitting vpon their buttocks. They haue twelue whelps when they bring moſt, but ye ſhall ſee them commonly with a litter of ſix or fiue: and ſomtime they come with juſt one, but that it is thought to be a prodigious ſigne; as alſo if the whelpes be all Dogges or all Bitches. The firſt vſually that they whelpe, be Dogs; for the reſt, they be one with another, a Dog and a Bitch: namely, if they were lined in the due ſeaſon, and at the juſt moneth. And commonly they goe proud ſix moneths after their former litter. The Bitches of Laconia ordinarily bring eight at a time. The Dogs of this race haue a propertie with them, that the more they be trauailed, the more luſtie and freſh they are, yea and the hotter after ſalt-bitches. They liue ten yeares, and the Bitches twelue. Of
D other kinds, ye ſhall haue them continue fifteen yeares, yea and otherwhiles twentie: but they engender not ſo long, but giue ouer commonly at twelue.

* Reſembling our Engliſh maſtiues.

Cats and Rats of Inde, called Ichneumones, in all other reſpects follow the Nature of Dogs, ſaue that they liue but ſix yeares. Conies kindle euery moneth: and albeit they be bagged, yet will they take the bucke againe, and conceiue vpon it; like as the Hares alſo will doe the ſame: for as ſoon as euer they haue kindled, they go to bucke and are preſently ſped: and ſay that the Leuerets or Rabbets lie ſucking at them yet wil they be with yong. When they be new kindled, they cannot ſee.

Elephants (as we haue alreadie ſaid) neuer bring but one at once, and that commonly is as big as a Calfe a quarter old. Camels goe a whole yeare. After they be 3 yeares old, they are
E ſufficient for to engender: and commonly they come in the ſpring: and it is a yeare after before they be couered againe. As for Mares, if there be three daies betweene, or but one, after they haue foled, it is thought they may very well be couered againe; yea and they are brought perforce to the ſtallion for this purpoſe. It is ſuppoſed alſo, that the ſhee Aſſe within ſeuen daies after, will ſooneſt conceiue. It is a rule, to ſhare and clip a Mares maine, before ſhee will abide the couering of an Aſſe, ſo vile and baſe a beaſt: for ſo long as the haire of her maine is well growne, ſhe is ſo proud and glorious, that ſhe will not abide the Aſſe to come neare her. So ſoone as they be couered and ſped, they run full into the South or North-wind, according as they be conceiued either with male or female: a thing that no other beaſts beſides, doth. And
F then, ſuddainly they change their colour; for their haire will be reddder, or at leaſtwiſe fuller and deeper, what colour ſoeuer it be. By which ſigne it is knowne they are with fole, and then they will admit no ſtallions vnto them, would they neuer ſo faine. And ſay, that ſome of them haue foles running by their ſides, they will doe their deed at worke neuertheleſſe: nay when they be with fole, they will labour as well as they did before: in ſo much, as many times they

ſteale a foling, before their maſter beware that they are with ſole. We haue read in Chronicles, that *Echecratides* the Theſſalian had a Mare, which euen then when ſhe was gone far with ſole, woone the beſt game in the Olympian race. They that haue ſought more narrowly into the ſecrets of Nature, ſay, That ſtone-Horſes, Dogs, and Bores, deſire the females in a morning: but Mares, Bitches, and Sowes make meanes to the male after noone. Mares that are kept within houſe at rack and manger with hay and prouender, deſire to be couered threeſcore daies before thoſe that goe abroad in the heard. Swine alone of all creatures when they be brimming, froth and fome at the mouth. And as for the Bore, if he heare the grunting of a Sow that ſeekes to be brimmed, vnleſſe he may come to her, will forſake his meat, vntill he be leane and poore: and ſhe againe will be ſo far enraged, that ſhee will be readie to run vpon a man and all to teare him, eſpecially if his cloths be white. But this rage and woodneſſe of hers is aſſwaged and allaied, only with bathing her ſhare behind with vineger. Some thinke there be certaine meats will prouoke beaſts to fleſhly luſt, namely, Onions giuen in meat to a beaſt; like as Rocket to a man or woman. Moreouer, it is ſuppoſed, that whatſoeuer is made tame, which by kind was wild, the ſame will not breed, as Geeſe and Ganders. In like manner, wild Swine & red Deere, if they be tamed; or if they doe, it is very long firſt: and ſuch only as were brought to hand euen from the time that they were very yong. Finally, this one thing is ſtrange and wonderfull, that all foure-footed beaſts, ſaue only the Mare and the Sow, if they find themſelues to be with yong, driue the male from them. But the Connie and the Hare alone will conceiue again when they be gone with yong.

Chap. LXIIII.

¶ *The varietie in liuing creatures, as touching their comming into the world.*

WHatſoeuer haue quicke creatures within them, bring the ſame forth with the head forward. For when the time is come, the yong thing turns about a little before, which otherwiſe lay ſtreight out at length in the bellie. Four-footed beaſts, whiles their dams go with them, lie with their legs ſtretched along, cloſe vnto their own bellies. An infant whiles it is in the mothers wombe, gathereth round into a ball, and hath his noſe lying juſt betweene his two knees. As for falſe conceptions or Moone-calues (wherof we ſpake before) ſome thinke they are engendred of the womans ſeed only: namely, when ſhe is not conceiued by a man, but by her ſelfe: and hereupon it is, that the ſaid conception hath no vitall nor animall life, becauſe it proceeds not of the conjunction of male and female both. True it is, that it is endued with a certain vegetatiue power, to be nouriſhed and to grow, like as we ſee intrees and many other plants.

Chap. LXV.

¶ *The breed of Mice and Rats.*

OF all creatures that bring forth their young perfect, Swine only farrow one Pig and two Pigs at a time, yea, and ſomtimes a number of them. Alſo they alone contrarie to the nature of all thoſe that either be whole-hoofed, or clouen-footed in twaine, bring a number of yong ones at one farrow. But aboue all, Mice and Rats for fruitfulneſſe do paſſe. And therefore I cannot put off the diſcourſe of them any longer: and yet therin I muſt follow *Ariſtotle* for mine Author, and the report withall of the ſouldiers that ſerued vnder *Alexander* the great. It is ſaid that they engender by licking, without any other kind of copulation: and that one of them hath brought ſix-ſcore at a time: alſo that in Perſia there haue been young Mice found with yong, euen in the bellie of the old dam. And ſome are of opinion, that they will be bagged, if they taſt but of a little ſalt. Why ſhould wee then wonder any more how ſuch multitudes of field-Mice and Rats ſhould come to deuour whole fields of corne? Howbeit, the reaſon is not yet known, how ſuch numbers of them ſhould al of a ſudden conſume away & come to nothing. For neither bee they found lying dead aboue ground, neither can any man come forth and ſay, that he hath turned vp any one with his ſpade as he digged in the Winter. The countrey of Troas is mightily giuen to breed great ſtore of them, inſomuch, as they haue forced alreadie the inhabitants to abandon the place and depart. Men ſay, that the ſeaſon proper

and

20030
copy 1

A and agreeable for their breeding in ſuch aboundance, is a great drought: alſo, that when they are toward their end, there be little wormes breeding in their heads that kill them. The Mice and Rats of Ægypt haue hard haire and pricky like to hedge-hogs. They go likewiſe vpright on their hinder feet, and walk as if they were two footed, after the manner of thoſe in the Alps. Moreouer, if beaſts of diuers kinds ingender together, they may wel breed yong between them, in caſe they do agree and jump in the time that the females of both ſhould go with yong. It is commonly thought and beleeued, that among foure footed beaſts the Lizard hath egs within her, and deliuereth them at her mouth; but *Ariſtotle* flatly denieth it. Howbeit they ſit not vpon them when they haue ſo done, as being forgetful where they laid them, ſo little or no memorie at all haue they. And therefore the yong Lizards of themſelues breake forth out of the
B ſhell.

Chap. LXVI.

¶ *Of a Serpent ingendred of the marrow of a mans back bone.*

I Haue heard many a man ſay, that the marrow of a mans backe bone will breed to a Snake. And well it may ſo be, for ſurely there be many ſecrets in Nature to vs vnknown, and much may come of hidden cauſes, as we may ſee euen among foure footed beaſts.

Chap. LXVII.

¶ *Of the Salamander.*

C. AS for example, the Salamander made in faſhion of a Lizard, marked with ſpots like ſtars, neuer comes abroad and ſheweth it ſelfe but in great ſhewres: for in faire weather he is not ſeen. He is of ſo cold a complexion, that if he do but touch the fire, he wil quench it as preſently as if ice were put vnto it. The Salamander caſteth vp at the mouth a certaine venomous matter like milke, let it but once touch any bare part of a man or womans body, all the haire will fall off, and the part ſo touched will change the colour of the skinne to the white morphew.

Chap. LXVIII.

D ¶ *Of thoſe that breed of others which neuer were ingendred. Alſo of thoſe that being ingendred, yet breed not.*

SOme creatures there be that breed of thoſe that neuer were ingendred themſelues; and yet not according to thoſe naturall means as others which wee haue ſhewed before; and ſuch alſo as either the Summer or Spring, or ſome certain ſeaſon of the yeare do breed. Among which ſome ingender not at all, as the Salamander: * for there is no more diſtinction of ſex in them, than in Yeeles, and in all thoſe which neither lay egs, ne yet bring forth any liuing creature. Oiſters likewiſe and all ſuch creatures as cleaue faſt either to rockes or to the ſhelues, are neither male nor female. As for ſuch as come of themſelues, if there be ſeene in them any di-
E ſtinction of male and female, ſomthing verily they ingender betweene them; but an imperfect creature verily it is, and not reſembling them: neither doth that generation breed ought any more, as we ſee the flies that ingender certain little wormes. The experience hereof is better to be obſerued in thoſe creatures called Inſects: whoſe nature is hard to be expreſſed, and yet I haue appointed a ſeuerall treatiſe for them apart. Wherefore I will go forward in the diſcourſe begun already, and namely as touching the ſence and vnderſtanding of the forenamed Creatures, and then proceed to the reſt.

* Which is found vntrue by experience.

Chap. LXIX.

F ¶ *The outward ſences of liuing Creatures.*

MAn excelleth all other Creatures, firſt in the ſence of feeling, and then of taſting: In the reſt many beaſts go beyond him. For the Ægles haue a clearer eie-ſight, the Geires a finer ſmell; and the Moldwarps, notwithſtanding they be couered ouer with earth (ſo

heauie,ſo thick and deafe an element as it is)yet their eare is far better than ours. Moreouer,albeit the voice of all them that ſpeake aboue ground doth aſcend vpward ſtill from them, yet heare they when they talke,yea and if a man chance to ſpeake of them,ſome hold that they vnderſtand their ſpeech,and thereupon do fly from them. A man,who at firſt lacketh his hearing, wanteth alſo the vſe of his tongue: neither are there any deafe borne,but the ſame likewiſe be dumbe. A man would not think,neither is it likely, that the Oiſters in the ſea do heare,and yet vpon any noiſe and ſound their manner is to ſink down to the bottome. And therefore when as men do fiſh for them in the ſea they are as ſilent as they may be. G

CHAP. LXX.

¶ *A diſcourſe, That fiſhes both heare and alſo ſmell.* H

FIſhes verily haue no eares,ne yet any holes to ſerue for hearing;and yet plain it is that they doe heare, as we may daily ſee in certaine fiſh ponds and ſtewes where fiſhes be kept: for when thoſe that haue the charge of them make a noiſe with clapping of their hands, as wild as they be otherwiſe,they ſhall haue them come in great flocks to take their meat that is thrown in to them: and this are they wont to do daily: and that which more is, in *Cæſars* Fiſh-pooles a man may ſee whole skuls of fiſhes to repaire at their call: yea, and ſome wil part from the reſt of their company,and come alone to land when they be named. Hereupon it is,that the Mullet,ſea-Pike,Stock-fiſh,and Chronius,are thought to heare beſt of all others,and therfore liue very ebbe among the ſhelues and ſhallowes. That fiſhes haue the ſence of ſmelling it is I manifeſt: for they are not all taken ne yet delighted with one kinde of bait: and this is obſerued,that before they bite they will ſmel to it. Some alſo there be that lie in holes vnder rocks, and no ſooner hath the fiſher beſmeared and anointed the mouth and ſides of the ſaid rocks in the very entrance to their holes,but he ſhall ſee them come forth,as it were to auoid the ſent of their own carion. Let them lie in the very deep,yet wil they reſort to certain odors and ſmells, namely,to the Cuttill burnt,and the Polype, which for that purpoſe they vſe to put into their neſts. And verily they cannot abide the ſmel of the ſinke and pumpe of a ſhip,neither wil they come neere vnto it: but aboue all things they may not away with the bloud of fiſh. The Pourcuttle hardly or not at all can be pulled from the rocks,ſo faſt cleaueth he: howbeit come neer him with the herb Marjerome or Savorie,he will preſently leape from the rocke and away,to K auoid the ſent thereof. Purples alſo be caught by means of ſome ſtinking bait. And for other creatures,who doubteth but they haue a perfect ſmell? Serpents are chaſed away with the ſmell and perfume of the Harts horn; but aboue all, with the odor of Styrax. And Piſmires are killed with the very fume of Origon,Quick-lime,or Brimſtone. Gnats loue all four things, and willingly will thither: but to any ſweet meats they come not neare.

CHAP. LXXI.

¶ *That the ſence of feeling is common to all liuing creatures.*

THere is not a liuing creature throughout the world but hath the ſence of feeling, though L it haue none els: for euen oiſters and earth-wormes,if a man touch them doe euidently feele. I would think alſo that there is none but taſteth as wel as feeles. For what ſhould the reaſon elſe be, that ſome deſire to taſt this, others that? And verily herein is ſeene aboue all the ſingular workmanſhip of Nature, in the frame of their bodies and the members thereof. Some ye ſhall haue to ſeiſe vpon their prey with their teeth,others ſnatch it with their talons and clawes: ſome peck and pluck it with their hookt bils, others pudder into their food with their broad nebs. Some with the ſharp point of their beaks worke holes into their meat; others lie ſucking at it. Some lick,others ſup in: to conclude, ſome chew,others ſwallow and deuoure whole as it is. As touching their feet, there is no leſſe varietie in the vſe thereof: in ſnatching and carrying away,in tearing and plucking a pieces,in holding faſt,and in cruſhing their prey. Some ye ſhall haue to hang by their feet, and others neuer lin ſcraping and ſcratching the earth.

CHAP.

Chap. LXXII.

¶ *What creatures liue of poiſon, and what of earth.*

Roe Bucks and Does, yea, and Quailes (as we haue ſaid before) will feed fat with poiſons; and yet they are the moſt meeke and gentle creatures liuing. Serpents haue a great deſire and loue to egs; wherein the ſubtilty of Dragons is worthy to be conſidered. For either they ſwallow them downe whole (if their throat will receiue them) and after they be within their body, breake and ſquize them in pieces with rolling and winding themſelues round toge-
B ther, and then caſt vp the ſhels againe: or if they be but young ones yet, and not ſo ſtrong as to gobble vp whole egs, then they will winde about an egge with their taile by little and little, & bind it ſo hard, that they wil cut off the crowne of it, as it were with a knife, and then ſup off the reſt which they claſp and hold faſt between. In like manner deale they with birds. For ſwallow they will them whole downe the gullet, and afterwards ſtraine and ſtruggle ſo with themſelues vntill they diſgorge again the feathers and bones that were in their bellies.

Scorpions feed vpon earth. And Serpents againe, if they may come handſomly to wine, will make means to drink their fil of it, how ſoeuer otherwiſe they haue but little need of any drink. They eat no meat at all, or very little, when they be kept cloſe within any thing: like as the ſpiders alſo, which otherwiſe naturally liue by ſucking. And therefore you ſhall not lightly ſee
C any venomous creature die either of hunger or thirſt. For neither haue they ſtore of heat, nor plenty of bloud, ne yet of ſweat: all which naturally prouoke a ſtomack, & giue an edge to appetite. And among theſe venomous creatures, thoſe be euer more dangerous which haue eaten ſome of their own kind, before they bite or ſting. Apes, Monkies, and Marmoſets beſtow and treaſure vp the meat that is giuen them, or that they can come by, within their cheeks, as in a ſtore-houſe. And when they be hungry, they get the ſame forth by little and little with their hands, & ſo fal to chew it. Thus practiſe they in making their prouiſion, for to ſerue them from day to day, and from one houre to another: which Piſmires vſually do from yeare to yeare.

Chap. LXXIII.

D

¶ *The meat and drinke of ſome creatures.*

Of all liuing creatures that haue many toes in their feet, the Hare alone feeds vpon graſſe and greene corne in the blade. As for thoſe that be whole hoofed, they liue both of the blade, and alſo of the fruit thereof. Alſo of ſuch as be clouen footed, Swine will eat all kind of food, yea, and liue of very roots. It is the property of whole hoofed beaſts alone, to wallow and turn ouer and ouer. All that haue teeth indented in like ſaws, be naturally deuourers of fleſh. Bears wil feed of corn, brouſe trees, eat grapes, liue of apples and other fruits, feed vpon bees, creifiſhes, and piſmires. Wolues (as we ſaid before) if they be very hungr , eat earth: ſheep feed the better & grow fat, if they may drink; and therfore ſalt is very good for them, becauſe it
E makes them thirſty. Draught beaſts, and ſuch as are vſed for carriage, albeit they liue of corne and graſſe, yet according to their drinking they do feed. Beſides thoſe mentioned hertofore, of wild beaſts the red and fallow Deere both, doe chew cud when they be made tame and fed by hand: but all chuſe rather in ſo doing, to lie than to ſtand, & in winter more than in ſummer, for ſeuen months ordinarily. The rats and mice in the country of Pontus, namely, Hermins, & ſuch like, after the ſame maner do chew cud and go ouer their meat again. What beaſts ſoeuer are toothed like ſaw teeth, lap as they drinke. So do alſo our common mice and rats, although they be of another kind, and are not ſo toothed. They that haue broad teeth, plaine, and vniforme, as horſes and kine, drinke ſupping and taking their ful draught. Bears in their drinking do neither the one nor the other, but bite at the water and ſo let it down. In Affrick the more part of wild
F beaſts drink not all ſummer long, for want of raine water: which is the cauſe that the Rats and Mice of Ginnie which be taken if they drink afterwards vpon ſo long diſuſe, die therewith. In the deſarts of Affrick, where there is no water euer to be had, there is ingendred a certain wilde goat named Oryx, which as by the nature of the place it wanteth drink, ſo it hath in her bodie a ſouerain and ſingular remedy againſt drought and thirſt. Which the common theeues & robbers by the high way ſide in Getulia, knowing well enough, endure a long time with the helpe

thereof

thereof without drinke; for they vſe to ſtanch and quench their own thirſt, with a certain moiſt holeſome liquour found in the bladders of the ſaid beaſt. In the ſame Affricke the Leopards lie in await among the thickets of trees, hidden within the branches; and ſo ſeize vpon them that paſſe by, and make ſpoile euen from the place where fouls vſe to perch. As for Cats, marke I pray you how ſilent they be, how ſoft they tread when they ſteale vpon the ſilly birds: how ſecret lie they in eſpiall for the poore little mice to leap vpon them. Their owne doung and excrements they will rake vp and hide in the earth, knowing full well, that the ſmell thereof will bewray where they are. G

CHAP. LXXIIII.

¶ *What beaſts accord together, and which they be that diſagree one from another.* H

BEſides theſe outward ſences abouenamed, euident it is alſo, that brute beaſts haue other inſtincts of nature. For they entertain friendſhip and enmity one with another (which cannot be without affection and paſſion) ouer and beſides thoſe other wars and amities which wee haue obſerued in their ſeuerall places. Swans and Ægles jar and war one with another: ſo doth the Rauen and the Witwall or Loriot, which ſeeke after one anothers egs in the night. Likewiſe the Rauen and Kite: for the Rauen is euermore ready to catch the Kites meat from him. Crowes and Owles are at mortall feaud one with another. The roiall Ægle hateth the Wren, and why? becauſe (if we may beleeue it) he is named Regulus (*i.* the pettie king.) Howlets alſo cannot agree with other little birds. Again, foules make warre with foure-footed beaſts. The Weaſell and the Crow be at deadly debate. The Turtle with the Creckit (Pyralis) that liueth about the fire. The Ichneumons with Waſpes: the Phalangia with other Spiders. And among water foules, Ducks and Drakes with the ſea-guls. The Seamews with the Buzzard Triorchis. As for the field Rats or Mice, and the dwarf-Herons, they ſeeke to prey one vpon the others little ones. The bird Ægithus (the leaſt in maner of all others) waiteth the Aſſe a ſhrewd turn; for when he rubbeth himſelf againſt the buſhes to ſcratch where it itcheth, he therewith breaketh and ouerthroweth her neſt; and therefore this ſilly bird is ſo much afraid of the Aſſe, that if ſhe heare him but bray, ſhe is ready to throw the egs out of her neſt, and thoſe that be already hatched, will for very feare fall downe: then in reuenge of this wrong, ſhe will flie vpon him, and with her bill peck where the skin is off and raw with rubbing, yea, and make holes euen to the very bone. Moreouer, Foxes and the Yeeles of Nilus cannot abide one another, but are in continuall war. So be Wezils and Swine. There is an vnhappy bird called Æſalon, and but little withall; yet will ſhe ſquaſh and breake the Rauens egs. And when ſhe hath yong ones, they bee much troubled and annoied with Foxes: ſhe again to be quit with them, will all to pinch & nip both the Fox and her cubs. The Rauens ſeeing that, come to aid (as it were) againſt a common enemy. The Gold-finch liueth among buſhes and thorns, and therefore ſhe alſo hates the Aſſe, becauſe he eateth vp the floures that grow therupon. The bird Ægithus, ſo far hateth another called Anthus, that men are verily perſuaded the bloud of them both will not mingle together: and hereupon it is, that the ſorcerers and witches haue brought it into an ill name. The Thoes and the Lions do fouly jarre and diſagree. In ſumme, the leaſt creatures as well as the biggeſt quarrell and fight one with another. Rats and field Mice cannot abide to come neere a tree that is full of Ant-neſts. The Spider eſpying a Serpent lying along vnder the ſhade of a tree where ſhe ſpinneth, ſlideth down vpon a fine thred to the head of the Serpent, and ſtingeth him ſo deep into the braine, that he falleth a hiſſing and grinding his teeth: he keepeth a winding and turning about, but hath not the power to breake the thred that hangeth aboue, ne yet to fly from the Spider: inſomuch, as the Serpent lieth there dead in the place. Contrariwiſe, Peacocks and Houſe-doues be as friendly one to another: ſo be the Turtles and Popinjaies, the Merles and Turtles likewiſe. The Crow and the leſſe Bittours alſo: for they ioine and band together againſt the common enemy the Fox. Likewiſe, the bird-Harpe and the Kite againſt the Buzzard. What will ye ſay? be there not tokens of affection euen in Serpents, the cruelleſt and felleſt creatures of all others in the world? I haue written already of the report or tale that goeth in Arcadia of a man, whoſe life was ſaued by a Dragon (that was brought vp by him) ſo ſoon as euer he knew him by his voice. As for the Aſpis, *Philarchus* telleth a ſtrange hiſtory of it. I K L M

20030
copy 1

A it. For he writeth, that in Ægypt there was an Aſpis vſed ordinarily to come to the table of a certaine Egyptian, and there tooke meat at his hand: which Serpent afterwards had yong ones, whereof one chanced to ſting a ſon of the maſter of the houſe, that he died of it. Now when the dam (the old Aſpis) came accordingly at the accuſtomed houre of repaſt for victuals, and perceiued the deed committed by her little one; not onely killed it in ſatisfaction of the former fact, but alſo forbare the houſe, and was neuer knowne to repaire thither againe.

CHAP. LXXV.

¶ *The ſleepe of liuing creatures.*

B THe queſtion, Whether liuing creatures ſleep or no? is not very difficult, but ſoon decided: For plain it is, that of land creatures, all that winke and cloſe their eies doe ſleepe. As for thoſe in the water, that they alſo ſleepe (though but a little) euen they are of opinion who otherwiſe make doubt of the reſt. And this they do not collect & gather by their eies (for lids they haue none to ſhut) but becauſe they are ſeene to lie ſo ſtill and quiet, as faſt and ſound aſleep, ſtirring no part, but a little wagging their tailes, and ſeeming to ſtart and bee affright at any ſudden noiſe made in the water. As for the Tunnies, we may auouch more confidently of their repoſe: for they come of purpoſe to ſleep vnder the banks or rocks. And flat broad fiſhes lie ſo ſtill ſleeping among the ſhelues, that oftentimes a man may take them vp with his hand. The Dolphins and Whales be heard to rout and ſnort again, they ſleepe ſo ſoundly. Moreouer; as touching Inſects, no man need to doubt that they ſleep, ſo quietly do they lie and make no
C noiſe: nay, if you bring a candle or other light, and ſet it euen before their eies; you ſhall not haue them to awake nor moue. An infant after it is borne, ſleepeth for certaine moneths at the firſt, and in manner doth nothing els. But the elder hee waxeth, wakefull is he euery day more than other. Babes at the very beginning do dreame. For they will waken and ſtart ſuddenly in a fright; and as they lie aſleep, keep a ſucking of their lips, as if it were at the breaſt heads. Some neuer dream at all. And if ſuch chance contrary to this cuſtome, for to dreame once, it hath bin counted for a ſigne of death, as we haue ſeene and prooued by many examples and experiments. And here in this place there offereth it ſelfe a great queſtion, and very diſputable *pro & contra*, grounded vpon many experiments of both ſides: namely, whether the ſoule of man while
D the body is at reſt, foreſeeth things to come? and how it ſhould ſo do? or whether this be a thing of meere chance and altogether coniecturall, as many others be? And ſurely if we go by hiſtories, we may find as many of the one ſide as the other. Howbeit all men in manner agree in this, That dreames either immediatly vpon drinking wine and full ſtomacke, or els after the firſt ſleep, are vaine and of no effect. As for ſleep it is nothing els but a retreat and withdrawing of the ſoule into the mids of it ſelfe. Euident it is, that Horſes, Dogs, Kine, Oxen, ſheep, and goats do dreame. Whereupon it is credibly alſo thought, that all creatures which bring forth their yong quicke and liuing, do the ſame. As for thoſe that lay egges, it is not ſo certaine that they dreame: but reſolued it is, that they all do ſleep. Now let vs paſſe and proceed to the treatiſe of Inſects.

THE ELEVENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

IT remaineth now to write of those liuing creatures, which are the most subtill of all others that Nature hath brought forth: forasmuch as some are of opinion, That they breath not, ne yet haue any bloud at all.

CHAP. I.

¶ *Of Insects in generall.* I

MAny and sundry sorts there be of Insects, as well among land creatures as those that fly in the aire. Some are winged, as bees: some haue partly wings and partly feet, as Pismires: others want both, and neither flie nor go on their feet. And wel may they all be called *Insecta*: by reason of those cuts and diuisions, which some haue about the necke; others in the breast and belly; the which do go round and part the members of the body, hanging together onely by a little pipe and fistulous conueiance. There be of them, that haue not the body diuided entire, one part from the other by these incisures, cuts, and wrinckles; but they appeare only either vnder the belly, or vpon the backe aboue, and go no deeper, neither yet round the whole compasse of the body. But a man shall perceiue in them certaine rings or circles, apt to bend and wind to and fro, and those so plated and plaited one ouer another, that in K nothing elswhere is more seen the workmanship of Nature, than in the artificiall composition of these little bodies.

CHAP. II.

¶ *The industrie and subtiltie of Nature in framing these Insects.*

IN bodies of any bignes, or at least-wise in those of the greater sort, Nature had no hard piece of work to procreate, forme, and bring all parts to perfection; by reason that the matter wherof they be wrought, is pliable and will follow as she would haue it. But in these so little bo- L dies (nay pricks and specks rather than bodies indeed) how can one comprehend the reason, the power, and the inexplicable perfection that Nature hath therin shewed? How hath she bestowed all the fiue senses in a Gnat? and yet some there be, lesse creatures than they. But (I say) where hath she made the seat of her eies to see before it? where hath she set & disposed the tast? where hath she placed and inserted the instrument and organ of smelling? and aboue all, where hath she disposed that dreadful and terrible noise that it maketh, that wonderfull great sound (I say) in proportion of so little a body? can there be deuised a thing more finely & cunningly wrought than the wings set to her body? Marke what long-shanked legs aboue ordinary she hath giuen vnto them. See how she hath set that hungry hollow concauitie in stead of a belly: & hath made the same so thirstie and greedy after bloud, and mans especially. Come to the weapon that it hath to pricke, pierce, and enter through the skinne; how artificially hath shee pointed and M sharpened it? and being so little as it is (as hardly the fineneſse thereof cannot be seen) yet as if it were of bigneſse & capacity answerable, framed it she hath most cunningly for a twofold vse: to wit, most sharpe pointed, to pricke and enter; and withall, hollow like a pipe for to sucke in

and

20030
copy 1

A and conuey the bloud through it. Come to the Wood-worme, what manner of teeth hath Nature giuen it, to bore holes and eat into the very heart of hard Oke? who heareth not the ſound that ſhe makes whiles ſhe is at her work? For in wood and timber is in manner all her feeding. We make a wonder at the monſtrous and mighty ſhoulders of Elephants, able to carry turrets vpon them. We maruell at the ſtrong and ſtiffe necks of buls, and to ſee how terribly they will take vp things and toſſe them aloft into the aire with their hornes. We keepe a wondering at the rauening of Tygres, and in the ſhag manes of Lions: and yet in compariſon of theſe Inſects there is nothing wherein Nature and her whole power is more ſeene, neither ſheweth ſhe her might more than in the leaſt creatures of all. I would requeſt therfore the Readers, that in peruſing this treatiſe, they will not come with a preiudicate opinion, nor (becauſe many of theſe
B ſilly flies and wormes be contemptible in their eies) diſdaine, loath, and contemne the reports that I ſhall make thereof; ſeeing there is nothing either in Natures workes that may ſeeme ſuperfluous, or in her order vnworthy our ſpeculation.

Chap. III.

¶ *Whether Inſects do breath, and whether they haue bloud or no?*

DIuers haue denied that they breath at al; and vpon this reaſon they ground their poſition; Becauſe they haue no arterie or wind-pipe annexed or reaching to any inſtrument within of reſpiration. And they be of opinion, that they liue indeed as plants, herbes, and trees: howbeit (ſay they) there is a great difference betweene hauing life, and drawing wind or vitall
C breath. And by the ſame rule they affirme, that they haue no bloud, which is in none that bee without heart and liuer. Neither do any things breath which want lungs. And from hence ariſeth a world of other queſtions thereupon depending. For the ſame men deny flatly, that theſe creatures haue any voice: notwithſtanding ſo great humming of bees, & ſinging ſound of graſhoppers, and ſuch other, whereof we will conſider in due time & place, accordingly. Verily for mine owne part, the more I looke into Natures workes, the ſooner am I induced to beleeue of her euen thoſe things that ſeem incredible. Neither do I ſee any inconvenience to thinke, that theſe Inſects may as well draw wind and breath without lungs, as liue without ſuch noble and principall parts as are requiſite for life in other creatures: according as we haue already ſhewed
D in the diſcourſe of fiſhes and ſuch like, that liue in the ſea; how ſoeuer the quantitie, depth, and heights of the water, may ſeeme to impeach and ſtop their breath. For who would eaſily beleeue, that ſome creatures ſhould flie at libertie, and liuing as they do in the mids of wind and aire, yet want wind and breath themſelues? that they ſhould haue a ſenſe and care to ſeek their liuing, to engender, to worke, and to forecaſt for the time to come: and howbeit they haue no diſtinct members, to carry (as it were in a ſhip) their ſeuerall ſences, yet that they ſhould heare, ſmell, and taſte; yea and be indued with other ſingular gifts beſides of Nature, to wit, wiſdome, courage, skill, and induſtrie. Indeed, confeſſe I muſt, that bloud they haue none: no more haue all creatures that liue vpon the land: howbeit a moiſt humor they haue, ſomewhat like vnto bloud, which ſerues them in ſtead thereof. Like as in Cuttels of the ſea, there is found a certain
E blacke liquor in ſtead of bloud: and in all the ſort of Purples and ſuch ſhel fiſhes, that excellent iuice which ſtaineth & dieth ſo as it doth. Semblably in theſe Inſects, whatſoeuer humor it is, whereby they liue, the ſame may well enough go for bloud and ſo be called: all the while that euery man hath liberty to giue it what name he thinketh fitteſt. As for me, my purpoſe is not to judge and determine of theſe doubtfull quillets, and their cauſes; but to ſet down and ſhew the nature of ſuch things as be cleare and apparent.

Chap. IIII.

¶ *The ſubſtance of the body in theſe Inſects.*

F THeſe Inſects, ſo far as a man may perceiue, ſeeme not to haue either ſinewes or bones, no chine nor griſtle, no fat, no fleſh, ne yet ſo much as a tender and brittle ſhell, as ſome Sea-fiſhes haue, nor that which may be truly called a skin; but a certain corporal ſubſtance of a middle nature between all theſe: for their body without, is like a dry thing, and yet more tender and ſoft than a ſinew: whereas in all other parts the matter is to be accounted rather drie

than

than hard. This is the very ſubſtance whereof they conſiſt, and nothing haue they beſides. For within there is nought, vnleſſe it be in ſome very few, who haue a certaine pipe or conduit in ſtead of a gut, & the ſame wrapped and infolded together. Which is the cauſe, that if they be cut in two and pulled in pieces, yet they haue a ſpeciall property to liue long, and each part aſunder wil pant & ſtir by it ſelfe. The reaſon is, becauſe the vitall vertue in them (whatſoeuer it is) is not ſeated in any one member, this or that, but ſpred and defuſed throughout the whole body, and leaſt apparent in the head, of all other parts: for, that alone, vnleſſe it be plucked away together with the breaſt, moueth not one jot. No kind of creatures haue more feet than theſe: and the more they haue, the longer liue they when they be diuided aſunder; as we ſee by experience in the Scolopendres. Eies they haue, that is certain; & beſides ſight, they are not without the ſences of feeling & taſting: ſome there be that ſmell, & a few that haue their hearing alſo.

Chap. V.

¶ *Of Bees.*

BVt among them all, Bees are principall, and by good right deſerue eſpeciall admiration, as being the only Inſects ordained by Nature for mans vſe. They gather honie, a moſt ſweet, pleaſant, fine, and wholeſome liquor. They frame the hony combs, and work the wax, which ſerue for a thouſand turns in this life. They indure pains continually, and diſpatch their worke and buſineſſe. They haue a policie and Commonwealth among themſelues. They hold their ſeuerall counſels: and there is not a ſwarme or caſt that they haue, without a king and captaine of their owne: and that which is moſt admirable of all, there be ciuill faſhions and cuſtomes among them. Moreouer, being as they are, neither tame and gentle, nor yet to be counted wilde and ſauage, yet (ſee the wondrous worke of Nature!) by the means of ſo little a creature, nay, a ſhadow rather (to ſay a truth) of the leaſt creature, ſhe hath effected a thing incomparable: what ſtrength of ſinewes, what force and puiſſance is able to countervaile this ſo great induſtry and effectuall power of theirs? What wit and policy of man is anſwerable to their diſcreet and orderly courſe? Beleeue me, they paſſe them all, and in this one point ſurpaſſe, That all things are common among them, and nothing know they priuat and ſeueral. What ſhould we debate and make queſtion any more as touching their breath? Why ſhould wee diſpute of their bloud, which cannot chuſe but be very little, in ſuch ſmal bodies? Let vs rather conſider henceforth their wit, and the gifts of their mind.

Chap. VI.

¶ *The naturall order and regiment that is in Bees.*

BEes all winter time keep cloſe within their hiues: and good reaſon; for how poſſibly ſhould they indure hard froſt and chilling ſnow? how ſhould they abide the piercing blaſts of the North winds? And verily it is the manner of all theſe Inſects ſo to doe, but yet they keepe not in ſo long. For why? being neſtled warm as they are within our houſes, they ſooner doe recouer their vigor, & come abroad betimes. But as concerning Bees, either the times haue changed, & places altered their courſe, or els the writers beforetime of this argument haue greatly erred. They begin to retire themſelues and take vp their wintering harbor, preſently vpon the ſetting and occultation of the ſtar Vergiliæ; and come not forth into the field againe, vntill after the riſing and apparition thereof. So that Bees go not abroad at the very beginning of the Spring, as Writers haue ſet downe (for who ſeeth not the contrary throughout all Italie) but remaine ſtill cloſe and ſecret, vntill that Beanes begin to bloom; before which time they ſettle not themſelues to any worke or labour. But from thence forward, they loſe not a day, they ſlack not their painful trauel, neither play they one jot, if the weather be faire & wil permit: the firſt thing they do, is to make their combs & wax, that is to ſay, their own habitations & ſtore-houſes. When they are prouided of lodging, they thinke vpon the multiplying of their owne kind: and finally, they gather and make both hony and wax: the ſubſtance whereof they ſucke from the floures of trees and hearbes, from the gums alſo of trees which breed ſuch gluie matter; and beſides, out of the iuice, gum, and roſin of the willow, elme, and cane. With theſe and ſuch like, they plaiſter all the hiue within throughout, as it were with a coat or parget, intermingling

20030
copy 1

A gling withall other iuices that are more vnſauorie, gathered from the bittereſt hearbs they can get: to the end that they might keepe out other little vermines that are greedy of their hony: as knowing full well, that they are about a piece of worke which is worthie to be deſired and ſought after. Of this gummy and glutinous ſubſtance they frame alſo their dores and entries which are wide and large.

Chap. VII.

¶ *The proper termes belonging to their worke.*

THe firſt foundation of their worke, skilfull hony-maſters do call Commoſis: the ſecond Piſſoceros: the third Propolis, which lieth between thoſe former coats and the wax of the
B hony-combe, whereof there is ſo great vſe in Phyſicke. Commoſis is the firſt coat or cruſt of a bitter taſt. Piſſoceros commeth next after it, as it were a thinner courſe of pitch or varniſh and a weaker kinde of wax, made of the more liquid and mild gum of vines and poplars. But Propolis conſiſteth of a more ſolid matter, as hauing the ſtrength of ſome floures withall: howbeit, as yet it is no ful and perfect wax, but the foundation and ſtrengthening of the combs: and ſerueth as a good defence againſt cold, and to ſtop the paſſage of waſpes and ſuch hurtful creatures as would do iniurie to the bees, for ſtil a ſtrong ſent it carrieth, as which, many men do vſe in ſtead of Galbanum. After this munition done, then followeth the prouiſion of that which is called Erithace, ſome terme it Sandaracha, and others, Cerinthus. This muſt ſerue for the bees meat, whereof they are to liue whiles they worke: and found it is oftentimes, laid apart within
C the concauities of their combs, it being alſo of a bitter taſte. Now this Erithace commeth of the * Spring-dew, and the moiſture iſſuing out of trees in manner of gum: in leſſe abundance euer, when the South-weſt wind blows: but when it is full South, more blacke: and in the Northerly conſtitution, far better and more red withall. Great ſtore hereof, Bees meet with vpon Almond trees. *Menecrates* ſaith, That it is a floure foreſhewing what harueſt ſhall inſue: * but no man ſaith ſo beſides him.

* *Rore veris* or Sea-dew, *Rore marino.*

* Being deceiued with the Homonymie of the word *Cerinthus*, which hath a double ſignification.

Chap. VIII.

¶ *What flowers they be which Bees ſerue themſelues moſt withall for their worke.*

D

AS for wax, Bees gather and make it of the floures of all trees, herbs, and plants, ſauing the docke and * Gooſe-foot, which are two kinds of herbs. Some except alſo a kind of Broom called Spart, but vntruly: for in Spaine (where there be many places full of that ſhrub) the honie carrieth the ſtrength thereof in the taſte. I am beſides of opinion, that they be deceiued who thinke that bees gather not of Oliue trees. For we ſee it ordinary, that there be more caſts and ſwarmes of Bees where Oliues grow in greater abundance. Theſe pretty creatures hurt no fruit whatſoeuer. They will not ſettle vpon a floure that is faded, and much leſſe of any dead carkaſſe. They vſe not to go from their hiue about their buſines aboue 60 paces: & if it chance, that within the precinct of theſe limits they finde not floures ſufficient: out goe their ſpies,
E whom they ſend forth to diſcouer forage farther off. If in this expedition, before they come home againe, they be ouertaken by the night, they couch vpon their backes for feare leſt their wings ſhould be ouercharged with the euening dew, and ſo they watch all night vntill the morning.

* Chenopodes

Chap. IX.

¶ *Thoſe that haue taken a ſpeciall pleaſure in Bees.*

F SVch is the induſtrie of this creature, that no man need to wonder at thoſe two perſons who delighted ſo much in them, that the one (namely *Ariſtomachus* of Soli) for threeſcore yeares lacking but twaine, did nothing elſe but keep bees. and *Philiſcus* the Thaſian emploied the whole time of his life in Forreſts and Deſarts, to follow theſe little animals: whereupon hee was ſurnamed *Agrius*. And both theſe vpon their knowledge and experience, wrote of Bees.

Chap. X.

¶ *The order that they keepe in their worke.*

THe manner of their buſineſſe is this. All the day time they haue a ſtanding watch & ward at their gates, much like to the *corps de guard* in a campe. In the night they reſt vntill the morning: by which time, one of them awaketh and raiſeth all the reſt with two or three big hums or buzzes that it giues, to warn them as it were with ſound of trumpet. At which ſignall giuen, the whole troupe prepares to flie forth, if it be a faire and calme day toward, for they doe both foreſee, and alſo foreſhew when it will bee either windie or rainie, and then will they keepe within their ſtrength and fort. Now when the weather is temperate (which they foreknow well enough) and that the whole armie is on foot and marched abroad, ſome gather together the vertue of the floures within their feet and legges: others fil their gorge with water, and charge the downe of their whole body with drops of ſuch liquor. The yonger ſort of them go forth to worke, and carry ſuch ſtuffe as is beforenamed, whiles the elder labor & build within the hiue. Such as carry the floures abouesaid, ſtuffe the inner parts of their legs behind (and thoſe Nature for that purpoſe hath made rough) with the help of their forefeet: & thoſe again are charged full by the means of their muffle. Thus being full laden with their prouiſion, they return home to the hiue, drawne euen together round as it wete in a heap, with their burden: by which time, there be three or foure ready to receiue them, and thoſe eaſe and diſcharge them of their lode. For this you muſt thinke, that they haue their ſeuerall offices within. Some are buſie in building, others in plaiſtering and ouercaſting, to make all ſmooth and fine: ſome be at hand to ſerue the workemen with ſtuffe that they need; others are occupied in getting ready meat and victuals out of that prouiſion which is brought in: for they feed not by themſelues, but take their repaſt together, becauſe they ſhould both labour and eat alike, and at the ſame houre. As touching the maner of their building, they begin firſt aboue to make arch-work embowed, in their combs, and draw the frame of their work downward; where they make two little allies for euery arch or vault, the one to enter in by, the other to go forth at. The combs that are faſtened together in the vpper part, yea and on the ſides, are vnited a little, and hang all together. They touch not the hiue at all, nor ioin to it. Sometime they are built round, otherwhiles winding bias, according to the proportion of the hiue. A man ſhll find in one hiue hony combs ſomtime of two ſorts: namely, when two ſwarms of bees accord together: and yet each one haue their rites and faſhions by themſelues. For feare leſt their combs of wax ſhould be ready to fal, they vphold them with partition wals, arched hollow from the bottom vpward, to the end that they might haue paſſage euery way to repaire them. The formoſt ranks of their combes in the forefront, commonly are built void and with nothing in them, becauſe they ſhould giue no occaſion for a theefe to enter vpon their labours. Thoſe in the backe part of the hiue, are euer fulleſt of hony: and therefore when men would take out any combes, they turne vp the hiues behind. Bees that are emploied in carrying of hony, chuſe alwaies to haue the wind with them, if they can. If haply there do ariſe a tempeſt or a ſtorm whiles they be abroad, they catch vp ſome little ſtony greet to ballance and poiſe themſelues againſt the wind. Some ſay, that they take it and lay it vpon their ſhoulders. And withall, they flie low by the ground vnder the wind when it is againſt them, and keep along the buſhes, to breake the force thereof. A wonder it is to ſee and obſerue the manner of their worke. They mark and note the ſlow-backs, they chaſtiſe them anon, yea, and afterwards puniſh them with death. No leſſe wonderful alſo it is to conſider how neat and clean they be. All filth and trumperie they remoue out of the way: no foule thing, no ordure lieth in the hiue to hinder their buſineſſe. As for the doung and excrements of ſuch as are working within, they be laid all on a heap in ſome by-corner, becauſe they ſhould not goe far from their worke: and in foule weather (when otherwiſe they haue nought to do) they turn it forth. Toward euening, their noiſe beginneth to ſlacke and grow leſſe and leſſe: vntill ſuch time as one of them flieth about with the ſame loud humming, wherewith ſhe waked them in the morning, and thereby giueth a ſignal (as it were) and commandement for to go to reſt: much after the order in a camp. And then of a ſudden they are all huſht and ſilent.

Chap. XI.

¶ *Of the drone Bees.*

THe houſes and habitations that Bees build firſt, are for the Commons: which being finiſhed, they ſet in hand with a pallace for their king. If they foreſee that it will be a good ſeaſon, and that they are like to gather ſtore of prouiſion, they make pauilions alſo for the Drones. And albeit they be of themſelues bigger than the very bees, yet take they vp the leaſt lodgings. Now theſe drones be without any ſting at all, as one would ſay vnperfect bees, & the
B laſt fruit of ſuch old ones as are weary and able to do no more good; the very later brood & increaſe, and to ſay a truth, no better than ſlaues to the right bees indeed. And therefore the others as maſter Bees ouer them, haue them at their commandment: if any drudgery or ſuch like buſineſſe is to be don, out are they ſent firſt: make they but ſlow haſt in that they are ſet about, ſure they are to pay for it, and to be puniſhed without mercy. And not only in their ordinarie worke they ſerue them in good ſtead, but alſo they help them to multiply: for the hotter that the place is, the more hope there is of a greater increaſe. Certes, this is found by experience, That the better the hiue is peopled with a number of bees, the Caſt when time comes will bee the greater, and the oftner will they ſwarme. But after the hony is growing once to maturitie and perfection, then begin they to driue theſe drones out of dores: nay, ye ſhall haue many bees
C ſet vpon one poore drone, and kill him out-right. So that a man ſhall not lightly ſee any of that kind but in the Spring time.

If one pluck off the wings from a drone, and put him again within the hiue, he will neuer lin vntill he haue done the like by all the reſt of the ſame kind. As touching the roiall pallaces for the kings and captaines that ſhall be, built they are all moſt ſtately, great of receit, in ſhew magnificent, ſeated by themſelues apart, and like citadels raiſed vpon ſome high knap or tuft of a mountaine. If one of theſe caſtles chance to be preſſed or cruſhed, there will no more come of that princely race. All the lodgings and roomes where the bees abode is, are ſix cornered, according to the number of feet emploied in that worke. None of all this is done at any ſet time or day appointed: but they take the opportunity when they can eſpie faire weather to fit their
D buſineſſe, and ſo do theſe things by ſnatches. And ſurely within a day or two at the moſt, they fill their ſtore-houſes with honie.

Chap. XII.

¶ *The Nature of Hony.*

THis pleaſant and ſweet liquor which we call hony, is ingendered naturally in the aire, and eſpecially by the influence and riſing of ſome ſtarres: but principally during the feruent heat of the canicular daies, euen when the Dog-ſtar is in his ful power and force: neuer before the appearing of the ſtar Virgiliæ, but alwaies before day. For ſo about the day breake betimes in the morning, the leaues of trees are found bedewed with honey: and looke who-
E ſoeuer they are, that haue occaſion to be abroad in the aire about the dawning of the morrow, they may euidently perceiue their cloths wet with a clammy humor of hony, yea, & their hairs glewed therewith together, if they go bare headed. Be it what it will, either a certaine ſweat of the skie, or ſome vnctuous gelly proceeding from the ſtars, or rather a liquor purged from the aire when it purifieth it ſelfe; would God we had it ſo pure, ſo cleare, and ſo naturall, and in the own kind refined, as when it deſcendeth firſt, whether it be from skie, from ſtar, or from the aire. For euen now ſuch as it is, paſſing as it were through ſo many hands: namely, falling from a region ſo high and remote from vs, and in the way as it commeth catching much filth: and namely, infected with the groſſe vapour of the earth which it meeteth in the fall: moreouer, ſucked
F and drunke (as it is) by the Bees from the leaues of trees and graſſe, and ſo gathered and laid vp in their little bellies or bladders (for at their mouth they ſpew and caſt it vp again:) corrupted alſo and ſophiſticated with other humors drawn out of floures: finally, ſo long ſoking within the hiues, and ſuffering ſo many alterations: yet for all the ſorrow, a great reſemblance it carieth ſtill with it of a moſt pleaſant, ſweet, and cœleſtiall liquor.

G

Chap. XIII.

¶ *The beſt kinde of Honie.*

THe beſt hony is euer there, where the beſt floures are, within the receptacles whereof, it lieth. As we may ſee in the counrry about Athens, which carrieth the name for honey: alſo in Sicilie within thoſe territories about Hymettus and Hybla: and laſtly, in the Iſle Calydna. Now this hony, whereof we treat, is at the firſt cleare and thin as water; and for certaine daies in the beginning, it workes and boiles like to new wine, and ſo purgeth it ſelfe. By the 20 day it getteth a certaine conſiſtence and thicke ſubſtance, and ſoon after gathers a thin cream or skin ouer it: which in the very heat of working, is raiſed of a ſcum, and ſo thickneth. The beſt H
ſimply that bees can ſucke, and leaſt infected with the corruption of 3 branches, is that which they get out of the leaues of Oke, Tilia [*i.* Linden tree] and Canes.

Chap. XIIII.

¶ *The ſundry ſorts of hony, according to diuers regions.*

HOnie (as we ſaid before) is better or worſe, according to the region where it is gathered; and that in many reſpects. For in ſome place ye ſhall haue goodly combs: howbeit, more commendable for wax than the hony in them: as in the Pelignians country, and Sicily. In others, and namely in Candie, Cypres, and Africk, the combs yeeld more hony than wax. Some I
countries there be, eſpecially in the North parts, where the combs paſſe for bigneſſe: inſomuch as in Germany there hath bin a hony-combe ſeene eight foot long, and blacke all within. But in what region ſoeuer it be that hony is found, three kinds there be of it. Firſt, the Spring hony made of floures only; like as the comb alſo: and thereupon the Greeks call it Anthinon, which is as much to ſay as the Floure-hony. Some would not haue this to be once touched, but to ſerue for nouriſhment of the young bees, that the ſwarmes or caſts may be more ſtrong and luſtie. Others againe leaue for the bees of none leſſe than of it: by reaſon of the great plenty like to follow, at the riſing of thoſe notable ſtars in the Summer enſuing. Moreouer, the combs are in their principall beauty about the Sun-ſtead in ſummer, when daies be longeſt, at what time as the Vine and Time do begin to floure. Alſo, in taking forth of the hony combs, needfull it is K
to be well aduiſed in ordering the matter for the prouiſion of food for bees. If they be cut ſhort and deſtitute of their meat, they either deſpaire and die for want, or els depart and flie away. Contrariwiſe, if you leaue them too much, plenty breeds idleneſſe, that they will not labour: neither deigne they to feed of Erithace, their ordinarie food, but fall to the good hony. They therefore that be well experienced in theſe matters, thinke it good to leaue them the twelfth part of this ſtore and vintage, if I may ſo ſay, which is gathered in the combs. And verily, it ſeemeth that Nature hath ordained a certaine ſet day for to begin this vintage, if men would take knowledge thereof, and marke it well; namely, the 30 day, after the bees ſwarmed and went forth: and vſually it falleth out, that this gathering commeth within the moneth of May. A ſeL
cond kind of hony there is, which we call Summer hony, and is named alſo Horæum, of that principall ſeaſon wherin it is made, namely, in the very midſt of dog-daies, when the ſtar Sirius is in his full ſtrength: and that commonly is 30 daies after the Sun-ſtead. And I aſſure you, Nature hath ſhewed her admirable and excellent power to men ward in this behalfe: in caſe their fraud and deceit would ſuffer her works in their entire and proper nature without corruption and ſophiſtication, which marreth all, and maketh nothing but confuſion. For vpon the riſing and apparition of any ſtar, and eſpecially of thoſe that be more excellent than the reſt, or after that a rainbow is ſeen aboue the earth, and no ſhowers of rain preſently follow, but a drizling dew warmed with the raies and beams of the Sun: ye ſhall haue that which falleth, not to be bare hony, but a very medicinable thing, euen a celeſtiall gift, ſingular good for eies and vlcers, yea, and comfortable to the principall noble parts within the body. And if this happen to M
be at the riſing of the dog-ſtar, and it chance withall, that vpon the ſame day (as oftentimes it falleth out) *Venus*, *Iupiter*, or *Mercury* bee Orientall, then ſhall yee haue ſo heauenly a ſweet liquor, that no one thing in the World may bee comparable to it for the curing of all our maladies, and euen to reduce and recouer vs backe from death vnto life, like vnto that cœleſtiall

and

20030
copy 1

A and diuine Nectar, which immortalizeth the gods aboue.

Chap. XV.

¶ *The markes of good hony.*

More plenty of hony is gathered in the full of the Moone, than at any other time: and if therewith the weather be faire, the ſame wil be more vncteous and fattie. In all kinds, the beſt hony is that, which runneth of it ſelfe as new Wine and Oile; and called it is Acedon, as a man would ſay, gotten without care & trauell. All Summer hony is red, as being made in the drieſt ſeaſon of the yere. The hony which commeth of Time, is held to be the beſt and
B moſt profitable; in colour like gold, in taſte right pleaſant; euident to be knowne by the little leaues therein: and the ſame is likewiſe fattie. That which is made of Roſemary, or within the aire and vapour of the ſea, is thick: and ſuch verily as is thus candied, and will not run like life-hony, is nothing commendable. As for Time honey it will not thicken: and if a man touch it, rope it wil and draw ſmall ſlimie threds after it: which is a principall ſigne of the weight and heauineſſe thereof. If hony be ſhort in the handling, and ſoon breake, and that the drops part one from the other, it is thought to be a token of the worſt and courſeſt of all. Another triall there is beſides of good hony, namely, if it be fragrant and odoriferous to ſmell vnto, ſweet in taſte, & biting withall, or quick at the tongues end, glutinous and cleare. As touching the driuing of hiues for ſummer hony, *Thaſius Dionyſius* is of opinion, that the tenth part therof ſhould
C be left for the bees, namely, if they were ful: if not, then according to the proportion: but if they were but light and very thin, he would not haue them to be touched at all. The Athenians goe by this rule, and do obſerue duly the Caprificial day, which is kept wholly vnto *Vulcan*: for then they euer begin to driue their hiues for this kind of honie.

Chap. XVI.

¶ *Of a third kinde of Honie: and how a man ſhould know good Bees.*

There is a third ſort of wild hony, which the Greeks cal Ericæum [*i.* Heath or Ling hony] and is of leaſt reckoning. It is gathered after the firſt rain in Autumne, when the heath and
D lings only bloom in the woods, wherupon it ſeems as if it were ſandy. This kind of hony is ingendred for the moſt part after the riſing of Arcturus, much about the Ides of September. Some there be that continue in gathering Summer hony to the riſing of Arcturus: betweene which and the Autumne Equinoctial are 14 daies; & from thence vnto the ſetting of Virgiliæ (namely, for the ſpace of 48 daies) the ſaid heath is moſt in his blooming time. This ſhrub the Athenians call Tetralix; the Eubœans name it Siſara: & they repute it to be a floure moſt pleaſant to bees, haply, becauſe at that time there is no plenty of other floures. This gathering of hony is about the end of vintage, & the occultation of the Vergiliæ: & commonly ends by the Ides of Nouember. In driuing of the hiues for this hony, by good reaſon, two [third] parts therof would be reſerued for the bees: & eſpecially thoſe corners of the combs, which haue in them
E the prouiſion called Erithace. From the mids of winter to the riſing of Arcturus, for 60 daies bees are nouriſhed only with ſleep, without any other food. But from that time vnto the ſpring equinoctial, and namely, where the weather is more warm, they are awake. Howbeit, they lie ſtil in their hiue, & then fal to their victuals which they had laid vp in ſtore againſt that time: but in Italy they do the like indeed after the riſing of the ſtar Virgiliæ: howbeit, till then they do nothing but ſleep. And there verily, men vſe when they take the hony forth of the hiues, to weigh the combs, and ſo by weight diſpenſe & ſet out how much they will leaue them for their food: hauing this opinion, that they are bound to deale in juſtice & equity euen with the very bees: inſomuch, as it is commonly ſaid, if they be defrauded of their due in this ſociety & part-taking, and find falſhood in fellowſhip, they wil die for griefe: & ſo both the old ſtock will be loſt, and
F the hope alſo of a new increaſe. In the firſt place therfore, this is a rule, that ſuch folk only be ſet about this buſineſſe to driue the hiues, who are neat & clean. A theefe & a woman whiles ſhe is in her monthly ſicknes, they abhor. In the taking out of hony, the beſt means to driue away the bees, is to ſmoke them out of the hiue: leſt that you anger them, or that they deuoure the honie themſelues with more greedines. Moreouer, when they grow to be idle, perfuming & ſmoking

of them thus now and then, maketh them more fresh to go about their worke. For when they lie still and doe nothing, they make their combes looke dead and blackish. Again, if they be ouermuch smoked, they will be the worse for it; and surely, the very hony soon catcheth the hurt hereof, for so tender and weake will it be, that with the least dew that is, you shal haue it to turn and wax soure. And therefore in all kinds of hony they obserue and keepe that which is called Acapnon [*i.* without smoke.] The hony gathered of both sorts of Thyme, called thereupon Bithymum, is not white: howbeit, very good it is for eies and to clense vlcers.

Now as touching the generation of Bees, and how they multiply and increase, much dispute there hath bin among the learned, and a nice question this is. For first and foremost, bees were neuer seen to ingender one with another: and therfore most men haue bin of opinion, that yong bees must needs be made of floures fitly and handsomely laid together and composed, according to Natures lore. Others say, that one master Bee which is the king in euery swarme, doth beget them all: and that he forsooth is the only male; bigger also than the rest and more strong, because he should not faint and faile in the action: for without such an one, we see there is no breed: and him all the other bees attend vpon, not as their leader and captain, but as the female follow the male. Certes this were a good coniectural opinion, and sounding to a truth, but that the breed of these Drone-bees aforesaid, doth checke and ouerthrow it cleare: for what reason is there that one and the same maner of procreation, should bring forth some perfect & others vnperfect? The former opinion yet might seeme more probable, but for another difficulty and inconuenience that crosseth it too; for otherwhiles in the vtmost edges and sides of the combs, there are seen to breed the bigger kind of bees, which chase and driue the others away: and this vermin is called Oestrus [*i.* the gad-bee or horse flie.] Now if those little wormes or grubs from whence the bees come, were made of floures, which they themselues formed and brought into fashion, how commeth this gad-bee, and whereof is he made? This is certaine, that bees couvy and sit as hens do: and that which is (after a sort) by them hatched, seemeth at the first to be a little white grub or magot, lying crosse ouerthwart the hony, and so fast sticking thereto, as if it seemed to feed thereupon. The king that shall be, at the very first is yellow, and of the colour of hony: as if he were made of the most choice and excellent floure of all the rest: nothing like to a grub as the other, but presently hath wings. The rest of the multitude, when they begin to take some shape, are called Nymphæ: like as the Drones at the beginning, be termed Sirenes or Cephenes. If a man take their heads from either sort, before they be winged, it is a most pleasant and excellent meat for the old dams. In processe of time as they grow bigger, the old bees distill and drop meat into their mouths, as they sit vpon them: then they keep most humming (as some thinke) for to set combs into an heat, which is requisit and necessarie for the hatching of them: and thus they continue, till the little pellicles or membranes be broken: within which, euery one lieth by it selfe, as egs: and then they break forth all together and shew themselues accomplished bees. The manner and experiment hereof, was seene vpon a time in a ferme neere vnto Rome, belonging to a nobleman of Rome who somtime had bin Consul: for he caused his hiues to be made of lanterne horns that a man might see through into them. These yong worms be 45 daies before they come to their perfection.

There is found in some combs, a certain bitter thing and hard like to wax, which the Latines call *Clerus*. This is as it were the abortiue and vntimely fruit of the bees, to wit, when either by maladie or idlenesse, or rather vpon some barrennesse and vnfruitfull disposition by nature, bees are not able to bring the same to perfection.

As for the yong bees, they are not so soon abroad, but they begin to labor with their mothers, and are trained by them to learn how to gather hony. This youg people haue a yong king also: vnto whom they make court, and whom they follow. And many such kings are bred at first, for feare lest they should want: but when the bees are grown big, they all agree with one accord and voice, to kill those that be most vntoward among them, for feare they should make diuisions, factions, and siding to parts. These kings be of two sorts: those that are red all ouer, be better than the black or partie-coloured. All the race of them be very faire and goodly to see to: and twice as big as the rest: their wings shorter, their legs streight: in their port and manner of march, more stately: carrying in their front a white star, like a diadem or coronet: far brighter also and more neat they be than the common sort.

Chap. XVII.

¶ *The regiment of Bees, and their gouernment.*

WHat ſhall a man now diſpute about *Hercules*, whether there was but one of that name or many? Likewiſe as touching the Sepulchre of Prince *Bacchus*, where and which it is? As alſo trouble his head in many other ſuch like antiquities, buried by long continuance of time. For behold, in one ſmall matter that is daily ſeene in our countrey houſes, in a thing annexed to our fermes, and whereof there is ſuch ſtore, all Authors who haue written of Agriculture are not yet reſolued: namely, Whether the king of Bees alone hath no ſting, and is armed only with majeſtie? or, whether Nature hath beſtowed a ſting vpon him, and denied him only the vſe thereof? For certaine it is, that this great commander ouer the reſt, doth nothing with his ſting: & yet a wonder it is to ſee, how they all are readie to obey him. When hee marches abroad, the whole armie goes forth likewiſe: then they aſſemble together, and enuiron him round about; they are of his guard, & ſo cloſe they keep vnited together, that they wil not ſuffer him once to be ſeen. At other times, when all his people are buſie in labor, himſelfe (as a right good captaine) ouerſeeth their workes, goes about from one to another, encouraging them in wel doing, and exhorting them to plie their buſineſſe: himſelfe only exempt from all other trauell & pains taking. About his perſon he hath a certaine guard euer attendant: he hath his Lictors & officers alwaies in readineſſe, in token of majeſtie and princely port. He neuer ſets forward, but when the whole ſwarme is preſt likewiſe to goe forth: and in truth, long time before a man may perceiue that they be about a voiage and expedition; for, many daies together there is an extraordinarie humming and noiſe within, whiles they prepare to diſlodge, truſſing vp as it were their bag and baggage, and expecting only a faire day of remoue. And ſuppoſe that the king haue in ſome battaile loſt one of his wings, yet will not his hoaſt forſake him and flie. When they be in march, each one deſires and ſtriues to be next the prince, as taking a joy and pride to be ſeene of him, how luſtily they performe their deuoir. If he begin to be wearie, they ſupport him with their ſhoulders: if he be tired indeed and faint outright, they cary him full and whole. If any one of their owne companie chance to faile for very wearineſſe, and doe drag behind, or ſtray aſide and wander out of the way, it will yet endeauour to follow the armie only by the ſmell and ſent. Where the king once ſettles and takes vp his reſting place, there they all pitch downe their tents and encampe. And I aſſure you, herein lieth a matter of great weight and importance; as touching the Auguries and preſages gathered by the manner of their ſetling, prognoſticating both to publicke ſtates and alſo to priuat perſons, ſomthing to enſue of much moment, either for good or otherwiſe; according as they haue been obſerued to hang together in cluſters like bunches of grapes, either at mens houſes, or on the temples of the gods. By occaſion whereof, folke had recourſe ro their deuotions and ſacrifice, for to appeaſe the heauenly powers: and yet oftentimes ſuch foretokens haue not beene expiat without ſome ſtrange euents in the end. There was a ſwarme of Bees reſted vpon the very lips and mouth of *Plato*, when he was but a very babe & infant; foreſhewing (no doubt) that ſingular eloquence of his, and ſweet vtterance that afterwards he had. Another caſt of Bees ſetled within the very camp of General *Druſus*, the very ſame day, when he obtained that notable victorie at Arbalo. By which examples we may ſee, that this conjecturall skill and learning of theſe Soothſayers holds not alwaies, nor prooues euer true: for they forſooth ſuppoſe this to be euermore a portenteous ſigne of ſome fearfull euent and misfortune. To returne again to our captaine Bee: if he chance to be entrapped and ſurprized by the enimie, the whole armie is ſure withall to bee taken with him. If he be defeited & ſlain, the field is loſt: all the reſt be ſcattered, and ſeek their fortune to ſerue ſome other prince: for without one king or other, liue they cannot. Sometime they are driuen to kill thoſe of the kings race, and namely when there be many kings together: but this they doe perforce and full againſt their wills: and before they will ſo do, they chuſe rather to ruinate and pul down the houſes wherein they were bred; eſpecially when there is ſome feare of ſcarſitie, by reaſon of the vnkind ſeaſon: and at ſuch a time alſo, they chaſe and driue away the drone bees. And yet I ſee ſome doubt made of them: for diuers be of opinion, that they be a kind of Bees by themſelues, and that the reſt do ſet againſt them as very theeues. The biggeſt they are of all others, but blacke and broad bellied: good reaſon therefore that they ſhould

be

be called Theeues, becauſe they come ſtealing and eat vp their honey. Certaine it is, that theſe G
drones be killed by the other Bees: and ſurely, king of their owne they haue none. But how they ſhould be naturally without a ſting, there is ſome queſtion, & the ſame as yet not determined. This is well known, that in a moiſt and rainie ſpring, Bees multiply better: but if it be drie weather, there will be more increaſe of hony. Now if it happen, that the meat in one hiue be ſpent, the Bees belonging thereto will aſſaile their next neighbors, with intent to rob & ſpoile them of their prouiſion. But they on the contrarie ſide, put themſelues in battel aray, with full intent to take them againe. And if there chance to be a keeper by, to ſee the combat, that part which perceiues him to fauor their ſide, wil not once make at him for to ſting him. Other cauſes there are beſides, which make them often to go together by the ears, & then ſhall ye haue 2 ſeuerall captaines to araunge their battalions one againſt another. But moſt of all they brawle and jar H
vpon occaſion of gathering and carrying floures, whiles they call each one to his owne companie, for to come forth and take part. But all this great fray is ſoon parted and diſpatched, either by caſting vp ſome duſt among them, or by making a little ſmoak & perfume vnder them. And reconciled ſoone they be againe, with ſetting before them a meſſe of milke, or honied-water.

Chap. XVIII.

¶ *Of the ſundrie ſorts of Bees in generall: and what things be contrarie and hurtfull vnto them.*

THere is a kind of ruſticall and wild Bee: and ſuch are more rough and hideous to ſee to: I
much angrier alſo and curſt than the reſt: howbeit, more laborious and painfull by farre.
Of domeſtical and tame houſe-Bees, there are two ſorts. The beſt be thoſe that are ſhort, well truſt vp and round, and withall, painted with ſundrie colours. The long ones be the worſe, and ſuch as reſemble waſpes: and yet the worſt of all others, be thoſe that are hairie all ouer. Within the kingdome of Pontus there be white Bees, and thoſe make honey twice in euerie moneth. Moreouer, along the riuer Thermodoon, there be two ſorts more. The one, gathers honey in trees: others, within the ground, and bring great encreaſe thereof: for they frame their combes with a threefold courſe and ranke. The ſting that Nature hath giuen vnto Bees ſticketh within their bellies. Some are of opinion, that with the firſt pricke they giue with it, they die K
preſently. Others hold, that they die not withall, vnleſſe they thruſt it forth ſo far, that ſome of the gut follows after: mary howſoeuer it be, they become afterwards no better than drones: neither gather they any more honey, as if they were guelded of their vigor and ſtrength; ſo as they ceaſe to doe good and harme both at once. We find it written in Chronicles, that horſes haue been ſtung to death by them. Filthie ſtinking ſauors they cannot abide, and namely, ſuch as be contagious; and from them will they flie farre enough. Nay more than that, ſure they will be to haunt & ſting them that ſmell as they go of ſweet pomanders and odoriferous ointments, notwithſtanding they be otherwiſe themſelues ſubject to the injuries of moſt liuing creatures. For firſt and foremoſt, they are moleſted and aſſailed by thoſe of their owne nature, but yet degenerate and of baſtard breed, to wit, Waſpes and Hornets: alſo by a kind of Gnats called Mu- L
liones, Swallowes, Martins, and ſome other birds, make foule worke among them, and are their mortall enemies. The Frogs lie in wait for them as they come to drink: which is the principall worke they haue to doe, when they be about to multiply and breed yong. And not thoſe Frogs only which keep in ſtanding pooles and running riuers, but thoſe land-Frogs of a Todes kind will come of their owne accord from out of the brambles and briers where they keep, and leap vp to the very dore and entrance of the hiue; were they wil blow and breath in vnto them: and when the Bees come flying forth thither, to ſee what the matter is, ſoone are they ſnapt vp and deuoured. And as for Frogs, all the ſort of them are ſuppoſed not to feele the pricke of their ſting. Sheep alſo are no friends of theirs: for if they be once intangled within their wool, hardly can they get out again. Seeth but Crab-fiſh neer to their hiues, the very aire & ſmel therof will M
kill them. Ouer and beſides, Bees naturally are many times ſick; and that do they ſhew moſt euidently: a man ſhall ſee it in them by their heauie looks, & by their faintneſſe in their buſines: ye ſhall mark how ſome will bring forth others that be ſicke and diſeaſed, into the warme ſun, and be readie to miniſter vnto them & giue them meat. Nay, ye ſhall haue them to carie forth their dead, and to accompanie the corps full decently, as in a ſolemne funerall. If it chance that

the

20030
copy 1

A the king be dead of ſome peſtilent malady, the commons & ſubiects mourn, they take thought and grieue with heauy cheere and ſad countenance: idle they be, and take no ioy to doe any thing: they gather in no prouiſion, they march not forth; onely with a certaine doleſull humming they gather round about his corps, and will not away. Then requiſite it is and neceſſarie to ſeuer & part the multitude, and ſo to take away the body from them, otherwiſe they would keep a looking at the breathleſſe carcaſſe, and neuer go from it, but ſtil moan and mourn without end. And euen then alſo they had need be cheriſhed and comforted with good victuals; otherwiſe they would pine away & die with hunger. To conclude, a man may ſoon know when Bees be well in health, by their cheerfulneſſe and freſh hue that they carry.

B

Chap. XIX.

Diſeaſes of Beees.

THere be diſeaſes alſo and imperfections in their worke: and namely when they fill not their combs, or bring not to perfection their yong Bees. The firſt is called Cleros, like as the other Blapſigonia. Moreouer, the ſound made by reuerberation of the aire, which men call Eccho, is hurtfull vnto them, for they feare mightily that reſounding noiſe comming with a double ſtroke. Miſts & fogs alſo trouble them much: as for ſpiders, they be their greateſt enemies of all others, in caſe they can preuaile ſo much as to enter into the hiue & weaue a copweb within it: for they kil all the Bees, and there is no remedie againſt it. Againe, that Moth or Butterfly which vſeth to fly about the ſnuffe of a candle burning, (a poore ſilly flie otherwiſe, and of baſe account) here doth much hurt, and that in diuers ſorts; for not only it ſelf
C eateth and gnaweth the wax of their combes, but alſo doth blow and leaue behind them ſuch excrements as afterwards proue other moths. Alſo, whereſoeuer he goes and flies within the hiue, he leaues behind him a certaine ſubſtance, comming moſt from the duſty downe of his wings, with which he thickneth the threds as it were of copwebs. There breed likewiſe euen in very wood certain worms, which aboue all things make means to eat the combs. What ſhould I ſpeake of their owne greedy feeding and glutting themſelues with too much liquour of the floures, in the Spring time eſpecially? whereupon enſueth a dangerous flux and looſneſſe of their belly. As for oile, it is not bane to Bees only, but alſo to all other Inſects: eſpecially if a
D man dip their heads in it, and then let them be in the Sun, for preſently they wil die of it. Many times Bees are cauſers of their own death, with getting a ſurfet by exceſſiue deuouring of hony, namely when they ſee it ready to be taken out of the hiue: for otherwiſe they are very thrifty ouer-great ſparers, and ſuch, as at other times will driue out thoſe that waſt prodigally, and be gluttinous, no leſſe than ſuch as be idle lusks, and ſlow at work. Nay, euen their own hony doth them hurt; for if they be anointed therewith in their hinder parts, they will die vpon it. Lo how many enemies this creature, ſo liberall and bountifull, hath! ſee how many caſualties it is ſubiect vnto! and yet what be theſe I haue already rehearſed, in proportion and compariſon of thoſe which are omitted. Their remedies will we ſpeak of in conuenient time and place: for this preſent content I will my ſelfe to treat only of their natures.

E

Chap. XX.

¶ *How to keepe Bees to the hiue: and the manner of repairing them.*

BEes ioy in the clapping of hands, and ringing of braſen baſons: at the ſound thereof they will aſſemble and come together: wherby it is plain, that they haue the ſence of hearing. When they haue done their taske of worke; when they haue brought forth their young ones, and fully accompliſhed all their deuoir, then they perform a ſolemnitie of exerciſe: wherin after they haue flown abroad in the open aire at libertie, fetched their compaſſe about on high, gathered into rings and rounds in manner of tournament for their pleaſure: then at laſt when it is time of repaſt they return home again. The longeſt time that they can liue (ſay that
F they paſſe through all dangers, and no misfortune light vpon them, but euery thing that is aduerſe fall out well and happily) is not aboue ſeuen yeares. And neuer was it knowne or heard of, that an hiue continued aboue ten yeares. Some Writers be of opinion, That dead Bees if they be kept within a houſe all a Winter, and when the Spring is come be laid forth in the hot

Sunne

Sun to fry,and one whole day be kept couered all ouer with fig tree aſhes,they will reuiue and G
be quick again. But ſuppoſe they be not only dead,but their bodies alſo loſt and gon,ſome ſay they may be repaired,and a new ſwarm ingendred, by laying the freſh panches of oxen or kine newly killed,with the dung,garbage and all,within a dunghill there to putrifie. *Virgil* affirms, that the carcaſſes of any yong ſteers will do the ſame: like as dead horſes will bred waſpes and hornets: and Aſſes carrion turne to be Beetle flies, by a certain metamorphoſis which Nature maketh,from one creature to another. And yet there be none of all theſe but are ſeen to engender: howbeit the manner of their breed is much after the nature of Bees.

Chap. XXI.

¶ *Of Waſps and Hornets.* H

WAſps vſe to build them neſts on high of earth and clay,and therein make their roomes and cels of wax. Hornets,in caues and holes vnder the ground. All theſe verily haue their chambers made with ſix corners, and yet their neſts conſiſt of ſome barke and ſubſtance like cobwebs. And as they be a barbarous and ſauage kind of creatures,ſo their yong is not vniforme: one is ready to fly abroad,while another is but yong & not fledge,and a third a meere worme and grub ſtill. All theſe breed in Autumne,and neuer in the ſpring. When the Moone is in the full they increaſe maruellouſly. As for the little waſpes, called Ichneumones (and leſſe they be than others) they vſe to kill one kind of ſpiders,called Phalangia,and carry I
them into their neſts: they beſmeare them all ouer with a liniment, ſit ouer them, and ſo procreate their own kind. Moreouer,all the ſort of theſe liue vpon fleſh, contrary to the manner of Bees,which will not touch a dead carcaſſe. But waſpes hunt after the greater flies, and when they haue whipt off their heads, carry away the reſt of their bodies for their prouiſion. The wild Hornets vſe to keep in hollow trees: all winter time, like other Inſects, they lie hid, and liue not aboue two yeres. If a man be ſtung with them,hardly he eſcapes without an ague:and ſome haue written,that 27 pricks of theirs will kill a man. The other Hornets which ſeeme to be the gentler be of two ſorts: the leſſe of body do worke and trauell for their liuing,and they die when winter is come; but the greater ſort of them continue two yeares: and thoſe alſo are nothing dangerous,but mild and tractable. Theſe make their neſts in the ſpring, and the ſame K
for the moſt part hauing foure dores or entries vnto them,wherein the leſſer labouring hornets aboueſaid are ingendred. When thoſe are quick,brought to perfection, & gotten abroad,they build longer neſts; in which they bring forth thoſe that ſhall be mothers and breeders; by which time thoſe yong hornets that worke be ready to do their buſineſſe and feed theſe other. Now theſe mothers appeare broader than the reſt, and doubtfull it is, whether they haue any ſting or no,becauſe they are neuer ſeen to thruſt them forth. Theſe likewiſe haue their drones among them as wel as Bees. Some think,that toward winter theſe all do loſe their ſtings. Neither Hornets nor Waſpes haue kings or ſwarmes, after the maner of Bees,but yet they repaire their kind,and maintaine their race by a new breed and generation.

Chap. XXII. L

¶ *Of Silk-wormes: the Bombylius,and Necydalus. And who firſt inuented ſilke cloath.*

A Fourth kind of flie there is breeding in Aſſyria, & greater than thoſe aboue named,called Bombyx [*i.* the Silke-worme.] They build their neſts of earth or clay, cloſe ſticking to ſome ſtone or rock,in manner of ſalt; and withall ſo hard,that ſcarcely a man may enter them with the point of a ſpear. In which they make alſo wax,but in more plenty than bees: and after that,bring forth a greater worme than all the reſt before rehearſed. Theſe flies ingender alſo after another ſort; namely,of a greater worme or grub,putting forth two hornes after M
that kind: and theſe be certain canker-wormes. Then theſe grow afterwards to be Bombylij; and ſo forward to Necydali: of which in ſix moneths after come the ſilke-wormes Bombyces. Silk-worms ſpin & weaue webs like to thoſe of the ſpiders,and all to pleaſe our dainty dames, who thereof make their fine ſilks and veluets,forme their coſtly garments and ſuperfluous apparell,which are called Bombycina. The firſt that deuiſed to vnweaue theſe webs of the ſilke-

worme,

20030
copy 1

A worme, and to weaue the ſame againe, was a woman in Coos named *Pamphila*, daughter of *Latous*: and ſurely ſhe is not to be defrauded of her due honor and praiſe, for the inuention of that fine ſilke, Tiffanie, Sarcenet, and Cypres, which in ſtead of apparell to couer and hide, ſhew women naked thorough them.

Chap. XXIII.

¶ *Of the Silke-worme in Cos.*

IT is commonly ſaid, that in the Iſle Cos there be certaine Silkwormes engendred of floures, which by the meanes of rain-ſhowers, are beaten downe and fall from the Cypres tree, Tere-
B binth, Oke, and Aſh: and they ſoone after doe quicken and take life by the vapor ariſing out of the earth. And men ſay, that in the beginning, they are like vnto little Butterflies naked; but after a while (being impatient of the cold) are ouergrowne with haire; and againſt the winter, arme themſelues with good thick-clothes: for being rough-footed, as they are, they gather all the cotton and downe of the leaues which they can come by, for to make their fleece. After this they fal to beat, to felt & thicken it cloſe with their feet, then to card it with their nailes: which done, they draw it out at length, and hang it betweene branches of trees, and ſo kembe it in the end to make it thin and ſubtill. When al is brought to this paſſe, they enwrap & enfold themſelues (as it were) in a round bal and clew of thread, and ſo neſtle within it. Then are they taken vp by men, put in earthen pots, kept there warme, and nouriſhed with bran, vntill ſuch time as they haue wings acording to their kind: and being thus well clad and appointed, they be let go
C to do other buſineſſe. Now as touching the wooll or fleece which they haue begun, men ſuffer it to relent in ſome moiſture, and ſo anon it is ſpun into a ſmall thread, with a ſpindle made of ſome light Kex or Reed. This is the making of that fine Say, wherof ſilk cloth is made; which men alſo are not abaſhed to put on and vſe, becauſe in ſummer they would go light and thin. And ſo far do men draw back now a daies from carying a good corſlet & armor on their backs, that they think their ordinarie apparell doth ouer-lode them. Howbeit, hitherto haue they not medled with the Aſſyrian Silkworme, but left it for the fine wiues and dames of the city.

Chap. XXIV.

D ¶ *Of Spiders, and their generation.*

IT were not amiſſe to joine hereunto a diſcourſe of Spiders, for their admirable nature, which deſerues a ſpeciall conſideration. Wherin, this is firſt to be noted, that of them there be many kinds, and thoſe ſo well known vnto euery man, that needles is to be particularize & ſtand much vpon this point. As for thoſe which be called Phalangia, their ſtinging and biting is venomous, their bodie ſmall, of diuers colors, and ſharpe pointed forward; and as they go, they ſeeme to hop and skip. A ſecond ſort be black, and their feet are exceeding long. All of them haue in their legs, three joints, The leaſt of this kind, called Lupi, ſpin not at all nor make any webs. The greater, ſtretch forth their webs before the ſmall entries into their holes within the ground. But the third kind of Spiders, be they which are ſo wonderfull for their fine ſpinning
E and skilful workmanſhip: theſe weaue the great and large cobwebs that we ſee; & yet their very womb yeeldes all the matter and ſtuffe wherof they be made. Whether it be, that at ſome certain ſeaſon naturally their belly is ſo corrupt (as *Democritus* ſaith:) or that within it there is a certain bed (as it were) which engenders the ſubſtance of ſilke. But ſurely what ſoeuer it is, ſo ſure and ſteadie nailes the Spider hath; ſo fine, ſo round, and euen a thread ſhe ſpinnes, hanging thereunto her ſelfe, and vſing the weight of her owne bodie in ſtead of a wherue; that a wonder it is to ſee the manner thereof. She begins to weaue at the very mids of the web, and when ſhe hath laid the warpe, brings ouer the woofe in compaſſe round. The maſhes and marks ſhe diſpenſes equally by euen ſpaces; yet ſo, as euery courſe growes wider than other: and albeit they do increaſe ſtill from narrow to be broader, yet are they held and tied faſt by knots that canot
F be vndone. Mark, I pray you, how artificially ſhe hides the ſnares in that net of hers, made into ſquares, to catch the poore flies. A man would not thinke (who ſees the long yarne in her web wrought ſerce-wiſe, ſmoothed and poliſhed ſo cunningly, and the verie manner of the woofe ſo glewiſh and clammie as it is, of it ſelfe) that all were to any purpoſe, and ſerued for that which

ſhe

ſhe intends. See withall, how ſlacke and hollow the net is made to abide the wind, for feare of breaking: and thereby ſo much the better alſo to fold and enwrap whatſoeuer coms within her reach! What a craft is this of hers to leaue the vpper part thereof in the front vndone, as if ſhe were wearie (for ſo a man may gueſſe, when he can hardly ſee the reaſon) and (as it is in hunters net and toile) that ſo ſoone as thoſe nets be ſtumbled vpon, they ſhould caſt the flies headlong into the lap and concauitie of the net? To come now vnto her neſt and hole: Is there any Architecture comparable to the vault and arched frame? And for to keep out the cold, how is it wrought with a longer and deeper nap than the reſt! What ſubtiltie is this of hers, to retire into a corner ſo far from the mids, making ſemblance as though ſhe meant nothing leſſe than that ſhe doth, and as if ſhe went about ſome other buſineſſe! Nay, how cloſe lies ſhe, that it is impoſſible for one to ſee, whether any bodie be within or no! What ſhould I ſpeak of the ſtrength that this web hath to reſiſt the puffes and blaſts of winds; of the roughneſſe to hold and not breake, notwithſtanding a deale of duſt doth weigh and beare it downe? Many a time ye ſhall ſee a broad web reaching from one tree to another: and this is when ſhe learns to weaue & begins to practiſe and trie her skill. Shee ſtretches a thread, and warps in length from the top of the tree downe to the very ground; and vp again ſhe whirles moſt nimbly by the ſame thread: ſo as at one time, ſhe ſpins and winds vp her yarne. Now if it chance that any thing light into her net, how watchfull, how quick ſighted, how readie is ſhe to run? Be it neuer ſo little ſnared euen in the very skirt and vtmoſt edge therof, ſhe alwaies skuds into the mids; for ſo by ſhaking the whole net, ſhe intangles the flie or whatſoeuer it be, ſo much the more. Looke what is ſlit or rent therein, ſhe preſently doth mend and repaire, and that ſo euen and ſmall, that a man cannot ſee where the hole was derned and drawne vp again. Theſe Spiders hunt alſo after the yong Lizards: firſt they enfold and wrap the head within their web: then, they catch hold and tweake both their lips together, and ſo bite and pinch them. A worthy ſight and ſpectacle to behold, fit for a king, euen from the ſtately Amphitheatres, when ſuch a combat chances.

Moreouer, there be many preſages and prognoſtications depend vpon theſe Spiders: for againſt any inundations and ouerflowings of riuers, they weaue and make their cobwebs higher than they were wont. In faire and cleare weather, they neither ſpin nor weaue, vpon thicke and cloudie daies, they be hard at worke: and therefore many cobwebs be a ſigne of raine. Some thinke, it is the female that ſpins and weaues; and the male, which hunts and gets in the prouiſion for the familie: thus ordering the matter equally in earning their liuing, as man and wife together in one houſe. Spiders engender together with their buttocks; & little worms they do lay like egs. For, conſidering that the generation of all Inſects beſides, in a manner can be declared and ſhewed no otherwiſe, I muſt not deferre the relation therof, it being ſo admirable as it is. Well then, theſe egs they lay in their webs, but ſcattering here and there, becauſe they vſe to skip and leap when they thruſt them forth. The Phalangius only ſits vpon the eggs within the very hole and thoſe in great number: which begin not ſo ſoon to peep, but they eat the mother, yea and oftentimes the father likewiſe, for he helps her alſo to cooue. And theſe kind of Spiders bring commonly 300 at a time: wheras all the reſt haue fewer. They ſit ordinarily thirtie daies. As for yong Spiders, they come to their full growth and perfection in foure weekes.

Chap. XXV.

¶ *Of Scorpions.*

SEmblably, the land Scorpions do lay certaine little worms or grubs in maner of eggs: and when they haue ſo done, periſh likewiſe for their labour, as the Spiders. Their ſtings be as venomous and dangerous, as thoſe of ſerpents: and albeit there enſue not thereupon ſo preſent death, yet they put folke to more paine a great deale; inſomuch as they languiſh and lie drawing on three daies before they die. If a maiden be ſtung with one of them, ſhe is ſure to die of it: other women alſo for the moſt part catch their death thereby, and hardly eſcape. Yea and men alſo find their poiſon to be mortall & deadly, if they be ſtung in a morning by them when they creep newly out of their holes, faſting, & before they haue diſcharged their poiſon by pricking one thing or other firſt. Their ſting lies in their tails, and readie they are with it alwaies to ſtrike. There is not a minute of an houre but they practiſe and trie how they can thruſt it forth, (ſo malicious they be) becauſe they would not loſe and miſſe the firſt opportunity preſented

vnto

20030
copy 1

A vnto them. They ſtrike both ſidelong or byas, and alſo crooked and bending vpward, with their taile. The poiſon that comes from them, is white, as *Apollodorus* ſaith, who alſo hath ſet downe 9 ſorts of them, and diſtinguiſhed them by their colours, which me thinks, was but ſuperfluous, and more than needed; conſidering that a man cannot know by his diſcourſe, which of them he would haue to be leaſt hurtfull and noiſome. He affirmeth, that ſome haue double ſtings, and that the males are more curſt and cruell than the females: for he auouches, that they do engender together, and that the males may be knowne by this, That they are long and ſlender. Moreouer, that they be al of them venomous about mid-day, when they be enchafed and ſet into an heat, by the ſcalding and ſcorching ſun: alſo when they be drie and thirſtie, they cannot drinke
B their full and quench their drought. This is well known, that thoſe which haue ſeuen joints in their tailes, be more fell than the reſt: for it is ordinarie in them to haue but ſix. In Affrick, this peſtilent creature vſes to flie alſo, namely, when the Southerne winds blow, which carrie them aloft in the aire and beare them vp as they ſtretch forth their armes like oares. The ſame *Apollodorus* before-named auouches plainely, that ſome of them haue very wings indeed. The people called Pſylli (who making a gainfull trade and merchandiſe of it, to bring in hither vnto vs the poiſons of other countries, and by that meanes haue filled Italie with forrein venomous beaſts) haue many times aſſaied to bring them hither; but neuer would they abide ſo much as the aire of Sicilie, nor liue in that tract. Howbeit we ſee of them now and then in Italie, but harmleſſe they be all: like as in many other places beſides, and namely about Pharus in Ægypt.
C In * Scythia they be ſo dangerous, that they kill their hogs; which otherwiſe be creatures that can eat ſuch poiſons, and yet liue and do full well. And if it be true that is ſaid, the black ſwine die more ſpeedily, eſpecially if after they be ſtung, they goe into the water and drench themſelues. If a man be ſtung with a Scorpion and drinke the powder of them in wine, it is thought to be preſent remedie. Men hold, that nothing is more contrarie vnto them than oile, if they be dipped therein: as alſo to the Stelliones, which are made like Lizards, and do no hurt to them only, becauſe they are without blood. Like as the Scorpions alſo are ſaid to be harmleſſe to a-any thing that is bloodleſſe. Some are of opinion, that they likewiſe deuoure their young, ſaue only one who is more ſlie and craftie than the reſt, who gets vpon the rumpe behind of the mother, and there ſits, being aſſured that hee is ſafe enough in that place, both from ſting of taile
D and tooth in mouth. This Scorpion reuenges the death of his other brethren and ſiſters: for in the end he skips vpon the backe of father and mother both, where he gnaweth and eateth them to death. To conclude, Scorpions vſually do breed eleuen young ones at a time.

* Or rather in Caria.

Chap. XXVI.

¶ *Of Stellions and Graſhoppers.*

THe Stellions after a ſort be of the nature of Chamæleons, liuing only vpon dew and Spiders. Graſhoppers liue alſo much after the ſame manner. And they be of two ſorts, namely, the leſſer, which come firſt, and die laſt: but thoſe be mute. The latter breed, ſeldome or
E neuer flie: and thoſe likewiſe are of two kindes. Such as ſing aloud be named Echetæ; and the leſſer ſort of them Tettigoniæ: but thoſe other are more ſhril, and chant full merrily. The male Graſhoppers in both kinds, do ſing: the females are ſilent. The people of the Eaſt countries make their food of them: euen the very Parthians, who otherwiſe abound in wealth. The hee Graſhoppers are the ſweeter meat before the time of engendring: and the ſhee Graſhoppers afterward, by reaſon of egs knotted within them, and thoſe be white. They engender with their bellies vpward. They haue a certain roughneſſe vpon their backs, which is very ſharp, and therwith they worke a hollow gutter in the ground, as a neſt to lay their egs and breed in. At the firſt, appeareth a little worme or maggot; whereof coms afterward that which they call Tettigometra, as one would ſay, the mother of Graſhoppers, or the great Graſhopper. For about the
F Sunſtead in Summer, the vtmoſt cruſt or caſe thereof breaketh, and then out they flie, and alwaies in the night. At the firſt, blacke they be and hard withall. Of all creatures that are known to liue, the Graſhoppers alone haue no mouth: in ſtead wherof, they haue a certaine ſharp pointed thing in their breaſt (like vnto their tongues that carrie ſtings in their mouthes) and with it they ſucke and licke in the dew. Their breaſt is full of little pipes, from whence commeth that ringing noiſe of the Echetæ which we do heare, as I haue aboue ſaid. Moreouer, their bellie is

emptie and hath nothing in it. When a man raiſeth them, ſo as they be thereby forced to flie, they yeeld forth a certaine humor: which is the onely argument that they be nouriſhed of the dew. They haue moreouer this one marke from all other liuing creatures, namely, no concauitie of their bodie to be ſeene wherby to void out any excrements. So dimme-ſighted they be, that if a man chance to come neare vnto them, plucking in and ſtretching out his finger before them, they will preſently leape vpon it, ſuppoſing that it is ſome leafe that waggeth. Writers there be, that make two more kinds of them, namely, the greater, which appeare at the firſt ſpring and budding of trees; wherupon it is called Surcularia: and a leſſer, which ſome name Frumentaria, others Auenaria. For this ſheweth it ſelfe when the corne is ripe and begins to die in the ſtraw.

Chap. XXVII.

¶ *Places wherein there be no Graſhoppers: alſo where they are mute.*

IN countries bare and naked of trees and wood, there breed no Graſhoppers: and therefore ye ſhall haue them at Cyrene, about the towne, but not in the plaines and fields therof. Neither ſhall a man meet with them in woods that be cold and full of ſhade. It ſeemes alſo, that they take a liking to ſome one quarter more than another: for in the region of the Mileſians, few places there be that haue them: but in Cephalenia, there is a riuer that doth limit and bound them: for of the one ſide there be plentie of them, and on the other, few or none. In the territorie of Rhegium they be all mute. Paſſe the riuer once and come into the Locrians countrey ye ſhall heare them chaunt luſtily. Wings they haue like to thoſe of Bees, but larger, to the proportion of their bodies.

Chap. XXVIII.

¶ *The wings of Inſects, and ſundrie kinds of Beetles.*

OF Inſects, ſome carie two wings about them, as the flies: others foure, as Bees. As for Graſhoppers, they flie with wings made like pellicles or fine skins. In ſumme, all Inſects which be armed with a ſting in their bodie or taile, haue foure apeece: and none againe haue aboue twaine that carrie their offenſiue weapon in their mouth. To the former, Nature hath giuen it for to reuenge; to the other, only to feed themſelues, and content their appetite. Moreouer, plucke from any of them their wings, there will neuer come new in the place. None that haue a ſting in their taile, be double winged. Some Inſects there be, which haue growing a certaine husk or cod ouer their wings, for the ſafegard and defence thereof, as the Beetles: and the wings of ſuch be thinner and more brittle than others. Sting they haue none, but a certaine kind of the great ones be armed with two long hornes boking out before them, and two-forked they be and toothed like Pinſons, in the top, which (when they liſt) they can bring together and make them meet, and ſo nip and bite withall. Theſe Beetles, folke vſe to hang about the necke of young babes, as preſent remedies againſt many maladies. Such Beetles, *Nigidius* calleth Lucanes. Ouer and beſides, there is another ſort, which tumbling vpon their back in dung, do roll it into great round balls with their feet; & therin do make neſts for to beſtow their little grubs (which are their young) againſt the cold of winter. Some there be that vſe to flie vp and down, and where euer they go, make a great buzzing noiſe as if they lowed. Ye ſhal haue others again that keepe in medowes; yea and Creckets that haunt the earth and ſtocke of chimnies, where they make many holes, and lie cricking aloud in the night.

The Glo-wormes, are named by the Greeks Lampyrides, becauſe they ſhine in the night like a ſparke of fire: and it is no more but the brightnes of their ſides and taile: for one while as they hold open their wings, they glitter; another while when they keep them cloſe together, they be ſhadowed and make no ſhew. Theſe Glowbards neuer appeare before hay is ripe vpon the ground, ne yet after it is cut downe. Contrariwiſe, the flies called Blattæ, liue and be nouriſhed in darkneſſe: light is an enemie vnto them, and from it they flie. They breed commonly in baines and ſtouves, of the moiſt vapors that be there. Of the ſame kind there be other great Beetles red in color, which work themſelues holes in the drie earth, where they frame certaine receptacles like vnto Bees combs, little and ſmall, ful of pipes reſembling hollow ſpunges; and

all

20030
copy 1

A all for a kind of baſtard honey, whereof yet there is ſome vſe in Phyſicke. In Thrace neare to Olynthus, there is a little territorie or plot of ground; where this one creature (among all other) cannot liue; whereupon the place is called Cantharolethus. The wings generally of all Inſects, be whole, without any ſlit: and none of them hath a taile but the Scorpion. Hee alone hath not only armes but alſo a ſting in the taile. As for the reſt, ſome of them haue a ſharp pricked weapon in their muzzle, as namely, the Breeſe or great Horſe-flie, called in Latine *Aſilus* or *Tabanus*, whether you will. Likewiſe Gnats alſo, and ſome kind of flies. And theſe prickes ſerue them in good ſtead both for mouth and tongue. Some of theſe are but blunt, & not good for to pricke, but only handſome to ſucke withall, as flies, which haue all of them a tongue, beeing euidently fiſtulous and like a pipe. And none of all theſe haue any teeth. There bee Inſects
B with little hornes proaking out before their eyes, but weake and tender they bee, and good for nothing; as the Butterflies. And there be againe, that are not winged, and ſuch be the Scolopendres. All Inſects that haue legges and feet, goe not directly, but bias and crooked. Of which, ſome haue the hinder legges longer than the former, and ſuch bend hooked outward; as the Locuſts.

Chap. XXIX.

¶ *Of Locuſts.*

C THe Locuſts lay egges in Autumne, by thruſting downe into the ground the fiſtule or end of their chine, and thoſe come forth in great abundance. Theſe eggs lie all winter long in the earth; and at the end of the ſpring the yere following, they put out little Locuſts, black of colour, without legs, and creeping vpon their wings. Hereupon it commeth, that if it be a wet ſpring and rainie, thoſe egs periſh and come to no good: but in a drie ſeaſon, there will be greater increaſe and ſtore of Locuſts the Summer enſuing. Some writers hold opinion, that they lay and breed twice a yeare: likewiſe that they periſh and die as often. For they ſay, that when the ſtar Vergiliæ doth ariſe, they breed: and thoſe afterwards about the beginning of the Dogdaies, die: and others come in their place. Others ſay, that they engender and breed againe their ſecond litter, at the full or ſetting of Arcturus. True it is indeed, that the mothers die ſo ſoone as they haue brought forth their little ones, by reaſon of a ſmall worme that preſently
D breedes about their throat, which chokes them. And at the ſame time, the males likewiſe miſcarrie. See what a little matter (to ſpeake of) bringes them to their death! and yet a wonder it is to conſider, how one of them when it liſt will kill a ſerpent: for it will take him faſt by the chaws, and neuer lin biting till ſhe hath diſpatched him. Theſe little beaſts breed no where but in plain and champion countries, namely, ſuch as be full of chinks and creuiſes in the ground. It is reported, that there be of them in India, three foot long: where the people of the country vſe their legs and thighes for ſawes, when they be thoroughly dried. Theſe Locuſts come by their death another way, beſides that aboue-named: for when the wind takes them vp by whole troupes together, they fall down either into the ſea, or ſome great ſtanding pooles. And this many a time happens by meer chance and fortune; and not (as many haue ſuppoſed in old time)
E becauſe their wings are wet with the night dew. For euen the ſame Authors haue written, that they flie not in the night for cold. But little know they, that it is ordinarie with them to paſſe ouer wide and broad ſeas, and to continue their flight many daies together without reſt. And the greater wonder is this, that they know alſo when a famine is toward: in regard wherof, they ſeek for food into far countries: in ſuch ſort, as their comming is euer held for a plague of the gods, proceeding from their heauie wrath and diſpleaſure. For then commonly they are bigger to be ſeen, than at other times: and in their flight they keepe ſuch a noiſe with their wings, that men take them for ſome ſtrange fowles. They ſhade and darken the very Sunne as they flie, like vnto a great cloud: inſomuch, as the people of euery country behold them with much feare, leaſt they ſhould light in their territorie, and ouer-ſpread the whole countrey. And verily their
F ſtrength is ſuch, that they hold out ſtill in their flight: and as if they had not enough of it to haue flowne ouer ſeas, they giue not ouer to trauerſe mightie great countries in the continent. And looke in what place ſoeuer they ſettle, they couer whole fields of corne with a fearefull and terrible cloud: much they burne with their very blaſt, and no part is free but they eat and gnaw euen the very dores of mens dwelling houſes. Many a time they haue been known to take

their flight out of Affrick, and with whole armies to infeſt Italie: many a time haue the people of Rome, fearing a great famine and ſcarſitie toward, been forced to haue recourſe vnto Sybils books for remedie, and to auert the ire of the gods. In the Cyrenaicke region within Barbarie, ordained it is by law, euery three yeares to wage war againſt them, and ſo to conquer them: that is to ſay, firſt to ſeeke out their neaſts, and to ſquaſh their eggs; ſecondly, to kill all their yong; and laſt of all, to proceed euen to the greater ones, and vtterly to deſtroy them: yea, and a greeuous puniſhment lieth vpon him that is negligent in this behalfe, as if he were a traitor to his prince and countrey. Moreouer, within the Iſland Lemnos there is a certaine proportion and meaſure ſet down, how many and what quantitie euery man ſhall kill; and they are to exhibit vnto the magiſtrate a juſt and true account thereof; and namely to ſhew that meaſure full of dead Locuſts. And for this purpoſe they make much of Iaies, Dawes, and Choughes, whom they doe honour highly, becauſe they flie oppoſite againſt the Locuſts, and ſo deſtroy them. Moreouer, in Syria they are forced to leuie a warlike power of men againſt them, and make riddance by that meanes. See in how many parts of the world this hurtfull and noiſome vermine is diſperſed and ſpread: and yet in Parthia they are taken for very good meat. The voice that they haue (ſuch as it) ſeemes to come from the hinder part of their head: for about that place where the joincture is of the ſhoulders to the nape of the neck, they are thought to haue certain teeth, which by grating and grinding one againſt the other, doe yeeld a kind of craſhing noiſe: and namely, about the time of both the Æquinoctials: like as the Graſhoppers at midſummers Sunſtead. Locuſts engender after the manner of all other Inſects which do engender: to wit, the female carries the male: and ſhe lying vnderneath, bends vp the very end of her taile againſt the other: and thus they continue a good while ere they part aſunder. To conclude, the males of all this kind be leſſe than the females.

Chap. XXX.

¶ *Of the ordinarie Piſmires of our countrey in Italie.*

MOſt part of Inſects do breed a grub or little worme. For euen the very Ant in the Spring time doth bring forth ſuch wormes like egges. Theſe ſilie creatures labor and trauell in common, as the Bees do: this only is the difference, that Bees do make their owne meat; wheras theſe ſtore vp only their food and prouiſion. As touching their ſtrength, if a man would compare the burdens that they carie, with their own bodies, he wil find and confeſſe, that there is not a creature againe in the world, for that proportion, ſtronger. And how doe they carrie them? euen with their very mouthes. Howbeit, if they meet with any greater load than they can bite betweene their chawes, then they ſet their ſhoulders to it, and with their hinder legs alſo make meanes to driue it forward. They haue among them a certaine forme of Commonwealth: they remember: they are not without care and fore-caſt. Looke what ſeedes or graines they do lay vp for prouiſion, ſure they will be to gnaw it firſt, for feare they ſhould ſprout and take root againe, and ſo grow out of the earth. If a corne or ſeed be too big for their carriage, they diuide it into peeces, that they may go with it more eaſily into their houſe. If their ſeeds within, chance to take wet, they lay them abroad, and ſo drie them. They giue not ouer worke by night, when the Moone is at the full: but when ſhe is in the change, they reſt and play them. When they are at worke, how painfull are they? how buſie, how induſtrious? And for as much as they make their purueiance in diuers places, and bring from al parts, without knowledge one of the other: they keepe among them certaine market daies, for a mutuall enteruiew and conference together. And verily, it is a world to ſee, how then they will aſſemble; what running, what greeting, what entercourſe and communication there is between them, whiles they are inquiſitiue, as they meet one with onother. What newes abroad: euen like merchants at a Burſe. Their waifare is ſo ordinarie and continual, that we may ſee the very hard flint and pebble ſtones worn with their paſſage too and fro: we may ſee (I ſay) a very path-way made where they vſe to goe about their worke: whereby, let no man doubt of what force and power continuall vſe is, of any thing whatſoeuer, be it neuer ſo little. Of all liuing creatures, they only and men, doe enterre and burie their dead among them. To conclude, thoroughout all Sicilie a man ſhall not ſee a flying Ant.

A

Chap. XXXI.

¶ *Of Indian Piſmires.*

IN the temple of *Hercules* at Erythræ, there were to be ſeen the horns of a certain Indian Ant, which were there ſet vp and faſtned for a wonder to poſteritie. In the countrey of the Northerne Indians, named Dardæ, the Ants do caſt vp gold aboue ground from out of the holes and mines within the earth: theſe are in colour like to cats, and as big as the * wolues of Ægypt. This gold beforeſaid, which they worke vp in the winter time, the Indians do ſteale from them in the extreme heate of Summer, waiting their opportunitie when the Piſmires lie cloſe within their caues vnder the ground, from the parching Sun. Yet not without great danger: for
B if they happen to wind them and catch their ſent, out they go, and follow after them in great haſt, and with ſuch fury they fly vpon them, that oftentimes they teare them in pieces; let them make way as faſt as they can vpon their moſt ſwift camels, yet they are not able to ſaue them. So fleet of pace, ſo fierce of courage are they, to recouer gold that they loue ſo well.

* O. Foxes

Chap. XXXII.

¶ *The diuers generation of ſome Inſects.*

C MAny Inſects there be that breed after another ſort than the former aboue ſpecified: and principally of dew which ſettles vpon the radiſh leafe in the beginning of the Spring. For being made thicke, and hardned with the heate of the Sun it growes to the bignes of the grain of Millet. From it ariſeth a little grub, and three daies after it becomes a kind of canker-worme: and ſo in proceſſe and tract of time it groweth bigger without mouing at all, and gathereth an hard husk or caſe about her: only if a man touch the webby panicles wherein the ſaid worme lieth inwrapped, it will ſeem to ſtir. This is called Chryſalis: and after ſome time, when the kex or husk is broken, he proueth a faire flying butter-fly.

Chap. XXXIII.

¶ *Of Inſects that breed in wood, and of wood.*

D SEmblably there be ſome Inſects ingendred of raine drops ſtanding vpon the earth, and others alſo of wood: for not only the ordinarie wood-wormes breed in timber, but alſo certain Brees and horſe-flies come of it, yea, and other ſuch like creatures, whenſoeuer the wood happen to be dotted with ouer-much moiſture. Like as within one of our bodies there haue bin found broad wormes of 30 foot in length, yea and ſometimes longer. Alſo there haue bin ſeen in dead carions many worms: and the very fleſh of liuing men is apt to breed ſuch vermin: and ſo is the haire of the head to harbor lice, of which filthy & loathſome creatures both *Sylla* the Dictator, and alſo *Alcman* (one of the moſt renowned Greeke Poets) periſhed. Moreouer, birds are much infeſted and troubled therewith. And as for Feaſants, they will dy thereof vnleſſe they beſtrew themſelues with duſt. Of ſuch beaſts as carry haire, it is verily thought
E that the Aſſe alone and ſheep are free from this kind of vermin. Some kind of cloath likewiſe is apt to ingender lice, and eſpecially thoſe which are made of wooll that ſheepe bare which were worried of wolues. Ouer and beſides, I find in ſome writers, That there is ſome water will ingender this vermin if we do but waſh therein. For euen in wax there will breed mites, which are thought to be of all creatures that haue life, the very leaſt. Alſo ye ſhall haue others again ingender of filthy dry duſt, namely fleas, which vſe to skip and hop with their hinder feet luſtily like theſe tumblers and vautors. Laſt of all, there be that come of a certaine moiſt pouder in cranies of the ground, and thoſe be our ordinary little flies.

Chap. XXXIV.

F ¶ *Of one kind of creature that hath no paſſage to void excrements.*

THere is a creature as foule and ill-fauoured as the reſt, which hath euermore the head faſt ſticking within the skin of a beaſt, and ſo by ſucking of bloud liueth, and ſwells withall: the only liuing creature of all other that hath no way at all to rid excrements out of the

body: by reaſon whereof when it is too full, the skin doth crack and burſt, and ſo his very food G
is cauſe of his death. In Horſes, Aſſes, and Mules theſe do neuer breed: in Kine and oxen they be common, and otherwhiles in dogs, who are peſtered not only with theſe ticks, but alſo with all other vermine aboue named. And in Sheepe and Goats a man ſhall finde none other but ticks. It is as ſtrange a thing alſo to ſee, how the horſe-leeches which be nouriſhed in ſtanding waters of fens, are thirſty after bloud: for theſe will thruſt their whole head into the fleſh, for to draw and ſuck out bloud. Finally, there is a kind of flies that plagueth dogs and none elſe: they are buſie commonly about their eares, where they will bite and ſting them ſhrewdly; for there they cannot come by them with their teeth to ſnap and kill them.

Chap. XXXV. H

¶ *Of Moths and Gnats.*

WOoll and cloth when they be duſty breed moths, eſpecially if a ſpider alſo be gotten within them. For the Spider is very thirſty; and by reaſon that he drinketh vp all the moiſture of the cloth or wool, he increaſeth the drineſſe much more. In paper alſo they will ingender. A kind of them there is which carry their coats and caſes with them, as cockles and ſnailes do; but they haue feet to be ſeen. If they be turned out of their coats or huſks, they preſently die. If they grow ſtill they wil proue to be Chryſalides. The wild fig tree breeds certaine Gnats called Ficarij. As for the Cantharides or French greene Flies, they be bred of little wormes in Fig trees, Peare trees, wilde Pines, or Pitch trees, the Eglantine Brier, I
and Roſes. A venomous vermin this is, howbeit medicinable in ſome ſort. The wings be they that are good in phyſick: caſt them away, & the reſt is deadly. Moreouer, there be other gnats that ſoure things will ingender. And no maruell, ſeeing there be ſome wormes found in ſnow, which are white, if the ſnow be but thin and new fallen. But in caſe it haue lien long, and bee deep, a man ſhall find in the mids within thoſe which are red (for ſnow alſo if it be old waxeth red) rough and hairy, greater alſo than the reſt, and dull of motion.

Chap. XXXVI. K

¶ *Of the fire-Fly called Pyralis, or Pyrauſta.*

THe fire alſo, a contrary element to generation, is not without ſome liuing creatures ingendred therein. For in Cypres, among the forges and furnaces of copper, there is to be ſeen a kind of four-footed creature, and yet winged (as big as the greater kind of flies) to flie out of the very midſt of the fire, and called it is of ſome Pyralis, of others Pyrauſta. The nature of it is this; ſo long as it remaines in the fire it liues: but if it chance to leap forth of the Furnace, and fly any thing farre into the aire, it dieth. There is a riuer in the kingdome of Pontus called Hypanis, which about the ſummer Sunſtead vſeth to bring down the ſtreame thin pellicles or bladders like to grape kernels: out of which there breaks forth and iſſueth a foure footed flie, like vnto thoſe aboue named; and it liueth not aboue one day, whereupon it is called L
Hemerobion [*i.* a day-fly.] All other Inſects of like ſort may continue and liue a ſeuen-night. The Gnat and the little wormes three weeks: but ſuch as bring forth their yong aliue, may endure a full moneth. As for the metamorphoſis of theſe creatures from one forme to another, it is moſt commonly performed in three daies, or foure at the moſt. All the reſt of the winged kind lightly die in Autumne: among which, the brees and horſe-flies are ordinarily blind firſt. To be ſhort, thoſe flies which haue bin drowned, and ſo come to their death, if they be laid and kept in hot cinders or aſhes, will come again to themſelues and reuiue.

Chap. XXXVII. M

¶ *A diſcourſe Anatomicall, of the nature of liuing creatures part by part, according to their particular members.*

The head. IT remaines now to treat of the ſeuerall parts of the body, and ouer and aboue the former deſcription, to particularize and ſet down the ſtory of one member after another. Firſt therefore this is generall, that all liuing creatures whatſoeuer hauing bloud, haue alſo heads: and

few

20030
copy 1

A few of them haue cops or creſted tufts vpon their heads, vnleſſe it be birds, and thoſe be of di-
uers forms and faſhions. The Phœnix is adorned with a round plume of feathers, out of the Creſts, tufts, and combes.
midſt of which growes another little pennache. Peacockes carry vpon their heads a tuft (as it
were) of little hairy trees: and the Stymphalides a lock of criſped and curled haires. Feaſants
haue feathers ſtanding vp like hornes. The pretty Titmouſe or Nonett is filletted or coifed
vpon the head: and in lieu thereof, the Lark hath a little peruke of feathers, whereupon at firſt
it was called Galerita, but afterwards after the French word Alanda, and of it one of the Ro-
man legions tooke the name, becauſe of their pointed Morions. We haue written alreadie of
the Ginny or Turky cocks and hens, vpon whom Nature hath beſtowed a folding creſt, lying
from the very bill, ouer the midſt of the head, vnto the nape of the necke. She hath giuen alſo
vnto all the ſort of Seamewes, Fen ducks, and Moore-hens, certain cops and criſped tufs: to the
B Woodpeck alſo and Baleare crane. But aboue all others, the houſe dunghill cocks carry vpon
their heads the goodlieſt ornament of their combe, and the ſame conſiſting of a maſſie and fle-
ſhie ſubſtance, indented beſides like a ſaw. And yet we may not properly ſay it is either fleſh,
griſtle, or calloſitie, but compoſed of ſome particular matter by it ſelfe, which canot well be
named. As for the creſts of dragons, I could meet with no man hitherto that euer ſaw them.

To come now to Horns, there be many fiſhes, as well of the ſea as freſh waters, and alſo Ser- *Hornes.*
pents, that haue horns in diuers and ſundry ſorts. But to ſpeak a truth and properly, they be no
hornes indeed, for thoſe pertain only to four-footed heaſts. As for *Actæon* and *Cippus*, of whom
we read in our Latine ſtory that they had hornes, I take them to be meer fables and no better.
C Certes in nothing more hath Nature taken her pleaſure than in this, as if ſhe had meant to de-
light and ſport her ſelfe in theſe armes and weapons of beaſts. For in ſome ſhe hath made them
knagged and branched, as in Deere, both red and fallow: in others plain and vniforme without
tines, as in the Spitters, a kind of Stag, which thereupon be called Subulones in Latin, for that
their horns be like a ſhoomakers * Nall blade. There be againe which haue broad hornes, and Subulæ.
plaited like a mans hand, with fingers ſtanding out of them: whereupon the beaſts that beare
them be called Platycerotes, [*i.* broad horned.] Roe bucks haue by nature branched heads, but
they are ſmall: and theſe do not mew and caſt them yearely, as the ſtag and bucke. All the ſort
of rams be armed with crooked horns, turning and winding with certain revolutions as if they
were gantlets or whorlebats, giuen them by nature to thumpe and jurre withall. Buls hornes be
D ſtrait and vpright, ready alwaies to do a miſchiefe. The females of this kind, to wit, Cowes, are
horned as wel as Buls: whereas in many others, the males only be in that wiſe armed. The wild
Goats, called Roch-goats, haue their hornes turning backeward, whereas in fallow Deere they
bend rather forward. There is a kind of Roe-buck called in Africke Addace, which the Greeks
haue named Strepſiceros, and they haue vpright hornes: but they are furrowed and wreathed
round about as if they were ribbed like the backe of a lute; or rather chamfered like the ridge
of a land, and alwaies ſharp pointed with a tip. Ye ſhall haue droues and herds of beaſts, namely
Kine and Oxen in Phrygia, which wil ſtir and wag their horns like eares: and thoſe in the king-
dome of the Troglodites, cary their hornes pendant directly to the ground, which is the cauſe,
that as they eat they are forced to beare their necks awry, and looke atone ſide. Some haue but
E one horne apiece, and that either in the midſt of the forehead, as the Oryx; or elſe in the noſe
and muffle, as the Rhinoceros, wherof we haue written before. In ſum, there be that haue ſtrong
and hard horns to butt with: others to ſtrike and gore withall: ſome crooking forward, others
bending backward. In ſome, they are good only to toſſe and fling, and that in diuers manners.
For there be of them that giue back, others turn one againſt another, and ſome euen ioyne and
meet together: but all run vp ſharp pointed in the end. A kind of beaſts there is that vſe their
horns in ſtead of hands to ſcratch their body when it itches: and others ſerue the turn to ſound
the way before them, as certain ſhel-Snails and Winkles. And theſe horns giuen for this pur-
poſe are ſome of them of a fleſhy ſubſtance, as thoſe of the ſerpents called Ceraſtæ: and other-
whiles one alone without a fellow. As for the Periwinckles and Snailes aforeſaid they are ne-
F uer without twain apiece: and at this paſſe they haue them, to put out and draw in as they liſt.
In Buffles horns the barbarous people of the North parts vſe to drinke: and ye ſhall haue the
hornes of one Buffles head to hold full two meaſures called Vrnæ, which is about 8 gallons. In
ſome countries men head their ſpeares and jauelins with horne. With vs in Italy they be cut
into thin plates, and ſerue for lanterns: and ſurely they are ſo tranſparent and cleare, that they

make

make the candle within incloſed to caſt the greater light, and farther off. Nay, they are good G
for many other toies of delight and pleaſure: inſomuch as ſome paint and die them with ſun-
dry colours, others verniſh and anneile them: and ye ſhal haue men to make thereof their fine
inlaid works in Marquetrie of diuers colours, called thereupon Ceroſtrata. All herns in man-
ner be hollow, ſaue that as they grow toward the pointed tip, they be ſolid and maſſie: onely
Deers both red and fallow are ſound and entire throughout: and euery yere they fal off. Huſ-
bandmen in the countrey, when they ſee their Oxe hooſes ſurbatted and worne too neere the
quick with ouermuch trauell, anoint their hornes with ſweet greaſe, & that is the way to make
them grow again. And in very truth the hornes of theſe beaſts are of ſo pliable a ſubſtance, and
eaſie to be wrought, that as they grow vpon their heads, euen whiles the beaſts are liuing, they
may with boiling wax be bended and turned euery way as a man will: yea, and if they be cut H
when they break new forth out of the skin, they may be eaſily writhed to grow ſeueraly in ſun-
dry parts, ſo as euery head may ſeem to haue foure hornes. For the moſt part, the hornes of
Cowes are more tender and thinner than the other; like as we ſee it is in the females of ſmal-
* With vs it is otherwiſe. ler beaſts: * Ewes haue none at all: ne yet Hinds and Does: no more than the beaſts that haue
feet clouen & diuided into many toes: or thoſe that be whole hoofed, except the Indian aſſe,
who is armed with one horne and no more. Beaſts clouen footed in twaine haue likewiſe two
hornes: but none at all haue they which are toothed in the vpper mandible. They that make
this reaſon, becauſe the matter of their teeth runs al into the horn, and ſo contrariwiſe, are de-
ceiued, and ſoon conuinced by this, That Hinds & Does are toothed no more than Stags and
Bucks, and yet are not horned. In other beaſts the hornes grow to the very bone of the head, in I
Deere only they come out of the skin, and are graffed no deeper. Fiſhes of all liuing creatures
haue the biggeſt heads for the proportion of their bodies, haply becauſe they might the bet-
ter diue vnder water and ſink to the bottom. No kind of Oiſters haue any head at all, no more
than Spunges, or any other in manner, which want al their ſences but only feeling. Some haue
heads indeed, but within their body, and not diuided apart from it, as Crabs and Creifiſhes.

Haire. Mankind of all liuing creatures hath moſt haire on the head, euen men as much as women,
as we may ſee in thoſe countries where they neuer cut their haire, but let it grow. And namely
in Sauoy, Dauphine, and Languedoc about the Alps, where men and women both weare long
haire; and thereupon that part of France is called Comata. And yet this is not ſo general, but K
that the nature of ſome land and ſoile may make ſome alteration and varietie. For the Myco-
nians naturally haue no haire at all: like as the Caunians be all ſubiect to the diſeaſe of hard
and ſwelling ſpleens, euen from their mothers womb. Some reaſonleſſe creatures likewiſe are
* Or rather Alpine. by nature bald, as Oſtriches, and certain * water Rauens, which of the Greeks are named there-
upon Phalacro-coraces. Seldom do women ſhed their haire clean, and become bald: but neuer
was any guelded man knowne to be bald: nor any others that be pure virgins, and haue not ſa-
crificed vnto *Venus*. The haire growing beneath the ventricles of the brain, & vnder the crown
of the head, like as alſo about the temples and eares, falls not off quite. Man alone of all crea-
tures groweth to be bald, I ſpeake not of thoſe that are ſo by nature. Men, women, and horſes
wax gray haired. Men and women both begin at the forepart of their heads to be griſlie, and af- L
terwards behind. Men and women alone be double crowned.

Brain pan. Some creatures haue the bones of their skull flat, plain, thin, and without marrow, and the
ſame vnited or ioined together by certain ſutures or ſeams indented & toothed on either ſide,
which run one into another. The ruptures and cracks of the brain pan cannot be conſolidated
and ſaudred perfectly again: but if the ſpels and pieces be gently taken out, and but ſmal, there
is no danger of death: for in their place there will grow a certaine callous cicatrice or fleſhie
ſubſtance that will ſupply in ſome ſort that defect. Bears of all others haue the tendreſt suls;
and Parrats the hardeſt, as we haue ſaid before in place conuenient.

Braines. Moreouer, all liuing creatures that haue bloud haue likewiſe brains: yea, & thoſe in the ſea
which we call Soft-fiſhes, although they haue no bloud at all, as namely the Pour-cuttles or M
Polypes. But man for his bignes and proportion hath moſt braine of all other, and the ſame is
the moiſteſt & coldeſt part he hath within his body. Infolded it is within two tunicles or kels,
both aboue and beneath: whereof if the one be pierced and wounded [to wit, *Pia mater*] there
is no way but preſent death. Alſo, men commonly haue more braines than women. And
both of them haue neither bloud nor veines therein: as for that which is in other creatures, it

wanteth

20030
copy 1

A wanteth all kind of fat. The learned Anatomiſts,who haue ſearched diligently into the nature of things,do teach vs a difference between the brain & marrow of bones:for,brains in the boyling and ſeething,wax hard. In the midſt of the braine of all creatures there be certaine little * bones. Man alone in his infancie hath his brain to pant and beat:and fully ſettled it is not,nor confirmed,before that he begins to ſpeak. Of all parts neceſſary for life,it is placed higheſt,and next vnto the cope of head and heauen both: without fleſh,without bloud, without filth & ordure. And in truth,it is the fort and caſtle of all the ſences: vnto it all the veines from the heart do tend: in it they all do likewiſe end. It is the very higheſt keep,watch-tower,and ſentinell of the mind: it is the helme and rudder of intelligence and vnderſtanding. Moreouer, in all creatures it lieth forward in the front of the head:and good reaſon,becauſe all our ſences bend that way juſt before our faces. From our braine comes ſleepe, from thence proceedeth our nappes, our nods,our reeling, and ſtaggering. And looke what creature ſoeuer wanteth braine, the ſame ſleepeth not. Stags (by report) haue within their heads twentie little wormes,to wit,in the concauity vnder their tongue,and about that ioincture where the head is graffed to the chin bone.

*Officula,ſome reade Oſcula, holes.

Man alone hath not the power to ſhake his eares. Of flaggie,long,and hanging eares, came the ſyrnames firſt of the *Flacci* (families & houſes in Rome.) There is no one part of the bodie coſteth our dames more than this,by reaſon of their precious ſtones and pendant pearls thereat. In the Eaſt countries,men alſo as wel as women,think it a great grace and brauery to weare earings of gold. As touching their proportion, ſome creatures naturally haue bigger or leſſer than others. Deere only,the fallow as well as the red,haue them ſlit and as it were diuided. In Rats and mice they be hairy. To conclude,no creature hath ears but thoſe that bring forth their yong aliue:and none of them are without,ſaue onely Seales, Dolphins, Vipers, and ſuch fiſhes as were called Cartilagineous and griſtly. And theſe all in ſtead of ears,haue certaine holes,or conduits,except the foreſaid griſtly fiſhes,& the Dolphins:and yet manifeſt it is, that they do heare wel enough. For delighted they be with muſick: and vpon ſome great noiſe and ſudden crack they are aſtoniſhed,and then eaſily taken. But maruel it is how they ſhould heare as they do: neither can I comprehend the reaſon and means thereof, no more than I am able to ſhew how they do ſmell? for no Organs and Inſtruments haue they thereof to be ſeene,& yet there is not an hound vpon the land ſents better,nor hath a finer noſe than they. Of all fouls, the Like-owle and the Otus alone,haue feathers like eares:the reſt haue only holes to heare by. And after the ſame manner ſkaled fiſhesand ſerpents. In Horſes,Mules,and Aſſes,and all ſuch as ſerue either pack or ſaddle,the ears are tokens of their courage more or leſſe,and will ſhew what ſtomack is within them. If they be tired and weary,they hang down flaggie: be they afraid, you ſhall perceiue them to wag too and fro: in heat of fury they ſtand pricking vp: in ſicknes they lie downe.

Eares.

Man only of all creatures hath a Face and Viſage: the reſt haue either muzles and ſnouts,or elſe bils and beakes.

Face or Viſage.

Other creatures haue Foreheads alſo as well as men: but in mans alone we may ſee & reade ſorrow & heauineſſe,mirth and joy,clemencie and mildneſſe,cruelty,and ſeuerity; and in one word,gueſſe by it,whether one be of a good nature or no?

Forehead.

In the aſcent or riſing of the forehead,man hath Eie-brows ſet,like to the eaues of an houſe; which he can moue as he liſt,either both at once, or one after another: and in them is ſhewed part of the mind within. By them we denie,by them wee grant. Theſe ſhew moſt of all others, pride and arrogancie. Wel may it be that pride doth appeare and ſettle in ſome other part,yet here is the ſeat & place of reſidence. True it is,that in the heart it beginnes,but hither it mounteth and aſcendeth,here it reſteth and remaineth. No part can it find in the whole body more eminent and hauty,and withall more ſteepe than the browes, wherein it might rule and raigne alone without controlment.

Eie-browes.

Next vnder the browes is the Eie,the moſt precious member of the whole body; which by the vſe of light makes difference between life and death. Yet hath not Nature giuen eies to all creatures: Oiſters haue none: and for ſome other ſhel-fiſhes,it is hard to ſay whether they haue any or none. As for Scallops,if a man ſtir his fingers againſt them as they lie gaping open,they wil ſhut,as if they ſaw. And the ſhel-fiſhes called Solenes,giue backe if any edge-toole come neere vnto them. Of foure-footed creatures, Moldwarpes ſee not at all: a certaine ſhew and forme

The Eie.

forme they haue of eies to be ſeen, if a man take off the skin that lieth ouer the place. Moreouer, among fouls of the aire, thoſe of the Herons kind, which are called Leuci, for that they be white, want (by report) one eie. And for certaine, in caſe of Augurie, if theſe birds flie either into the South or North, it is holden for an excellent good preſage, for they aſſure men that peril is paſt and promiſe ſecuritie. *Nigidius* affirmeth, That neither Locuſts nor yet Graſhoppers haue eies. As for ſnailes and ſuch like, the two little horns that they put forth, ſerue them in ſtead of eies, as they ſound or trie the way before them. The earth-mads and all the ſort of worms & grubs, are without eies. Men alone of all liuing creatures haue eies of diuers colours, ſome of one, and ſome of another. For all other creatures of one and the ſame kind, are eied alike. Howbeit, ſome horſes there be that extraordinarily haue *red eies. But in men it is hard to ſet down the infinit variety and difference in them: for ſome haue great glaring eies: others againe as little & as pinking. Others alſo there be that haue them of a moderate and reaſonable bignes. Some be goggle eied, as if they would ſtart out of their heads, and thoſe are ſupported to be dim-ſighted: others be hollow eied, and they are thought to haue the beſt and cleareſt ſight: like as they who for colour haue goats eien. Moreouer, ye ſhall haue ſome men, who can diſcern a far off: others againe that ſee not but neere at hand. Many there are, whoſe eieſight dependeth of the Sunnes light: for let the day be ouercaſt and cloudy, or the Sun gon downe, they ſee juſt nothing: and others contrariwiſe there be, that all the day time haue but a bad ſight; yet in the night ſeaſon they ſee better than any others. As concerning 2 balls or apples in one eie, as alſo who they bee that can bewitch and hurt folk with their very eie, ſufficient hath bin ſaid already. *Gray eies commonly in the dark ſee more cleare than others. It is reported of *Tiberius Cæſar* the Emperor to haue had this property by himſelf, that if he were awakened in the night, for a while he could ſee euery thing as wel as in the cleare day light; but ſoon after, by little and little, the darkneſſe would ouercaſt and ſhadow all again: a gift that no man in the world was euer known to haue but himſelfe. *Auguſtus Cæſar* of famous memory, had *red eies like to ſome horſes: and indeed wall-eied he was, for the white thereof was much bigger than in other men: which alſo was the cauſe, that if a man looked earneſtly vpon him, and beheld him wiſtly (and a man could not anger him worſe) he would be diſpleaſed, & highly offended. *Claudius Cæſar* had a fleſhy ſubſtance about the corners of his eies, that tooke vp a good part of the white, and many times they were very red and bloud ſhotten. *C. Caligula* the Emperor, his eies were euer ſet in his head, and ſtiffe again. *Nero* had a very ſhort ſight; for vnleſſe he winked (as it were) and looked narrow with his eies, he could not well ſee ought, were it neuer ſo neere. Twentie couple of profeſſed maſters of fence and ſword-plaiers there were in the fence-ſchoole, that *C. Caligula* the Emperor maintained: & among the reſt two there were & no more, whom a man could not make to winke, or once to twinckle with their eies: preſent before them what weapon he would, or make offer to ſtrike, ſo ſteady & firm were they: and therfore they euermore carried the prize, & were inuincible. So hard a matter is it for a man to keep his eies from twiring: and many men naturally cannot chuſe but be euermore winking and twinckling with their eies: but ſuch are holden for fearful and timorous perſons. None haue their eyes all of one color: for the bal or apple in the midſt is ordinarily of another color than the white about it. Neither in any one part of the body are more ſignes and tokens to be gathered of the affection and diſpoſition of the heart, than in the eie, of man eſpecially aboue all other creatures. By it we may know whether one be modeſt, ſtaied, ſober, gentle, mild, pittifull or no. It ſheweth malice, hatred, loue, heauineſſe, ſorrow, and joy. In the caſt alſo of the eie there is as much variety; for ſome haue a furious, cruell, terrible, fierce, ſterne, and fierie looke: others ſhew grauitie and conſtancie in their eie. Some haue an ouerthwart regard with them, others looke askew and awry. One while a man lookes atone-ſide, and hath a wanton ſheeps eie: another while he caſteth his eie downe, and lookes heauily: and when he liſt againe, hee can giue one a pleaſant and merry looke. In briefe, the Eies are the very ſeat and habitation of the minde and affection. For one while they be ardent and fierie: otherwhiles they be bent and fixed vpon a thing: one while they twinckle, another time they winke cloſe and ſay nothing. From them proceed the teares of compaſſion: When wee kiſſe the eie, we thinke that we touch the verie heart and ſoule. From hence commeth our weeping: from hence guſh out thoſe ſtreames of water that drench and run downe the cheeks. But what might this water and humour be, that in the hearts griefe iſſueth in ſuch plentie, and is ſo ready to flow? Where may it lie at other times, when we are in joy, in mirth, and repoſe? it

cannot

20030
copy 1

A cannot be denied, That with the Soule we imagine, with the minde we ſee, and the Eies as veſſels & inſtruments receiuing from it that viſuall power and faculty, ſend it ſoon after abroad. Hereupon it commeth, that a deep and intentiue cogitation blinds a man ſo, that he ſeeth not; namely, when the ſight is retired far inward. Thus it is, that in the Epilepſie or Falling-ſickneſs the eies are open and yet ſee nothing: for why? the mind within is darkened. Moreouer, Hares haue this qualitie, to ſleep open eied: and ſo do many men beſides them: and this the Greekes do expreſſe by the terme ὑπνοβλεφαρίζειν. Nature hath framed and compounded the eie, of many thin membranes or skins. As for thoſe tunicles without-forth, they are tough and hard * like horn, to withſtand the iniuries of heat and cold: and thoſe ſhe hath ordained eftſoones to be clenſed and purified with the moiſture of teares; to the end that they ſhould be ſlipperie and moueable, for to turne quickly and to ſhift from all that may offend. As for the middle part & membrane of the eie, ſhe hath ſet in a ball, like a window made of tranſparent horne [or rather of a grape:] the little compaſſe whereof containeth all the ſight of the Eie, and ſuffereth it not to wander and roll here and there, but directeth it as it were within a certaine pipe or ſmall conduit: by which means alſo (to note by the way) the apple being gathered into ſo narrow a circle, doth eaſily auoid all inconueniences that are incident vnto it, for to annoy the ſame. This ball and point of the ſight is compaſſed alſo round about with other circles of ſundry colors, black, blewiſh, tawny, ruſſet, and red; to the end that by this medley and temperate mixture of colors enuironed with the white beſides, the light might be let in & repreſented to the Optick-ſinew: and alſo by a temperat reuerberation and beating backe from thoſe other colours, it ſhould not dazle or offend the apple with the exceeding brightneſſe thereof. In ſum, this mirror or glaſſe-window, is ſo perfect and ſo artificially contriued, that as little as the ball of the ſight is, a man may ſee himſelfe ful and whole in it. And this is the cauſe that many fouls, from a mans fiſt are ready to peck at the eies aboue all other parts, for that they would gladly ſort and draw vnto their owne repreſentation and image, which they ſee in the eies, as vnto that which they naturally affect. Certain ſumpter-horſes and mules, & ſuch like beaſts of carriage only, are troubled with ſore eies, and diſeaſed that way at euery change and increaſe of the Moon. But man alone, in the catarrhact & ſuffuſion of the eie, by voiding from it a certain humor which troubled the ſight, doth recouer and ſee again. There haue bin many known blind 20 yeares and more, & yet afterwards inioied the benefit of their eies. Some haue bin borne blinde, without any fault or defect of their eies. Diuers men likewiſe haue ſuddenly loſt their ſight by ſome ſecret accident and no outward offence knowne to giue occaſion thereof. Many right skilfull maſters in Chirurgerie, and the beſt learned Anatomiſts are of opinion, That the veines of the eies reach to the braine. For mine owne part, I would rather thinke that they paſſe into the ſtomacke. This is certain, I neuer knew a mans eie pluckt out of his head, but he fell to vomiting vpon it, & the ſtomack caſt vp all within it. We that be citizens of Rome, haue a ſacred and ſolemne manner and vſe among vs, To cloſe vp their eies that lie a dying, and are giuing vp the Ghoſt; and when they be brought to the Funerall fire, to open them againe. The reaſon of this ceremonious cuſtom, is grounded hereupon, That as it is not meet for men aliue to haue the laſt view of a mans Eie in his death, ſo it is as great an offence to hide them from heauen, vnto which this honor is due, & the body now preſented. Man alone is ſubiect to the diſtortion & depraued motion of his eies. Hereof are come the ſyrnames of certain families in Rome, *Strabones* & *Pæti*: for that the firſt of thoſe houſes were ſquint-eied, and had rolling eies. Thoſe that were borne blink but with one eie, our countrymen called *Coclites*: as alſo them that were pinke-eied and had very ſmall eies, they termed *Ocellæ*. As for ſuch as came by thoſe infirmities by ſome iniurie or miſchance, they were ſurnamed *Lucini*. Moreouer, we ſee that thoſe creatures which ordinarily do ſee by night (as Cats do) haue ſuch ardent and fierie eies, that a man cannot indure to look full vpon them. The eies alſo of the Roe-bucke and the Wolfe are ſo bright, that they ſhine again, and caſt a light from them. The ſea-calues or Seales, and the Hyenes, alter eftſoones their eies into a thouſand colours. Ouer and beſides, the eies of many fiſhes do glitter in the night, when they be drie: like as the putrified and rotten wood of ſome old trunke of an oke or other wood. Wee haue ſaid before, that thoſe winke not nor ſhut their eie-lids, who cannot roll their eies atone-ſide, but are faine to turne their whole head withall when they would ſee a thing that is not iuſt before them. The Chamæleons (by report) rol their eies all whole euery way as they liſt, vp and downe, too and fro. Crabs looke awrie. And yet ſuch fiſhes as are incloſed within a brittle

brittle and tender ſhell, haue their eies inflexible & ſtiffe. Lobſters and Shrimpes for the moſt part, haue their eies ſtanding out very hard, albeit they be couered with the like ſhells. Thoſe that haue hard eies, are not ſo well ſighted as thoſe that haue moiſt. It is commonly ſaid, that if a man pluck the eies out of the heads of yong ſerpents, or yong Swallows, they wil haue new again in their place. All Inſects and other creatures that lie within hard ſhels, ſtir their eies as four-footed beaſts do their ears: but in thoſe that haue tender ſhels, their eies be hard. And all ſuch, as alſo fiſhes & Inſects, haue no lids to their eies, and therfore couer them not. But there be none without a thin membrane or pellicle ouer them, which is cleare and tranſparent like glaſſe. G

Eie-lids. Men and women haue haire growing on the brims of both Eie-lids: but women do colour them euery day with an ordinarie painting that they haue: ſo curious are our dames and would ſo fain be faire & beautiful, that forſooth they muſt die their eies alſo. Nature ywis gaue them theſe hairy eie-lids for another end, namely, for a palaiſade as it were & rampier of defence for the ſight, yea, and to ſtand out like a bulwark for to keep off and put by all little creatures that might come againſt the eies, or what things ſoeuer els ſhould chance to fall into them. Some write, That the haire of the eie-lids will ſhed and fal away, but not without ſome great injury, and namely, in ſuch perſons as be ouermuch giuen to lecherie. No other liuing creatures haue theſe haires, but ſuch as otherwiſe be clad all ouer their bodies with haire or feathers. But, as four-footed beaſts haue them in the vpper lid only, ſo Fouls haue none but in the nether: like as thoſe ſerpents which are tender skinned and four-footed, as Lizards. The Oſtrich is the only foule which hath haire on the vpper eie-lidde. The Ape hath on them both as well as man. Moreouer, all fouls haue not eie-lids, and therefore ſuch do not winke, namely, thoſe that bring forth liuing creatures. The greater and heauier foules, when they would cloſe their eies doe it with drawing vp the nether lid. The ſame alſo twinkle by means of a pellicle or skin comming from the corners of their eies. Doues and ſuch like birds wink with both eie-lids: but four-footed beaſts that lay egs, as Tortoiſes and Crocodiles, vſe the nether lid only, without any twinkling at all, becauſe their eies be very hard. The vtmoſt compaſſe or edge of haire in the vpper lid, the Latines called in old time *Cilium*, and thereof came the name of the brows, to be *Supercilium* in Latine. This brim of the eie-lid, if it be diuided by any wound, cannot be drawne together againe: like as ſome few parts beſides of mans body. H I

Bals of cheeks Vnder the eies, are the balls of the Cheeks, which men and women only haue; which in old time they called *Genæ* in Latine. And by the law of the twelue Tables, women were expreſſely forbid not to teare, rent, or ſcratch them in any caſe with their nails. This is the feat of baſhfulneſſe and modeſty: heare appeareth moſt of all the redneſſe of bluſhing. Vnder them, are the hollow pits of the cheekes, wherein mirth and laughter do lodge and inhabite. K

Noſe-thrils. Man only hath his Noſe ſtanding forth aloft, which now adays they dedicate to ſlie ſcoffing and deriſion, inſomuch as they attribute that terme do dry mockers and flowters. And verily there is not a creature beſides, that hath his noſtrils ſo bearing out. [As for birds, ſerpents, and fiſhes they haue holes only to ſmel at, without any other noſthrils to be ſeen:] & hereof come the ſurnames of *Simones* and *Silones*, whereof the former haue flat noſes, the other are hooked and camoiſe noſed vpward. Infants haue bin known many times when they are ſeuen moneths old, to want the holes and paſſages both of noſe and eares. L

Lips. Then follow the Lips: ſome men there be that put them far out, by reaſon that they are gag-toothed or tut-mouthed, and thoſe are called *Brocci*. Others againe who are blabber-lipped, are named in Latine *Labeones*.

Mouth. As for the mouth, all creatures haue it that bring forth their yong aliue: and either it is gentle and pliable, or elſe hard and vnruly; as we ſee horſes; that either willingly receiue, or elſe refuſe the bit. By which alſo we giue to men, the tearme either of modeſt and good countenance, or elſe of ſhameleſſe and vntoward. But in ſtead of mouth and lips both, Nature hath giuen to

Bills. all foules ſharpe Bills of an horny ſubſtance. and as many of them as liue vpon rauin and prey, haue them hooked inward: but ſuch as gather and pecke onely, they haue ſtrait beakes. As for thoſe that either graſe, root, or pudder in mud, like to ſwine, they are broad and flat billed. As for horſes, mules, and ſuch like, they vſe their mouthes in ſtead of hands, to gather in their food as they either feed in paſture, or be at racke and manger. And the wider mouthes haue they that liue of killing and deuouring other beaſts. M

No

20030
copy 1

A No creatures liuing, but man and woman, haue Chins and Iaws. The riuer Crocodile alone moueth the vpper iaw: the land Crocodiles chew as other creatures do, but only bias. *The Chin & Iaw.*

Of Teeth, there be three ſorts: for either they be framed like ſaws, or els ſet flat, euen, and leuell: or laſt of all, ſtand gabbing out of the mouth. The ſaw teeth run one betweene another, as if two combes grew together, becauſe they ſhould not weare if they met one with another, as we ſee in ſerpents, fiſhes, and dogs. Horſes & men haue their teeth of one euen leuell. The bore, the water-horſe, and the Elephants, haue their tusks and fangs ſticking forth. Of thoſe teeth which are ſmooth and meet juſt one againſt another; ſuch as diuide and cut the meat, be broad edged, as the fore-teeth: thoſe that grind and chew, be double, and ſtand within the chaw: but ſuch as ſeuer and part the meat in the mouth, be ſharp pointed: and we call them our eie-teeth; the Latines *Caninos*, or Dog-teeth. And theſe are they, that of ſaw teeth be the longeſt. Euen *The Teeth.*

B and leuel-ranged teeth, be either in both chaws alike, as in an horſe; or els they be wanting before in the vpper chaw, as in Kine, Buls, Oxen, Sheep, & all ſuch as chew cud. Goats haue none aboue but the 2 foreteeth. None haue gabbed tusks ſtanding forth of the mouth, whoſe teeth are faſhioned like a ſaw. The females of them that haue thoſe fangs & tusks, if haply they haue the like (for ſeldome they are ſeen with ſuch) make no offenſiue vſe of them at all: for whereas the Bores do ſtrike with them, the Sowes only do but bite. No horned beaſts hath ſuch tuskes: But all thoſe haue hollow teeth, wheras in all the reſt, they be ſound & ſolid. All fiſhes be toothed like ſaws, ſaue only the guilt-head Scarus; for this only of all creatures liuing within the water, hath an euen courſe of teeth. Furthermote, many fiſhes be found to haue their mouth, yea

C and their tongue, couered and beſet all ouer with teeth: to the end, that by the means of many wounds (as it were) they might make ſoft their meat, which otherwiſe they could not poſſibly chew and teare. In many the teeth ſtand in the pallat and roofe of their mouth, yea and in their very taile. Moreouer, ſome there be that haue them crooking inwardly to the mouth, that the meat might not fall out againe: as hauing no other means to hold it in. Alſo, the Aſpides, and Serpents are likewiſe toothed, but they haue aboue, both on the right ſide & the left, two teeth that be very long, and thoſe are hollowed within after the maner of ſmal pipes, like to the ſtings of Scorpions, by which they diſcharge their phiſon. The beſt writers who haue ſearched moſt curiouſly into the ſecrets of Nature, do hold, That the venome of Serpents is nought els but their gal; and that by certain veins vnder their ridge bone, the ſame paſſeth along to the mouth.

D Some ſay, that a Serpent hath but one venomous tooth; which becauſe it is crooked, therefore he turneth and bendeth it vpright when he would ſting or bite withall. Others affirme, that at ſuch a time the ſame falls out, and a new commeth vp again and groweth in the place: for eaſie it is to be driuen or ſhaken out: and we ſee ſome of them handled and carried in mens boſomes, without that tooth. It is ſaid moreouer, that the Scorpions haue the like tooth in their taile, and moſt of them three together. Vipers teeth are couered and lie hidden within their gumbs. This Serpent being full of poiſon, redoubleth her pricke, and at euery bit letteth in poiſon into the wound. No flying foule hath teeth, ſaue only the Bat or winged-mouſe. Of all creatures which beare no hornes, the Camell onely hath no fore-teeth in the vpper chaw. Such as be horned, haue no ſaw-teeth. Snailes likewiſe haue teeth: witneſſe the leaues and tendrils of vines,

E which the very leaſt of them all do gnaw and eat away. But for ſea-fiſhes, that thoſe which liue in ſhels or be griſtly, ſhould haue their foreteeth; and namely, that the ſea-Vrchins 5 apiece; I cannot but wonder how men could come by the knowledge. Inſects in ſtead of teeth, haue a ſharp pricke to ſting withal. Apes haue teeth euen as men. An Elephant hath foure teeth within to chew with (beſides thoſe that ſtand out) which in the males turne and bend vpward, but in the female they are ſtreight, & ſhut directly downward. The fiſh alſo called Muſculus Marinus, which goeth before the Whale or Whirlpoole as his guid, hath no teeth at all; but in ſtead thereof, his mouth all within, his tongue alſo and pallat, is rough againe with certaine briſtles. The leſſe four-footed land-beaſts, haue the two fore teeth of either ſide, longer than the reſt. As for all other creatures, they bring their teeth with them into the world: man only is born with-

F out them, and at the 7 moneth they commonly breed. In all other creatures they continue ſtill and ſtick faſt; except Men, Lions, Horſes, Mules, Aſſes, Dogs, and ſuch as chew cud, for theſe change their teeth: but Lions and dogs caſt only the eie-teeth, called *Canini* in Latine. The eie-tooth of a Wolfe (ſo it grow on the right ſide of the head) is thought to doe ſtrange matters. The great grinders which ſtand beyond the Eye-teeth, in no creature whatſoeuer doe fall

out of themſelues. As for the fartheſt cheek-teeth in a mans head, which be called *Genuini*, [*i.* G
the Wit-teeth] they come about the time that he is 20 yeares old, and in many at 80 yeares of age. Sure it is, that thoſe teeth fall from women in their old age, and ſoone after come againe: ſuch women I meane, as had no children in their youth. And *Mutianus* hath reported, That hee ſaw one *Zancles* a citizen of Samothrace, who had new teeth comming vp after he was an 104 yeares old. Moreouer, males ordinarily haue more teeth than the females: as we may ſee in mankind, Sheep, goats, and Swine. *Timarchus* the ſon of *Nicocles* the Paphian, had a double courſe of teeth in either jaw. He had a brother alſo who neuer caſt his foreteeth, and therefore hee wore them before to the very ſtumps. We reade in Chronicles of one man that had a tooth growing out of the very pallat of his mouth. As for the eye-teeth, if they be loſt by any miſchance, there neuer grow again any other for them. In horſes only, of all other creatures, teeth wax whiter by H
age: for in the reſt, they turne to be browne and reddiſh. The age of Horſes, Aſſes, and Mules, is knowne by a marke in the teeth: a horſe hath in all 40. At the end of 30 moneths, hee loſeth his fore teeth of either chaw, as well aboue, as beneath: the yere following as many, euen thoſe that be next, namely at what time as they put out thoſe which be called the cheeke teeth. At the beginning of the fifth yere, he loſeth other two, but there come vp new in the place in the ſixth yere. By the ſeuenth yere he hath all, as well thoſe that ſhould come in others place, as thoſe which are firme and neuer change. A guelding neuer caſts his teeth, no not his ſucking teeth, in caſe he were guelded before. Aſſes in like manner begin to ſhed their teeth at the 30 moneth of their age; and ſo forward from 6 moneths to 6 moneths: and if they fole not before they haue ſhed their laſt teeth; they are for certaine to be holden barren. Kine and Oxen, when I
they be two yeres old, do change their teeth. Hogs or Swine neuer haue any teeth to fall. Now when as theſe marks are gon out, which ſhew the Age of Horſes, Aſſes, and ſuch like, yee muſt (to know their age) go by the ouergrowth & ſtanding out of the teeth, the greineſſe of the haire ouer their brows, and the hollow pits thereabout: for then are they ſuppoſed to be 16 yeares of age. As touching men, ſome are thought to haue venome and poiſon in their teeth: inſomuch, as they be ſhewed bare and naked againſt a cleare mirror or looking glaſſe, they wil dimme the beauty thereof, yea, and kill yong pigeons whiles they be calow and vnplumed. But foraſmuch as we haue ſpoken ſufficiently of teeth, in our treatiſe as touching the generation of Man, wee will paſſe ouer the reſt, and proceed vnto other parts; ſaue onely that this is to be obſerued and noted, How children be ſicke when they be about breeding of their teeth. And to conclude, of K
all other creatures, thoſe are moſt dangerous with their Teeth, which haue them framed like ſawes, and cloſing one betweene another.

The Tongue. Now as concerning Tongues, we obſerue much diuerſitie in them: for all creatures are not tongued alike. Firſt and formoſt, Serpents haue very thin tongues, and the ſame three-forked; blacke of colour, ſhaking, and ready to pierce; and if a man take them forth, very long. Lizards haue tongues two-forked and full of haires: ſo haue the Seales or Sea calues a double tongue: but the tongues of theſe beforenamed, are as ſmall as haires: as for the reſt, their tongues ſerue them to licke their muffles and lips all about. Fiſhes haue their tongues for the greater part therof, cleauing faſt to their pallat; and in Crocodiles they are ſo, clean throughout. But as wel fiſhes as other creatures of the water, haue a fleſhy palat, which ſerues them in ſtead of a tongue L
to taſt withall. Lions, Libards, and all of that ſort, yea and Cats, haue their tongues rough and vneuen, made like a file with many ſmall edges lapping one ouer another: in ſuch ſort, as that with licking it wil weare the skin of a man ſo thin, that their ſpittle and moiſture when it commeth neare vnto the bloud and the quick, will driue oftentimes into rage and madneſſe, thoſe whom they ſo licke, yea although otherwiſe they be made tame and gentle to come to hand. As touching the tongues of Purple fiſhes we haue written already. Frogs haue their tongues in the forepart faſt to the mouth: the hinder part within toward their throat, is free and at liberty, whereby they keep that croking which we heare at one ſeaſon of the yeare; namely, when the males cal to the femals for to ingender; & then they be called Olalygones: for at that time they let down their nether lip ſomwhat vnder the water, that they gargle with their tongue leuell to M
the water, which they receiued into their throat: and ſo while their tongue quauereth withall they make that croking noiſe aboueſaid: he that would looke then aduiſedly vpon them, ſhould ſee their ſpecks ſo ſwoln and ſtretched out full, that they will ſhine againe: he ſhould perceiue, their eies ardent and fierie with paines that they take thus with the water. Thoſe creatures that haue

20030
copy 1

A haue pricks and ſtings in their hin-parts,are furniſhed alſo with tongue and teeth. As for Bees, their tongue is very long;and the Graſhoppers put it forth a good way. They that haue a fiſtulous ſting or pricke in their mouth, are prouided neither of teeth nor tongue. In ſome Inſects, (as namely Piſmires) the tongue lieth cloſe within. Elephants, aboue all other beaſts, haue a large and broad tongue. All creatures haue their tongue looſe and at liberty at all times, each one in their kind: man only is oftentimes ſo tongue-tied, that needful it is to cut certain ſtrings and veines for to eaſe it. *Metellus* the high prieſt and chiefe ſacrificer at Rome, had ſuch a ſtuttering and ſtammering tongue (by report) that againſt he ſhould dedicate the temple of the goddeſſe *Opifera*, he labored ſo with his tongue for vtterance, for certaine moneths together, & took ſuch pains, as if he had bin vpon the racke. All children, by that time that they be ſeuen yeares
B old at the fartheſt, ſpeake readily, ſo as they be not by ſome vnnaturall cauſe impeached. But ſome men there be, which haue their tongues ſo at commandement, and ſo artificially they can handle it and their throat together, that they are able to counterfeit the ſinging of all birds, and the voice of any other creature, that one cannot know and diſcerne them aſunder. As touching Taſte, which is the judgement of meats and drinks, to wit, What ſmack and tallage they haue: all other liuing creatures find it at the tip of their tongue only: but man taſteth as wel with the pallat or roofe of his mouth. The ſpungeous kernels, which in men be called Tonſillæ, or the Almands, are in ſwine named the Glandules. That which betweene them hangeth downe from the inmoſt part and roofe of the mouth, by the name of the Vvula, is to be found in man onely.

Vnder it, there is a little tongue (which the Greekes call Epigloſſis) at the root of the other; *The flap Epi-*
C and the ſame is not to be found in any creature that laieth egs. A twofold vſe it hath, lying as it *gloſſis.*
doth between the two pipes. Whereof, that which beareth more outward, and is called The rough Arterie, or the Windpipe, reacheth vnto the lungs and heart. And as a man doth eat and *The Winde-*
ſwallow downe his meat, this foreſaid little flap doth couer it, for feare leſt as the ſpirit, breath, *pipe, and We-*
and voice paſſeth that way, the meat or drink (if it ſhould go wrong to the other conditi or paſ- *zand pipe.*
ſage) might indanger a man and put him to great trouble. The other is more inward, called properly the Gullet, or the Wezand, by which we ſwallow down both meat and drink, and it goeth to the ſtomacke firſt, and ſo to the belly. This alſo the ſaid flap doth couer by turns, to wit, as a man doth either ſpeake or draw his breath, leſt that which is already paſſed into the ſtomacke, ſhould come vp againe, or be caſt vp vnſeaſonably, and thereby impeach a man in his ſpeech: the
D Windpipe conſiſteth of a griſtly and fleſhie tunicle: the Wezand of a membranous or ſinewie ſubſtance and fleſh together.

There is no creature hauing a necke indeed, but it hath alſo both theſe pipes. Wel may they *The Necke.*
haue a gorge or throat, in whom there is found but the gullet only: but nape of neck behind they can haue none. As for thoſe vpon whom Nature hath beſtowed a neck, they may with eaſe turn their head about too and fro euery way, to looke about them, becauſe it is compoſed of many ſpondyles, or turning round bones, tied and faſtened one vnto another by ioints and knots. The Lion only, together with the Wolfe, and the Hyæna, haue this necke bone of one entire and ſtraight peece, and therefore ſtiffe that it cannot turne. Otherwiſe it is annexed to the chine, and the chine to the loines.

E This Chine likewiſe is a bony ſubſtance, but made round and long, and fiſtulous within, to *The Chine-*
giue paſſage to the marrow of the backe, which deſcendeth from the brain. Learned men are of *bone.*
opinion, That this marrow is of the ſame nature that the braine is: and they ground vpon this experience, That if the thin and tender skin that incloſeth it be cut through, a man cannot poſſibly liue, but dieth immediatly. All creatures that be long legged, haue likewiſe in proportion as long necks. So haue alſo water-fouls, although their legs be but ſhort. But contrariwiſe, yee ſhall not ſee any birds with long necks, that haue hooked tallons. Men onely and Swine, are troubled with the ſwelling bunch in their throats: which many times is occaſioned by corrupt water that they drinke. The vpper part or top of the Wezand, is called the Gorge, or the gullet:
F the nether part or the extremitie thereof, is the Stomacke. There is another fleſhie concauitie of this name, vnder the windpipe, annexed to the chine-bone: long it is and wide, made in faſhion of a bottle, flagon, or rather a gourd. Thoſe that haue no gullet, are alſo without a ſtomack, a necke, and a wezand, as fiſhes: for their mouths and bellies meet. The ſea Tortoiſe hath neither tongue nor teeth: with the edge of his muffle (ſo ſharpe it is) he is able well enough to chew all his victuals.

The Stomack. Vnder the Arterie or wind-pipe, is the mouth of the ſtomacke; of a callous or griſtly ſubſtance, thicke toothed, with prickles in manner or a bramble, for the better diſpatching of the meat: and theſe notches or plaits grow ſmaller and ſmaller, as they approch neerer to the belly: ſo as the vtmoſt roughneſſe thereof in the end is like vnto a Smiths file. G

The Heart. Now are we come to the Heart, which in all other liuing creatures is ſcituate in the very midſt of the breſt: in man only it lies beneath the left pap, made in maner of a peare, & with the pointed and ſmaller end beareth out forward. Fiſhes alone haue it lying with the point vpward, to the mouth. It is generally receiued and held, that it is the firſt principall part which is formed in the mothers wombe: next vnto it the braine, and the eies laſt of all. And as theſe be the firſt that die, ſo the Heart is laſt. In it (no doubt) is the moſt plenty of heat, which is the cauſe of life. Surely it euer moueth and panteth, like as it were another liuing creature by it ſelfe: co- H
uered it is within-forth with a very ſoft, yet a ſtrong tunicle, that enwrappeth it: defended it is beſides with a ſtrong mure of ribs, and the breſt bone together: as being it ſelfe the principall fortreſſe and caſtle, which giues life to all the reſt. It contains within it certaine ventricles and hollow receits, as the chiefe lodgings of the life, and bloud, which is the treaſure of life. Theſe in greater beaſts are 3 in number: & none there is without two. This is the very ſeat of the mind and ſoule. From this fountain there do iſſue 2 great veſſels, maſter-veins or arteries, which are diuided into branches: & being ſpred as wel to the fore-part as the back parts of the body, into ſmaller veins, do miniſter vitall bloud to all the members of the body. This is the only principall part of the body that cannot abide to be ſick, or languiſh with any infirmity: this lingereth not in continuall pain: no ſooner is it offended, but death inſueth preſently. When all other I
parts are corrupt and dead, the Heart alone continueth aliue. All liuing creatures that haue an hard & ſtiffe heart, are ſuppoſed to be brutiſh: thoſe that haue ſmall Hearts, be taken for hardy and valiant: contrariwiſe, they are reputed for timorous and fearfull, which haue great Hearts. And the biggeſt Heart, in proportion of the body, haue Mice, Hares, Aſſes, Deere, Panthers, Weaſels, Hyenes, & in one word, all creatures either by nature fearefull, or vpon feare hurtful. In Paphlagonia, Partridges haue two Hearts. In the Hearts of Horſes, Kine, Buls and Oxen, are otherwhiles bones found. The Heart in a man groweth yerely two drams in weight, vntill it be 50 yeares of age: and from that time forward it decreaſeth from yere to yere as much: whereupon he is not able to liue aboue 100 yeares, for want of Heart: as the Ægyptians be of opinion; whoſe manner is to preſerue the dead bodies of men ſpiced and embalmed. It is reported of K
ſome men, that they haue hearts all hairy: and thoſe are held to be exceeding ſtrong and valorous. Such was *Ariſtomenes* the Meſſenian, who ſlew with his owne hands * 300 Lacedæmonians. Himſelfe being ſore wounded and taken priſoner, ſaued his owne life once, and made an eſcape out of the caue of a ſtone quarrie, where he was kept as in a priſon: for hee got forth by narrow Fox-holes vnder the ground. Being caught a ſecond time, whiles his keepers were faſt aſleep, he rolled himſelfe to the fire, bound as he was, and ſo without regard of his owne bodie, burnt in ſunder the bonds wherewith he was tied. And at the third taking, the Lacedæmonians cauſed his breſt to be cut and opened, becauſe they would ſee what kind of Heart hee had: and there they found it all ouergrown with hair. Moreouer, this is obſerued in peruſing the inwards of beaſts, That when they be wel liking, and do preſage good, the Heart hath a kind of fat in the L
vtmoſt tip thereof: howbeit, this would be noted, That according to the Soothſaiers learning, their Heart is not alwaies taken for a part of the bowels or intrails: for after the 123 Olympias when *Pyrrhus* king of Epyrus was departed out of Italy, what time as *L. Poſthumius Albinus* was king ſacrificer at Rome, the Soothſaiers and Wiſards began firſt to look into the heart, among other inwards. That very day when as *Cæſar* Dictator went firſt abroad in his roiall purple robe, and tooke his ſeat in the golden chaire of eſtate, he killed two beaſts for ſacrifice, & in both of them the intrailes were found without any Heart: whereupon aroſe a great queſtion and controuerſie among the Augures and Soothſaiers, How it could be, that any beaſt ordained for ſacrifice ſhould liue without that principall part of life? or whether poſſibly it might loſe it for that preſent only? Ouer and beſides, it is held for certaine, that if any dye of the trembling and ache of the heart, or otherwiſe of poiſon, their heart will not burne in the fire. And verily, an Oration M
there is extant of *Vitellius*, wherein he challengeth *Piſo*, and chargeth him directly with Poyſoning of *Germanicus Cæſar*, vpon this preſumption; for he openly proteſted and prooued, That the heart of *Germanicus* would not conſume in the funerall fire, by reaſon of poyſon. But contra-

riwiſe,

* In three ſundry battels.

20030
copy 1

A riwiſe, *Piſo* alledged in his own defence the foreſaid diſeaſe of the Heart called Cardiaca, wherof as he ſaid *Germanicus* died.

Vnder the Heart lie the Lights, which is the very ſeat of breathing: whereby we draw and deliuer our wind. For which purpoſe, ſpungeous it is and ful of hollow pipes within. Few fiſhes, as we ſaid before, haue any Lungs: other creatures alſo that lay egs, haue but ſmal, and the ſame full of froth, and without bloud: wherupon they be not thirſty at all: which is the cauſe likewiſe that Seales and Frogs can diue ſo long vnder the water. The Tortoiſe alſo, albeit he haue very large Lungs, and the ſame vnder his ſhell, yet there is no bloud therein. And verily, the leſſer that the lungs be, the ſwifter is the body that hath them. The Chamæleons lights be very big, for the proportion of his body, for little or nothing els hath he within it. *The Lights or Lungs.*

Next followeth the liuer, which lies on the right ſide. In that which is called the head of the
B Liuer, much varietie and difference there is. For a little before the death of *Marcellus* (who was ſlaine by *Annibal*) as he ſacrificed, there was found a Liuer in the beaſt, without that head or fibres aforeſaid: and the next day after, when he killed another for ſacrifice, it was ſeen with two. When *C. Marius* ſacrificed at Vtica, the ſame was likewiſe wanting in the beaſt, being opened. Semblably, when prince *C. Caligula* the Emperor ſacrificed vpon the firſt day of Ianuarie, at his entrance into the Conſulſhip, the Liuer head was miſſing: but ſee what followed! in that yeare his hap was to be ſlain. Moreouer, his ſucceſſor *Claudius* within a month before he died by poiſon, met with the like accident in his ſacrifice. But *Auguſtus Cæſar*, late Emperor of famous memory, as he killed beaſts for ſacrifice, the very firſt day that he entred vpon his imperiall dignity, found in 6 of them 6 liuers, which were all redoubled & folded inward, from the nethermoſt
C lobe or skirt beneath: wherupon anſwer was made by the Soothſayers, That within one yere he ſhould double his power and authority. The foreſaid head of the Liuer, if it chance to be ſlit or cut, preſageth ſome euill hap, vnleſſe it be in caſe of feare and penſiueneſſe: for then it betokeneth good iſſue, and an end of care and ſorrow. About the mountaine Briletum and Tharne; alſo in Cherſoneſus neere vnto Propontis, all the Hares ordinarily haue two Liuers: and (a wonderous thing it is to tell) if they be brought into other countries, one of the ſaid Liuers they looſe. *The Liuer.*

Faſt to the Liuer hangeth the Gall; yet all creatures haue it not. And about Chalcis in Eu-
D bœa, the ſheep are quite without Gall. But in Naxus they all haue two Gals, and the ſame very big. The ſtrangers that come into both thoſe parts, think the one as prodigious & monſtrous as the other. Horſes, Mules, Aſſes, Deere both red and fallow, Roe-bucks, Swine, Cammels, and Dolphins haue no Gall. Some Mice and Rats there be which haue it. And few men there are without, howbeit, ſuch are of a ſtronger conſtitution, more healthfull, & longer liued. Howbeit ſome are of opinion, That all horſes haue Gall, not annexed to their liuer, but within their belie: and as for the Deere abouſaid, it lieth (as they think) either in their taile, or els their guts: which (by their ſaying) are ſo bitter, that hounds and dogs by their good wils would not touch them. Now this Gal is nothing els but an excrement purged from the worſt bloud: & therefore bloud is taken to be the matter thereof. Certain this is, that no creatures haue Liuers, but ſuch as likewiſe haue bloud. And in truth, the Liuer receiueth bloud from the heart, vnto which it is
E adioined, and ſo conueigheth and deſtributeth it into the veins. Black choler lying in the Liuer cauſeth fury and madneſſe in man: but if it be all caſt vp by vomit, it is preſent death: hereupon it commeth, that we terme furious and raging perſons by the name of cholericke, or full of Gall: ſo great is the venome of this one part, if it reach once to the ſeat of the mind, and poſſeſſe it. Nay more than that; if it be ſpred and diſperſed ouer all parts of the body, it infecteth it with the yellow jaundice, yea, and coloureth the very eies, as it were with Saffron. Let it out of the bladder or bag wherin it is, ye ſhal ſee it ſtain veſſels of braſſe, yea, they wil becom black againe, and loſe their brightneſſe if they be touched therewith. No maruell then if the venome and poiſon of ſerpents, proceed from the Gall. They that vſe to feed of worme-wood growing in Pontus, commonly haue no gall. Rauens, Quailes, and Feaſants, haue their gall ioining to
F their kidnies, or rather to their guts, of one ſide and no more: and ſome to the guts only, as Pigeons, Haukes, and Lampreies. Few birds there be that haue gall in the Liuer. As for Serpents and Fiſhes, they haue the greateſt gals of all others, for the proportion of their bodies. Moſt of them haue their gall along their guts throughout, in manner of the Hauke and the Kite. Moreouer, in all Whale fiſhes their gall is faſtened to the liuer: and ſo we ſee it lieth in the Seales, *The Gall.*

whoſe Gall is ſingular good for many purpoſes. Oxe Gall in limming giueth a golden colour: G
The Soothſaiers haue dedicated it to *Neptune*,& the mighty power of water. *Auguſtus* the Emperor found two Galls in a beaſt that he killed for ſacrifice,vpon that very day whereon he obtained that famous victorie at Actium. Some ſay,that the lobes or fibres in the ſmal Liuers of certaine Mice and Rats,are commonly found to be as many as the Moone is daies old in euery moneth: and looke how many daies you reckon of her light,ſo many may you count the fibres aforeſaid. Alſo,that their liuer groweth at mid-winter, when daies be at ſhorteſt. In the kingdomes of Grenada and Andaluſia in Spaine, Connies are many times found with double Liuers. The land Frogs of Toads kind, haue one lop or lappet of the liuer, which Ants will not touch; becauſe of the poiſon therein,as is ſuppoſed. Liuer of all things may be kept and preſerued longeſt: and we reade in chronicles,that there haue bin found in ſome cities long beſieged, H
Liuers in ſalt or pouder,which had continued a 100 yeres. Serpents and Lizards haue long Liuers. In that ſacrifice which *Cæſina Volaterranus* killed, Dragons were ſeen to iſſue from among the Entrails and the Liuer; and this turned to be a lucky preſage. And verily,why ſhould wee think this report or any other in ſacrifices,to be incredible? conſidering that vpon the very day that K. *Pyrrhus* was ſlain,the heads of the beaſts being ſlain for ſacrifice (notwithſtanding they were cut off from the bodies) moued forward vpon the ground, and licked vp their owne bloud.

The Midriffe The vpmoſt inwards of a man, to wit, the Heart and Lungs, are diuided from the other entrails beneath,by certain pellicles or rims of the Midriffe, which the Latines call Prœcordia, (becauſe they are drawne and ſet before the Heart as a defence:) and the Greeks Phrenes: true I
it is,that Nature in great prouidence hath incloſed all the noble and principal parts within ſeuerall skins and coats of their owne, which might ſerue in ſtead of ſheathes and caſes for their better defence: but in this partition of the Midriffe, ſhee had a more particular regard to the propinquitie of the Stomack and Belly, leſt that the vitall parts being ſo neare, ſhould be oppreſſed and ſuffocated with the ſtreams and vapors of the meat therin boiling. To this parr are we beholden for our quick wit,this membrane of the Midriffe we may thank for our ready conceit and vnderſtanding: to which effect,charged it is with no fleſh,but compoſed of fine & ſubtild ſinews. The ſame likewiſe is the very eſpeciall ſeat of mirth: as we may perceiue euidently by tickling vnder our armeholes,vnto which it reacheth: and as in no place of mans body the skin is more fine and tender, ſo it taketh as great pleaſure to be tickled and lightly ſcratched K
there. And herupon it is,that in ſolemne combats of ſword-fencers at vtterance with the ſharp, as alſo in field battels,we haue many a time ſeen men wounded and thruſt through the Midriffe,to die laughing.

The Bellie or Paunch,with the Guts. To proceed in our Anatomy,all creatures hauing a Stomack or Read,are not without a belly vnder it. As many as chew cud,haue the ſame * double or two fold,the reſt one and no more: and looke who want bloud,are without it alſo. For ſome there be that haue one entire gut,that beginneth at the mouth,and by a certaine way redoubleth and returneth backe againe thither, and namely,the Cuttill and the Polype. In man it is annexed to the bottome of the Stomack, like as in a Dog. And in theſe twaine onely,narrower it is in the lower part: which is the cauſe that none but they do vomit; for when their bellies be full,the ſtreight paſſage beneath keepes L
the meat from deſcending,and ſo it returneth vpward: which cannot happen to them that haue it wide and large,whereby the meat is ſooner ſent downe into the guts beneath. Next to the bag of the Stomack,men and ſheep haue the ſmall guts called Lactes,through which the meat paſſeth: in others it is named Ile. Next vnto which are the greater guts, that reach into the Paunch: and in man they are full of windings and turnings: which is the reaſon, that as many as haue a great ſpace between the Stomacke and the Paunch, are more hungry and greedy of meat than others. And thoſe who haue the fatteſt and moſt greaſieſt bellies, moſt commonly are the groſſeſt of capacity and vnderſtanding. Some fouls likewiſe haue a two-fold receptacle for their meat: the one is the gizzer,craw,or gorge, wherein they beſtow at the firſt their meat when they take it new: the other is the true ſtomacke indeed; into which they ſend out of the former,the victuals already altered,prepared,and in good forwardnes of concoction. And ſuch M
be Hens and Pullein, Coiſts or Stock-doues, Houſe-doues,or Pigeons,and Partridges. All the reſt in manner want the ſaid gizzer, but in ſtead thereof haue a wider gorge, where-through the meat paſſeth into the ſtomack,as Choughes, Rauens,and Crowes. Some againe there bee that

haue

* *Ariſtotle* ſaith foure fold.

20030
copy 1

A haue neither one nor other, but be far different from the reſt,and theſe haue their bellie hard to their gorge: and eſpecially ſuch as haue long neckes and narrow, as the bird Porphyrio. The paunch or bellie of thoſe beaſts which are whole houfed,is hard and rough. And in land beaſts, it is in ſome thicke toothed, and ſet full of ſharp pricks:in others it is framed rugged likewiſe, plaited croſſe in manner of lattice, readie to catch and bite whatſoeuer. Thoſe which haue not teeth in both chawes, nor yet chew cud, do in this bellie concoct and digeſt their victuals, and out of it they ſend the meat into the paunch where the guts lie. This member, in the mids,is in all creatures faſtened to the nauill:and in man it is like vnto that of a ſwine, hauing toward the neather part,a great gut named Colon: and this is it, which giues occaſion to the intollerable paine of the colique. This Gut in dogs,is very ſtreight and narrow,whereupon they haue much
B adoe to diſcharge it, and lightly they doe not skummer, but with great paine and difficultie. Thoſe creatures of all others be counted moſt vnſatiable, whoſe meat paſſes immediatly out of their bellie into the ſtraight gut Longaon, or the Tiwill:as among foure-footed beaſts, the Wolfe, engendred betweene the Hind and a hee-Wolfe: and in foules,the Cormorant. An Elephant hath foure bellies or paunches:all other parts within,be anſwerable to thoſe in Swine. Their lungs be foure times as big as thoſe in an Oxe. The gorge or craw,and the ſtomacke or gizier in birds,is the thicke and fleſhie. In the maw or ſtomack of Swallows young birds,there be ſome certaine little white ſtones, or elſe of a reddiſh colour, called thereupon Chelidonij: and they be in great requeſt in Art-Magicke,namely for charmes and enchantments. Likewiſe in the ſecond bellie or paunch of yong Heifers,there is found a ſmall,black,and grauelly ſtone round as a bal,and light withall:a ſingular remedie(as it is thought)for women that haue hard
C labour and be deliuered with much paine & difficultie, ſo it be taken before that euer it touch the ground. The Stomacke and the Guts, are kept within a fat and thin cawle, in all creatures but thoſe that lay egs. *The Cawle or Kell.*

Vnto this Cawle,is faſtened the Spleene on the left ſide of the belly juſt againſt the liuer. And otherwhiles theſe two ſhift their places, and one lies where the other ſhould; but that is euer held as a prodigious token. Some are of opinon,that thoſe creatures which lay egs haue a Splene,but it is very ſmal:as alſo the Serpents. And ſurely ſuch an one appeares plainely in the Tortoiſe,Crocodile,Lizards,and Frogs. Certaine it is,that the bird Ægocephalus hath none at all,no more than others that want bloud. This member hath a propertie by it ſelf ſomtimes, *The Splene.*
D To hinder a mans running: whereupon profeſſed runners in the race that be troubled with the ſplene,haue a deuiſe to burne and waſt it with an hot yron. And no maruell: for why? they ſay that the Splene may be taken out of the bodie by way of inciſion, and yet the creature liue neuertheleſſe:but if it be man or woman that,is thus cut for the Splene, hee or ſhee loſeth their laughing by the means. For ſure it is, that vntemperate laughers haue alwaies great Splenes. In Scepſis(a countrey of Aſia)the ſheep haue very ſmall Splenes,and from them were deuiſed the remedies to cure the diſeaſe thereof, and to waſt their exceſſiue greatneſſe.

But about Briletum and Tharne(the hils abouenamed)the Deer haue foure Kidnies apeece: whereas on the contrarie ſide, neither feathered fowle nor skalie fiſh, haue any. Moreouer, the Kidnies ſticke cloſe vnto the bones. The right Kidney in all creatures is the bigger, leſſe fat, *Kidnies.*
E dryer of the twaine:howbeit in both of them, there is a fat iſſueth out of the mids, ſaue only in Seales. All liuing creatures are fatteſt about the raines of the backe:and ſheepe may be ſo far ouergrowne with fat, that they will die thereof. Somtime there be little ſtones found within them. Al four-footed beaſts that bring forth their yong quick,haue kidnies. And of ſuch as lay egs,the Tortoiſe alone,which alſo hath all other entrails. The Kidnies of a man,be like to thoſe of Kine and Oxen, as if they were compoſed of many together.

Nature hath embarred the Breaſt-parr(wherin lie the vitall members) with ribs round about: but toward the belly(which needs muſt grow and ſtretch) ſhe hath not ſo done,but hath giuen it libertie:for no liuing creature hath bones to compaſſe the panch. Mans Breaſt only is broad and ſquare: in all others it is framed otherwiſe,like the keele of a ſhip:which is more euidently to be ſeene in birds and in water-fowles moſt of all others. As for Ribs,man only hath eight
F that be full and whole: Swine haue ten:horned beaſts thirtene:Serpents thirtie. *Breſt & ribs.*

Vnder the belly and paunch in the fore- part of the bodie, hangeth the bladder: which no creature laying egs hath,ſaue only the Tortoiſe. It is found in none but ſuch as haue a paire of lungs,and the ſame with bloud:neither in any creeping creature without feet. Betweene it and *The Bladder.*

the

the belly be certaine canals or arteries, reachiug to the groine, which by the Greeks are named *Ilia* [*i.* the Flanks.] In the bladder of a Wolfe, is found a little ſtone called Syrites. But in ſome mens bladders, ye ſhall ſee otherwhiles certaine groſſe haires to engender, like to briſtles; alſo grauell and ſtones, which put them to intollerable paine. This bladder conſiſteth of a certaine tunicle or skin, which if it be once wounded, cannot again be conſolidated; no more than thoſe fine pellicles or rinds that enwrap the braine and the heart. For you muſt thinke, that there be many ſorts of theſe membranes or filmes ſeruing to ſundrie vſes. G

The Matrix As for women, their inward parts are anſwerable to mens in all theſe reſpects abouesaid: and beſides, they haue by themſelues adjoyning cloſe vnto the bladder, another little bag or purſe; whereupon it is called in Latine *Vterus*: and it hath another name beſide, to wit, *Loci*; which we call the Matrice, the Mother, or the Wombe: and in other creatures it is tearmed *Vulua*. In Vipers, and ſuch as hatch their egs within them it is double. In thoſe that lay eggs, it lyeth faſt to the Midriffe. In women, it hath of either ſide two chombers or concauities. If at any time it chance to be peruerted and turned the wrong way, or take aire into it, it is deadly, and riſeth vp to ſtop the wind. If Kine be with Calfe, men ſay, they carrie not their yong but in the right cell or receptacle thereof, yea, although they goe with two Calues at once. Our fine-toothed gluttons do find a better taſt in a Sows wombe that ſlips and caſts her Pigs and it together, or is cut out of her belly, than if the dam bringeth forth her fruit at ful time. The one forſooth is called Ejecticia, the other, Porcaria. And the beſt is that of a yong Sow that neuer farrowed before: and contrariwiſe, of old Sows and ſuch as haue giuen ouer to farrow. After ſhe hath pigged, vnleſſe ſhe be killed the ſame day, the ſame hath a dead color, and is but leane. And yet that of a young Swine is not greatly commended, vnleſſe it be of her firſt Pigs. Howbeit, thoſe of old Sowes alſo be in requeſt, ſo they haue not giuen ouer breeding: and namely, if they be taken either within two daies before they ſhould pig, or within two daies after they haue pigged, or at leaſtwiſe, the very ſame day. The next to the caſt-wombe abouesaid, is that of a Sow killed a day after ſhe hath pigged. The paps and teats of ſuch a Sow, newly hauing farrowed, is counted excellent good meat, ſo that it be taken before euer the Pigs ſucked them drie: but thoſe of a Sow which hath caſt her pigs before time, is held for the worſt of all. In old time they called this morcell in Latine *Abdomen*, and before it was growne hard and brawnie, they neuer were wont willingly and wittingly to kil Sowes,* euen vpon the point of their farrowing, and being readie to Pig [as our monſtrous gluttons doe now adaies, becauſe they would haue the teats ſoft, tender, and full of milke.] H I K

* Incientes.

Tallow and greaſe. All horned beaſts hauing teeth growing but in one jaw, and paſterne bones about their feet, do beare tallow or ſewet, and feed fat. Thoſe that be clouen-footed, or otherwiſe haue feet deuided into many toes, and beare no horns; haue no tallow, but greaſe or fat. The tallow or ſewet growes to be hard, and when it is thoroughly cold, is brittle and apt to crumble and breake; and is euer found in the edge and extremities of the fleſh: contrariwiſe, the ſeam or greaſe is enterlarded betweene the fleſh and the skin; liquid it is, and eaſie to melt. Some creatures there bee that will neuer be fat, as the Hare and Partridge. Generally, whatſoeuer is barren, be it male or female, will ſoone feed fat. Sooner grow they to be old which are ouer-fat. No liuing creatures there are but haue a certain fat in their eies: & the tallow in any thing whatſoeuer, is ſenſleſſe: for neither hath it Arteries nor Veines. The fat alſo & greaſe in moſt of them, is without ſence. And hereupon it is, That ſome affirme, how Mice and Rats haue gnawne and eaten fat Hogs whiles they were aliue, and made them neſts in their backs: yea, and *Lucius Apronius* ſomtimes Conſull, had a ſonne ſo fat that he could not goe, ſo heauie was he loden with greaſe; inſomuch, as he was faine to take ſome of his greaſe forth of the bodie, and ſo diſcharge himſelſe and become lighter. L

Marrow. Marrow ſeemeth to be much of the ſame natnre: in youth it is red, and in age waxeth white. This is neuer found but in hollow bones: and yet not in the legs of Horſe, Aſſe, Mule, or Dog. And therefore if they chance to be broken, they will not ſowder and vnite againe, which happens when the Marrow runs out to the place of the fracture. In thoſe that carrie greaſe or ſewet, fattie it is and greaſie: but in horned beaſts it reſembles Tallow. Sinewie it is, and that onely in the ridge of the backe of as many as haue no bones, as namely, in all fiſhes. Beares haue none at al. A Lion likewiſe hath but very little, to wit, in ſome few bones of his thighes & buts behind, and alſo of his legs before vnder his ſhoulders. For his other bones are ſo hard, that they will M

ſtrike

20030
copy 1

A ſtrike fire, as it were an hard flint. The Marrow is hard in them that gather no greaſe, but rather tallow.

The bones of Aſſe legs are good to ſound ſhrill, and to make pipes of. Dolphins haue verie bones, and not prickie chines: for they bring forth their yong aliue. Serpents haue only prickie ridges. Fiſhes that be ſoft haue no bones: but their bodie is bound with certaine hoopes or circles of fleſh, as the Cuttill or Calamarie. Neither haue Inſects any bones at all. Thoſe fiſhes which be not ſoft, but griſtly, haue a kind of marrow in their ridge bone. Seales haue griſtle, and no bone. The eares and noſethrils of all creatures, if they beare vp but a little, haue a ſoft tender griſtle apt to bend and wind: ſuch is the goodneſſe of Nature, prouiding that they ſhould not breake. A griſtle if it be broken, will not cloſe together and be ſound. Neither will bones, if
B ought be cut from them, grow againe: vnleſſe it be in horſes and ſuch beaſts of carriage, and namely, betweene the houſe and the paſternes. *Bones and Griſtles.*

A man Groweth in height and length vntill hee be one and twentie yeares of age: then beginnes he to ſpread and burniſh in ſquareneſſe. As well men as women-kind, ſhute vp moſt and vndoe the knot that hindered their growth, when they are come to fourteene yeares of age, and be vndergrowne: and moſt is this ſeene, if ſome ſickneſſe happen about that time. *Growth.*

As for the Sinewes, Ligaments, and Cords, which take their beginning at the heart, be couered (as it were) with a certain white and glutinous ſubſtance; and the like cauſe and nature they haue. Theſe in all bodies, are tied to the ſlipperie bones: the knitting of the bones together, which be called joints, they faſten and bind together, ſome by comming betweene, others by claſping round about, & others again, by paſſing croſſe ouer: in one place they be twined round,
C in another broad, according as the figure of each part doth require. Be they cut a two, as they cannot knit againe, ſo they put a man to no paine: pricke or wound them, a wonder to ſee, what extremitie of paine will thereupon enſue. Some creatures be without nerues and ſinewes, as namely fiſhes, for they ſtand much vpon Arteries, and yet ye ſhall haue neither the one nor the other in ſoft fiſhes. Look where there be Sinews, Cords, and Ligaments, thoſe that lie more inward and vnderneath, ſtretch out the part and giue libertie: whreas the vppermoſt that lie ouer them, draw the ſame in as much. *Sinues, Cords & ligaments*

Among theſe are hidden the Arteries, that is to ſay, the paſſages of the ſpirit and life. And ouer them ride the Veines, euen the very conduits and channels that carie the bloud. The Pulſe
D or beating of Arteries, is moſt euident in the extremities or ends of any members; and for the moſt part bewraies hidden diſeaſes. *Herophilus* that renowmed Poet and interpreter of Phyſick, hath with maruellous skill reduced the order thereof into an art: he hath ſet downe moſt artificially, the certaine meaſures and times, the compaſſe, the metricall lawes thereof, according to euery age: when they ſtrike euen and ſteadie, when too faſt, when too ſlow. But the skill herof is little exerciſed, and his inuention in that behalfe neglected: becauſe it ſeemed ouerwittie, ſubtile, and curious. Howbeit, the obſeruation of the ſtrokes, either comming thick & faſt, or ſlow and ſoftly, giueth a great light to judge of the ſtrength of Nature, that gouerns our life. Arteries want ſence, and no maruell, for they be without bloud. Neither do they all containe within them vitall ſpirit. For there haue beene knowne ſome of them cut in twaine, and yet that part of
E the body only is mortified, which receiued the offence. Birds haue neither Veines nor Arteries. Likewiſe, Serpents, Tortoiſes & Lizards, haue but very little bloud. The Veines diſperſed at the laſt into moſt fine and ſmall threadie fibres vnder all the skin, grow at the length to bee ſo ſlender that the bloud cannot poſſibly paſſe thorough them, nor any thing elſe: ſaue a thin humor or moiſture, which thorough infinite ſmall pores of the skin doth breath forth, and ſtands there like a dew, and is called Sweat. The place where all the Veines doe meet in a round knot together, is the Nauell. *Veines and Arteries.*

Chap. XXXVIII.

F ¶ *Of Bloud, as well that which ſooneſt waxeth drie, as that which will not thicken at all. Alſo, which is the groſſeſt bloud, and heavieſt, which the lighteſt and thinneſt: and laſt of all, what creatures liuing haue no bloud at all.*

THoſe that haue much bloud, and the ſame fat and groſſe, are angrie and chollericke. The bloud of males is commonly blacker than that of females: yea, and more in youth than in old

old age: and the ſame in the bottome and lower part, ſetleth fatter and groſſer than aboue. In G
bloud conſiſts a great portion and treaſure of life. When it is let out, it caries with it much vi-
tall ſpirit: howbeit, ſenceleſſe it is, and hath no feeling. The ſtrongeſt creatures bee they which
haue the thickeſt bloud: but the wiſeſt, thoſe that haue thinneſt: the more fearefull, that haue
leaſt: but dull and blockiſh altogether which haue none at all. Buls bloud of all other ſooneſt
congealeth and waxeth hard, and therefore poiſon it is, to be drunke eſpecially. The bloud of
Bores, red and fallow Deere, Roe-buckes, and all Buffles, will not thicken. Aſſes bloud is moſt
fatty and groſſe: and contrarily, mans bloud is thinneſt & fineſt. Thoſe beaſts which haue more
than 4 feet, are bloudleſſe. Thoſe that be fat haue ſmall ſtore of bloud, becauſe it is ſpent in fat-
neſſe. Man only bleeds at the noſe: ſome at one noſthrill alone, others at both: and ſome againe
void bloud downward by the Hemorrhoids. Many there be that caſt vp bloud at certaine times, H
ordinarie, by the mouth: as not long ſince *Macrinus Viſcus*, late pretor of Rome: and vſually eue-
rie yeare *Voluſius Saturninus*, Prouoſt of the citie; who notwithſtanding liued vntill hee was a-
boue foureſcore and ten yeres old. Bloud is the only thing in the body that increaſes preſent-
ly. For ſo we ſee, that beaſts killed for ſacrifice wil bleed moſt freſhly & in greater abundance,
if they dranke a little before. Thoſe creatures that lie hidden in the earth at certaine times, (as
we haue ſaid before) haue no bloud in all that while; vnleſſe it be ſome few, and thoſe very ſmal
drops gathered about their hearts. A wonderfull worke of Nature, that it ſhould be ſo: as alſo
that in a man it ſhould alter and change euer and anon, ſo as it doth vpon euery ſmall occaſion:
and the force and ſtrength thereof varie, not only for defect and want of matter to diſperſe a-
broad, but alſo for euery little motion and paſſion of the minde, as ſhame, anger, and feare. For I
one while it ſheweth pale, another whiles red, more or leſſe, in much varietie of degrees. In caſe
of anger it wil ſhew one color: of ſhame and baſhfulneſſe appearing in another. In feare, doubt-
leſſe it retires and flies backe, in ſuch ſort, as a man knowes not what is become of it: ſo as many
in that fit haue ben ſtabbed and run thorough, and yet bleed not at all one drop: but this ſud-
daine change of colour happens to men only. For in other creatures, which (as we haue ſaid) do
alter their hue, it is an outward colour that they take from the reflection of certain places neer
vnto them, man alone hath this change from within himſelfe. To conclude, all maladies and
death eſpecially, conſume the bloud.

Chap. XXXIX. K

¶ *Whether in Bloud reſteth the ſouereignetie or no? Alſo of the nature of Skin of Haires, and the Paps.*

SOme meaſure not the fineneſſe of ſpirit and wit by the puritie of bloud: but ſuppoſe that creatures are brutiſh, more or leſſe, according as their Skin is, thicker or thinner: and as the other couertures of their bodie be either groſſe and hard, or thin and tender: as we ſee for example in Oiſters and Tortoiſes. They affirme moreouer, that the thick hide in Kine & Oxen, and the hard briſtles in Swine, impeach the entrance of ſubtile aire and fine ſpirit into their bo-dies: in ſuch wiſe, that nothing can pierce and paſſe through, which is pure and fine, as it ſhould be. And hereto they bring men alſo, as a proofe, who are thicke skinned, and more brawnie; for L
to be more groſſe of ſence and vnderſtanding: as who would ſay, that Crocodiles were not ve-
ry wittie and induſtrious, & yet their skin is hard enough. And as for the Riuer-horſe, his hide
is ſo thicke, that thereof jauelines and ſpeares are turned: and yet ſo induſtrious is that beaſt,
that in ſome caſe he is his owne Phyſician, and he hath taught vs to open a veine, and let bloud.
The Elephants skin is ſo tough and hard, that therof be made targuets and ſhields, of ſo good
proofe, that is is impoſſible to pierce them thorough, and yet they are thought to be of all four-
footed beaſts, moſt ingenious and wittie. Wherefore, conclude we may, that the skin it ſelfe is
ſenceleſſe, and hath no fellowſhip at all with the vnderſtanding: and eſpecially that of the head;
and wherſoeuer it is of it ſelfe naked and without fleſh, be ſure (if it be wounded) impoſſible it
is to conſolidate the wound, and namely, in the eie lids and bals of the cheekes. All creatures M
that bring forth their young quicke, are hairie: thoſe that lay egs, haue either feathers, as birds:
skales, as fiſhes: or elſe be couered with ſhels, as Tortoiſes: or laſt of all, haue a plaine skin and
no more, as Serpents. The quils of all feathers be hollow. Cut them, they will grow no more:
plucke them, they will come againe. Inſects flie with thin and brittle pellicles or membranes.

The

20030
copy 1

A The ſea Swallowes haue them euermore moiſt and drenched in the ſea. As for the Bat, he is afraid to wet them, and therfore flies about houſen, & his wings beſides are diuided into ioints. The haires that grow forth of a thick skin, are commonly hard & groſſe, but euermore thinner and finer in the females. In horſes and mares they grow at length vpon their mains. Lions alſo haue them long about their ſhoulders and foreparts. Connies haue long haires about their cheekes, yea, and within-forth: as alſo in the ſoles of their feet: and ſo hath the Hares, according to the opinion of *Trogus*: who thereby collecteth, that hairy men likewiſe are more letcherous than other. The hairieſt creature of all other is the Hare. In mankind only there grows haire about the priuy parts: and whoſoeuer wants it, man or woman, is holden for barren, & not
B apt for generation. Haires in men and women are not all of one ſort: for ſome they bring with them into the world, others come vp and grow afterwards. Thoſe they haue from their mothers womb do not lightly fall and ſhed, and leaſt of all in women. Yet ſhal ye haue ſome women to ſhed the haire of the head, by occaſion of ſicklineſſe: as alſo other women to haue a kinde of down vpon their face, namely when their monethly fleurs do ſtay vpon them. In ſome men the later kind of haires, to wit of the beard, &c. wil not come of their own accord without the help of Art. Four-footed beaſts ſhed their haire yerely, and haue it grow again. Mens haire of their heads groweth moſt: and next to it that of their beards: if the haire be cut it grows not again at the cut end, but ſprings from the root. It growes apace in ſome ſickneſſes, and moſt of all in the conſumption of the lungs, and in old age, yea, and vpon the bodies of the dead. In lecherous
C perſons, the haire of their head, browes, and eie-lids, with which they came into the world, doe fall more early than in others: but thoſe that ſpring afterward grow ſooner again if they be cut and ſhauen. The wooll and haire that foure footed beaſts do beare is more courſe and thick by age, but it comes not in ſuch plenty as before. And ſuch haue alwaies their backe well couered with haire and wooll, but their bellies bare. Of Kine and Ox hides ſodden there is made glew: but the Bulls hide hath no fellow for that purpoſe. Man only of all males hath euident paps in his breaſts: other creatures haue little nipples only in ſhew of teats. Neither hath all females teats in their breſts, but only ſuch as are able to ſuckle their yong: none that lay egs haue paps: nor any haue milk vnles they bring forth their yong liuing: and yet of all fowles I muſt except
D the Bat alone. As for the ilfauored Scritchowles called Stryges, I think they be but tales that go of them: namely, That they will giue milk out of their breſts to yong infants. True it is, all men agree in this, That the manner was in old time to vſe in curſing and execration, the terme of Strix; but what bird it ſhould be I ſuppoſe no man as yet knoweth.

Chap. XL.

¶ *Notable obſeruations in liuing Creatures as touching their paps.*

SHee Aſſes are much pained with the ache of their vdders, when they haue foled; and therefore after ſix moneths they will not giue them any more ſucke: whereas mares doe ſuckle
E their colts a whole yeare almoſt. Thoſe beaſts which be whole hoofed, and haue not aboue two yong at once, haue all of them two paps and no more, and thoſe in no other place elſe but between their hinder legs. Such as be clouen footed, and horned likewiſe, haue them in that place: but Kine haue foure teats; Ewes & Goats but two apiece. Such beaſts as be very fruitful and bring many yong, and likewiſe whoſe feet are parted into toes, theſe haue many nipples or teat heads all along their belly, diſpoſed and ſet in a double courſe, as namely Sowes: of which thoſe of the better ſort haue 12; the common ſort but tenne. Alſo Bitches after the ſame maner. Some beaſts haue 4 teats in the mids of their belly, as Panthers: ſome twain and no more, as the Lioneſſe. The Elephant alone hath twaine vnder his ſhoulders or legs before, and thoſe not euident in the breaſt part, but ſhort thereof, and lying hidden as it were within
F the arm-pits. And generally, none that haue their feet diuided into toes, haue vdders behinde vnder their hin legs. A Sow at euery farrow giues the formoſt nipples to thoſe pigs that come firſt, and ſo in order as they be farrowed: and thoſe teats be they that are next to her throat, and higheſt. Euery pig knowes the own pap, and will take it and no other when it comes firſt into the world; and thereof it is nouriſhed. If a pig be taken from the ſow, the milk of that pap wil dry vp preſently, or returne backe, and the pap it ſelfe fall flat to the belly. Alſo if it chance that but one ſucking pig be left, that pap alone wil do the part and let down milke, which Nature

ture firſt appointed for that one pig. She Beares haue foure paps apiece. Dolphins haue no more but two teats and nipples in the bottom of their belly, and thoſe not very apparant to the eye, nor ſtreit and direct, but lying ſomwhat aſide and byas: and no beaſt beſides giueth ſucke as it runneth but ſhe. To conclude, Whales, Wirlepooles, and Seales, nouriſh their yong with their vdder and teats. G

Chap. XLI.

¶ *Of Milke: and of what milke Cheeſe cannot be made.*

THe milk that comes from a woman before ſhe hath gon 7 months with child is not good: but from that time forward it is wholſome, becauſe the infant may liue and do well after that terme. H Many are ſo frim and free of milke, that all their breaſts are ſtrut and full thereof euen as far as to their arm-holes. Camels giue milke vntill they be great with yong again: and their milke is thought to be moſt ſweet and pleaſant in taſt, if to one meaſure thereof you put three of water. A Cow hath no milke ordinarily before ſhe hath calued. The firſt milke that ſhe giueth downe is called Beeſtins: which, vnleſſe it be delayed with ſome water, will ſoon turn to be as hard as a pumiſh ſtone. She Aſſes are not ſo ſoon with yong, but they haue milke in their vdders: but if they go in good and battle paſture, it is not good their yong foles ſhould ſuck their milke in two daies after; for the very taſt thereof is enough to kil them: and this diſeaſe that comes of Beeſtins is called Coloſtratio. The milk that thoſe giue which haue teeth in both chawes is not good to make cheeſe of, becauſe it will not cruddle. I Camels milke of all others is thinneſt, and Mares milke next to it. Aſſes milk is holden for to be thickeſt, and therefore they vſe it in ſtead of renning, to turn milke and gather curds thereof. It is thought alſo to be very good for to make womens skin faire and white. Certes the Empreſſe *Poppæa*, wife to *Domitius Nero*, had alwaies whereſoeuer ſhe went, 500 ſhe Aſſes milch, in her train: and in their milke ſhe bathed and waſhed her whole body, as in an ordinary bain, ſuppoſing that thereby her skin was not only whiter, but alſo more neat, ſmooth, and void of riuels. All ſorts of milke will thicken with fire, and turne into whey with cold. Cowes milke maketh more cheeſe than Goats milk, by twice as much almoſt, although you take no more of the one than the other. The milke of thoſe that haue aboue foure paps is naught for cheeſe: but theirs K is better that haue but twain. The rennet of an hind-calfe or Leveret, and a Kid, is much commended. But eſpecially of a Leveret or Rabbet, which alſo is medicinable for the flux of the belly: a thing to be obſerued in them alone, of all creatures that are toothed in both chawes. A wonder it is, that barbarous nations liuing of milke, haue for ſo many hundred yeares either not knowne, or elſe not regarded the benefit of cheeſe: and yet they vſed to thicken their milk into a kind of pleaſant ſoure curd in manner of a Sellibub; and to charn butter thereof, which is the skum and cream of milke, much thicker than that which is called whey. To conclude, I may not let paſſe, That Butter hath the vertue and properties of oile: inſomuch as forrein and barbarous nations do anoint their children therewith, as we alſo do ours.

Chap. XLII.

¶ *Cheeſes of ſundry ſorts.*

AT Rome (the only place that hath beſt meanes neere at hand, to judge of the fruits and commodities of all nations in the world) the cheeſes which come out of the prouinces of Nemauſium, and from the villages of Læſo and Baux, are highly praiſed for the beſt; but they laſt not long: their commendation is for the preſent ſeaſon while they be greene and new. There are brought good cheeſes from two coaſts of the Alps, which greatly praiſe the paſture thereabout. Alſo dainty cheeſes are made in Dalmatia, from whence we haue paſſing good; and namely from Drinaldi. Moreouer, the prouince of Ceutronia ſends vs excellent M cheeſe from Vatuſium. But the great ſtore and plenty of cheeſe commeth from the Apennine mountain: which yeeldeth vs the Cebane cheeſe out of Liguria, which is very fine meate, notwithſtanding it be made moſt of ewes milk. Alſo out of Vmbria we haue good cheeſe, from the dairies along the riuer Æſio. Howbeit in the confines between Tuſcane and Liguria, the monſtrous great cheeſes are made, and namely about Luca, for one of them weigheth a thouſand pounds.

20030
copy 1

A pounds. Next to theſe in goodneſſe be thoſe that are made neer the city of Rome about Veſtinum: but from out of the Sæditian territory and the plains thereabout, there come cheeſe that paſſe all the reſt. As for cheeſes made of goats milke, they are not to be defrauded of their due praiſe, eſpecially when they they are freſh and new made: and if beſides, they may haue a little drineſſe in ſmoke, which giueth both a good luſtre, and alſo a pretty taſt to them: for ſuch cheeſes be made within the very city of Rome, and go beyond all others. As for the cheeſes made in France, they taſte like a medicine, and haue an aromatical reliſh with them. For outlandiſh cheeſes beyond-ſea the Bithynian carry the beſt name. That there is a certain tarter or ſalter (if by nothing els) may wel be known by the taſt of the cheeſe made thereof: for there is none, but the older they are, the more ſaltiſh they be: yet ſuch are well known to recouer their
B freſh taſte again, if they be ſoked in Thyme vinegre. Some report, that *Zoroaſtres* liued in the deſart wilderneſſe 20 yeares with cheeſe: the which was ſo well tempered, that it ſeemed nothing old, for it neither moulded nor yet bred vermin.

Chap. XLIII.

¶ *The difference betweene the members of Man and other Creatures.*

OF liuing creatures vpon the land, Man alone is two footed. He only hath a cannell bone and ſhoulders, armes alſo to embrace: whereas others haue ſhoulders only & fore-legs to reſt vpon. In all creatures that haue hands, they be fleſhy within-forth only: for the back part conſiſts of skin and ſinewes. Some men there be with ſix fingers to one hand. Wee
C haue heard, that *M. Curiatius* a Nobleman of Rome had two daughters ſo handed: whereupon they were called *Sedigitæ*. Alſo there was a man named *Volcatius*, who was an excellent poet, and had ſix fingers to an hand, whereupon he was named *Sedigitus*. Euery finger of a mans hand hath three joints; the thumbe twaine, and it bendeth and boweth full oppoſite to all the reſt of the fingers: and yet by it ſelfe it ſtretcheth awry from the others, and is thicker than the reſt of the fingers. The little finger is equall in length to the thumbe: the fore-finger and the fifth (or ring finger) are iuſt of one ſize: betweene which the middle finger is the longeſt. Thoſe foure footed beaſts that liue of rauine and prey haue fiue toes to their fore-feet, whereas others haue but foure: Lions, Wolues, and Dogs, and ſome few others, haue likewiſe 5 toes or pawes in their hin-feet, and one like a ſpur, which beares forth behind, and hangs down from the pa-
D ſtern bone of the foot. All other ſmaller beaſts haue fiue to a foot. The armes of all men be not of a iuſt and euen meaſure: for it is well known, That there was a Thracian ſword-Fencer named *Studioſus*, belonging to the fence-ſchoole of *C. Caligula* the Emperour, whoſe right arme was longer than the left. Certaine beaſts without reaſon vſe the miniſtery of their fore-feet in ſtead of hands, and as they ſit on their rumpe reach meat therewith to their mouth, as ſquirils.

Chap. XLIV.

¶ *The reſemblance that Apes haue to men.*

E AS for all the race and kind of Apes, they reſemble the proportion of men perfectly in the face, noſe, eares, and eye-lids; which eye-lids theſe creatures alone (of all foure-footed) haue vnder their eyes as well as aboue: nay, they haue paps and nipples in their breſts, as women: armes alſo and legs bending contrarie waies, euen as ours doe. Nailes they haue alſo and fingers like to vs, with the middle finger longer than the reſt, as ours be. A little they differ from vs in the feet; for ſomewhat long they are, like as their hands be; and the ſole of their foot is anſwerable to the palm of their hand. Thumbs and great toes they haue moreouer, with joints directly like a man. And ſetting aſide the member of generation, and that only in the he Ape, all inward parts are the very ſame that ours, as if they were made iuſt by one patterne.

Chap. XLV.

F

¶ *Of Nailes.*

NAiles are taken and reputed for the extremities and vtmoſt ends of the ſinewes: and ye ſhall finde them in as many as haue fingers and toes. But in Apes they are channelled

halfe round like a gutter tile, whereas in man they be flat and broad. When one is dead they G
will grow. In rauenous creatures hooked they be and bowing inward: in dogs right and ſtrait, ſaue only that which in moſt of them crooks from behind their legs like a ſpur. All creatures that haue the faſhion of a foot, haue toes therto except an Elephant. And yet he ſeems to haue an appearance of fiue in number, but they are not diuided aſunder, or if they be, they are not diſtinct one from another but very ſleightly, and like rather to houfs than nails: the forefeet alſo are bigger than the hinder. In the hin-feet they haue ſhort ioints. The elephant bends his hams inward, as doth a man: whereas all other liuing creatures bow the ioints of their hinder legs, otherwiſe than of the former. For ſuch as ingender and breed yong aliue bend their knees before them: but the ioint of their hough behind clean backward. Mens knees and elbowes bow contrary one to the other: ſo do Beares and all the ſort of Apes, which is the cauſe they be not H
ſo ſwift of foot as others. Foure footed beaſts, as many as lay eggs (as the Crocodile and Lizards) haue their knees before, bending backward; but thoſe behind bowing forward: and yet their legs be crooked like a mans thumbe. In like ſort, they that haue many feet: vnleſſe it be the hin feet of all, in as many as do skip and hop; for they all be ſtraight. Birds, after the manner of foure footed beaſts, doe bow their wings forward, but the ioint of their legges backeward.

In the knees of men there is generally repoſed a certaine religious reuerence, obſerued euen in all nations of the world: for humble ſuppliants creep and crouch to the knees of their ſuperiors: their knees they touch, to their knees they reach forth their hands: their knees (I ſay) they worſhip and adore as religiouſly as the very altars of the gods: and for good reaſon haply I
they do ſo, becauſe it is commonly receiued, That in them there lies much vital ſtrength. For in the very ioint and knitting of both knees, on either ſide thereof before there are two emptie bladders as it were, like a paire of cheeks; which hollowneſſe and concauitie if it be wounded and pierced through, cauſeth as preſent death as if the throat were cut. In other parts likewiſe of the body we vſe a certain religious ceremonie: for as our maner is to offer the backe part of the right hand to be kiſſed, ſo we put it forth and giue it as well in teſtimonie of faith and fidelitie. It was an antient faſhion in Greece, when they would make court and with great reſpect tender a ſupplication to ſome great perſonage, to touch the chin. In the tender lappet of the eare is ſuppoſed to reſt the ſeat of remembrance, which we vſe to touch when we mean to take one to beare witneſſe of an arreſt or other thing done, and to depoſe the ſame in the face of the K
court. Moreouer, behind the right eare likewiſe is the proper place of *Nemeſis* (which goddeſſe could neuer yet find a Latine name, ſo much as in the very Capitol) and that place are we wont to touch with the fourth finger (which is next the leaſt) in token of repentance, when we haue let fal ſome word raſhly, and would craue pardon of the gods therefore. The crooked and ſwelling veins in the legs man alone hath, and women very ſeldome. *Oppius* writes, that *C. Marius* (who had bin Conſul of Rome 7 times) endured, without ſitting down for the matter, to haue thoſe veins taken forth of his legs, a thing that neuer any was known to abide before him. All foure-footed beaſts begin to go ordinarily on the right hand, and vſe to ly downe on the right ſide: others go as they liſt. Lions and Camels only haue this propertie by themſelues, to keep pace in their march, foot by foot, that is to ſay, they neuer ſet their left foot before their right, L
nor ouer-reach with it, but let it gently come ſhort of it and follow after. Men & women haue the greateſt feet in proportion of all creatures: but females vſually in euery kind haue leſſe & ſlenderer feet than males. Men and women only haue calues in their legs, and their legs full of fleſh. Howbeit we reade in ſome writers, That there was one man in Ægypt had no calfe at all to his legs, but was legged like a crane. Man alone hath palmes of his hands, & broad flat ſoles to his feet; and yet ſome there be who that way are deformed and disfigured. And thereupon it came that diuers came to be ſirnamed *Planci* [*i.* flat footed:] *Plauti* [*i.* ſplay footed:] *Scauri*, [*i.* with their ancles ſtanding ouermuch out:] *Pauſi*, [*i.* broad footed.] Like as of their miſſhapen legs ſome haue bin named *Vari* [*i.* wry legged:] others, *Vatiæ*, and *Vatinij*, [*i.* bow-legged:] which imperfections beaſts alſo are ſubiect vnto. Whole hoofed are all they that beare M
not horns: in regard wherof they be armed with houfe in ſtead of that offenſiue weapon: and ſuch as they be haue no ancle bones: but all clouen footed haue thoſe bones. Howbeit all that haue toes want ancles: and in a word, there is not one hath them in the fore-feet. Camels haue ancles like to Kine and Oxen, but ſomewhat leſſe: for indeed they be clouen footed, although

the

20030
copy 1

A the partition be very little, and hardy diſcerned vnder the foot, but ſeemeth fleſh all ouer the ſole, as Beares alſo, which is the cauſe that if they trauaile farre vnſhod, their feet are ſurbated, and the beaſts will tire.

Chap. XLVI.

¶ *A diſcourſe of beaſts houſes.*

THe Houſes of Horſes, Mules, Aſſes, and ſuch like beaſts of carriage onely, if they be pared and cut, will grow againe. In ſome parts of Sclauonia, the Swine are not clouen-footed, but whole hoofed. All horned beaſts in manner be clouen-footed: but no beaſt beares
B two hornes, and hath withall the houſe of one entire peece. The Indian Aſſe hath onely one horne. The wild Goat alſo called Oryx, is clouen houſed, and yet hath but one horne. The Indian Aſſe moreouer, of all the whole houſed beaſts alone, hath the paſterne or ankle-bones. As for Swine, a mungrell kind they are thought to be of both, in regard of thoſe bones; and thereupon are reputed filthy and acurſed. They that haue thought that a man had ſuch, are ſoon conuinced. As for the Once, he indeed alone of all thoſe whoſe feet are diuided into toes, hath that which ſomewhat reſembles a paſterne bone. So hath a Lion alſo, but that it is more crooked and winding. As for the ſtreight paſterne bone indeed, it beareth out with a bellie in the joynt of the foot; and in that hollow concauitie wherein the ſaid bone turnes, it is tied by ligaments.

C

Chap. XLVII.

¶ *Of Birds feet, and their Clawes or Tallons.*

OF Fowles, ſome haue their feet diuided into clees and toes; others be broad and flat footed: and ſome are betweene both; which haue indeed their toes parted and diſtinct, and yet their feet be broad between. But of all them that haue foure toes to a foot: to wit, 3 in the forepart, and one behind at the heele in manner of a ſpurre: howbeit this one is wanting in ſome; that are long legged. The Wrinecke or Hickway, with ſome few others, haue two before and other two behind. The ſame bird putteth out a tongue of great length, like to ſerpents. It turneth the necke about and looketh backward: great clawes it hath like thoſe of Choughes.
D Some bigger birds haue in their legs one other ſhanke-bone more than ordinarie. None that haue crooked tallons, be long legged. All that ſtaulke with long ſhankes, as they fly ſtretch out their legges in length to their tailes: but ſuch as be ſhort legged, draw them vp to the midſt of their belly. They that ſay, No bird is without feet: affirme alſo, That * Martinets haue feet: like as alſo the ſwift Swallow called Oce, and the ſea Swallow Drepanis. And yet ſuch birds come ſo little abroad, that they be ſeldome ſeen. To conclude, there haue been now of late, Serpents knowne flat-footed like Geeſe. * *Apodes.*

Chap. XLVIII.

¶ *Of the feet of Inſects.*

E

ALl Inſects hauing hard eies, haue their fore-legges longer than the reſt, to the end that otherwhiles they might with them, ſcoure their eies, as we ſee ſome flies doe: but thoſe whoſe hinder-legs are longeſt, vſe to skip and hop, as Locuſts. Howbeit, all of them haue ſix legs apeece. Some Spiders there be, that haue two ouer and aboue the ordinarie, and thoſe be very long: and euery leg hath three joynts. As for ſome ſea-fiſhes, we haue ſaid before that they haue eight legs: namely, Manyfeet, Pourcuttles, Cuttles, Calamaries, and Crabfiſhes: and thoſe moue their fore-clees like armes a contrary way, but their feet either they turne round or elſe fetch them crooked atone ſide: and a man ſhall not ſee any liuing creature againe, al round, but they. As for others, they haue two feet to guide them and lead the way; but Crabs onely
F haue foure. There be Inſects beſides vpon the land, that exceed this number of feet; and then, they haue no fewer than twelue: as the moſt ſort of wormes: yea and ſome of them reach to an hundred. No creature whatſoeuer hath an odde foot. As touching the legs of thoſe which bee whole houſed, they be all full as long when they firſt come into the world, as euer they will be: well may they ſhoot out bigger and burniſh afterward, but (to ſpeake truly and properly) they

grow no more in length. And therefore when they be yong ſucking foles, a man ſhall ſee them G
ſcratch the haire with the hinder feet: which, as they wax elder and bigger, they are not able to do, becauſe their legges thriue only in outward compaſſe, and not in length. Which alſo is the cauſe, that when they be new foled, they cannot feed themſelues but kneeling, vntill ſuch time as their neckes be come to their full growth and juſt proportion.

Chap. XLIX.

¶ *Of Dwarfes: and genitall parts.*

There are no liuing creatures in the world (euen the very fowles of the aire not excepted) but in each kind there be dwarfs to be found. As for thoſe males which haue their inſtru- H
ments of generation behind, we haue ſufficiently ſpoken. In Wolues, Foxes, Weeſils, and Ferrits, thoſe genitall members be of a bonie ſubſtance; and of them there be ſoueraigne medicines made, for to cure the ſtone and grauell in mans bodie engendred. The Beares piſle alſo, becommeth as hard as an horn (men ſay) ſo ſoone as his breath is out of his bodie. As for Camels piſles, they vſe in the Eaſt countries to make their beſt bow ſtrings therof, which they account to be the ſureſt of all others. Moreouer and beſides, the genitall parts put a difference between nation and nation; alſo between one religion and another: for the prieſts of *Cybele* (the great mother of the gods) vſe to cut off their owne members and to gueld themſelues, without danger of death. On the contrarie ſide, ſome few women there be, monſtrous that way, and in that part reſemble men: like as we ſee there are Hermaphrodites, furniſhed with the members I
of both ſexe. In the daies of *Nero* the Emperor, the like accident was ſeen (and neuer before) in ſome foure-footed beaſts. For he, in very truth, exhibited a ſhew of certaine mares that were of the nature of thoſe Hermaphrodites, found in the territorie of Treuiers in France: and they drew together in his owne coach. And verily a ſtrange and wondrous ſight this was, To ſee the great monarch of the world, ſit in a charriot drawne by ſuch monſtrous beaſts. As touching the ſtones of Rams Buckes, and greater beaſts, they hang dangling downe between their legs: but in Bores, they be thruſt together, & knit vp ſhort cloſe to the bellie. Dolphines haue theſe parts very long, and the ſame lying hidden within the bottom of their bellies. In Elephants likewiſe they be cloſe and hidden. In as many creatures as doe lay egges, the ſtones ſticke hard to their K
loines within the bodie: and ſuch be euer moſt quicke of diſpatch in the act of generation, and ſoone haue done the feat. Fiſhes and Serpents haue none at all; but in ſtead therof there be two
* *Triorchis.* ſtrings or veines reach from their kidnies to their genitall member. The * Buzzard (a kind or Hawke) is prouided of three ſtones. A man hath his cods ſometime bruiſed and broken, either by ſome extraordinarie accident, or naturally: and ſuch as be thus burſt, are counted but halfe men, and of a middle nature betweene Hermaphrodites and guelded perſons. To conclude, in all liuing creatures whatſoeuer, the males be ſtronger than the females, ſetting aſide the race of Panthers and Beares.

Chap. L. L

¶ *Of Tailes.*

There is not a liuing creature, excepting men and Apes (take as well thoſe that bring forth their yong aliue, as others that lay egges only) but is furniſhed with a taile, for the neceſſarie vſe of their bodies. Such as be otherwiſe rough-haired and briſtly, yet haue naked tailes, as Swine: thoſe that be long ſhagged and rugged, haue very little and ſhort skuts, as Beares: but as many as haue long ſide haires, be likewiſe long tailed, as Horſes. If Lizards or Serpents haue their tailes cut off from their bodies, they will grow againe. In fiſhes they ſerue in good ſtead, as rudders and helmes to direct them in their ſwimming: yea they fit their turnes as well as oares, to ſet them forward as they ſtirre them, to this or that hand. There be Lizards M
found with double tailes. Kine and Oxen haue the longeſt rumpe for their tailes of any other beaſts; yea and the ſame at the end, hath the greateſt tuft and buſh of haire. Aſſes haue the ſaid docke or rumpe longer than horſes: and yet all ſuch beaſts either for ſaddle or packe, haue it ſet forth with long haires. Lions tailes are faſhioned in the very tip thereof, like vnto Kine or Oxen, and Rats: but Panthers are not after the ſame manner tailed. Foxes and Wolues

haue

20030
copy 1

A haue ſhag tailes like ſheep, but that they be longer. Swine carie their tailes turned and twined round. And Dogs, that be of curres kind and good for nothing, carrie their tailes cloſe vnderneath their bellies.

Chap. LI.

¶ *Of Voices.*

Ariſtotle is of opinion, That no liuing creature hath any voice, but ſuch only as are furniſhed with lungs and wind-pipes: that is to ſay, which breath and draw their wind: and therefore he holdeth, that the noiſe which we heare come from Inſects, is no voice at all, but a very
B ſound, occaſioned by the aire that gets within them, and ſo being encloſed, yeelds a certaine noiſe, and reſoundeth againe. And thus it is (quoth he) that ſome keep a humming or buzzing, as Bees: others make a cricking with a certain long traine, as the Graſhoppers; for euident it is, and wel known, that the aire entring into thoſe pipes (if I may ſo term them) vnder their breaſt, and meeting with a certaine pellicle or thin skin, beates vpon it within, and ſo ſets it a ſtirring, by which attrition, that ſhril ſound commeth. Again, it is as apparent, that in others, and namely, Flies and Bees, the buzzing which we heare, begins and ends euer with their flying. For (no doubt) that ſound commeth not of any wind that theſe little creatures either draw or deliuer, but of the aire which they hold incloſed within, and the beating of their wings together. As for
C Locuſts, it is generally beleeued & receiued, that they make that ſound with clapping of their feathers and wings and thighs together. In like manner, among fiſhes in the waters, the great Scallops make a certaine noiſe as they ſhoot out of the water. But ſoft fiſhes and ſuch as lie couered with a cruſt or ſhell, neither vtter voice, nor yet yeeld ſound. As for other fiſhes, although they be without lungs and pipes, yet are they not quite mute, but deliuer a certaine ſound. Howbeit, they that would maintaine, that fiſhes are dumbe indeed, doe cauill and ſay, that ſuch a noiſe commeth of craſhing and grinding their teeth together. But what will they ſay then to the water-Goat, & the riuer Bore, which in the riuer Achelous do euidently grunt: as alſo others, wherof we haue ſpoken? Againe, ſuch as lay egs do hiſſe: and Serpents draw their
D hiſſing out in length. The Tortoiſe hiſſes likewiſe, but after a broken manner, with ſtaies and reſts between. Frogs keep a croaking after their kind, as hath been ſaid before: and yet a man may ſeem well to doubt therof, how it ſhould be? conſidering, that the noiſe which they make comes but from their teeth and mouth outward, and is not framed in their breaſt or ſtomacke. Howbeit, in them there is great difference, by occaſion of the nature of diuers countries. For in Macedonie (by report) they are mute: and there alſo the Swine be dumbe. As for birds, the leaſt euermore be moſt full of chirping, chaunting, and ſinging; and moſt of all, about the treading time. Some of them keepe a ſinging when they fight, as Quailes: others, when they goe to fight, as Partridges: and ſome again after victorie, as cocks. And they haue a crowing by themſelues differing from the cackling of hens: whereas in other birds you canot diſcerne the male
E from the female by the ſinging, as we ſee in Nightingales. Some ſing all the yeare long, others at certaine times, as we haue more at large declared, in the particular treatiſe of each bird. The Elephant he ſends out at his very mouth (ſomwhat ſhort of his muffle) a certaine ſound like to ſneeſing: but thorough that muffle or trunke of his, he ſounds (as it were) out of a trumpet. Kine only of females, haue a bigger voice than Buls: for in euery kind elſe the female hath a ſmaller voice than the males: like as we ſee in mankind, the gelded Eunuchs. As an infant is comming into the world, it is not heard to crie all the while that it is in the birth, before it be fully born. When it is a yeare old, it begins to prattle and talke, but not before. King *Cræſus* had a ſonne, who lying ſwoddled in his cradle, ſpake by that time he was 6 months old: but this was a prodigious ſigne, and preſaged the finall ruine of that kingdome. Thoſe children that begin with
F their tongue betime, are later ere they find their feet. The voice in man or woman beginneth to change and waxe greater at 14 yeares old. The ſame in old age growes again to be ſmaller: and in no other creature doth it more often alter. Moreouer, as touching the Voice, there be ſtrange and wonderfull matters reported, and thoſe worth the rehearſal in this place. For firſt and foremoſt, we do ſee, That vpon the ſkaffold or ſtage in publick Theatres, if the floore be ſtrowed ouer well and thicke with ſaw-duſt or ſand, the voice of the actors will be drowned and loſt, yea, and remain ſtil aboue the ſkaffold, as if it were there buried: alſowhere there be hollow and vn-

euen wals round about or emptie drie-fats and tuns ſet, the voice will be taken vp in them, and G
paſſe no farther. But the ſame voice, betweene two wals directly ſet one by another, runs apace:
yea, and through a vault it may be heard from the one end to the other, be the ſound neuer ſo
low; prouided, that all be ſmooth and euen between, and nothing to hinder the paſſage thereof.
To ſpeake yet ſomwhat more of the Voice: In it doth reſt a great part of the countenance
and viſage of man, wherby he is diſcerned and knowne. For we know a man by hearing his voice
before we ſee him, euen as well as if our eies were fixed vpon him. And ſee how many men and
women there are in the world, ſo many ſundrie voices there bee, for each one hath a ſeuerall
voice, as well as a face, by himſelf. And hereof ariſes that varietie of nations, that diuerſitie of
languages all the world through. From hence come ſo many tunes in ſong, ſo many notes in
Muſick, as there bee. But aboue all, the greateſt thing to be noted in Voice, is this, That wheras H
the vtterance of our mind, therby doth diſtinguiſh vs from brute and wild beaſts: the ſame euen
among men maketh as great a difference betweene one and another, as the other is betweene
man and beaſt.

Chap. LII.

¶ *Of the excreſcence and ſuperfluitie of ſome members. Alſo the diſcourſe and ſayings of Ariſtotle as touching mans life*

LOoke what part is more than ordinarie by nature, in any liuing creature, the ſame ſerues to
no vſe. As for example, the ſixt finger in a mans hand is euermore ſuperfluous, and there- I
fore fit for nothing. It was thought good in Ægypt once to nouriſh and keep a monſtrous
man who had foure eies, wherof two ſtood in the backe part of his head behind: but ſurely he
ſaw neuer a whit with them. I wonder verily, that *Ariſtotle* not only beleeued, but alſo ſticked
not to ſet downe in writing, that there were certaine ſignes in mans bodie, whereby we might
foreknow whether he were long liued or no. Which, albeit I take to be but vanities, & not raſh-
ly to bee vttered without good aduiſement (becauſe I would not haue men amuſed, and buſi-
ly occupied in ſearching Prognoſtications in themſelues, as touching their owne life) yet will
I touch the ſame, and deliuer them in ſome ſort, ſince ſo great a clerk as *Ariſtotle* was, held them
for Reſolutions, and thought them worth the penning. He putteth downe therefore, as ſignes of
ſhort life, thin teeth, long fingers, a leaden hew, many lines in the palme of the hand, with croſſe K
bars or ſhort cuts. Contrariwiſe, he ſaith, That thoſe who are Lute backed, thicke ſhouldered,
and bending forward, who alſo in one hand haue two long life lines, and aboue 32 teeth in their
head, and beſides are wel hanged, and haue large eares, bee long liued. And as far as I can gueſſe,
he requires not, that all theſe ſignes ſhould concurre and meet together, for to ſignifie as is be-
foreſaid: but, as I ſuppoſe, his meaning is that euery one of them by it ſelfe is ſignificatiue and
ſufficient. Surely, theſe Phyſiognomers & Chiromantines or Palmeſtrie, as friuolous and foo-
liſh as they be, yet now adaies are in credite, and euery man is full of them. *Trogus*, a moſt graue
and renowmed Author among vs, is of opinion moreouer, That there is judgment to be giuen,
not only of mens complexions, but alſo of their conditions, by their very ſight & countenance:
and ſurely, I think it not amiſſe to ſet downe his very words. A large and broad forehead (ſaith L
he) is a token of a dull conceit and heauie vnderſtanding: and contrariwiſe, they that haue a lit-
tle forehead, are by nature, fickle and inconſtant: and finally, a round forehead, and bearing out
argues anger and choller, as if this outward tumor thereof bewraied the ſwelling and boiling,
of that humor. In whomſoeuer the eie-browes are ſtreight and lie euen, they betoken ſoft and
effeminat perſons: but if they bend and bow toward the noſe, they ſhew auſteritie. Say their tur-
ning and bending be toward the temples of the head, they are ſignes of a mocker and ſcorner:
finally where they lie very low, ſuch perſons (be ye ſure) are malicious, ſpightfull, and enuious.
Long eies, in whomſoeuer they bee, do teſtifie hurtfull and dangerous perſons. They that haue
the corners full of fleſh, are of a malicious nature: where the white of the eie is ſpread large and
broad, it is a token of impudencie. And ſuch as euery whiles be winking and cloſing of their
eie-lids, (truſt me truly) they be giddie-headed, and vnſtaied. Thoſe that haue great eares, and M
eſpecially the laps therof, make account they be blabs of their tongue, and fooles withal. Thus
much of Phyſiognomie, according to *Trogus*.

CHAP.

20030
copy 1

CHAP. LIII.

¶ Of the Spirit and breath of liuing creatures: alſo what things be venomous in taſte, and do kill. Of mens food. And laſt of all, what hindereth digeſtion and concoction of meat.

THe breath of Lions hath a very ſtrong deane and ſtinking ſmell with it: but that of a beare is peſtilentiall and deadly: inſomuch, as no beaſt will touch where a beare hath breathed and blown vpon: for ſurely ſuch will ſooner corrupt & putrifie than others, as if they were blaſted. As for the breath of a man, Nature hath ſuffered it to be infected many waies, namely, by the viands and meat that he eateth; by faulty and rotten teeth; and moſt of all by old age. And yet our breath, without which there is no ſence, feeleth no pain it ſelf, as being void of feeling and altogether ſenceleſſe. The ſame goeth and commeth continually without reſt and intermiſſion: the ſame is alwaies new and freſh: and as it ſhal depart out of the body laſt, ſo it ſhal remaine alone, when all is gon beſides it. Finally, returne it ſhall into the aire and the heauen, from whence it firſt came. Now, albeit this breath that we draw, be the very means whereby we liue, and without which we cannot maintain our life, yet otherwhiles troubleſome it is vnto vs, and plagueth vs as a very puniſhment ordained for vs. The Parthians of all others be moſt ſubject to this inconuenience, euen from their very youth, by reaſon of the groſſe feeding of all meats indifferently, without choiſe and diſcretion: and ſpecially of their drunkenneſſe. For exceſſiue drinking of wine cauſeth ſtinking breat. But the Nobles and great States of that countrey haue a remedy therfore, and make their breath ſweet, by taking with their meats the kernels of Pome-citrons, which yeeld a moſt pleaſant ſauor. The very breath of Elephants cauſeth Serpents to come out of their holes: but Stags and ſuch other Deere, therewith do blaſt & burn them. As touching certain kinds of men, who by ſucking only could draw & fetch out the poyſon out of bodies wounded by venomous Serpents, we haue already ſpoken. As for hogs, they will feed of Serpents, and do well enough, wheras to other creatures they be no better than poiſon. All thoſe little creatures, which we named Inſects, wil die if they be but ſprinckled or wet with oile. The Vultures or Geires which flie from ſweet ointments, are deſirous yet of other odors and perfumes: like as Beetles like well the ſmell of Roſes. Some Serpents there be that the Scorpion kils. The Scythians poiſon their arrow heads with the venomous filthy bloud of vipers and mans together. A preſent poiſon this is, and remedileſſe; and it no ſooner toucheth but it taketh, and killeth forthwith. As touching thoſe creatures that feed of poiſon, wee haue ſpoken heretofore. Moreouer, ſome creatures there be, which otherwiſe being harmleſſe, if they be fed with venomous beaſts or plants, become alſo themſelues noiſom & dangerous. The wild bores in Pamphylia, and vpon mountains of Cilicia, that haue eaten Salamanders, become venomous: and whoſoeuer chance to eat of their veniſon, are ſure to die vpon it. And yet cannot a man know any ſuch venome therein, either by ſent at noſe, or taſt of tongue. Moreouer, the very water or wine wherein a Salamander hath bin ſtifled and ſuffocated, or whereof it hath but drunk, wil kil a man that ſhall but ſip thereof neuer ſo little. The like is to be ſaid of that Frog which we cal *Rubeta* [*i.* the toad that liues in buſhes.] See how many ambuſhes our life is ſubject vnto! Waſpes feed greedily vpon Serpents, and vpon that food their ſtings be deadly. And therefore you ſee it skilleth much what meats we eat, and the maner of our food is very material. As we may learn farther in that treatiſe which *Theophraſtus* wrote of the Ichthyophagi that liue of fiſh: where he hath ſet downe, That Kine and Oxen doth eat fiſh, but they muſt in any caſe be aliue.

To come now vnto mens diet: their beſt and moſt wholſome feeding is vpon one diſh and no more, and the ſame plaine and ſimple: for ſurely this hudling of many meats one vpon another of diuers taſtes is peſtiferous: but ſundrie ſauces are more dangerous than that. As touching our concoction: all tart and ſharp meats are of hard digeſtion: alſo fulneſſe and ſurfeting: haſty and greedie feeding likewiſe be enemies to digeſtion, and hurtful to the ſtomack. In ſum, we digeſt our meat more hardly in Summer than in Winter, and in age worſe than in youth. Now to helpe and remedie all this exceſſe and enormitie, vomite hath beene deuiſed: but vſe it whoſoeuer will, he ſhall find the naturall heat of his bodie thereby to decay: he ſhal ſenſibly perceiue that it hurteth the teeth, and eies eſpecially. To goe to bed vpon a full ſtomacke, and

to

to digeſt in ſleepe, is better to make a man fat and corpulent, than ſtrong and luſty. And therefore wreſtlers and champions who are acquainted with ful & liberall diet, vſe rather to walk after meat for to digeſt. And in one word, much watching maketh beſt digeſtion. G

CHAP. LIIII.

¶ *Of making bodies fat or leane. Alſo, what things being taſted, do allay hunger, and quench thirſt.*

BOdies grow to be burly and groſſe, with ſweet meats, fat feeding, & much drinke: contrariwiſe, drie diet, actually cold, and thirſt withal, make a body lean. There be beaſts in Africk, and eſpecially the leſſer ſort, which drink not aboue once in foure daies. A man may well liue 7 daies without any food whatſoeuer: & wel is it knowne, that many haue continued more than 11 daies without meat or drink. There haue bin ſome known ſo hungry euermore that nothing would ſatisfie them, and ſuch haue died for very famine, although they did nothing elſe but eat: a diſeaſe incident to no creature but a man. Some again can aſſwage and appeaſe their hunger, yea, and ſlack and extinguiſh their thirſt with a very little, and yet preſerue & maintain the naturall ſtrength of their body: namely, with taſting butter, cheeſe made of Mares or Aſſes milk, and Licorice. But to conclude aud knit vp this diſcourſe: the worſt and moſt dangerous thing euery way that can be in all the courſe of our life, is Exceſſe and Superfluity; but to the health of our bodies moſt of all: and therefore the beſt courſe is, to cut off by all meanes that which is offenſiue and heauy to the body. Thus much ſhall ſuffice as touching liuing and ſenſible creatures. Let vs therefore now proceed to the reſt of Natures workes. H I

THE TVVELFTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

K

The Proeme.

L

THus you ſee by that which hath bin written before, what are the natures as well in generall, as particularly in parts, of all liuing and ſenſitiue creatures within the compaſſe of our knowledge. It remaineth now to diſcourſe of thoſe which the earth yeeldeth: and euen they likewiſe are not without a ſoule in their kind (for nothing liues which wanteth it:) that from thence we may paſſe to thoſe things that lie hidden within the earth, and are to be digged out of it: to the end, that no worke and benefit of Nature might ouerpaſſe our hands, and be omitted. And in truth, theſe treaſures of hers lay long couered vnder the ground, inſomuch as men were perſuaded, that Woods & Trees were the laſt & only goods left vnto vs and beſtowed vpon vs by Nature. For of the fruit of trees had wee our firſt food: their leaues and branches ſerued to make vs ſoft pallats and couches within the caues: and with their rinds and bark we clad and couered our nakedneſſe. And euen at this day, ſome Nations there be that liue ſtill in that ſort, and no otherwiſe. A wonderfull thing therefore it is, that from ſo ſmall ond baſe beginnings wee ſhould grow to that paſſe in pride, that wee muſt needs cut through great mountaines for to meet with marble: ſend out as far as to the Seres for ſilk ſtuffe to apparell vs: diue downe into the bottome of the red ſea for pearls: and laſt of all ſinke deepe pits euen to the bottom of the earth, for the precious Hemerauld. For this pride and M

vanitie

20030
copy 1

A *vanitie of ours, we haue deuiſed means to pierce and wound our eares: becauſe, forſooth it would not ſerue our turns to weare coſtly pearles and rich ſtones in carkanets about our necke, borders vpon the haire of our head, bracelets about our arms, and rings on our fingers; vnleſſe they were ingrauen alſo, and cut into the very fleſh of our bodies. Well then, to follow the courſe of Nature, and the order of our life (as meet it is we ſhould) wee will treat in the firſt place of Trees, and lay before mens faces the life of the old world, and what was their behauior and demeanure at the firſt, in their maner of liuing.*

CHAP. I.

¶ *The honour done in old time to Trees. When the Plane-trees were firſt knowne in Italy, and of their nature.*

B IN old time, Trees were the very temples of the gods: and according to that antient manner, the plaine and ſimple peaſants of the country, ſauoring ſtill of antiquity, do at this day conſecrate to one god or other, the goodlieſt and faireſt Trees that they can meet withal. And verily we our ſelues adore not with more reuerence & deuotion the ſtately Images of the gods within our temples (made though they be of glittering gold, and beautifull yuorie) than the very groues and tufts of trees, wherein we worſhip the ſame gods in all religious ſilence. Firſt and formoſt, the antient ceremonie of dedicating this and that kind of Tree to ſeuerall gods, as proper and peculiar vnto them, was alwaies obſerued, and continueth yet to this day. For the mighty great C Oke named Æſculus, is conſecrated to *Iupiter*; the Laurell to *Apollo*; the Oliue tree to *Minerua*; the Myrtle to *Venus*; and the Poplar to *Hercules*. Moreouer, it is receiued and beleeued generally, That the Syluanes and Faunes, yea, and certaine goddeſſes, are appropriate and aſſigned to woods and forreſts; yea, there is attributed vnto thoſe places a certain diuine power and godhead, there to inhabit: as well as vnto heauen the proper ſeate for other gods and goddeſſes. Afterwards, in proceſſe of time men began to taſte alſo the fruit of Trees, and found therein a juice (without all compariſon) more lenitiue and pleaſant to the contentment of their nature than that which came of corn and grain: for thereof made they Oile, a ſingular liquor to refreſh and comfort the outward members and parts of the body: out of it they preſſed wine, the one- D ly drinke that giueth ſtrength within, and fortifieth the vitall powers. From thence gather wee ſo many fruits, yerely growing and comming of themſelues without the labour and induſtry of man. And albeit, to ſerue our belly & pleaſe our tooth, we ſtick not to maintain fight and deale in combat with wild beaſts in the forreſts; although we hazard our ſelues in the ſea, to meet with monſtrous fiſhes which are fed with the dead bodies of men caſt away by ſhipwracke; and all to furniſh and ſet out the table; yet is not the cheare thought good enough, vnleſſe fruits alſo be ſent vp at the later end, that they may haue the honor in al feaſts of the ſecond ſeruice, and the banket. Beſides all this, Trees ſerue our turns for a thouſand neceſſary vſes, without which our life could not be well maintained. With Trees we ſaile ouer ſeas into ſtrange lands, and by tranſporting commodities and merchandiſe too & fro, we make lands meet together: of Trees we build our houſes, wherein we dwell. Trees were the matter in times paſt, whereof were made E the images of the gods. For as yet no man thought of the coſtly Anatomy of the elephant, neither was their tooth in any account: wheras now adaies we make the treſſels, frames, and feet of our tables, euen of the ſame yuory that we ſee the faces of gods are portraied of, as if we had our warrant from them to begin & maintain our riot and ſuperfluity in this behalf. We find in old Chronicles, That the Frenchmen and Gaules took occaſion firſt to come down into Italy, & to ouerſpread the whole country (notwithſtanding they were beforetime debarred from thence by the impregnable fort, as it were, and the vnpaſſeable bulwark of the Alps between:) becauſe one *Elico*, a Swiſſer or Heluetian, who had made long abode at Rome (where he was entertained for his skil in Smiths worke and Carpentry) at his return home again into his country, brought F ouer with him dry figs and Raiſons: the firſt fruits alſo as it were of oile & wine for a taſt, to ſet their teeth a watering. And therefore the French had good reaſon, and might wel be born withall and pardoned, for ſeeking to conquer euen by force of armes thoſe countries where ſuch fruits grew. But who would not maruell rather at this, That our people here ſhould go into far countries, and fetch a tree from thence, euen out of another world, only for the ſhade that it gi-

ueth:

veth? For ſurely, of fruitfull trees Italy hath ſtore enough: and what tree ſhould that be, but the very Plane? brought firſt ouer the Ionian ſea into the Iſle Diomedea, for to beautifie the tomb of *Diomedes*: from thence tranſlated into Sicily, and ſo beſtowed at length vpon Italy, & there planted as a moſt ſingular, rare, & ſpeciall tree. But now is it carried as far as Terwin and Tournay in France, where it is counted an appertenance to the very ſoile that paieth tribute: inſomuch, as people that wil but walk and refreſh themſelues vnder the ſhadow of it, muſt pay a cuſtome therefore vnto the people of Rome. *Dionyſius* king of Sicily, and the firſt of that name, cauſed them to be brought from Rhegium in Calabria to his Roial city, where his pallace was, only of a ſingularity, becauſe they ſhould be ſeen to giue a ſhade before his houſe, where afterwards was made the Colledge or place of publick exerciſe. But theſe trees did not greatly like the ſoile, for they neuer grew big, nor proſpered to any purpoſe. Howbeit, I find in writers, that there were other beſides in Italy, and namely about Adria, as alſo in Spain. And all this happened about the time that Rome was ſackt by the Gauls. But afterwards they came to be ſo highly eſteem'd, that for to make them grow the better, men wolud be at the coſt to water them with wine: for this was found by experience, that nothing was ſo good for them as to poure wine to their roots. Thus haue we taught euen our trees alſo to drinke wine, and be drunke. The Plane trees of any great name at firſt, were thoſe that grew in the walking place of the Academia in Athens; where the root of one outwent the boughs 36 cubits in length. Now in this age there grows a famous one in Lycia, neer to the high way were men paſſe too & fro, & it hath a pleaſant cold fountain adioining to it: the ſame is hollow within like to a houſe, & yeelds a caue of 81 foot in compaſſe: but it caries ſuch an head withal like a groue, ſo large, ſo broad, & ſo branched, that euery arm reſembles one entire tree: inſomuch, as the ſhade therof takes vp & ſpreadeth a great way into the fields. And becauſe in euery reſpect, it might reſemble a very cabbin and caue indeed, there are ſtony banks & ſeats within, in form of an arbor round about, made as it were of pumiſh ſtone ouergrown with moſſe. And in truth, this tree, and the ſcituation therof is ſo admirable, that *Licinius Mutianus* thrice Conſull, and lately Lieutenant generall and Gouernor of that Prouince, thought this one thing worthy to be recorded as a memoriall to poſterity, That he and 18 more perſons of his company, vſed to dine and ſup within the hollowneſſe of that tree: where the very leaues yeelded of the own ſufficient bed and bench-room to reſt and repoſe themſelues: where they might ſit ſecured from danger of wind to blow vpon them: where whiles he ſat at meat, he wiſhed nothing more than the pleaſure to heare the ſhowers of rain to pat drop by drop, and rattle ouer his head vpon the leaues: & finally, that he tooke much more delight to lie within the ſaid cabbin, than in a ſtately chamber built of fine marble, all glorious within with hangings of tapiſtrie and needleworke of ſundry colours, and the ſame ſeeled ouer head with an embowed roofe laid with beaten gold. Moreouer, *Caligula* the Emperor had ſuch another Plane tree growing in the country about Velitræ, moſt artificially: wherein he vſed to take great pleaſure, with admiration of the ſundry lofts and planks one ouer another, the large ſettles alſo and ſpacious branches that the boughs yeelded, where he was wont to ſit at repaſt, making one of the 15 gueſts. For the room was of that capacity, that it would not only receiue ſo many to ſit with eaſe at the table, but alſo the gentlemen and ſeruitors that waited and miniſtred vnto them: and he termed this ſupping place by the name of, His neſt: becauſe it ſeemed like a birds neſt in a tree. There is to be ſeen at Gortyna, within the Iſland Candy, one Plane tree neere vnto a faire fountain: recorded it is as well by Greekes as Latines in their writings, and by the teſtimony of them both, neuer ſheds the leaues, but remains alwaies green, as well in Winter as Summer: by occaſion whereof aroſe the tale (ſo much giuen is Greece to deuiſe fables by and by of euery ſmall matter) That *Iupiter* vnder that tree defloured the yong lady *Europa*: as if (forſooth) there were no other tree but it of the ſame kind and nature, in Cyprus. But as the nature of man is euermore curious, and ſeeketh after nouelties) the Candiotes deſirous to haue of the ſame race within Creet, ſet many ſlips thereof in ſundry places, as if they longed to haue more ſuch vicious fruit (as is before-named:) for in very deed that Tree is in no one thing more commendable, than for excluding the heat of the Sunne in Summer, and admitting it in Winter. In the time of *Claudius Cæſar*, late Emperour, there was an enfranchiſed ſlaue belonging to *Marcellus Eſerninus*, a daintie guelded Eunuch of Theſſalie, and exceeding rich, who cauſed certain Plane trees to be brought out of Candie into Italie, for to plant them at a manor which he had in the the territorie neare vnto Rome. This freed Eunuch for to grow into

more

20030
copy 1

A more power and fauor with *Cæſar*, had ingraffed himſelfe, as adopted among his freed men: and ſurely for his wealth might well be called *Dionyſius*, who was the firſt that tranſplanted theſe kind of trees. Thus you ſee, that ouer and aboue thoſe monſtruoſities which Italy hath deuiſed of it ſelfe, we haue remaining and reigning among vs thoſe alſo of ſtrange and forraine nations abroad in the world.

Chap. II.

¶ *Of the low or dwarfe Plane tree. And who firſt deuiſed to clip and ſhred Arbours.*

B AS big as theſe Plane-trees, are yet there be thoſe of a forced ſmalneſſe to the other, called Chamæplatani: whereby a man may ſee, that we haue inuented the meanes to haue abortiue trees alſo euen to hinder their growth, that they cannot come to their ful perfection. And therefore euen in Trees as well as in other liuing creatures, there is a certaine infelicitie, which may well be termed, A dwarfiſh vntowardneſſe. This ſmalneſſe in trees may come, by the maner of planting them, as wel as by cutting and keeping them downe. The firſt man that deuiſed to ſhred and cut arbors, was one *Cn. Martius*, a gentleman of Rome, and a fauorit of the Emperour *Auguſtus*; and this inuention hath not bin knowne aboue 80 yeares.

Chap. III.

C ¶ *Of Trees that be ſtrangers in Italy: and namely of the Citron or Limon Tree.*

CHerry-trees, Peach-trees, and generally all that either haue Greek names or any other but Latine, are held for aliens in Italy. Howbeit, ſome of them now are infranchiſed and taken for free denizens among vs: ſo familiar they be made vnto vs, and they like the ground ſo well. But of them, we will ſpeake in the ranke of thoſe trees that beare fruit. For this preſent we are to treat of thoſe that be meere forrainers: and for good lucke ſake, begin we will with that D which of all others is moſt holeſome; to wit, the Citron tree, called the Aſſyrian tree; and by ſome, the Median Apple-tree: the fruit whereof is a counterpoiſon and ſingular Antidote againſt all venome. The tree it ſelfe, bears the leafe like vnto an Arbut tree; mary it hath certain pricks among. The Pomecitron is not ſo good to be chewed and eaten of it ſelfe: howbeit very odoriferous it is: as be the leaues alſo therof, which are vſed to be laid in wardrobes among apparel; for the ſmel thereof wil paſſe into the cloths, and preſerue them from the moth, ſpider and ſuch like vermin. This tree beares fruit at all times of the yere; for when ſome fall for ripeneſſe, others wax mellow; and ſome again, begin then but to ſhew their bloſſome. Many forrainers haue aſſaied to tranſplant them, and ſet them in their own countries, in regard of their excellent vertue to reſiſt poiſons. And for this purpoſe they haue caried yong quick ſets, or plants E of them, in earthen pots made for the purpoſe, and incloſed them well with earth: howbeit the roots had liberty giuen them to breath (as it were) at certain holes for the nones, becauſe they ſhould not be clunged and pent in priſon. Which I rather note, becauſe I would haue it known once for all, and well remembred, That all plants which are to be remoued and carried far off, muſt be ſet very cloſe, and vſed in the ſame order moſt preciſely. But for all the care and paines taken about it, for to make it grow in other countries, yet would it not forget Media and Perſia, nor like in any other ſoile, but ſoon die. This is that fruit, the kernels wherof (as I ſaid before the lords and great men of Parthia vſe to ſeeth with their meat, for to correct their ſoure and F ſtinking breaths. And verily there is not a tree in all Media, of better reſpect than is the Citron tree. As for thoſe trees in the region of the Seres (which beare the ſilk wool or cotton) we haue ſpoken thereof in our Coſmographie, when we made mention of that Nation.

Chap. IV.

¶ *Of Indian Trees: and when the Ebene was firſt knowne at Rome.*

IN like manner, diſcourſed we haue of the talneſſe and greatneſſe of Indian trees. Of all thoſe trees which be appropriate to India, *Virgil* hath highly commended the Ebene aboue all the reſt:

reſt: and he affirmeth, That it will not grow elſwhere. But *Herodotus* aſſigneth it rather to Æthyopia; and ſaith, That euery three yeares the Æthyopians were wont to pay by way of tribute vnto the kings of Perſia, * 200 billets of the timber of that tree, together with gold and yuory. Moreouer, I muſt not forget (ſince that mine author hath ſo expreſſely ſet it downe) that the Ethyopians in the ſame regard were bound to pay in like manner, twentie great and maſſie Elephants teeth. In ſuch eſtimation was yuorie then, namely in the 310 yeare after the foundation of Rome, at what time as *Herodotus* put forth that hiſtorie at Thurij in Italy. The more maruell it is, that we giue ſo much credit to that writer, ſaying as he doth, How that in his time & before, there was no man knowne in Aſia or Greece, nor yet to himſelfe, who had not ſo much as ſeen the riuer Po. The Card or Map of Ethiopia, which lately was preſented and ſhewed to the Emperor *Nero* (as we haue before ſaid) doth ſufficiently teſtifie, That from Syene (which confines and bounds the lands of our Empire and dominion) as far as to the Iſland Meroe, for the ſpace of 996 miles, there is little Ebene found: and that in all thoſe parts betweene, there be few other trees to be found, but Date trees. Which peraduenture may be a cauſe, That Ebene was counted a rich tribute, and deſerued the third place, after Gold & Iuory. Certes, *Pompey* the Great, in that ſolemnitie of triumph for the victorie and conqueſt of *Mithridates*, ſhewed one Ebene tree. *Fabianus* is of opinion, that it wil not burne: howbeit, experience ſheweth the contrary, for take fire it will, yea and caſt a pleaſant and ſweet perfume. Two kindes there be of Ebene: the one, which as it is the better, ſo likewiſe it is rare and geaſon; it carrieth a trunke like another tree, without knot, the wood thereof is blacke and ſhining, and at the very firſt ſight, faire and pleaſant to the eie, without any art or poliſhing at all. The other is more like a ſhrub, and putteth forth twigs as the Tretrifolie. A plant this is, commonly to be ſeene in all parts of India.

Chap. V.

¶ *Of certaine Thornes, and Fig-trees of India.*

THere groweth alſo among the Indians, a Thorne reſembling the later kind of Ebene: and found to ſerue for the vſe of candles: for no ſooner commeth it neere vnto the fire, but it catcheth a flame, & the fire leaps preſently vnto it. Now it remains to ſpeak of thoſe trees, which ſet *Alexander* the Great into a wonder, at what time as vpon his victory he made a voiage for to diſcouer that part of the world. Firſt and formoſt, there is a fig tree there, which beareth very ſmall and ſlender Figs. The property of this tree, is to plant and ſet it ſelfe without mans help. For it ſpreadeth out with mighty armes, and the loweſt water-boughes vnderneath, doe bend ſo downward to the very earth, that they touch it againe, and lie vpon it: whereby, within one yeares ſpace they will take faſt root in the ground, and put forth a new Spring round about the Mother-tree: ſo as theſe branches thus growing, ſeeme like a traile or border of arbors moſt curiouſly and artificially made. Within theſe bowers the Sheepherds vſe to repoſe and take vp their harbor in Summer time: for ſhady and coole it is, and beſides well fenced all about with a ſet of young trees in manner of a pallaiſado. A moſt pleaſant and delectable ſight, whether a man either come neere, and looke into it, or ſtand a farre off: ſo faire and pleaſant an arbour it is, all greene, and framed arch-wiſe in juſt compaſſe. Now the vpper boughes thereof ſtand vp on high, and beare a goodly tuft and head aloft like a little thicke wood or forreſt. And the body or trunke of the Mother is ſo great, that many of them take vp in compaſſe threeſcore paces: and as for the foreſaid ſhadow, it couereth in ground a quarter of a mile. The leaues of this Tree are verie broad, made in forme of an Amazonian or Turkiſh Targuet: which is the reaſon, that the Figges thereof are but ſmall: conſidering that the leafe couereth it, and ſuffereth it not to grow vnto the full. Neither doe they hang thicke vpon the Tree, but here and there very thinne, and none of them bigger than a beane. Howbeit, ſo well and throughly ripened they bee with the heate of the Sunne, notwithſtanding the leaues are betweene, that they yeeld a moſt pleaſant and ſweet rellice in taſt, and are a fruit for a king, anſwerable to the mightie, huge, and prodigious tree that beareth it. Theſe Fig-trees grow abundantly about the riuer Aceſine.

CHAP.

20030

A

Chap. VI.

¶ *Of the tree named Pala: of other Indian trees, whereof the names be vnknowne. Alſo of thoſe that beare wooll or Cotton.*

ANother tree there is in India, greater yet than the former, bearing a fruit much fairer, bigger, and ſweeter than the figs aforeſaid; and whereof the Indian Sages & Philoſophers do ordinarily liue. The leafe reſembleth birds wings, carrying three cubits in length, and two in bredth. The fruit it puts forth at the bark, hauing within it a wonderfull pleaſant iuice: inſomuch as one of them is ſufficient to giue 4 men a competent and ful refection. The trees name
B is Pala, and the fruit thereof is called Ariena. Great plenty of them is in the country of the Sydraci, the vtmoſt limit of *Alexander* the Great his expeditions and voiages. And yet is there another tree much like to this, and beareth a fruit more delectable than this Ariena, howbeit, the guts in a mans belly it wringeth, and breeds the bloudy-flix. Whereupon *Alexander* made open proclamation and ſtraitly forbad, That no man ſhould taſte thereof. As for the Macedonian ſouldiers, they talked much of many other trees, but they deſcribed them in generall tearmes only, and to the moſt of them they gaue no names at all. For one tree there is beſides, in other reſpects reſembling the Terebinth, and it carrieth a fruit much like to Almonds; onely it is leſſe, but of a moſt ſweet and toothſome taſte. In Bactriana verily, ſome take it to be a ſpeciall kind of the Terebinth indeed, rather than a tree like vnto it: but that tree which carrieth a fine
C flax, whereof they make their dainty linnen & lawn, it hath leaues like to thoſe of the Mulbery tree, and beareth a red berry like to the hips of an Eglantine. They plant and ſet theſe in their fields and plains: and ſurely, ſtanding as they do in ſuch order, there are no rowes of any trees that yeeld a fairer ſight and proſpect. The Oliue tree of India is but barren, ſaue that it brings a fruit much like the Wild Oliue.

Chap. VII.

¶ *Of Pepper trees: of the Cloue tree, and many other.*

D THe trees that beare Pepper euery where in thoſe parts, be like vnto our Iuniper trees. And yet ſome haue written, That they grow only vpon the front of the hill Caucaſus on that ſide which lieth full vpon the Sun. The corns or graines that hang thereupon, differ from Iuniper berries: and thoſe lie in certain little huskes or cods like to the pulſe called Faſels or Kidney beans. If that be plucked from the tree before they gape and open of themſelues, they make that ſpice which is called long-Pepper: but if as they do ripen, they cleaue and chawn by little & little, they ſhew within, the white pepper: which afterwards being parched in the Sun, changeth colour, and waxeth black, and therewith riueled alſo. Peppers be ſubiect to the iniury of the weather as well as other fruits: for if the ſeaſon be vnkindly and vntemporat, they will catch a blaſt, and then the ſeeds will be deafe, void, light, & naught. This fault is called among the Indians, Brechmaſis, which in their language ſignifieth, an abortiue or vntimely fruit. This pepper of all other kinds is moſt biting and ſharp, but it is the lighteſt, and pale of colour with-
E all. The blacke is more kindly and pleaſant: and the white is more milde in the mouth than both the other. Many haue taken Ginger (which ſome cal Zimbiperi, and others Zingiberi) for the root of that tree: but it is not ſo, although in taſte it ſomwhat reſembles pepper. For Ginger grows in Arabia and Troglodytica in medowes about the villages: and it is a white root of a certain little herbe. And howſoeuer it be very bitter and biting, yet it quickly meeteth with a worme, and rottes. A pound of Ginger is commonly ſold at Rome for ſix deniers. Long pepper is ſoon ſophiſticated, with the Senuie or muſtard-ſeed of Alexandria: & a pound of it is worth fifteen Romane deniers. The white coſteth ſeuen deniers a pound, and the blacke is ſold after foure deniers by the pound. As for Pepper, I wonder greatly that it ſhould be ſo much in re-
F queſt as it is: for whereas ſome fruits are ſweet and pleaſant in taſte, and therefore deſired; others beautifull to the eie, and in that regard draw chapmen: Pepper hath neither the one nor the other. A fruit or berry it is (call it whether you will) neither acceptable to the tongue, nor delectable to the eie: and yet for the biting bitterneſſe that it hath, we are pleaſed therwith, and we muſt haue it fet forſooth from as far as India. What was he, gladly would I know, that ven-

tured firſt to bite of pepper and vſe it in his meats? Who might he be, that to prouoke his appetite and find himſelfe a good ſtomack, could not make a ſhift with faſting and hunger onely? Surely, Ginger and Pepper both, grow wild in thoſe countries where they do like, and yet wee muſt buy them by weight, as we do gold and ſiluer. Of late daies here in Italy, wee haue made means to haue the Pepper tree growing among vs: and verily a litle ſcrubby plant it is, or ſhrub rather, bigger ſomwhat than the myrtle, and not far vnlike. The graine that ours beareth, carrieth the very ſame bitterneſſe that the greene pepper of India is thought to haue before it be ful ripe. For here it wanteth the due parching and ripening againſt the ſun: and by that means commeth ſhort of the riuels and blackneſſe that the outlandiſh pepper hath. Sophiſticated it is, by intermingling with it the grains or berries of Iuniper: for ſurely, they do maruellous ſoon take the taſte and ſtrength of pepper. And as for the weight, there be diuers waies to deceiue the chapman therein.

Ouer and beſides, there is another fruit that commeth out of India, like vnto pepper cornes, and it is called Cloues, but bigger ſomwhat and more brittle. And they ſay, that it groweth in a certain groue conſecrated to their gods in India. Tranſported ouer it is vnto vs for the ſweet ſmell that it caſteth.

Moreouer, the Indians haue a thorny and pricky plant, which beareth a fruit like to pepper, and paſſing bitter: the leaues be ſmal and grow thick after the maner of Priuet: it putteth forth branches 3 cubits long: the bark is pale, the root broad and of a wooddy ſubſtance, reſembling the colour of box. Of the infuſion of this root in faire water, together with the ſeed, in a braſen veſſell, is made that medicine or compoſition which is called Lycium. A buſh there groweth likewiſe vpon mount Pelion [like Pyxiacantha, *i.* the Berberrie buſh] whereof is made a counterfeit Lycium. In like manner, the root of the Aſphodill, with an Oxe-gal, Wormewoot, Frankincenſe, and the mother and lees of oile, wil do the ſame: but the beſt Lycium, and moſt medicinable, is that which doth yeld a great froth or ſcum. The Indian merchants do ſend it ouer in bags made of the skins either of Camels or Rhinocerotes. In ſome parts of Greece they name the very buſh whereof this Lycium is made, Pyxacanthum Chironium.

Chap. VIII.

¶ *Of Macir, Sugar, and the trees of the region Ariana.*

THe Macir likewiſe is brought out of India. A reddiſh bark or rind it is, of a great root; and beareth the name of the tree it ſelfe: but the form of that tree I know not how to deſcribe. This rind ſodden in hony, & ſo condit as a Succade, is a ſingular good medicine for thoſe that be troubled with the Dyſentery or bloudy-flix: as for ſugar, there is of it in Arabia; but the beſt comes out of India.* A kind of hony it is, gathered and candied in certaine Canes: white this is like gum [Arabick] and brittle between a mans teeth. The graines hereof when they are at the bigſt, exceed not a filberd nut, and ſerue only for phyſick. In the realm of Ariana (which confineth and boundeth vpon the Indians) there is a certain thorny plant, ſo ful of ſharp pricks, that it is comberous to them who come about it; which yeeldes a precious liquor iſſuing out thereof, like to Myrrhe. In the ſame prouince there grows a peſtilent venomous ſhrubbe called Rhaphanus, bearing leaues like the bay tree, which with their fragrant ſmell train horſes thither to eat thereof; but they are ſo good for them, that they left not *Alexander* the Great ſcarce one horſe of all his Cauallerie, they died ſo faſt of that food at his firſt entrance into the countrey. The like accident befell to him alſo among the Gedroſians. In like manner, there is another thornie plant (by report) in that region, leaued like the Laurell: the iuice and liquor whereof, if it be ſprinckled or daſhed in the eies of any liuing creature whatſoeuer, puts them quite out and makes them blind. Moreouer, they haue an herb there, of a ſingular pleaſant ſauor, but couered all ouer it is with little venomous ſerpents: their ſting is preſent death. *Oneſicritus* reports, That in the vales of Hircania there be trees like fig-trees, which the Hircanians call Occhi, out of which there diſtils or drops hony euery morning for the ſpace of two houres.

* White ſugar candie.

Chap. IX. ¶ *Of Bdellium: and the trees growing by the Perſian gulfe.*

NEere to theſe parts lies Bactriana, wherin is the moſt excellent Bdellium. The tree that bears it is black, of the bigneſſe of an Oliue, with leaues like an Oke; and the fruit reſembleth

20030
copy 1

A bleth wild figs, and is of the ſame nature. The gum thereof, ſome cal Brochos; others, Malachra; and there be again that name in Maldacon. Howbeit, when it is blacke, and brought into roſes or lumps, they giue it another name, and call it Hadrobolon. But indeed the right Bdellium when it is in the kinde, ſhould be cleare, as yellow as wax, pleaſant to ſmell vnto, in the rubbing and handling fatty, in taſte bitter, and nothing ſoure. Being waſhed and drenched with wine (as they vſe it in ſacrifices) it is more odoriferous. There is found of it in Arabia, India, Media, and Babylon. As for that which is brought out of Media, they call it Peraticum: this is more tractable and gentle in hand, more cruſty and bitter than the reſt. But the Indian Bdellium is the moiſter and more gummy: this is ſophiſticated with Almonds, whereas the other kinds be made
B counterfeit with the bark of Scordaſtus, a tree that yeelds the like gum. But this trumpery and deceit is found by the ſmell, colour, weight, taſte, and fire. And let this one word for all, ſerue as a generall rule to proue all ſuch drugs and ſpices by. The Bactrian Bdellium when it is in the fire, yeeldeth a dry and ſmoky fume, and hath many white markes in it reſembling the nailes of ones fingers: beſides, it hath his juſt poiſe and weight that it ought to haue, neither more nor leſſe; for as it ſhould not be ouer weighty, ſo it may be too light. Commonly the price goeth after this rate, to wit, three deniers a pound.

Vpon theſe regions aboue-named, confineth Perſis, whereas the red ſea (which we named in our Geographie, the Perſian gulfe) floweth at certain tides far into the land, and in theſe ſands and downes are to be ſeen diuers trees of ſtrange natures: for when the tide is paſt, you ſhal ſee
C at a low water ſome trees with their roots bare, as if they were eaten with the ſalt water; & a man cannot tell whether they were brought thither with the tide, or left in the ebbe: but ſurely the naked roots ſeem to claſp & take hold of the barren ſands, as if they were Polype fiſhes ſhould cling to any thing. And yet the ſame, when the ſea floweth again, notwithſtanding they be beaten vpon with the waues, ſtand faſt and ſtir not. Again, at ſome high water and ſpring-tide, they be couered all ouer with water: and by good arguments it is euident to the eie, That nouriſhed they be with the roughneſſe of the ſurging ſea-water. Their heights is wonderfull: and faſhioned they be in forme of an Arbut tree: the fruit without-forth like to Almonds, but the kernels within be writhed.
D

Chap. X.

¶ *The Trees of the Iſland Tylos within the Perſian ſea. Moreouer of thoſe trees that beare Wooll or Cotton.*

WIthin the ſame gulfe of Perſia, there lieth an Iſle full of woods to the Eaſt ſide, euen vpon that coaſt which is ouerflowed with the tide. Euery tree within, is equall in bigneſſe to the fig-tree: the bloſſoms that they carry, are ſo ſweet, as it is wonderful & vnſpeakable: the fruit like a Lupine, yet ſo rough & prickly, as no beaſt will gladly touch it. In
E the higheſt part and knap of the ſame Iſland, there be trees bearing wooll, but not in ſuch ſort as thoſe of the Seres: for whereas the leaues of thoſe do carry a downe or cotton, theſe are altogether without and barren thereof: and but that they be ſomewhat leſſe, they might ſeeme to be vine leaues. Howbeit they beare a fruit at the laſt, like Gourds in faſhion, and as bigge as Quinces; which when they be full ripe, do open and ſhew certain bals within of down: whereof they make moſt fine and coſtly linnen clothes.

Chap. XI.

F ¶ *Of the Goſſampine trees: as alſo of other Cotton or Bombaſe trees, whereof clothes be made. In what manner diuers trees do yeeld their fruit.*

THere is a leſſer Iſle named Tylos, ten miles from the other, where be trees called Goſſampines, which yeeld more cotton than thoſe in the greater. King *Iuba* ſaith, that this cotton groweth about the branches of the ſaid trees, and that the linnens made therof be farbetter than thoſe of the Indians. As for thoſe trees in Arabia whereof they make their linnen cloth, he affirmeth that they be called Cynæ, and haue leaues like the Date tree. Thus you ſee, how the Indians be clad with trees of their own. In thoſe Iſlands called Tyli, there is another tree which beareth a bloſſome much like the floure of a White Violet, or Scock-gilloſre, but foure times

as big, which may ſeeme ſtrange in that tract. And yet there is another Tree not vnlike to it, G
howbeit fuller of leaues, and bearing a bloſſome like to a Damaske or incarnate Roſe. This
floure ſhutteth cloſe in the night, beginneth to open in the morning at the Sun-riſing, and by
noone ſheweth out at the full. The inhabitants haue a by-word and ſaying among them, That
it ſleepes all night, and wakes in the morning. The ſame Iſland bringeth forth Date trees, O-
liue trees, Vines, and amongſt other fruits Figges alſo. No Trees there, doe ſhed their leaues:
for the Iſland is well watered with cold and quicke-ſprings: and beſides it hath the benefit of
raine. As touching Arabia, which lieth neere and bordereth vpon theſe Iſlands, the ſpices and
odoriferous fruits that be therein, are to be treated of with diſtinction: for their merchandiſe
doth conſiſt of roots, branches, barke, juice or liquor, gums and roſins, wood, twigs, floures, leaues
and apple. H

Chap. XLI.

¶ *Of Coſtus, Spike-nard, and the diuers kindes of Nard.*

BVt the root and leafe be of greateſt price in India. And firſt and formoſt the root of Coſtus
bites and burns in the mouth; and is of a moſt excellent and ſoueraigne ſmell: for otherwiſe
the branches or body of the ſhrub is good for little or nothing. In the Iſland Patale (which
lieth at the very firſt foſſe and mouth where the riuer Indus falleth into the ſea) there be found
two kindes thereof: namely, the black, and the white, which is counted the better. A pound of
Coſtus is held at 16 Roman deniers. I

As touching the leafe of Nardus, it were good that we diſcourſed therof at large, ſeeing that
it is one of the principall ingredients aromaticall that go to the making of moſt coſtly & pre-
cious ointments. The plant it ſelfe Nardus, hath a maſſie, heauy, & thick root; but ſhort, black,
and brittle, notwithſtanding that it be fatty and oleous. Soone it vinoweth and catcheth a kind
of muſtineſſe: and like to the Cypreſſe [or Cyperus] it hath a ſharp taſt, rough and ſmal leaues,
but comming thick. The head of Nardus ſpreads into certain ſpikes or eares, whereby it hath
a twofold vſe, both of ſpike and alſo of leaf; in which regard it is ſo famous. A ſecond ſort there
is of it growing along the riuer Ganges, condemned altogether as good for nothing, for it hath
a ſtrong and ſtinking ſauor: whereupon it is called Ozænitis. There is an herbe growing euery
where called Pſeudonardus, or baſtard Nard, which is obtruded vnto vs and ſold for the true K
Spikenard. A thicker leafe it hath and a broader than the other: the colour is more pallat and
weak, inclining to white. Alſo the very root of the right Nard, for to make the better weight, is
mingled with gums, with Litharge of ſiluer, Antimony, or the rind of Cyperus. But the good,
ſincere, & true Nard is known by the lightnes, red colour, ſweet ſmell, and the taſte eſpecially:
for it drieth the tongue and leaueth a pleaſant relliſh behind it. The Spike carieth the price of
an 100 Roman deniers a pound. As touching the leaues, the diuerſitie rhereof makes difference
alſo in the price: for that which hath the larger leaues, and therupon is called Hadroſphærum,
is worth 30 deniers a pound. A ſecond ſort there is with a ſmaller leafe, and of a middle ſize,
named therefore Meſoſphærum: and that is bought after 60 deniers the pound. But the beſt
of all is that with leaſt leaues, and carrieth the name of Microſphærum: and that the merchant L
ſelleth for 75 deniers the pound. What kind ſoeuer it be, the greener and newer it is, the better
is it reputed, and more odoriferous, than that which hath been long kept. Yet ſay it be old ga-
thered, if the colour hold and keepe well, men preferre it before the blacker, though it bee new.
With vs in Italie, and in this part of the World, the leafe of Nardus comming from Syria, is
eſteemed beſt: next to it the Celtick, out of France: and in the third place that of Candy, which
ſome name Agrion, [i. the wild] others Phu: and this hath a leafe reſembling Loueach or Ale-
ſanders, a ſtalke a cubite long full of ioints and knots, of a weake whitiſh and light purple co-
lour; the root groweth crooked, full of ſtrings and haires hanging to it, and is much like to birds
clawes or feet. As for Baccharis, it is called likewiſe Ruſtick-nard: but of it wil we ſpeak among M
other floures. Al theſe kinds of Nardus are to be reckoned herbs, ſaue that only of the Indians:
of which, the Celticke or French Nard, is plucked and gathered together with the root: and for
the better preparing thereof, it ought to be well waſhed and ſoked in wine, aud ſo dried in the
ſhade out of the Sunne. Then is it made vp into certaine bundels of an handfull apeece,
bound vp in papers, and differeth not much in goodneſſe from the Indian Spikenard: How-
beit

20030
copy 1

A beit, lighter it is than that of Syria. A pound of it is worth at Rome 13 deniers. The only proof and triall of all their leaues is this, That they be not brittle, and rather ripe drie, than ſere or rotten-dry, That they breake not and fall in pieces. With the Celticke and French Nard there euermore groweth another herbe, called Hirculus, and it taketh that name of a ſtrong and Goatiſh ſmell which it yeeldeth: beſides, ſo like it is vnto the other, that it is foiſted in among the good, and ſo ſold with it. Yet herein is the difference; for that this hath no ſtem or ſtalke at all; the leaues thereof alſo are leſſe: and laſt of all, the root is neither bitter in taſte, nor ſweet in ſmell.

CHAP. XIII.

B ¶ *Of Aſara-Bacca, Amomum, Amomis, and Cardamomum.*

ASarum or Fole-foot, called otherwiſe, Aſara-Bacca, hath the very properties and vertues of Nard: and therefore ſome haue called it Wild Nard. An herbe it is, carrying leaues like to Iuie, ſaue that they be more round and ſofter: it putteth forth a purple floure, and hath a root like vnto the French Nard. The floure is full within of ſeeds like grape kernels, of an hot taſte, and reſembling wine. In ſhadowie mountaines it floures twice a yeare. The beſt groweth in Pontus, the next to it for goodneſſe is found in Phrygia: that of Illyricum is of a third ranke. The root is digged vp when it beginneth to put forth leaues. They vſe to dry it in the Sun: ſoon it wil vennow and be mouldy; quickely alſo it waxes old, and loſes the ſtrength. Of late daies there was an herbe found in Thracia, the leaues whereof differ in nothing from the
C Indian Nard.

As for the grape of Amomum, which now is in vſe and much occupied, ſome ſay it groweth vpon a wilde vine in India. Others haue thought, that it commeth from a ſhrubbe like Myrtle, & carieth not aboue a hand-bredth, or 4 inches in height. Plucked it is together with the root: and gently muſt be laid and couched in bunches by handfuls, for if great heed be not taken, it will ſoone burſt and breake. The beſt Amomum and moſt commendable, is that which carrieth leaues like to thoſe of the Pomegranate, without riuels and wrinckles, and beſides, of a red colour. The next in goodneſſe is that which is pale. The greene or graſſe coloured is not all out ſo good, but the worſt of all is white: and that colour comes by age, and long keeping: a pound of theſe grapes intire and whole in the cluſter, is worth 60 Roman deniers. But if they be crum-
D bled and broken, it will coſt but 48. This Amomum groweth likewiſe in a part of Armenia named Otene: alſo, in the kingdomes of Media and Pontus. It is ſophiſticated with the leaues of the Pomgranate, and with ſome other liquid gum beſides, that it may hang vnited together and roll round into the forme of grapes.

Now as touching that which is called Amomis, it is leſſe full of veins, and nothing ſo ſweet ſmelling, but harder than Amomum: whereby it appeareth, that it is either a diuers plant from it, or els if it be the ſame, it is gathered before it be full ripe.

Cardamomum is like to theſe aboue rehearſed, both in name, and alſo in making and forme: but it bears a longer graine for ſeed. The maner alſo of gathering and cutting it downe, in Arabia, is the ſame. Foure kinds there be of it. The firſt is moſt green and fatty withal: hauing foure
E ſharp corners, and if a man rub it between his fingers, he ſhal find it very tough and ſtubborne: and this is moſt eſteemed of all the other. The next to it is ſomwhat reddiſh, but inclining to a whitiſh colour. A third ſort is ſhorter, leſſer, and blacker than the reſt. Howbeit, the worſt is that which hath ſundry colours, is pliable and gentle in the rubbing, and ſmelleth but a little. The true Cardamomum ought to come neare in reſemblance to Coſtus. And it grows in Media. A pound of the beſt will coſt 12 deniers.

The great affinitie or kinred rather in name, that Cinnamon hath with theſe ſpices before rehearſed, might induce me to write therof in one ſuit, euen in this place: but that more meet it is to ſhew firſt the riches of Arabia, and to ſet down the cauſes why that country ſhould be ſyr-
F named Happy and Bleſſed. Wee will begin therefore with the chiefe commodities thereof, namely. Frankincenſe and Myrrhe: and yet Myrrhe is found as wel in the Troglodites country, as in Arabia.

Chap. XIV.

¶ *Of Happy Arabia, that yeeldeth plenty of Frankincenſe.*

There is no region in the whole world that bringeth forth frankincenſe but Arabia: and yet is it not to be found in al parts therof, but in that quarter only of the Atramites. Now theſe Atramites inhabit the very heart of Arabia, and are a county of the Sabæi. The capitall city of the whole kingdom is called Sabota, ſeated vpon a high mountain: from whence vnto Saba, the only country that yeelds ſuch plenty of the ſaid incenſe, it is about 8 daies journey. As for Saba (which in the Greek tongue ſignifieth, a ſecret myſterie) it regards the Sunne riſing in Summer, or the North-Eaſt, encloſed on euery ſide with rockes inacceſſible: and on the right hand it is defended with high cliffes and crags that beare into the ſea. The ſoile of this territorie, by report, is reddiſh, & inclining to white. The forreſts that carry theſe Incenſe trees ly in length 20 Schænes, and beare in bredth half as much. Now that which we cal Schænus, according to the calculation of *Eratoſthenes*, contains forty ſtadia, that is to ſay, fiue miles: how ſoeuer ſome haue allowed but 32 ſtadia to euery Schænus. The quarter wherein theſe trees grow is full of high hills: howbeit, go down into the plains and valley beneath, you ſhall haue plenty of the ſame trees, which come vp of their own accord, and were neuer planted. The earth is fat, and ſtandeth much vpon a ſtrong clay, as all writers do agree. Few Springs are there to be found, and thoſe that be are full of Nitre. There is another tract by it ſelfe confronting this country, wherein the Minæans do inhabit: and through them there is a narrow paſſage, whereby the frankincenſe is tranſported into other parts. Theſe were their firſt neighbours that did traffique with them for their Incenſe, and found a vent for it: and euen ſo they doe ſtill at this day, whereupon the frankincenſe it ſelfe is called of their name, Minæum. Setting theſe people of the Sabeans aſide, there be no Arabians that ſee an Incenſe tree from one end of the yere to another: neither are all theſe permitted to haue a ſight of thoſe trees. For the common voice is, that there be not aboue 3000 families which can claime and challenge by right of ſucceſſion that priuiledge to gather incenſe. And therefore all the race of them is called Sacred and Holy: for looke when they go about either cutting and ſlitting the trees, or gathering the Incenſe, they muſt not that day come neere a woman to know her carnally; nay they muſt not be at any funerals, nor approch a dead corps, for being polluted. By which religion and ceremonious obſeruation the price is raiſed, and the incenſe is the dearer. Some ſay, theſe people haue equall liberty in common to go into theſe Woods for their commodities when they will: but others affirme that they be diuided into companies, and take their turns by yeares. As concerning the very tree I could neuer know yet the perfect deſcription of it. We haue waged warres in Arabia, and our Roman armie haue entred a great way into that country. *C. Cæſar* the adopted ſon of *Auguſtus* wan great honour and glory from thence: and yet verily, to my knowledge, there was neuer any Latine Author, that hath put down in writing the form and faſhion of the tree that carrieth incenſe. As for the Greeke Writers, their bookes doe vary and differ in that point. Some giue out, that it hath leaues like to a Peare tree, only they be ſomewhat leſſe, and when they come forth they be of a graſſe green colour. Others ſay that they reſemble the Lentiske tree, and are ſomwhat reddiſh. There be again who write, that it is the very Terebints and none elſe, that giueth the Frankincenſe: of which opinion king *Antigonus* was, who had one of theſe ſhrubs brought vnto him. King *Iuba* in thoſe books which he wrot and ſent to *C. Cæſar*, ſon to the Emperor *Auguſtus*, (who was inflamed with an ardent deſire to make a voiage into Arabia, for the great fame that went thereof) ſaith, That the tree which beares Frankincenſe hath a trunke or body writhen about, and putteth forth boughes and branches like for all the world to the Maple of Pontus. *Item*, that it yeeldeth a iuice or liquour as doth the Almond tree; and ſuch are ſeene commonly in Carmania: as alſo thoſe in Egypt which were planted by the carefull induſtrie of the *Ptolomees*, Kings there. Howeuer it be, this is receiued for certaine, that it hath the very barke of a Bay tree: Some alſo haue ſaid that the leaues be as like. And verily ſuch kind of trees were they which were ſeen at Sardis: for the Kings of Aſia likewiſe were at the coſt and labor to tranſplant them, and deſirous to haue them grow in Lydia. The Embaſſadours who in my time came out of Arabia to Rome, haue made all that was deliuered as touching theſe trees, more doubtfull and vncertaine than before. A ſtrange matter, and wonderfull indeed, conſidering that twigges and branches of the Incenſe tree haue paſſed betweene:

by

20030
copy 1

A by the veiw of which impes, we may judge what the Mother is: namely, euen and round in the bodie, without knot or knar, and from thence ſhe putteth out ſhoots.

They vſed in old time to gather the Incenſe but once a yere, as hauing little vent, and ſmall returne, and leſſe occaſion to ſell than now adaies: but now, ſince euery man calleth for it, they feeling the ſweetneſſe of the gaine, make a double vintage (as it were) of it in one yere. The firſt, and indeed the kindly ſeaſon, falls about the hotteſt daies of the Summer, at what time as the Dog daies begin: for then they cut the Tree where they ſee the bark to be fulleſt of liquor, and wheras they perceiue it to be thinneſt and ſtrut out moſt. They make a gaſh or ſlit only to giue more libertie: but nothing do they pare or cut cleane away. The wound or inciſion is no ſooner
B made, but out there guſheth a fat ſome or froth: this ſoone congeales and growes to be hard: and where the place will giue them leaue, they receiue it in a quilt or mat made of Date tree twigs, plaited and wound one within another wicker-wiſe. For elſewhere, the floore all about is paued ſmooth, and rammed downe hard. The former way is the better to gather the purer and clearer Frankincenſe: but that which falleth vpon the bare ground, prooues the weightier. That which remaines behind, and ſtickes to the Tree, is parted and ſcraped off with kniues, or ſuch like yron tooles; and therefore no maruell if it be ful of ſhauings of the bark. The whole wood or forreſt is diuided into certaine portions: and euery man knowes his owne part: nay, there is not one of them will offer wrong vnto another, and encroch vpon his neighbors. They need not to ſet any keepers to look vnto thoſe Trees that be cut, for no man will rob from his fellow if
C he might; ſo juſt and true they be in Arabia. But beleeue me, at Alexandria where Frankincenſe is tried, refined, and made for ſale, men canot look ſurely ynough to their ſhops and work-houſes, but they will be robbed. The workeman that is emploied about it, is all naked, ſaue that he hath a paire of trouſes or breeches to couer his ſhame, and thoſe are ſowed vp and ſealed too, for feare of thruſting any into them. Hood-winked he is ſure ynough for ſeeing the way to and fro, and hath a thicke coife or maske about his head, for doubt that he ſhould beſtow any in mouth or eares. And when theſe workmen be let forth againe, they be ſtripped ſtarke naked, as euer they were borne, and ſent away. Whereby we may ſee, that the rigor of juſtice canot ſtrike ſo great feare into our theeues here, and make vs ſo ſecure to keepe our owne, as among the
D Sabæans, the bare reuerence and religion of thoſe woods. But to returne againe to our former cuts. That Incenſe which was let out in Summer, they leaue there vnder the Tree vntil the Autumne, and then they come and gather it. And this is moſt pure, cleane, and white.

A ſecond Vintage and gathering there is in the Spring: againſt which time, they cut the bark before in the Winter, and ſuffer it to run out vntil the Spring. This comes forth red, and is nothing comparable to the former. The better is called Carpheotum, the worſe, Dathiathum. Moreouer, ſome ſay, that the gum which iſſueth out of the young trees is the whiter: but that which comes from the old, is more odoriferous. There be others alſo of opinion, that the better Incenſe is in the Iſlands. But King *Iuba* doth auouch conſtantly, that there is none at all in the Iſlands. That which is round like vnto a drop, and ſo hangeth, we call the male Incenſe; wheras
E in other things lightly we name the male, but where there is a female. But folk haue a religious ceremonie in it, not to vſe ſo much as the tearme of the other ſexe, in giuing denomination to Frankincenſe. Howbeit, ſome ſay, that it was called the Male, for a reſemblance that it hath to cullions or ſtones. In very truth, that is held for the cheife and beſt ſimply, which is faſhioned like to the nipples or teats that giue milk, ſtanding thick one by another: to wit, when the former drop that diſtilled, hath another preſently followeth after, and ſo conſequently more vnto them, and they all ſeeme to hang together like bigs. I read, that euery one of theſe were wont to make a good handfull, namely, when men were not ſo haſty & eager to carry it away, but would
F giue it time and leiſure to drop ſoftly. When it is gathered in this ſort, the Greeks vſe to call it Stagonias and Atomus: but the leſſer goblets they name Orobias. As for the ſmall crums or fragments which fall off by ſhaking, wee called Manna, [*i. Thuris.*] And yet there be found at this day drops of Incenſe that weigh the third part of a pound, that is to ſay, about * 39 Roman deniers. It happened on a time, that king *Alexander* the Great being then but a very little child, made no ſpare of Incenſe, but caſt ſtill vpon the altar without all meaſure when he offered ſacrifice. Whereupon, *Leonides* his tutor and ſchoole-maiſter, by way of a light reproofe, ſaid vnto him thus, Sir you ſhould in that maner burne Incenſe when you haue once conquered thoſe nations where there growes Incenſe. Which rebuke and checke of his tooke ſo deep a print in

or rather 33 and a ſcruple.

Alexanders

Alexanders heart, and ſo well he carried it in memorie, that after he had indeed made conqueſt of Arabia, he ſent vnto the ſaid *Leonides* his Tutor, a ſhip ful fraught and charged with Incenſe; willing him not to ſpare, but liberally to beſtow vpon the gods when hee ſacrificed. To returne againe to our hiſtorie. When the Incenſe is gathered (as is beforeſaid) conueighed it is to Sabota, vpon Cammels backs, and at one gate (ſet open for that purpoſe) is it brought into the citie. For by law forbidden it is on pain of death, to take any other way. Which done, the Prieſts there of the god whom they call *Sabis*, take the diſme or tenth part of the Incenſe, by meaſure, and not by weight, and ſet it apart for that god. Neither is it lawful for any man to buy or ſell, before that duty be paied: which ſerues afterwards to ſupport certaine publick expenſes of the citie. For al ſtrangers and trauellers within the compaſſe of certain daies journey, if they come to the citie, are courteouſly receiued, and liberally entertained at the coſt and charge of the ſaid god *Sabis*. Caried forth of the country it cannot be, but thorough the Gebanites: and therfore there is a cuſtome paid to their king. The head citie of that kingdome, Thomna, is from Gaza (the next port-towne in Iudæa toward our coaſt) ſeuen and twentie miles fourſcore times told: and this way is diuided into 62 daies journy by Camels. Moreouer, beſides the tyth aforeſaid, there be meaſures beſtowed vpon the Prieſts to their owne vſe: and others likewiſe to the kings Secretaries and Scribes. And not only theſe haue a ſhare, but alſo the Keepers, Sextons, and Wardens of the temple, the Squires of the bodie, the Guard and Penſioners, the kings officers, the Porters, Groomes, and other ſeruitors pill and poll, and euery one hath a ſnatch. Moreouer, all the way as they trauell; in one place they pay for their water, in another for fodder and prouender, or elſe fortheir lodging & ſtable-room, & euery where for one thing or other they pay toll: ſo as the charge of euery Cammell from thence to the ſea vpon our coaſt, commeth to 688 deniers: and yet we are not come to an end of paiments. For our Publicanes and cuſtomers alſo belonging to our Empire, muſt haue a fleece for their parts. And therefore a pound of the beſt Incenſe will coſt 16 deniers: of the ſecond 15: and the third 14. With vs it is mingled and ſophiſticated with parcels of a white kind of Roſin which is very like to it: but the fraud is ſoone found, by the meanes aboue ſpecified. The beſt Incenſe is tried and knowne by theſe markes, *viz.* If it be white, large, brittle, and eaſie to take a flame when it comes neare a coale of fire; laſt of all, if it ſtill not abide the dent of the tooth, but flie in pieces and crumble ſooner than ſuffer the teeth to enter into it.

Chap. XV.

¶ *Of Myrrhe, and the Trees that yeeld it.*

SOme haue written, That the Trees which beare the Myrrhe, doe grow confuſedly here and there in the ſame woods, among the Incenſe Trees: but more there are who affirme, That they grow apart by themſelues. And in truth, found they are in many quarters of Arabia, as ſhall be ſaid when we treat of the ſeuerall ſpecies of Myrrh. There is very good Myrrh brought out of the Iſlands: and the Sabæsns paſſe ahe ſeas, and trauell as far as to the Troglodites countrey for it. There is a kind of Myrrhe tree planted by mans hand in Hort-yards, and much preferred it is before the wild that groweth in the woods. Theſe Trees loue to be raked, bared, and cleanſed about the roots: they delight (I ſay) to haue the ſuperfluous ſpurnes rid away from the root: and the more that the root is cooled, the better thriueth the Tree. The plant groweth ordinarily fiue cubits high, but not all that length is ſmooth and without pricks: the bodie and trunke is hard and wrythen, thicker than the Incenſe trees: it is greateſt toward the root: and ſo ariſes ſmaller and ſmaller, taperwiſe. Some ſay, that the bark is ſmooth and euen, like vnto that of the Arbute Tree: others againe affirme, that it is prickly and full of thornes. It hath a leaſe like to the Oliue, cut more criſped and curled, and withall it is in the end ſharp-pointed like a needle. But King *Iuba* writes, that it beareth the leafe of Loueach or Aliſanders. There be who write, that it reſembles the Iuniper, ſaue only that it is more rough and beſet with ſharp pricks And ſome let not to dream & talke, that both Myrrhe and alſo Incenſe came from one and the ſame Tree. Indeed, the Myrrhe trees are twice cut and launced in one yeare, and at the ſame ſeaſons, as wel as the Incenſe trees: but the ſlit reacheth from the very root vp to the boughes, if they may beare and abide it. Howbeit, before that inciſion be made; they ſweat out of themſelues a certain liquor called Stacte, which is very good Myrrh, and none better. As wel of this franke

20030
copy 1

A franke and garden myrrh tree, as of the wild in the woods, the Myrrh is better that is gathered or runs in Summer time. There is no allowance of myrrh offered and giuen to the god *Sabis*, as there was of Incenſe, becauſe it is found in other countries. Howbeit the King of the Gebanites hath payed vnto him for toll and cuſtome a fourth part of all that paſſeth through his kingdome. To conclude, whatſoeuer is bought in any market or place abroad, they put and thruſt it hard together in leather bags one with another: but the Druggiſts and Apothecaries can ſoon ſeparate the better from the worſe, and be very cunning and ready to digeſt them according to the marks that they go by, as well of ſmell as fattineſſe.

Chap. XVI.

B ¶ *Diuers kindes of Myrrhe: the nature, vertue, and price thereof.*

MAny ſorts there be of Myrrh. Of all the wild kinds, the firſt is that which groweth in the Troglodites country. Next to it is Minæa, in which rank you may place Attramittica and Auſaritis, which both come out of the realme of the Gebanites. In a third place reckon that which they call Dianitis. A fourth ſort is gotten here and there in all parts, and hudled together. In the fift range is Sembracena, ſo called of a city within the kingdom of the Sabæans, and is next vnto the ſea. The ſixt they call Duſaritis. Beſides all theſe, a white myrrh there is found but in one place, which ordinarily is brought to the city Meſalum, & there ſold. The Trogloditick myrrh they chuſe by the fattineſſe thereof, and for that it ſeemes to the eye greener: it ſhewes alſo foule, rude, and ilfauoured: but ſharper it is, and more biting in mouth
C than the reſt. The Sembracene hath none of theſe faults, but is pleaſant and cheerful to ſee to, howbeit of ſmall operation and ſtrength. But to ſpeake in a word, and once for all, the beſt myrrh is known by little pieces which are not round: and when they grow together, they yeeld a certain whitiſh liquor which iſſueth and reſolueth from them, and if a man break them into morſels, it hath white veines reſembling mens nailes, and in taſte is ſomewhat bitter. A ſecond degree there is in goodnes, when it ſheweth ſundry colors within. And the worſt of all is that which within-forth is black; and the ſame is worſe yet, if it be as black without. As touching the price of myrrh, it alters as it is more or leſſe in requeſt, and according as it meeteth with many or few chapmen. For ye ſhal haue Stacte ſold ſomtimes for 6 deniers a pound, and
D otherwhiles for 50. The greateſt price of the garden frank-Myrrh, or that which is ſet by mans hand is 22 deniers. The red called Erythrea is neuer aboue 16: and this is taken to be the true myrrh of Arabia. The kernell within of the Trogloditick Myrrh will coſt 13 deniers a pound: but that which they call * Odoraria is ſold for 14. All kinds of Myrrh be mingled and ſophiſticated with pieces of Maſticke comming from the Lentiske, and with other gum: *Item* with Elaterium [*i.* the iuice of the wild cucumber] to make it more bitter: as alſo, that it might ſeem weightier, with the ſome of lead, or litharge of ſiluer. And ſurely ſetting aſide theſe two corruptions, all the reſt are found by the very taſt of the gum, which alſo will ſticke vnto the teeth in the chewing. But the craftieſt and fineſt deuice to counterfeit it, is with Indian myrrh, gathered there from a certain thorny plant which growes among them. This is the onely thing
E that India bringeth forth worſe than other countries. And verily ſo bad it is, that ſoone it may be knowne from other myrrhes.

* or *Adoraria*, *i.* θυμιαματὰ, which ſerueth for perfuming in temples.

Chap. XVII.

¶ *Of Maſtick, Ladanum, and Bruta of Enhæmus, Strobus, and Styrax.*

FRom the foreſaid Myrrh therefore laſt named, let vs for the affinitie paſſe to Maſtick: which comes alſo of another thorny tree in India, as alſo in Arabia, called Lama. Howbeit of Maſtick there be two ſorts: for both in Aſia and alſo in Greece there is found an hearbe, which directly from the root putteth forth leaues, and it beareth a bur or thiſtle head like an
F apple, full of ſeeds. Cut the top of this herbe, and there will iſſue forth a certain liquor ſo like vnto the right maſtick, that hardly a man ſhall know the one from the other. Ouer and beſides, there is a third ſort of Maſticke in Pontus, more like to Bitumen. Howbeit, the very beſt Maſtick is brought out of the Iſland Chios, and the ſame is white, and a pound of it is worth in Rome 20 deniers: but the black ye ſhall buy for twelue. As for the Chian Maſticke, it iſſueth forth

forth as a gum out of the Lentisk tree. Mingled this is also like as frankincense, with rosin. G

Moreouer, Arabia doth glory euen yet in their Ladanum. And many haue reported, that this comes by fortune or chance, and by occasion of violence and wrong done to an odoriferous plant that yeeldeth it in this manner following: The Goats they say, harmefull creatures as they be to all plants, but more desirous to be brousing of sweet and aromaticall shrubs (as if they knew how precious they were) vse to crop the sprouts and sprigs of this plant which beareth Masticke; which being so full of this odoriferous and sweet liquor, that they smel again, doth drop and distill the said moisture, which the shrewd and vnhappy beast catcheth among the shag long haires of his beard. Now by reason that dust getteth among, it baltereth & cluttereth into knots and balls, and so is concocted into a certaine consistence in the Sunne. And hereupon it is, that in Ladanum are found goats haires. But this hapneth by their saying, in no H other place but among the Nabatæans in the frontiers of Arabia toward Syria. The later moderne writers call the plant which yeeldeth Ladanum, Strobos: and they affirme, That in the forrests of Arabia where these do grow, the boughes are much broken by the brousing of these goats, and so the iuice and liquor stickes to their locks and beards. But the true Ladanum (say they) is peculiar to the Iland Cyprus (for, giue me leaue I pray you, to speake by the way of euery kind of spice and aromaticall drugs, & not strictly to keep & obserue the order & consequence of places where they be found.) And by report, after the same manner as this Ladanum in Arabia, there hangeth and cleaueth to the beards and shagge haired legs and flankes of the goats there also, a certain grease and fattinesse called Oesypus: but, according to them, it must be gotten when they crop off the leaues and floures of the herbe Cistus, in a morning for their I breakefast, at what time as the Iland Cyprus standeth all with a dew. Now when the morning mist is dispatched by the heat of the Sunne, there gathereth dust amongst these moist and wet haires of theirs, and sticketh to: and then the Islanders come and comb from their beards and flanks that which the call Ladanum. Some call that plant in Cyprus whereof it is made, Ledon: and in truth thereof it taketh the name of Ledanum amongst them. For by their report, this herbe hath a fatty substance setling vpon it, and the peasants of the countrey roll the herbs together into balls or rundles, with small cords, and so make vp those little lumpes ye see. By which we may perceiue, that as well in Arabia as Cyprus there be two kinds of Ladanum: the one mixed with earth, and naturall of it selfe: the other brought into balls and artificiall. The earthy is brittle and will crumble: the artificiall is tough, clammy, and will cleaue to ones fin- K gers. Moreouer, it is said that there be certain shrubs in Carmania that beare Ladanum, as also about Egypt, by occasion of plants thither brought by the *Ptolomæs*, kings of Egypt: or as some say it is the Incense tree that bringeth it forth: and is gathered after the manner of a gum issuing out of the tree by incision made in the barke, and is receiued in goat skins. The best Ladanum is worth forty Asses a pound. Sophisticated it is with Myrtle berries, and with other filth of beasts. The good Ladanum indeed, which is of it selfe without other mixture, ought to haue a wild and sauage smell with it, as if it came out of a wilderneſſe. Greenish it is, and drie to see to: but handle it neuer so little, and presently it doth relent and wax soft. Set it on fire, and it burneth bright and cleare, and then it casts a sweet and pleasant odour. But all that is counterfeit and mixed with myrtle berries may soon be knowne, for they will crackle in the L fire. Besides, the true Ladanum hath rather stony grit comming from the rockes, mingled with it, than dust.

In Arabia, the Oliue tree also hath a kind of liquour which issueth out of it: and thereof is compounded a certain soueraign salue named of the Greeks Enhæmon, which is singular good to draw vp wounds and heale them clean. In the maritime parts and sea coasts the said Oliue trees at some tides are ouerflowed with the waues. Yet receiue the Oliue berries no hurt thereby: notwithstanding it be certain, that the sea doth leaue salt vpon the leaues. Thus you see what be the peculiar commodities as touching trees, proper vnto Arabia. True it is that it hath others besides, but because they be found elsewhere, and knowne to be better in other places than in Arabia, I will treat of them in their course and ranke when it commeth. And yet Ara- M bia it selfe, as fruitfull and happy as it is in this behalfe, is wondrous eager in seeking after forreine spices, and sendeth for them into strange countries. So soone are men glutted and haue their fill of their owne: and so greedy and desirous be they of other countries commodities.

They

20030
copy 1

A They ſend therfore as far as the Helymæans, for a tree named Bruta, like to a ſpreding cypres, hauing boughes couered with a whitiſh bark, caſting a pleaſant ſmelling perfume when it burneth, and highly commended in the chronicles and hiſtorie of *Claudius Cæſar* for ſtrange vertues and wonderfull properties. For he writeth, That the Parthians vſe to put the leaues therof in their drinke, for to giue it a good taſt and odoriferous ſmell. The odour thereof reſembleth the Cædar very much: and the perfume is a ſingular remedie againſt the ſtinking and noiſome fumes of other wood. It groweth beyond the great channell of the riuer Tigris, called Paſitigris, vpon the mount Zagrus neare vnto the citie Citaca.

They ſend moreouer to the Carmanians for another tree called Strobos, and all to make ſweet perfumes: but firſt they infuſe the wood thereof in Date-wine, and then burn it. This is an excellent perfume: for it wil fill the whole houſe, riſing vp to the chambers aloft to the arched
B ſeelings of the rouſe, and returning downe againe to the very floore and ground beneath, moſt pleaſantly. But it ſtuffes a mans head, howbeit without any paine or ach at all. With this perfume they procure ſleep to ſick perſons. And for the traffick of this commodity, the merchants meet at the citie Carras, where they keep an ordinarie faire or mart: and from thence they went cuſtomably to Gabba, twentie daies journey off, where they were wont to haue a vent for their merchandiſe, and to make returne: and ſo forward into Paleſtine of Syria. But afterwards (as K. *Iuba* ſaith) they began to go to Charace, and to the kingdom of the Parthians, for the ſame purpoſe. For mine owne part, I thinke rather with *Herodotus*, That the Arabians tranſported theſe odours and ſpices to the Perſians firſt, before that they went therewith either into Syria or Ægypt: and I ground vpon the teſtimonie of *Herodotus*, who affirmeth, That the Arabians paid e-
C uery yeare vnto the KK. of Perſia the weight of a talent in Frankincenſe, for tribute.

Out of Syria they bring back Storax, with the acrimonie and hot ſmell wherof, being burnt vpon their herths, they put by and driue away the loathſomneſſe of their own odors, wherewith they are cloyed: for the Arabians vſe no other fuell at all for their fires; but ſweet wood. As for the Sabæans, they ſeeth their meats in the kitchin, ſome with the wood of the Incenſe tree, and others with that of Myrrhe: inſomuch as both in citie and country their houſes be full of the ſmoke and ſmell thereof, as if it came from the ſacrifice vpon the altars. For to qualifie therfore this ordinarie ſent of Myrrhe and Frankincenſe wherewith they are ſtuffed, they perfume their houſes with Storax, which they burne in Goats skins. Loe, how there is no pleaſure whatſoeuer but breedes lothſomneſſe, if a man continue long to it. The ſame Storax they vſe to burn
E for the chaſing away of Serpents, which in thoſe foreſts of ſweet trees, are moſt rife & common.

Chap. XVIII.

¶ *Of the felicitie of Arabia.*

NEither Cinamon nor Caſia do grow in Arabia, and yet is it named Happie: vnworthie countrey as it is, for that ſurname, in that it taketh it ſelfe beholden to the gods aboue therefore, whereas indeed they haue greater cauſe to thanke the infernal ſpirits beneath. For what hath made Arabia bleſſed, rich, and happie, but the ſuperfluous expenſe thnt men be at, in funerals; employing thoſe ſweet odors to burne the bodies of the dead, which they knew
F by good right were due vnto the gods. And verily it is conſtantly affirmed by them who are acquainted well with the world, and know what belongeth to theſe matters, That there commeth not ſo much Incenſe of one whole yeares increaſe in Saba, as the Emperor *Nero* ſpent in one day, when he burnt the corps of his wife *Poppea*. Caſt then, how many funerals euery yeare after were made throughout the world: what heaps of odors haue been beſtowed in the honor of dead bodies: wheras they offer vnto the gods by crums and graines only. And yet when as men made ſupplication to them with the oblation of a little cake made with ſalt, and meale, and no more; they were no leſſe propitious and merciful, nay they were more gratious and fauourable a great deale, as may appeare by hiſtories. But to returne againe to Arabia, the ſea enricheth it more than the land, by occaſion of the orient pearles that it yeeldeth and ſendeth vnto vs. And ſurely our pleaſures, our delights, and our women together, are ſo coſtly vnto vs, that there is not a
D yeare goeth ouer our heads, but what in pearles, perfumes, and ſilkes; India, the Seres, and that demy-Iſland of Arabia, ſtands vs at the leaſt in an hundred millions of Seſterces, and ſo much fetch they from vs in good money, within the compaſſe of our Empire. But of al this maſſe of

Spice

Spice and Odors, how much (I pray you) commeth to the ſeruice of the cœleſtiall gods, in G
compariſon of that which is burnt at funerals, to the ſpirits infernall?

Chap. XIX.

¶ *Of Cinamon, and the wood thereof called Xylocinnamomum. Alſo of Canell or Caſia.*

FAbulous antiquitie, and the prince of lyers *Herodotus*, haue reported, That in that tract where *Bacchus* was nouriſhed, Cinamon and Canell either fell from the neſts of certaine fowles, and principally of the Phœnix, thorough the weight of the veniſon and fleſh which they had preyed vpon and brought thither whereas they builded in high rockes and trees; or H
elſe was driuen and beaten downe, by arrowes headed with lead. Alſo that Canell or Caſia was gotten from about certaine mariſhes, guarded and kept with a kind of cruell Bats, armed with terrible and dreadfull tallons, and with certain flying Pen-dragons. And all theſe deuiſes were inuented only to enhaunce the price of theſe drugs. And this tale is told another way, namely, That in thoſe parts where Canell and Cinamon grow (which is a country in manner of demy-Iſland, much enuironed with the ſea) by the reflection of the beames of the Noon-ſun, a world of odoriferous ſmells is caſt from thence, in ſuch ſort, that a man may feele the ſent at one time of all the aromaticall drugs as it were met together, and ſending a moſt fragrant and pleaſant ſauour far and neare: and that *Alexander* the Great ſailing with his fleet, by the very ſmell alone diſcouered Arabia a great way into the maine ſea. Lies all, both the one and the other: for Ci- I
namone or Cinamon, call it whether you will, groweth in Æthiopia, a countrey neare vnto the Troglodites, who by mutuall marriages are linked together in great affinity. And in very truth the Æthiopians buy vp all the Cinamon they can of their neighbours, and tranſport it into other ſtrange countries ouer the vaſt Ocean, in ſmal punts or boats, neither ruled with helme and rudder, nor directed to and fro with ores, ne yet caried with ſailes or any ſuch meanes of nauigation: one man alone ſhall ſee you there in a boat, armed and furniſhed with boldneſſe only in ſtead of all, to hazard himſelf and his goods in the ſurging ſea. Theſe fellowes, of all times of the yeare, take the dead of the winter, and then (to chuſe) they will venter to croſſe the ſeas for their voyage, when the Southeaſt winds are aloft & blow luſtily. Theſe winds ſet them forward in a ſtreight and direct courſe thorough the gulfes; and after they haue doubled the point of K
Argeſte, and coaſted along, bring them into the famous port or hauen-towne of the Gebanites, called Ocila. And albeit this voiage be long & dangerous (for the merchants hardly can return in fiue yeres, and many of them miſcarie by the way) yet by report they are nothing diſmaied and daunted therwith, but willingly aduenture ſtill. And being at Ocila, what thinke you doe they exchange for, and wherewith fraight they their veſſels back againe homeward? euen with glaſſes, veſſels of copper and braſſe, fine cloth, buckles, claſpes, and pincers, bracelets and carcanets, with pendant jewels: ſo as a man would verily thinke, that this trafficke were maintained and the voiages enterpriſed vnder the credit & for the pleaſure of womankind eſpecially. Now as touching the plant that bears Cinamon, the talleſt is not aboue 2 cubis high aboue ground, nor the loweſt vnder one hand-breadth or 4 inches: in compaſſe about 4 fingers thicke: immedi- L
atly from the earth it putteth forth twigs, and is full of branches of ſix fingers length, but it looketh as if it were drie and withered: whiles it is greene it yeelds no ſmell at all, and the leaf reſembleth Origan: it loues drought, for in rainie weather it is leſſe fruitfull, and yet it is of this nature, To be cut as a coppis. It will grow verily in plaines, but gladly it would lodge among the thickeſt rough of buſhes, greeues, & briers that are to be found: ſo as men haue much adoe to come by it and to gather it: but neuer is cut or cropped without eſpeciall permiſſion of a certtaine god, which they take to be *Iupiter*; and this patron of the Cinamon tree, they call *Aſſabinus*. To obtaine leaue and licenſe ſo to do, they are glad to ſacrifice the inwards of 44
Kine or Oxen, Goats alſo and Rams: and when they haue all done, yet permitted they be not to go about this buſineſſe either before the Sun riſing, or after his ſetting. Now when theſe twigs M
and branches be cut, the Sacrificer or Prieſt diuides and parts them with a jauelin, and ſets by one portion for the god abouesaid: the reſt doth the merchant put vp and beſtow in paniers for the purpoſe. This manner of diuiſion is otherwiſe reported, namely, That the whole heap is caſt into three parts, whereof the ſunne hath one for his ſhare: but they draw lots firſt for euery

one

20030
copy 1

A one of theſe trees ſeueral bundles or parcels of Cinnamon ſticks; and that which falleth to the Sun is let alone and left behind: but of the own accord it catcheth a light fire and burneth. The beſt Cinamon is thought to be that which growes about the ſlendereſt ſticks, for the length of an hand bredth from the vpper end. The ſecond ſort in goodneſſe is that which is next it, and ſomwhat lower, but it beareth not full ſo much as an hand bredth; and ſo conſequently in order by degrees downward; for the worſt and of leaſt price is that which is neereſt the root, becauſe there is leaſt barke, the chiefe thing required in Cinamon: which is the cauſe that the twigs in the tree top are preferred before the reſt, for that in them there is moſt barke. As for the very wood it ſelfe, which is called Xylocinamonum, there is no reckoning made of it, becauſe of the acrimonie and ſharpeneſſe that it hath, reſembling Origan. A pound thereof is worth 20 deniers. Of Cinamon there be (according to ſome) two kinds; to wit, the whiter and
B the blacker. In times paſt, the white was in more requeſt: but now adaies the black is moſt ſet by: yea, and that of diuers colours is better eſteemed than the white. But the trueſt marke indeed to chuſe the beſt, is to ſee that it be not rough, and that it crumble not quickely if one piece be rubbed againſt another. That which is tender and hath beſides a white bark, is not regarded at all, but condemned for the worſt. Moreouer, this is to be noted, that the King onely of the Gebanites ſetteth the price and ſale of Cinamon: he it is that ſelleth it in open market according as it is by him taxed. In old time a pound of it was ſould for 1000 deniers, and this price afterward roſe higher by one halfe, by reaſon that the forreſts of Cinamon were (as men ſay) burnt by the barbarous Troglodites their neighbors in their furious wrath. Now why it ſhould be ſo deare, no man certainly knows: whether it were through the great rich merchants
C who ingroſſed all into their hands by way of monopoly, or by ſome other caſualtie and chance of fire aforeſaid. But true it is and well knowne by that we find in diuers writers, That there be ſuch hot Southerne windes blowing in thoſe parts, that in Summer many times they ſet the woods on fire. *Veſpaſian Auguſtus* the Emperor was the firſt that dedicated in the Temples of the Capitoll and goddeſſe *Peace*, garlands and chaplets of Cinamon encloſed within fine poliſhed gold. In that temple which the Empreſſe *Auguſta* cauſed to be built in the palace vpon Mount Palatine, for the honor of *Auguſtus Cæſar* late Emperor, her husband, I haue my ſelf ſeen a Cinamon root of great weight, ſet in a cup of gold, which yearely did put forth certain drops which congealed into hard grains. That monument remained there to be ſeen, vntill the Temple and all was conſumed by fire.

E As concerning Caſia or Canell, a plant it is, which groweth neer to the plains from whence the Cinamon comes; but it loueth to liue vpon mountaines, and beareth a bigger and rounder wood in the branches than the Cinamon, and hath a thin rinde or skin, more truly than a bark: the ſlenderer that the ſame is, and lighter, the more reckoning is made of it; clean contrary to the Cinamon. This ſhrub that beareth Caſia groweth to the height of 3 cubits: and 3 colours it carieth; for when it comes vp firſt, for a foot from the root it is white: then as it ſhooteth halfe a foot higher it waxeth red: but as it riſeth farther it is blackiſh: and this part is held for the beſt; and ſo the next to it in a degree lower: but the white is of no regard at all, and therefore they neuer cut the twigs and branches neere the root, nor aboue two cubits in length. And when they haue cut them in this manner, they preſently ſow them vp in greene skinnes of
F four-footed beaſts, killed new and freſh for that purpoſe, that of their corruption and putrefaction there might breed certaine wormes to eat out the wood within the barke, and ſo make it hollow; for the bark is ſo bitter that the worm will not touch it. The neweſt and freſheſt Canell is reputed beſt, and that which hath a moſt delicate ſmell; very hot in the mouth, and burning the tongue, rather than gently warming it without any great biting. Such Canell is of a purple colour, and very light in hand; which ſeeming much to the eye, yet weigheth little: beſides, the pipes be but ſhort, and the outward rinde or coat is not brittle and eaſie to fall in pieces. This elect and choice Canell the barbarous people call Lacta. Another ſort there is named Balſamodes, becauſe it hath a ſmell reſembling Balm: bitter it is in the mouth, & therefore of more vſe in phyſicke; like as the blacke is moſt imployed in ſweet perfumes and oyntments. There is no drugs that varieth more in price than the Canell: for whereas the beſt will coſt fifty deniers Roman a pound; all the reſt a man may buy for fiue.

Chap. XX.

¶ *Of Iſocinnamon, Cancamum, and Tarum.*

THe Huckſters and regraters that buy and ſell againe haue another kinde, which they call Daphnoides, and they ſyrname it Iſo-cinnamon: and ſurely they hold it at 300 deniers a pound. Mingled it is and made counterfeit with Storax; with the ſmalleſt and tendreſt branches alſo of Lawrell, for the likeneſſe it hath to the bark therof. Moreouer, it is ſet & planted in our part of the world here in Italy, alſo in the vtmoſt marches and confines of our Empire, along where the riuer Rhine runs, it liueth, being ſet neere vnto Bee-hiues. Howbeit, becauſe it wants the parching heate of the Sun, it is nothing ſo deepe coloured; and thereupon alſo it comes ſhort of the ſmell that the other hath. Out of the regions which bound on thoſe parts where Caſia and Cinamon groweth, there are brought ouer vnto vs two other ſpices, called Concamum and Tarum: but by the way of the Troglodite Nabathæans, who onely of the antient Nabathæans there ſetled and remained,

Chap. XXI.

¶ *Of Serichatum, Gabalium, and Myrobalanum,* [i. *Ben.*]

IN the ſame country, the Arabians come charged alſo with Serichatum and Gabalium: but they make an hand with it among themſelues, and ſpend it quite: in ſuch ſort, as their drugs are known only in name to vs in this part of the world, albeit they grow together with Cinamon and Caſia. And yet otherwhiles there is Serichatum brought vnto vs, which ſome perfumers vſe to put into the compoſition of ointments. And a pound of it is commonly exchanged for ſix deniers.

As for Myrobalanon, [*i. Behen*] it growes ordinarily in the region of the Troglodites, about Thebais, and that part of Arabia which diuideth Iury from Egypt: a drug that Nature hath brought forth only for ointment, as the very name giueth it. Whereby it appeareth alſo, that it is a very nut of a certain tree, which beareth leaues like to Heliotropium: whereof we wil ſpeak among other herbs. The fruit that this plant beareth is about the bignes of a filberd nut. That which growes in Arabia, and yet called Syriaca, is white: but contrariwiſe that about Thebais is black. The former of theſe two is commended for the goodneſſe of the oile which is preſſed out of it: but the Thebaick Ben is in greater requeſt for the plenty that it yeeldeth. As for the Trogloditick, it is the worſt of all, and the cheapeſt. And yet ſome there be that prefer the Æthiopian Ben before all other. The Nut and fruit thereof is black and fat, with a ſmal and ſlender kernell within: howbeit the liquor preſſed forth of it is more odoriferous: and it groweth in champian countries and plains. It is affirmed moreouer, that the Egyptian Ben is more oleous and fat, hauing a thicker ſhell, and the ſame red. And albeit that it grow in mariſh ground, yet is it a ſhorter plant and more dry than the others. But contrariwiſe they ſay, that the Arabick is green of colour, and thinner in ſubſtance: and for that it groweth vpon the mountaines it is more maſſie and weighty. But the beſt ſimply by many degrees, is that Ben which is called Petræa, comming from about the town aboueſaid; with a blackiſh rind, & white kernel. Now the Perfumers and Apothecaries, do preſſe only the husks and ſhels; but the Phyſitians extract an oile out of the very kernels, which as they ſtamp, they poure hot water euer and anon vnto it, by little and little.

Chap. XXII.

¶ *Of Phœnicobalanus, Calamus odoratus, and Squinanth.*

THe Date in Egypt called Adipſos hath the like vſe in ointments, and is next in requeſt for ſuch odoriferous compoſitions, as the Myrabalanus, or Ben aforeſaid. Green it is in colour, it ſmelleth like vnto a Quince, and hath no wooddy ſtone within. But to ſerue for thoſe purpoſes aboue recited, it muſt be gathered ſomewhat before it beginneth to ripen. That which is left behinde vngathered is called Phœnicobalanus. This waxeth blacke, and maketh them drunke that eat thereof. As for Myrobalanus, or Ben, it is worth two Romane deniers a pound.

20030
copy 1

A pound. The occupiers and ſhopkeepers call the very ſetling and grounds of their ointment and compoſitions, by the name of Myrobalanon.

Moreouer, within Arabia there growes alſo the ſweet Calamus, which is common to the Indians & Syrians likewiſe. That of Syria paſſes all the reſt, and comes vp in a tract of that countrey, diſtant from the coaſt of our Sea fiftie ſtadia. Between mount Libanon, and another mountain of no account [for it is not Antilibanon as ſome haue thought] in a little vale beneath neer vnto a lake, the marſhes and flats whereof are drie in Summer for the ſpace of thirtie ſtadia, there grow both ſweet Calamus, and alſo Sqinanth or Iuncus Odoratus, [*i.* the Sweet-ruſh.] For let vs ſpeak alſo in this place of the ſaid Scænanth: and although it be but a ruſh, and another booke is appointed for the treatiſe and hiſtorie of ſuch Hearbes, yet becauſe we handle the
B *Species* that go to the compoſition of ſweet Perfumes, Pomanders, & ointments, I cannot paſſe it ouer. Well then, neither the one nor the other of theſe twaine, differ in ſight from the reſt of that kind. But Calamus is the better of the twaine, and hath a more pleaſant ſmell; for a man may wind the ſent of it preſently a great way off: beſides, it is ſofter in hand: and better is that which is leſſe brittle, and breaketh in long ſpils and ſhiuers, rather than knappeth off like a Radiſh root. Within the pipe of this reed, there lieth a certaine matter like vnto a Spiders-web, which the Apothecaries call the flower of it, and that Calamus is counted better, which hath more in it of theſe floures. There is another mark alſo of good Calamus, namely, if it be black: and yet in ſome place, they make no reckoning of the blacke Calamus. But in a word, the ſhorter and thicker that the reed is, the better is the Calamus: and the ſame is more ſupple and pliable when a man would breake it. As for Calamus, it is worth eleuen deniers the pound: but
C Squinanth is ſold for fifteen. Moreouer, ſome ſay that there is a ſweet ruſh or Squinanth found in Campania. And now are we gone from thoſe lands that coaſt vpon the deep ocean, and come to thoſe that confront and lie vpon our Mediteranean ſeas.

Chap. XXIII.

¶ *Of Hammoniacum, and Spagnum.*

TO begin withall, in the ſands of thoſe parts of Affrick, which lie vnder Æthiopia, there is a liquor diſtilleth, called in Greeke *Hammoniacum*, of *Hammon*, which ſignifieth Sand, and
D the Oracle of *Iupiter Hammon*, for neare vnto the temple where the ſaid Oracle returnes Anſwers, there grow certaine trees within the ſands, which they call Metopia, from which, Hammoniacum droppeth in manner of a roſin or gum: and of it there be two kinds: the one is named Thrauſton, like vnto the male or better Frankincenſe, and is moſt eſteemed: the other is fat and full of roſin, and they cal it Phyrama. The manner to ſophiſticate Hammoniacum, is with ſand, to make men beleeue that it grew among the ſands, and gathered it in the growing and comming vp: and therefore the good Ammoniacum is known when it is in leaſt morcels, and thoſe very cleare. The price of the beſt is after fortie aſſes the pound.

Beneath theſe quarters, and within the prouince Cyrenaica, there is found a paſſing ſweet Moſſe, called Sphagnos; and of ſome Bryon [aromaticum.] Of all ſuch Moſſes, this is thought
E to be the beſt. Next vnto it, is that of Cyprus: and in a third ranke, the moſſe which groweth in Phœnicia. There is ſuch Moſſe (by report) in Ægypt, and likewiſe in France: whereof, for my part, I make no doubt: for they be nothing elſe but the grey and whitiſh haires that we ſee hang to trees, and about the oke eſpecially, called commonly Moſſe; but only that theſe be ſweet and odoriferous. The cheife praiſe is of the whiteſt and lighteſt: a ſecond commendation belongs to that which is red: but the blacke is worth nothing, neither is any reckoning made of that which groweth in Iſlands and rockes, and (to conclude) all thoſe that ſmell not as Moſſe ſhould, bur rather like to Dates, or the plants whereof they come.

Chap. XXIIII.

¶ *Of Cyprus, Aſpalathus, and Marum.*

THere is a tree in Ægypt called Cypros, bearing leaues like to Ziziphus or the Iujube tree, and a grain reſembling Coriander ſeed, with a white floure very pleaſant and ſweet. Theſe floures be ſteeped and ſodden in common oile: out of which is afterwards preſſed medi-

cinable oile called Cyprus,or Cyprinum. A pound of it will coſt fiue Roman deniers. The beſt comes from that tree which growes vpon the bankes of that riuer Nilus about Canopus,which is the firſt mouth where it diſcharges it ſelfe into the ſea. The ſecond in goodneſſe groweth about Aſcalon a citie of Iudæa. The third in worth for ſmell and ſweetnes, is had from the Iſle Cyprus. Some take this Cyprus to be the plant,which in Italy is called Liguſtrum. [*i.* Priuet.] G

In the ſame tract groweth Aſpalathus: a white thornie ſhrub it is, of the bigneſſe of a ſmall tree,and beareth a floure reſembling a roſe. The root of it is in requeſt for the making of ſweet perfumes and ointments. There goes a common ſpeech, That euery plant ouer which the rainbow is ſeen bent,will caſt the ſame ſent that Aſpalathus doth: but if it chance that the rainbow ſettle ouer Aſpalathus,then it wil yeeld a ſweet ſauor incomparable, and ſuch as cannot be expreſſed. Some call it Eryſiceptrum, others Sceptrum, ſimply. The good Aſpalathus is red,or rather of a fierie colour,maſſie and heauie in hand,with a ſmell of Caſtoreum. It is ſold for fifteene deniers the pound. H

In Ægypt likewiſe there groweth Marum, but it is not ſo good as that of Lydia; for it hath greater leaues,and thoſe ſpotted with ſundry colours; wheras the other hath little ſhort leaues, but they ſmell paſſing ſweet.

Chap. XXV.

¶ *Of Baulme, as well the liquor thereof called Opobalſamum, as the wood named Xylobalſamum. Alſo of Storax* [*Calamita*] *and Galbanum.*

BVt the Baulme is that ſweet and odoriferous liquor that goes beyond all others. The tree that yeelds it, Nature hath beſtowed only vpon the land of Iurie. In old time it was not to be found but in two parkes or hortyards, belonging both to the kings of Iurie, whereof the one contained not aboue twentie jugera or acres, the other not ſo much. The Emperors *Veſpaſians*, both father and ſon, brought one of thoſe little Balm trees to Rome, and ſhewed it openly to the whole citie. *Pompey* the Great likewiſe made proud boaſt and vaunted much, when hee ſaid, That trees alſo by him were borne in triumph. Now this Balme tree ſerueth and doth homage, yea is tributarie with the whole nation where it groweth: but it is of a nature far different from that which both our Latine writers, & thoſe alſo of forrain countries, haue deſcribed: for more like it is to a vine than a Myrtle. It is planted by ſlips and branches, as the vine: and of late bound and tied alſo like a young vine. It ſpreadeth and filleth the hills where it is ſet, after the manner of thoſe vines in vineyards, which without any helpe of props, ſupport and beare vp themſelues. Cut likewiſe it is, pruned, and cleanſed, from thoſe ſuperfluous ſhoots that it puts out. It loueth to be well husbanded, digged about, raked, and trimmed: and with this ordering, growes apace, ſo as within three yeres it is fruitfull. It beares a leafe much like to Rue, and continueth with a greene head all the yeare long. At the ſacking and deſtruction of Ieruſalem, the Iewes in a furious rage both againſt their owne perſons & their goods, would needs haue wreaked their anger and been reuenged on the poore Baulme trees, and haue ſpoiled them for euer: but the Romans on the other ſide ſtood in their defence, ſo as about this very plant, there was a cruell battell fought. But now theſe trees are vnited vnto the domaine of our Empire: and by order from the ſtate, are ſet and maintained: ſo as neuer at any time before, were they more in number, or taller of growth: howbeit the higheſt exceeds not two cubits. And three ſorts there be of them. The firſt hath ſmall branches and ſmall like haires; whereupon it is called Eutheriſtos, [*i.* eaſie to be cut or lopt.] The ſecond, rough and rugged to ſee to, bowing and bending forward, full of twigs and branches; ſweeter alſo than the other to ſmell to, and this they name Trachy in Greeke, which is as much to ſay as Rough. The third they call Eumeces, becauſe it is higher than the reſt, and it hath beſides a ſmooth barke: this in goodneſſe is the ſecond; and the firſt, named Eutheriſtos, is the worſt. The fruit or ſeed that the Baulme tree beareth reſembleth wine in taſt, of colour red, and it is not without a certaine veine of fat. The worſt part of the graine or fruit, is the lighter in weight, and the greener. It is clad with boughes and leaues thicker than the Myrtle. Now, for to draw the precious liquor out of it called Baulme, inciſion ought to be made in the barke, with glaſſe-kniues, with ſharp flint ſtones, or lancets of bones. For it may not abide, that any inſtrument of yron or ſteele ſhould come neare vnto the quicke; it dieth preſently if you touch the heart of it therewith: and yet the ſame will ſuffer all I K L M

ſuperfluous

20030
copy 1

A ſuperfluous boughes and branches to be cut off and pruned. But he that launceth and maketh inciſion, muſt guide and gage his hand very artificially in the cutting, that he go not too deep, nor prerce a jot farther than the barke. This feat being wiought, there iſſues out of the wound a juice or liquor, which they call Opobalſamum, of an excellent and ſurpaſſing ſweet ſmell: but it comes forth by ſmall drops: and as it thus weepes, the teares ought to be receiued in wooll, and then afterwards it is gathered and laid vp in ſmall hornes. Out of which it is poured into earthen pots that neuer were occupied. This Baulme when it is freſh and new, may be likened to Oile, in thickeneſſe and conſiſtence, but in colour it is white; in time it growes reddiſh, and hard withall, howbeit, cleare and tranſparent, that a man may ſee thorough it. During the wars that *Alexander* the Great waged in Iurie, it was ordinarie in a Summers day to gather one ſpoonefull of this liquor, and that was all that might be done. And when the ſeaſon ſerued beſt
B for this purpoſe, and that it was counted a plentifull yere, the greater hort-yard or parke of the kings aboue ſaid, neuer yeeldeth in al aboue 6 gallons, and the leſſer but one: ſold it was commonly for the double weight in ſiluer. But at this day, euery tree that may beare it, and hath a larger veine to abide inciſion, is launced thrice in a ſummer: and after that, it is lopt and ſhread. And thoſe cuttings are good chaffer, and ſold very well to the merchant. For being thus lopped once in 5 yeares at the fartheſt, they yeeld in branches for wood only, eight hundred deniers. This is called Xylobalſamum, and it goes into odoriferous compoſitions: for in default of the right Baulme liquor, the Apothecaries make a ſhift to ſerue their turne with the wood alone, called Xylobalſamum. As for the very bark, it enters alſo into many medicinable confections:
C no maruell therefore if it carrie ſome price. But it is the liquor only that is ſo precious, the liquor it is which yeelds that moſt fragrant ſmel; then followes the grain or fruit in a ſecond degree, the bark in a third, and the wood as it is laſt, ſo it hath leaſt grace and credit. Of the wood, the beſt is that which in color reſembles Box, and giues ſweeteſt ſent. But of the fruit, the greateſt graines and the weightieſt, be moſt eſteemed; ſuch bite at the tongues end, and be hote in the mouth. Howbeit, this is adulterated with the ſeed of * Hypericum, that comes from the citie Petra. But the deceit is ſoone detected and found, for that ſeed is not ſo big, ſo maſſie and full, nor ſo long as the true graine of Baulme: beſides, it hath but a dull ſauor or none at all, and in taſt reſembles pepper. The liquor is knowne to be right or good, if it be oileous and fat, thin, and ſheere, ſomwhat inclining to red; and, if in rubbing betweene your fingers, it renders a plea-
D ſant ſauour. The white Baulme may be raunged in a ſecond place of goodneſſe: the greene and the thicke is not ſo good as it: but the blacke is worſt. For Baulme as well as Oile, will be ſtale and worſe for the age, if it be kept too long. This is moreouer obſerued, that in euery inciſion, that which flowed forth before the ſeed is ripe, is moſt precious. Ouer and beſides, this Baulme may be ſophiſticated with the owne ſeed: and hardly can this couſenage be found out, but that it hath a bitterer taſt than that which is naturall. For the good Baulme ſhould be pleaſant and delicat in the mouth, not ſoure nor tart at all: only in ſmel it ſhould haue a harſh verdeur. Corrupted it may be otherwiſe, with Oile of Roſes, of Cyperus, of Lentiske, or Maſticke, of Ben, of Terebinth, and Myrtles, alſo with Roſin, Galbanum, and Cyprian waxe, as occaſion ſerues, and according as men liſt to ſophiſticat it. But the greateſt knauerie of al, is to mingle gum among
E it: for being ſo handled, it will ſticke and cleaue to the palme or inſide of a mans hand, nay, it will ſinke in water to the bottome, which are two chiefe properties of the right Balme. For the very pure and perfect Baulme ought to cleaue too: but when it hath gum mingled among, ſtick it will likewiſe, but it will gather ſoon a brittle rouſe or cruſt vpon it, which quickly cracks and breaks. Alſo this ſophiſtication is found out by the taſt. But in caſe there be any trumperie of Wax or Roſin, the fire wil ſoone bewray it; for when it burnes, it will yeeld a more muddie and blacke flame. As for the ſophiſtication made with honie, it may ſoon be knowne: for preſently the flies will take it, and gather thicke about it. Ouer and beſides, put a drop of pure Baulme into warme water, it will ſettle to the bottom of the veſſell, and congeale: but contrariwiſe, the
F counterfeit Baulme, will flote and ſwim aboue like oile. Againe, if it haue Galbanum in it, yee ſhall ſee a white ſtreake or circle round about it. To conclude, would you know in a word the right Baulme indeed? It will turne milke, and cruddle it: and it wil not ſtain a cloth. In ſumme, there is no merchandiſe and commodity in the world, wherin there is practiſed more fraud and deceit, than in the trafficke of Baulme. For a Sextare or wine quart of Baulme will coſt a thouſand Roman deniers by retaile, which was bought for three hundred and no more at the hands

* i. S. Iohns wort.

of the factors vnder the Emperor, who ſold it firſt. Whereby a man may ſee how gainfull it is G
to increaſe this liquor by ſophiſtications. As for the Baulme wood Xylobalſamum, the price of it is ſix deniers a pound.

Now it remaines to ſpeake of Storax [Calamita] comming out of that part of Syria, which aboue Phœnice, confronts and borders next to Iurie: and namely, about Gabala, Marathus and the mount Caſius in Seleucia. The tree that yeeldeth this gum or liquor, is alſo named Styrax, like vnto a Quince tree. It hath firſt a rawiſh auſtere taſt, which afterwards turnes to be more ſweet and pleaſant. There is found within a reſemblance of canes and reeds, full of this iuice. Howbeit, about the riſing of the Dog ſtar there be certain winged wormes ſettle vpon the ſaid reeds, creepe in and eat away the marrow (as it were) which lay within: ſo as a man ſhall find nought left behind but a mouldy duſt or rotten powder, good for nothing. Next to this Storax of Syria, great account is made of that which commeth out of Piſidia, from Sidon, Cypres, and H
Cilicia: but leaſt reckoning is made of that which Candie ſendeth vs. That which is brought from the mount Amanus in Syria, is good for the Phyſicians, but better for the perfumers and confectioners. From what nation ſoeuer it comes, the beſt Storax is that which is red, ſomewhat glutinous beſides by reaſon of the fattines. The worſt is that which hath no conſiſtence and tenacitie, but crumbles like bran, and is ſo mouldie that it is ouergrowne with a white hoarie moſſe. The pedlers and ſuch like petie merchants can skill how to ſophiſticate this drug alſo, with the roſin of cedar and gum: otherwhiles alſo with honie, or bitter almonds. But al theſe deceits are known by the taſt. The price of the beſt is 19 deniers a pound. There is a Storax beſides which Pamphylia doth yeeld, but drier it is, and nothiug ſo full of moiſture. I

Moreouer, we haue from Syria out of the ſame mountain Amanus, another kind of gum called Galbanum, iſſuing out of an hearbe like Fennell-geant, which ſome call by the name of the ſaid Roſin, others Stagonitis. The beſt Galbanum, and which is moſt ſet by, is griſtly and cleare withall, reſembling Hammoniacum, without any ſpils of wood in it. For in that wiſe the hucksters vſe to deceiue chapmen by mingling beanes with it, or the gum Sagapenum. The right Galbanum, if you burn it, chaſeth away Serpents with the ſtrong perfume or ſmoke thereof. It is ſold for fiue deniers the pound: and is vſed only in Phyſicke for medicines.

Chap. XXVI.

¶ *Of Panaces, Spondylium, and Malobathrum.* K

THe ſame perfumers ſeeke alſo into the ſame Syria for Panaces growing there, and yet it is to be found alſo about Pſophis, a citie in Arcadia; and the fountaines from whence floweth the riuer Erymanthus: yea, and in Affricke beſides, and Macedonie. This Panax is an hearbe with a tall ſtalke and round tuft in the head like Fennell, and yet it is a plant by it ſelfe, growing to the height of fiue cubits. At the firſt it putteth out foure leaues, and afterwards ſix. They be very large and round withall, lying vpon the ground: but toward the top they reſemble the leaues of an Oliue: it beareth ſeed in the head hanging within certaine round tufts, as doth the Ferula. Out of the ſtalk of this hearb there there is drawn a liquor by way of inciſion, made in harueſt time: and likewiſe out of the root in Autumne, or the fall of the leaf. And this is called Opopanax. The beſt lookes white when it is gathered and congealed. The next in worth and L
weight, is that which is yellow. As for the blacke it is of no account. The berter Opoponax coſteth not aboue two Aſſes a pound.

Another hearbe there is of this Fennell kind, namely Spondylium, ſomwhat different from the former, but in leaues only; becauſe they be leſſe than thoſe of Panax, and diuided after the manner of the Plane leaues. This Spondylium groweth no where but in cold and ſhadowie places. It carrieth a fruit or graine called alſo Spondylium, which reſembleth the forme of Sil or Siler montanum, and ſerueth for no vſe but Phyſick.

We are beholden moreouer to Syria for Malobathrum. This is a tree that beares leaues rolled vp round together, and ſeeming to the eie withered. Out of which there is drawne and preſſed an Oile for perfumers to vſe. Ægypt is more fruitfull of this hearbe than Syria. And yet M
there comes a better kind therof from India than both thoſe countries. It is ſaid, that it grows there in meeres and ſtanding waters ſwimming aloft, after the manner of Fen-lentils or Duckes meat, more odoriferous than Saffron: enclining to a blacke colour: rough in handling, & in taſt

ſalt

20030
copy 1

A ſalt or brackiſh. The white is not ſo well eſteemed. It wil ſoon be mouldie when it is ſtale. The relliſh thereof ought to reſemble Nardus at the tongues end. The perfume or ſmell that *Malobathrum or the leafe yeeldeth when it is boiled in wine, paſſeth all others. It is ſtrange and monſtrous, which is obſerued in the price: for it hath riſen from one denier to 300 a pound, whereas the Oile it ſelfe doth coſt 60. *Folium.

Chap. XXVII.

¶ *Of Oile Olive, made of greene Oliues, likewiſe of Grape Veriuice.*

FOr the mixture and compoſition of ointments, the Oile of vnripe Oliues and Veriuice is very good: and verily, made it is in two kinds, & after two ſorts, to wit, of the Oliue, and the
B Vine. Of the Oliues, if yee would haue good, they ought to bee preſſed whiles they be yet white; for if they turn colour once and be blackiſh, the worſe is the Oyle or Veriuice that commeth thereof. And ſuch kind of Oliues be called Drupæ, namely, before they be fully ripe and good to eat, and yet haue loſt their colour. And herein is the difference, for that the oyle of this later ſort is green, the other is white. Now as for grape Verjuice, it ſhould be made of the Vine Pſythia, or Amminea, and before the canicular daies, when as the grapes bee but new knit, and no bigger than the Cich-peaſe. The grapes (I ſay) muſt be gathered for this purpoſe, at the beginning before they change colour, & the juice thereof ought then to be taken. Then ſhould the Verjuice that comes from it, be ſunned: and heed muſt be taken in any caſe, that no dews by night do catch it, and therefore it would ſtand in couvert. Now when this iuice or verjuice is
C gathered, it is put vp in earthen pots: and otherwhiles kept alſo in veſſels of copper. The beſt grape verjuice, is red, ſharp, and ſoure in taſte, dry withall and ſcyptick. A pound or a pinte of ſuch verjuice is worth ſix deniers. It may be made in another ſort: namely, by punning and ſtamping vnripe grapes in morters: drying it afterwards in the Sunne, and ſo made vp into certain rolls or trochiſks.

Chap. XXVIII.

¶ *Of Bryon and Oenanthe: of the tree Elate, and Cinnamon Cariopus.*

THe moſſe of the white Poplar or Aſp, which is reputed as the grape therof, is vſed likewiſe
E in theſe odoriferous and ſweet compoſitions. The beſt grows about Cnidos or Caria, in thirſty, dry, and rough places. A ſecond ſort is that which is found vpon the Cedar of Lycia. To this pertaineth Oenanthæ, which is no more but the grapes of the wild vine called Labruſca. Gathered it is when it floureth, that is to ſay, when it ſmels beſt. It is dried in the ſhade vpon a linnen ſheet lying vnder it, and then put vp into little barrels. The chiefe commeth from Parapotamia: the ſecond from Antiochia and Laodicea in Syria: and a third ſort from the mountaines of Media: and this is beſt for medicine. Some prefer before all theſe, that which groweth in the Iſland Cyprus. As for that which is made in Africke, it is meet for Phyſitions onely, and is called Maſſaris. Now, the better euer is that which they gather from the white wild vine, than from the black. Moreouer, there is another tree which ſerues for perfumes: ſome call it Elate, and we Abies [*i.* the Fir] others Palma or the Date, and ſome againe Spathe. That
F which grows about the ſands of Africk, where *Iupiter Hammons* temple ſtandeth, is highly commended aboue the reſt: and after it, that in Ægypt. Next thereto is the Syrian. This tree is odoriferous when it grows in dry places only: it hath in it a certaine fat liquor or Roſin, and entreth into compoſitions of ſweet ointments, for to correct and mitigate the other oile. In Syria there is a drug which they call Cinnamum Caryopon. A iuice or oyle this is, preſſed out of a certain nut. This Cinnamon differeth much in forme from the ſtickes of true Cinnamon indeed aboue ſpecified: although in ſmell it commeth neare vnto it. A pound thereof is worth to be bought and ſold 40 Aſſes, [*i.* 2 *ſhil.* 6. *d.*]

THE

G

THE THIRTEENTH BOOK OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

H

The Proeme.

THus far forth the woods and forreſts are of eſtimation, in regard of the pleaſure they doe vnto vs for perfumes and ſweet odors: and in truth, if we conſider duly theſe aromaticall plants, admirable they be euerie one in their kinde, euen as they be weighed apart by themſelues alone. But ſuch is the riot and ſuperfluitie of man, that being not content with that perfection of Nature I *ſhining in thoſe plants and trees aboue rehearſed, he hath not ceaſed to mingle and compound them, and ſo of them all together for to make one confuſed ſmell: and thus were our ſweet ointments and precious perfumes deuiſed, whereof we purpoſe to write in this booke next inſuing.*

CHAP. I.

¶ *Of Ointments, Perfumes, and their compoſitions: and when they came into knowledge firſt at Rome.*

K

AS touching the inuention of Ointments, it is not well knowne who was the firſt that deuiſed them. Certaine it is, that during the raigne of the Troianes, and whileſt Ilium ſtood, men knew not what they meant: nay, they vſed not ſo much as Incenſe in Sacrifice and diuine ſeruice. The ſume and ſmoke of the Cedar and the Citron trees onely, the old Troianes were acquainted with when they offered ſacrifice: their fuming and walming ſteame (more truly I may ſo terme it, than any odoriferous perfume) they vſed: which they might eaſily come by, ſince they were plants growing among them, and ſo familiar; notwithſtanding they had found out the iuice of Roſes, wherwith yet they would not correct the foreſaid ſtrong fumes in thoſe daies; for that alſo was knowne to be a commendable qualitie of Oile Roſate. But the truth is, The Perſians L
and none but they ought to be reputed the inuentors of precious perfumes and odoriferous ointments. For they to palliate and hide the ranke and ſtinking breath which commeth by their ſurfet and exceſſe of meats and drinkes, are forced to helpe themſelues by ſome artificiall meanes, and therefore goe euermore all to be perfumed and greaſed with ſweet ointments. And verily, ſo farre as euer I could finde by reading hiſtories; the firſt prince that ſet ſuch ſtore by coſtly perfumes, was King *Darius*, among whoſe coffers (after that *Alexander* the Great had defeated him and woon his campe) there was found with other roiall furniture of his, a fine caſket full of perfumes and coſtly ointments. But afterwards they grew into ſo good credit euen among vs, that they were admitted into the ranke of the principal pleaſures, the moſt commendable delights, and the honeſteſt comforts of this life. And more than that, men proceeded ſo M
far, as therewith to honour the dead: as if by right that duty belonged to them. And therefore it ſhall not be amiſſe to diſcourſe of this theame more at large. Wherein I muſt aduertiſe the Reader by the way, that for the preſent I will but only name thoſe ingredients that go into the compoſition of theſe ointments: ſuch I mean as came not from herbs and trees, ſhrubs & plants; reſeruing the treatiſe of their natures, vertues, and properties, vnto their due place.

First

20030
copy 1

A Firſt and formoſt therefore, all perfumes took their names either of the country where they were compounded, or of the liquors that went to their making, or of the plants that yeelded the ſimples and the drugs: or els of the cauſes and occaſions proper and peculiar vnto them. And here it would be noted alſo principally, that the ſame ointments were not alwaies in like credit and eſtimation: but one robbed another of their honor and worth: inſomuch, as many times vpon ſundry occaſions, that which was lately in requeſt and price, anon gaue place to a new and later inuention. At the firſt in antient time, the beſt ointments were thought to come from Delos; but afterwards, thoſe that were brought out of Ægypt: no talke then but of Mendeſium, compounded at Mendes, a city there. And this varietie and alteration was not occaſioned alwaies by the diuerſity of compoſition and mixture, but otherwhiles by reaſon of good or bad drugs: for ye ſhould haue the ſame kind of liquors and oiles better in this country for one pur-
B poſe, and in that for another: yea, and that which in ſome place was right and true, the ſame did degenerat and grow to a baſtard nature, if you changed once the region: for a long time, the oile or ointment of Iris or the Floure-de-luce root made at Corinth, was in much requeſt, and highly praiſed: but afterwards that of Cizicum won the name and credit, for the artificiall compoſition thereof. Semblably, the oile of Roſes that came from Phaſelus, was greatly called for: but in proceſſe of time, Naples, Capua, and Præneſte, ſtole that honor and glory from thence in that behalfe. The ointment of Saffron, confected at Soli in Cilicia, imported for a good while and carried the praiſe alone: but ſoone after, that of Rhodes was euery mans money. The oile drawne out of the floures of the wild vine in Cyprus, bare the name once; but afterwards that of Egypt was preferred before it: & in the end the Adramyttians gained the credite and com-
C mendation from both places, for the perfect and abſolute confection thereof. The ointment made of Marjoram, gaue credit for a certain time to the Iſle Cos: but not long after, their name was greater for another made of Quinces. As for the oile Cyprinum, which came of Cypros, the beſt was thought to be made in Cyprus: but afterwards there was a better ſuppoſed to be in Egypt: where the ointments Metopium and Mendeſium all of a ſudden were better accepted than all the reſt. It was not long firſt, but that Phœnice put Ægypt by that credit for thoſe two ſingular compoſitions, & left the Ægyptians the name alone for the foreſaid oyle Cyprinum. The Athenians were renowned for their antient Panathenaicum, & euer held their own. There was in old time a notable compoſition named Pardalium, made in Tharſus: but now the mixture & making thereof is quite loſt. The ointment likewiſe Narciſſimum, where the floure of
E the Daffodil was the Baſis, is now forgotten, and no more made of it. The manner of compounding all theſe ointments, was twofold, to wit, either of the iuice & liquor, or els of the very ſubſtance & body of the ſimples. The former ſort reſemble rather the nature of oiles: but the later of ointments. And theſe the Greeks cal either Stymmata, which yeeld the conſiſtence & thicknes to ointments; or Hedyſmata, which ſerue to aromatize and giue a compleat perfection to them. There is a third thing between theſe, requiſit alſo to the full making of theſe ſweet ointments, namely, the colour: although many take no regard at all of it. And for this purpoſe, the perfumers put into their compoſitions Cinnabaris [*i.* Vermillion or Sanguis Draconis] and Orcanet. The ſalt moreouer that is ſtrewed among, ſerueth to repreſſe and correct the nature of the oile that vniteth all the ingredients beſides. But thoſe that haue the root of Orcanet in them,
F need no ſalt at all to be put in beſides. As for Roſin and Gum, they are mingled with the reſt to incorporat the drugs and ſpices, and to keep in the ſweet odour therof, which otherwiſe would euaporate and ſoon be loſt. We are to preſume by all likelyhood, that the firſt compoſition of ointments and ſooneſt made, was of the odoriferous moſſe Bryon, and the oile of Ben onely: whereof we haue written in the former book. Then came in place a more compound ointment called Mendeſium, and that receiued Roſin alſo to the foreſaid oile of Ben. And more than that, another beſides named Metopium. Now is this Metopium an oile compounded, which the Egyptians do preſſe out firſt of bitter Almonds, but they added thereto for to incorporate the better, grape Veriuice: and the ingredients beſides, were Cardamanum, Squinanth, ſweet Calamus, Hony, Wine, Myrrhe, the graines or ſeeds of Baulme, Galbanum, Roſine, and Terpintine. One of the meaneſt and baſeſt ointments now adaies, and therefore thought to be as antient as any other, is that which conſiſts of the oile of Myrtles, ſweet Calamus, Cypreſſe, and Cypros, [Squinanth] Lentiske, and the rind of the Pomegranat. But I would thinke verily, that Oyntments came to bee ſo diuulged and common euery where abroad, by meanes of Roſes moſt

of

of all: conſidering, that nothing grows more rife in all places. Which was the cauſe, that the G
ſimple mixture of oile Roſate, without any ſophiſtication beſides, continued for a long time,
hauing the addition of grape Verjuice, the floure of Roſes, the Saffron, Cinnabaris, or Sang-
Dragon, Calamus, Hony, Squinanth, the floure of ſalt called Sperma-ceti, or els in lieu therof
the root of Orcanet, & Wine. The oile or ointment of Saffron was after the ſame ſort made, by
putting thereto Cinnabaris, Orcanet, & wine. Semblably is to be ſaid of the oile of the ſweet
leſſe Maioran, wherin was mixed grape verjuice and ſweet Calamus. This compoſition was ſin-
* Samſuchus. gularly wel made in Cyprus & at Mitylene, where great ſtore of ſweet *Majoran grows. There
be other oiles likewiſe which are not of ſo good reckoning, namely, of Myrtles, & Bayes, which
receiue a mixture with the addition of Majoran, Lillies, Feni-greek, Myrrhe, Caſia, Spikenard,
Squinanth, & Cinnamon. Moreouer, of great quinces & the leſſe called Mala Struthea, is made H
the oile Melinum, whereof we wil ſpeak hereafter: which the perfumers vſe in their ointments,
by putting thereto grape-verjuice, the oile Cyprinum, the oile Seſamine, Baulme, Squinanth,
* Suſinum. Caſia, & Sothernwood. As touching the oile of *Lillies, which is the moſt ſubtil and thinneſt
of all other, it is made of Lillies, Ben, ſweet Calamus, Hony, Cinnamon, Saffron, Myrrhe, & Aſ-
palathus. Alſo the foreſaid oile Cyprinum is made of the floures of Cypros, of Veriuice, Car-
damonum, Calamus, Aſpalathus, & Sothernwood. Some there be that put moreouer vnto this
oile, Myrrhe & Panace. The Sidonians are excellent at the making of this compoſition: & after
them the Egyptians, ſo that they put not in Seſamium oile: for it wil laſt & keep good ful four
yeres: & if it begin to loſe the ſmel, it is quickned and refreſhed again with Cinnamon. Now
* Telinum. as touching the ointment of *Feni-greek, it is made of freſh oile, Cyperus, Calamus, Melilot, Fe- I
ni-greeke, Hony, oile of Quinces, the greater & the leſſe ſweet Marioram. This was of higheſt
reputation in the daies of *Menander* the comicall poet. But long after there ſucceeded into the
ſame place of credit, the ointment Megalium: ſo called for the great glory that it caried: & this
was compounded of the oile of Ben, of Baulm liquor, ſweet Calamus, Squinanth, Balm-wood,
Caſia, & Roſin. In the making hereof, this property it had by it ſelfe, that all the while it was a
compounding and ſeething, it ſhould euer and anon be vented, & ſhifted out of one veſſell into
another, vntill the ſmel of it were gone. Which neuertheleſſe it would recouer againe after it
was once cold. Moreouer, ſome liquors there be of themſelues, that without any other mixtures
may ſerue and go for noble ſweet ointments. Among which, that of Malabathrum is the chief: K
next to it the Flour-de-luce of Sclauonia, and the great ſweet Marioram of Cyzicum. Howbeit,
the Herbariſts loue to be putting in ſome few ſpices beſides, as well in the one as the other: but
ſome make choiſe of one thing, ſome of another to intermingle withall. They that take delight
to haue their mixtures moſt compound, adde vnto either of thoſe abouenamed, Hony, the floure
of ſalt, grape veriuice, the leaues of Agnus Caſtus, and Panace, & generally all that be ſtrange
and forrain, to make their compoſitions ſeem more wonderful. To the oile or ointment of Cin-
* Xylobalſamum namon, there goes the oile of Ben, Balm-wood, ſweet Calamus, Squinanth, the * fruit or ſeedes
* Carpobalſamū of Balſamanum, Myrrh, & Hony Aromatical. This is of all other the thickeſt ointment in ſub-
ſtance. The price of this, is from 35 deniers to 300 the pound. As for the ointment Nardinum
or Foliatum, it is compoſed of the oile of green Oliues or grape veriuice, of the oile of Ben, of L
Squinanth, Coſtus, Spikenard, Amomum, Myrrhe, and Baulme. Howbeit, this point would not
be forgotten in the making of this compoſition, that it is a very eaſie matter to ſophiſticate it,
by reaſon, that there be no fewer than nine herbs or ſimples which we haue declared, that come
neere to the Indian Spikenard, and may be taken for it. Finally, to quicken and fortifie the ſent
of all theſe ointments, there muſt no ſpare be made of Coſtus and Amomum, which of all o-
ther drugs pierce into the noſthrils, and caſt a ſtrong ſmell. To make them thicker and more
pleaſant, there would be good ſtore of Myrrhe put in: but to haue them better for the vſe of
Phyſicke, and more medicinable, it is good to ſeaſon them wel with Saffron. As for Amomum,
of it ſelfe alone it cauſeth all ointments where it comes to be moſt quicke and penetratiue: in-
ſomuch as it cauſeth head-ache. Some for to ſpare coſt thinke it ſufficient to aromatize onely M
theſe ointments with thoſe drugs that are ſo deare and precious, either by ſtrewing the pouder,
or ſprinckling their liquors amongſt, whereas the reſt of the ingredients be boiled: but ſuch
compoſitions be nothing ſo effectuall, as when all be ſodden and fermented together. As for
Myrrhe it ſelfe, it maketh alone a precious ointment without any other oile, I meane that one-
ly of the liquor Stacte: for otherwiſe it is exceeding bitter and vnpleaſant. If it bee mingled

with

20030
copy 1

A with the oile Cyprinum, it looketh greene; if with the oile of Lillies, it will be fatty and vnctuous; if with Mendeſium, blacke; with oile Roſet, white; with that of Myrrh, pale. Lo what were the inuentions in old time of aromaticall and odoriferous ointments: loe what were the deuiſes afterwards of the ſhopkeepers and perfumers, to picke pence out of our purſes, and to rob vs. It remains now to ſpeak of the parangon indeed of all theſe pleaſures and delights: of that I ſay wherein conſiſts the very height and chiefe point of this argument in hand.

Chap. II.

¶ *Of the Ointment called Roiall: of drie Perfumes, Poulders, and Pomanders: and how they be kept.*

B THe Roiall Ointment therefore (which the Parthian kings vſed ordinarily, and of whome it took that name to be called Roiall) is tempered and compoſed in this manner: to wit, of Ben, Coſtus, Amonium, Cinamon, the Arbut or Comarus, Cadamonum, Spikenard, Marum, Myrrhe, Caſia, Storax Calamita, Ladanum, Baulme liquor, ſweet Calamus, Squinanth of Syria, the floure of the wild vine, Malabathrum, Serichatum, Cyperus, Aſpalathus, Panace Saffron, Cypros, Marioram the greater, clarified, or purified Hony, and Wine. As for Italy (the lady and conquereſſe of all other nations) there growes nothing in it good to make ointments, no nor nothing throughout all Europe, vnleſſe it be the Flour-de-luce root, and the Celticke Spikenard: for wine, Roſes, Myrtle leaues, and oile, are well known to be common for all coun-
C tries.

As for thoſe mixtures which be called Diapaſmata, they conſiſt of dry ſpices and drugs. Alſo the dregs or grounds of Ointments, they cal Magma. Moreouer, this is to be obſerued in the mixture and compoſition of thoſe Ointments, That the drugs which be put in laſt, are euer the ſtrongeſt and moſt effectuall.

Now as touching the keeping of Ointments, they are beſt preſerued in pots or veſſels of Alabaſtre: and Odors are ſureſt maintained and continue longeſt, being incorporate in oile: which the fatter that it is, ſerueth better for a continuance of their ſent; as a man may ſee very well in the Oile of Almonds. And to ſay a truth, the older that an ointment is, and the longer fermented, the more vertue it hath for the age. The ſun is an enemy vnto them, and therefore they muſt
D incorporate and vnite together in the ſhade, and be put vp in veſſels of lead. The triall of them is taken with the back-part of the hand, for feare leſt that the heat of the fleſhie ſide within, ſhould corrupt and marre them.

Chap. III.

¶ *Of the Superfluitie in expence at Rome, about theſe Ointments: and at what time they were firſt vſed there.*

AT this day there is not in Rome any thing wherein men more exceed, than in theſe coſtly and precious ointments: and yet of all other, they are moſt ſuperfluous and may be beſt
E ſpared. True it is, that much money is laid out vpon pearles and precious ſtones; but theſe are in the nature of a domaine and inheritance, and fall to the next heire in ſucceſſion. Againe, rich and coſtly apparell ſtand vs in a great deale of coine; howbeit they are dureable and laſt a long time: but Perfumes and ointments, are ſoone done and gone; they exhale and breath away quickly; they are momentanie, they ſerue but for the preſent, and die ſuddenly. The greateſt matter in them, and their commendation is this, To cauſe a man (what buſineſſe ſoeuer he hath otherwiſe) to caſt his eie and looke after a gentlewoman as ſhe paſſes by perfumed in the ſtreets, and ſendeth a ſmell from her as ſhe goes. This is all the good they do: and yet forſooth a pound of this ware muſt coſt 400 deniers: ſo deare is the pleaſure that paſſes from our ſelues & goes to
F another: for the party himſelfe that carrieth the perfume about him, hath little or no delight at all in it: others they be that read the benefit and pleaſure thereof. And yet amoug theſe odoriferous compoſitions, there is choiſe and difference betweene one and another. We finde in the writings of *M. Cicero*, that he made more account of thoſe ointments that ſauored of the earth, than thoſe which ſmelled all ſtrong of Saffron: as if he meant thereby, That in this exceſſiue diſorder and moſt corrupt enormitie of all others, a certaine moderation yet and ſad delay

would

would do wel; and that a ſeuerity (if I may ſo ſay) in the vice it ſelf, were better to be liked. But G
ſome take delight eſpecially in thick and groſſe ointments, and are not content to be perfumed yea and bathed all ouer, vnleſſe they be beſmeared, greaſed, and daubed alſo therewith. I haue my ſelfe ſeen ſome of them to annoint the very ſoles of their feet with theſe precious Baulms: and (by report) it was *M. Otho* that firſt taught the Emperor *Nero* this wanton delicacie. But I would gladly know, and ſome good body tell me, I pray, how he could feele the ſmell thereof, and what delight or contentment it might yeeld from that part of the body? I haue heard ſay beſides, by ſome of the inward familiars and ſpeciall fauorits of this prince, That he commanded the very walls of his baines and ſtouves to be perfumed with precious ointments: and that *C. Caligula* the Emperor, cauſed the very veſſels and ſeats wherein he vſed to ſit when he bathed or ſwet in his hot-houſe, to be in that manner annointed. And becauſe this might not ſeeme to H
be a ſpeciall pleaſure fit for an Emperor onely, I knew one of *Neroes* ſeruants afterwards, who vſed ſo to do as wel as his lord and maſter. But I muſe and maruell at nothing ſo much, as that this wanton delight ſhould find the way and enter ſo far as into the mids of the camp. For wot ye what? I aſſure you the very ſtandards and enſignes, the Ægles (I ſay) and Minotaures, ſo duſty as they be otherwiſe, ſo foule and ill-fauored, as being kept ſo long, and ſtanding by vnoccupied, are wont forſooth to be annointed and perfumed vpon high and feſtiuall daies. And, ſo god helpe me, I would I knew who it was that firſt brought vp this faſhion and needleſſe ſuperfluitie: Certes, I would not defraud him of his due honor: I would (I ſay) recommend his name vnto all poſterity. But thus it is (no doubt) and it cannot otherwiſe be; Our Ægles and ſtanderds (bribed, hired, and corrupted with this ſo good a reward) haue therefore in recompenſe conque- I
red the whole world. Vnder ſuch colors and pretences (indeed) we deceiue our ſelues, and cloak the vice and ryot of our times: and thus hauing ſo good a reaſon as this, to induce and draw vs on, we may not ſticke to haue precious baulmes vpon our heads, ſo it be vnder our ſallats and mourrons.

To ſay for certainty and preciſely, when this enormity entered firſt into Rome and began there to raigne, I am not able. Sure it is, as appeareth vpon record, That after the ſubduing of K. *Antiocus* and the conqueſt of Aſia, which was about the 565 yeare from the foundation of Rome, *P. Licinius Craſſus*, and *L. Iulius Cæſar* the Cenſors, publiſhed an edict, prohibiting and forbidding to ſell any forreine or ſtrange ointments within Rome: for ſo they termed theſe ſweet mixtures and compoſitions. But (beleeue me) now adaies, ſome there be ſo wanton and delicat, K
that there is no wine or other drinke good with them, nor will go downe their throat, vnleſſe it be ſpiced and aromatized with theſe baulms: and ſo little paſſe they for the bitterneſſe of theſe odours and ſmels, that they are well content to waſt and ſpend a deale therof, without and within, behind and before, aboue and beneath, to enioy the perfume thereof in all parts of the body. Well knowne it is, that *L. Plotius*, brother to *L. Plancus*, a man of great credit and authority, as hauing bin twice Conſul, and Cenſor beſides, being outlawed and proclaimed a baniſhed perſon by the decree of the * Trium virs, was diſcouered within a certaine caue at Salernum, where he lay cloſe hidden and ſure enough otherwiſe, by the very ſmel onely of a precious ointment that he had about him: and ſo by that meanes (beſides the ſhame and diſgrace that he receiued, thus to detect himſelfe and be found of his enemies) the rigor of the act and arreſt that L
paſſed againſt him, was executed and performed vpon his body. And who would euer pitty ſuch perſons, & not iudge them worthy to come to ſo bad an end? but to conclude all this diſcourſe, there is not a country in the world that yeelds ſuch plenty and varietie of drugges fit for theſe compoſitions, as Egypt: and next to it, Campaine in Italy may carry the name, for the ſtore of roſes there growing.

Antonie, Leidus, & Octauius.

Chap. IIII.

¶ *Of Dates, and Date trees: their nature and ſeuerall kinds.*

THe land of Iury is as much renowned, or rather more, for the abundance of Palms or Date M
trees which it affourdeth: the diſcourſe whereof we will now enter into. True it is, and it cannot be denied verily, that there be of them found in Europe, and namely, euery where in Italy; but ſuch, be all of them barren. Alſo in the maritime parts and ſea-coaſts of Spaine, ye ſhall meet with Palmes that beare Dates, but they are but tart and vnpleaſant, and indeed neuer

come

20030
copy 1

A come to their maturity and ripenesse. Those of Africk, I must needs say, bring forth a sweet and pleasant fruit, but it will not last, and soon is gone: whereas contrariwise, in the East parts, the people make wine thereof; and in some countries they vse it for bread, yea the very fruit and four-footed beasts do ordinarily feed of Dates: and therefore we hold and conclude, that Dates may be truly called forrein fruits; and their Trees, meere strangers in this part of the world. For in Italy a man shal not find so much as one Palm tree that comes vp of it selfe, without it be set or planted by mans hand: neither in any other region whatsoeuer, vnlesse it lie vnder some hot climat: but to beare fruit ye shal neuer know it in any country, if the same be not extreme ardent and scortching. Date trees loue a light and sandy ground, and specially (for the most part) if it stand much vpon a veine of Nitre besides. And yet contented will they be to grow by some riuer side, where they may haue, as it were, one foot in the water, and be euer drinking all the yere
B long, especially in a drie season. Some thinke, that dung is as contrary and hurtfull vnto them, as to some kind of Citron trees in Assyria, vnlesse it be mingled & tempered with water, or the trees planted neere to some running riuer. Moreouer, many kinds there be of Date trees: and the first are smal, and exceed not the bigneſſe of shrubs: these in some parts are barren, and in others fruitful: they shute out little short branches round about, but very full of leaues, the which in most places serue in stead of parget & rough-cast, to defend wals of houses against the weather and drifts of rain. Howbeit a second sort there be that are much taller, and whole forrests stand only vpon those trees: they put forth leaues sharp pointed, and they grow round about disposed one close vnto another in manner of comb-teeth: and these must of necessitie be taken for wild,
C and no better: and they loue here and there as it falleth out, to be intermingled among those of the tamer kind, as if they tooke I wot not what pleasure in their company. The rest growing in the East parts, be streight, round, and tall, enuironed about the body with circles or houps made of the very barke it selfe, and they are of the thickeneſſe of a mans thumbe, set in order one aboue another like steps & greeces neere together, in such sort that the people of the East may easily climbe them, by the means of the said barke, which serueth not onely for a vestiment to the tree, but also for staires to him that would mount vp, so that it is a wonder to see how nimbly a man will run vp to the top. These Date trees beare all their branches toward the head, and their fruit comes not forth among the leaues as in other trees, but hangeth to certaine branches and twigs of the owne betweene the boughes like clusters of grapes: insomuch as it resembleth partly the nature of a grape, and partly of an apple. The leaues made in forme of a knife blade
D sharp toward the point, slit as it were and clouen in the edge along both sides, make shew at the first of certain faire and beautifull gems: and now they serue in stead of cords, and to bind vines together: also being diuided and sliued into flakes, they are good to plait for hats and light bongraces for the head, against the heat of the Sunne. Moreouer, all learned men who are deeply studied in the secrets of Nature, be of opinion & do teach vs, That in all trees and plants, nay rather in all things that proceed out of the earth, euen in the very herbs, there are both sexes. Let it suffice therefore to haue spoken thus much once for all in this place. But there is no tree whatsoeuer, in which this distinction of male and female appeareth more, than in Palme-trees: for the male putteth forth his bloome in the branch; but the female sheweth no floure at all, but sprouteth and shooteth out buds in manner of a thorne: howbeit both in the one and the
E other, the pulp or flesh of the Date commeth first, and after it the wooddy stone within, which stands in stead of the grain and seed of the Date. And this appeares euidently by a good token, for that in the same branch there be found little yong Dates without any such stone at al. Now is the said stone or kernell of the Date, in forme long, not so round and turned like a ball as that of the Oliue. Besides, along the back it hath a cut or deep slit chamfered in (as it were) betweene two pillowes; but in the mids of the belly on the other side, for the most part it hath a round specke, formed like a nauill, whereat the root or chit beginneth first to put forth. Moreouer, for the better planting of Dates, they set two together of their stones in a ranke with the bellies downward to the earth, and as many ouer their heads: for if one alone should come vp, it were not able to stand of it selfe, the root and young plant would be so feeble; but foure together so
F ioine, clasp, and grow one to another, that they do well enough and are sufficient to beare themselues vpright: the kernel or wooddy substance within the Date, is diuided from the fleshy pulp and meat thereof, by many white pellicles or thin skins between: neither lieth it close thereto; but hollow a good distance from it, saue that in the head it is fastened thereunto by a thred or

ſtring: and yet there be other pellicles that cleaue faſt and ſticke to the ſubſtance of the Date within. The Date is a yeare in ripening. Howbeit in certaine places, as namely in Cyprus, the meat or fleſhie pulp thereof is ſweet and pleaſant in taſte, although it be not come to the full ripeneſſe: [where alſo the leafe of the tree is broader, and the fruit rounder than the reſt:] mary then you muſt take heed not to eat and ſwallow down the very bodily ſubſtance of it, but ſpit it forth after you haue wel chewed & ſucked out the iuice therof. Alſo they ſay, that in Arabia the dates haue but a faint & weak ſweetnes with them: & yet K. *Iuba* makes greateſt account of thoſe which the region of the Scenites in Arabia doth yeeld, where they be called Dabula: and he commends them for their delicate and pleaſant taſt, before all others. Moreouer, it is conſtantly affirmed, That the females be naturally barren, and will not beare fruit without the company of the males among them to make them for to conceiue: yet grow they wil neuertheleſſe and come vp of themſelues, yea and become tall woods: and verily a man ſhall ſee many of the females ſtand about one male, bending and leaning in the head full kindly toward him, yeelding their branches that way as if they courted him for to win his loue. But contrariwiſe, he a grim ſir and a coy, carries his head aloft, bears his briſtled & rough arms vpright on high: and yet what with his very lookes, what with his breathing and exhalations vpon them, or elſe with a certain duſt that paſſes from him, he doth the part of an husband, inſomuch as all the females about him, conceiue and are fruitfull with his only preſence. It is ſaid moreouer, that if this male tree be cut downe, his wiues wil afterwards become barren and beare no more Dates, as if they were widows. Finally, ſo euident is the copulation of theſe ſexes in the Date trees, & knowne to be ſo effectuall, that men haue deuiſed alſo to make the females fruitful, by caſting vpon them the blooms and down that the male beats, yea, and otherwhiles by ſtrewing the pouder which he yeelds vpon them. Beſides the maner aboueſaid of ſetting date ſtones for increaſe, the trees may be replanted of the very truncheons of two cubits long, ſliued and diuided from the very brain (as it were) of the green tree in the top, and ſo couched and interred, leauing only the head without the ground. Moreouer, Date trees wil take again and liue, if either their ſlips be pluckt from the root, or their tendrils & ſmall branches be ſet in the earth. As for the Aſſyrians, they make no more adoe, but if it be a moiſt ſoile, plaſh the very tree it ſelfe whole as it ſtands, and draw it along and ſo trench it within the ground, and thus it will take root and propagate: but ſuch will neuer proue faire trees, but skrubs only. And therefore they deuiſe certain Seminaries or Nource gardens of them, and no ſooner be they of one yeares growth, but they tranſplant them; and ſo againe a ſecond time when they be two yeares old: for theſe trees loue alone to be remoued from one place to another. But whereas in other countries this tranſplantation is practiſed in the ſpring, the Aſſyrians attend the very mids and heat of Summer, and in the beginning of the Dog-daies vſe to replant them. Moreouer, in that countrie they neither cut off the heads, ne yet ſhred the branches of the yong plants with their hooks and bils; but rather bind vp their boughes, that they may ſhoot vp in height the better. Howbeit, when they are ſtrong, they cut their branches, for to make the bodies burniſh and waxe thicker, but yet in the lopping they leaue ſtumps of boughes halfe a foot long, to the very tree: which if they were cut off, in other places, would be the death of the mother ſtocke. And foraſmuch as Date trees delight in a ſalt and nitrous ſoile (according as hath bin before ſaid) the Aſſyrians therefore when they meet not with a ground of that nature, ſtrew ſalt, not cloſe about the roots, but ſomwhat farther off. In Syria and Egypt, there be ſome Date trees that diuide themſelues and are forked in twaine, riſing vp in two trunkes or bodies. In Crete, they haue three, and ſome alſo fiue. The nature of the Palme or Date tree, is to beare ordinarily when they be three yeares old: howbeit in Cyprus, Syria, and Egypt, it is foure yeares firſt ere ſome bring fruit; yea and fiue yeares before others begin: and ſuch neuer exceed a mans heigth, neither haue they any ſtone or wooddy kernel within the Date ſo long as they be young and tender: during which time they haue a pretty name for them, and call them Gelded Dates: and many kindes there be of theſe trees. As for thoſe that be barren and fruitleſſe, all Aſſyria and Perſia throughout, vſe them for timber to make quarters and pamels for ſeeling, waineſcot, and their fine ioyned workes. There be alſo of Date trees coppey woods, which they vſe to fell and cut at certaine times: and euermore they put forth a yong ſpring from the old root and ſtock. Theſe haue in the very head and top, a certain pleaſant and ſweet marow, which they terme, The braine: and therfore thoſe that loue to eat it, wil cut and take it away, & yet the tree wil liue neuertheleſſe:

a thing

20030
copy 1

A a thing that ye ſhall not lightly ſee in any others of that kinde. As for thoſe Date trees which haue broader leaues, & the ſame ſoft and pliable, very good to make windings to bind vines and ſuch like, they be named by the Greeks Chamæropes: great abundance there is of them in Creta, but more in Sicily. The wood of Date trees yeelds coles, that in the burning will keep fire long: howbeit a dead flame it is that they make, and nothing quicke. As touching thoſe that be fruitfull, ſome beare Dates with a ſhort ſtone or kernell within; others with a longer: theſe are more ſoft, thoſe be harder. Some carry a kernell of a bony ſubſtance, like the Moon Croiſſant, which many are wont to poliſh with ſome tooth, and in a kind of religion are perſuaded, that it is good againſt witchcraft, & is of vertue to procure womens loue. Some of theſe ſtones be clad and couered with many skins or pellicles, & others with fewer: ye ſhal haue in this Date, thoſe
B tunicles thick & groſſe; in that, thinner and more fine. In ſum, if a man would ſearch into them particularly, hee ſhould find fifty ſundry ſorts of Dates ſaue one, with ſeuerall, ſtrange, and barbarous names, and as many different wines made of them. But the principall and moſt excellent of all the reſt, ſyrnamed Roiall Dates, for that they were reſerued for the kings owne mouth of Perſia, were knowne to grow no where els but in Babylon, and in one hortyard or park only of a Bagous (for ſo they vſe to call their eunuches or gelded perſons, and ſuch in times paſt reigned as KK. ouer them:) and this park was euermore annexed to the crowne, and went with the royal Scepter, as a chiefe demaine of the Empire, and paſſed from one Prince to another by ſucceſſion. But in the South-countries and meridionall parts of the world, the Dates ſyrnamed Syagri are highly commended aboue all others, and moſt eſteemed: and next to them, thoſe which be
C called Margarides, are in account and good requeſt: theſe be ſhort, white, and round, more like in form to berries and little buttons, than to maſt-fruit and Dates indeed: whereupon they took their name of Pearls, which they do reſemble. It is reported, that in the city Chora, there is one of theſe trees that bears Dates like to Pearles; as alſo another that carries the Dates Syagri. I my ſelfe verily haue heard ſtrange things of this kind of tree, and namely in regard of the bird Phœnix, which is ſuppoſed to haue taken that name of this Date tree [called in Greeke φοῖνιξ] for it was aſſured to me, that the ſaid bird died with that tree, and reuiued of it ſelfe as the tree ſprung againe. Now at the very time that I wrote this Hiſtory of Natures works, I ſaw the ſame tree with fruit vpon it: the Date that it bears is great, hard, rough in handling, and in taſt reſembling ſome harſh and wild fruit, far different from other kinds of Dates: in ſuch ſort, as I won-
D dred not at the name of Syagros, ſo like it taſted to the fleſh and veniſon of a wild Bore in the forreſt, that comes to our board. In a fourth rank of Dates for goodneſſe, are to be ranged thoſe which they call Sandalides, for the reſemblance of ſlippers or pantofles which they vſed in old time, named Sandalio. But in theſe daies they be as rare, as otherwiſe pleaſant; ſo that within the bounds of Æthyopia (a wonderfull matter) there be not aboue fiue of them to be found. After the Sandalides, the Dates Caryotæ are in greateſt requeſt; for they be not only good to eat, but alſo a wine is made of their iuice, which they yeeld in great abundance: for all the people of the Eaſt make their ſpeciall drink thereof. But true it is, that this kind of wine is hurtful to the head, and therfore the Greeks gaue it that name. Now as theſe countries aboue ſaid doe affoord plenty of Date trees, and the ſame fruitfull enough, ſo Iury alone carries the name and
E the praiſe for goodneſſe of Dates; and not all Iury neither, but the territory about Iericho eſpecially: and yet I muſt needs ſay, that there be gathered very good Dates in the vales of Iury, which be named Archelais, Phaſelis, & Liuias. And theſe Dates of Iury, haue this ſpecial property aboue all others, To be full of a fat white liquor reſembling milk, which hath a certaine taſte of wine, and is exceeding ſweet and pleaſant withall like honey. The drier kind of theſe Dates be thoſe that tooke name of one *Nicolas*, and were called Nicolai: paſſing faire and great they be aboue all others by far; for foure of them laid in a rank one at the end of another, will make a cubit in length. Other Dates there be, not ſo faire to the eie as theſe Caryotæ, but ſurely for pleaſant taſt they may be well their ſiſters, like as they be called thereupon Adelphides.
And a third kind there be of the ſame Caryotæ, which they commonly call Pateton: ouer full
F they are of liquor, and ſo drunke (as a man would ſay) with their own iuice, that they burſt euen as they hang vpon the tree their mother, yeelding their wine in that manner of their owne accord, as if they were troden with mens feet in a wine-preſſe; and thereupon they got that name. Another kind there is yet by it ſelfe, of thoſe Dates that be drier than the reſt, and they bee very long and ſlender, yea, and otherwhiles not ſtreight, but bending and crooked. As for thoſe

which we dedicate to holy vſes, and namely, when we ſacrifice and offer oblations to the gods, the Iews (a nation aboue all others noted for contempt and mockery of the gods their worſhip and diuine ſeruice) do name Chydæi [*i.* vile and of no price.] The Dates in Egypt called Thebaides, as alſo thoſe in Arabia, be all ouer-drie and withered, poore, leane, and thin. Parched as they be continually with the heat of the ſun, a man would deem they were couered with a cruſt or ſhell, rather than with a skin or pill. Go further into Æthiopia, there they be ſo dry that they will ſoon crumble into pouder like meale; and indeed they make thereof their bread, when it is tempered and wrought with water. Theſe Dates be round, and bigger than a good apple; and they grow vpon a plant or ſhrub which ſpreads branches of a cubit length: and the Greeks call them Cycæ. They hang 3 yeres before they be ripe: and euermore you ſhall ſee vpon the tree Dates ripe, when others come new forth green and ſmall. As for the Dates of Thebais in high Egypt, ſo ſoon as they be gathered, preſently they are put vp into barrels, whiles their naturall heat is in them; for if that courſe were not taken with them, it would ſoon exhale and vaniſh away: yet will they decay and rot, if they be not baked againe in the ouen. As touching all other Dates, they ſeeme to be the common and vulgar ſort, ſimply called Dates: and yet both the Syrians and K. *Iuba*, hold them for junkets and banketting diſhes. For as in ſome part of Phœnice, and Cilicia they be called Balani, [*i.* glandes or maſt] ſo we at Rome terme them by the verie name of their own country Phœnice, & by no other. And euen of them there be many kindes; and thoſe different one from another, either in forme, for that ſome be round, others long, or els in colour, whiles there be of them red and black: in which regard, a man may obſerue in them, (by report) as great variety as in figs: howbeit the whiteſt be the beſt and moſt commended. Great diuerſity there is alſo among them in quantity and bigneſſe, inſomuch as yee ſhall haue many of them that want nothing of a cubit; and other for them againe no bigger than a beane. Now as touching the Dates that be barrelled vp and kept, they be ſuch only as come from ſalt and ſandy grounds, as in Iury, and Cyrenaica in Africk: for thoſe of Egypt, Cyprus, Syria, and Seleucia in Aſſyria, will not keepe and be preſerued; and therefore they muſt be ſpent out of hand: for which they take good order to franke their ſwine and feed other cattel fat with them. The true ſigne to know a faulty or a ſtale date, is this, If a certaine white ſpecke or wart which ſtucke vpon it when it grew on the branch, be ſhed and faln off. Now to conclude this treatiſe, I thinke it not amiſſe to ſet downe for an example, what did betide the ſouldiers that were of *Alexanders* army, who with eating of green dates new ripe, were choked, and ſo died. In the Gedroſians country, this accident befell vnto them, onely by the nature of the fruit it ſelfe, eat they of it as moderatly as they could: but in other parts, their greedy and ouer liberall feeding vpon them, was their bane. For ſurely new dates as they come from the tree, are ſo exceeding pleaſant and delicious, that a man can hardly forbeare and make an end in good time, before hee ſurfet of them and catch a ſhrewd turne.

G H I K

Chap. V.

¶ *Of the trees in Syria.*

BEſides the Date tree, there be other eſpeciall trees in Syria proper vnto that countrey: for in the firſt place there are a kind of Nuts there growing, commonly knowne and called Fiſticks. And (by report) this vertue they haue, either taken as meat, or drunke in drink, To reſiſt the ſting and biting of ſerpents. Alſo out dry * Figs, and a leſſer ſort than they named Cottana come from thence. Alſo the Damaſcene prunes, growing vpon the mount Damaſcus; as alſo the fruit Sebeſten are the commodities of Syria: how ſoeuer they are now familiar here with vs in Italy. As for Sebeſten, there be wines in Egypt made thereof. Alſo the Phœnicians haue a leſſe kind of Cedars much like to the Iuniper: and two ſorts there be thereof, the Lycian and the Phœnician, which differ in the leafe: for that which hath an hard, ſharpe, and prickie leafe, is called Oxycedrus: full of branches it is beſides, and ſo knurrie, that it is troubleſome to the hand. As for the other Cedar, it hath an excellent ſmell. Both twaine doe beare a fruit of the bigneſſe of Myrtle leaues, and ſweet in taſt. Moreouer, of the greater Cedar there bee two kindes: that which doth bloſſome, beareth no fruit: and contrariwiſe, that which is fruitfull, ſheweth no bloſſome: and in this, the new fruit commeth foorth alwaies before the old of the former yere be ripe and gathered: alſo the ſeed of it is like that of the Cypreſſe. Some cal this Cedar,

L M

* called Lenten figs.

20030
copy 1

A Cedar, Cedrelate: whereof commeth the beſt Roſin. And the timber of it is euerlaſting: wherfore in old time they were wont to make the images of the gods, of this wood, as it appeares by the ſtatue of *Apollo Soſianus*, made of Cedar wood, brought from Seleucia. In Arcadia there is a tree like the Cedar, but in Phrygia it is called a ſhrub.

Chap. VI.

¶ *Of the Terebinth.*

MOreouer, in Syria grows the Terebinth or Terpentine tree. The male beareth no fruit. The females be of two ſorts: the one carrieth red grains of the bigneſſe of Lentils, the other bring forth pale ſeeds. This fruit of the Terebinth ripeneth with grapes. Vpon the
B mountaine Ida neere Troas, it is as big as a beane, more pleaſant to ſmell to, and glutinous like Roſin, if a man handle it. But in Macedonie the tree is but ſhort, and ſpreadeth branches like a ſhrub: contrariwiſe, about Damaſcus in Syria, it is very great and tall. The timber of it is verie tough, continueth a long time, and neuer ſhrinks for age: of colour blacke, but paſſing faire, and reſplendent withall. It puts forth floures in cluſters after the manner of the Oliue, but it is red: and the leaues otherwiſe grow very thick. It beareth alſo certaine ſmall cods or bladders ful of a gummy and clammie moiſture (which alſo iſſueth out of the barke) and out of thoſe bladders there come forth little flies like gnats.

Alſo the male Rhus or Sumach of Syria doth beare fruit: wheras the female is barren. This plant putteth forth leaues like to the Elme, but that they be ſomewhat longer, and ful of hairs,
C and euermore the ſteles of the leaues grow contrary one againſt the other. As for the branches, they be ſlender and ſhort, good for curriers to dreſſe their skins and make leather white. The ſeed or graine thereof reſembles Lentils: and being ripe, it is red, and commonly with the grape. The which is called Rhus or Sumach, euen as the tree: a neceſſarie fruit for many medicines.

Chap. VII.

¶ *Of the Ægyptian and Cyprian Sycomores or Fig-trees.*

D IN Ægypt likewiſe there be found many trees which grow not elſ-where: and principally the Sycomore, which thereupon is called the Ægyptian Fig-tree. The tree for leafe, bigneſſe, and barke, is like vnto the Mulberry tree. It bears fruit not vpon the branches, but out of the very body of the ſtocke. And the ſame is a paſſing ſweet fig, but without any grains at all within. It doth increaſe in exceeding great abundance, ſo it be ſcraped and clawed only with yron hooks: for otherwiſe it will not ripen. Come then foure daies after to gather it, you ſhall not miſſe but find it ripe, and new comming vp in the place. Thus in euery ſummer you ſhall haue a 7 fold increaſe, and the ſame in much plenty, yeelding alſo great abundance of milke. And ſay that you do not vſe the ſcraping or paring aboue named, yet ſhal you be ſure of 4 fruits in a ſummer, one vnder another; but ſo as the new wil driue the old before it, and cauſe it to ſhed and fall before it be wel ripe, for want of that handling beforeſaid. The timber of this tree is counted right
E good and profitable; hauing one ſingular property by it ſelf. No ſooner is it hewed, but preſently it is caſt into ſtanding pooles, and there drowned. This is the only way to ſeaſon, and dry it. At the firſt (I ſay) it ſinks downe to the bottom: but afterwards it begins to flote aboue: & without all queſtion, the water which vſeth to wet and drench all other tres, ſoketh and ſuckes forth the ſap and humidity of this wood. Now when it begins once to ſwim aloft, it is a ſigne that it hath the full ſeaſoning, and is good for building and other workes.

Like to this Sycomore in ſome ſort is a certaine tree in Candy, which is called the Cyprian fig-tree. For this likewiſe beareth fruit comming out at the very ſtock, or the maine armes and boughes thereof, when they be growne to any thickneſſe: but it puts forth certain ſprigs with-
F out any leaues at all, and they reſemble roots. Now this tree is in body much like to the Poplar, but in leafe, to the Elm. It bears fruit foure times a yeare, and as often doth it bud. But the green figs will hang ſo ſtill and neuer ripen, vnleſſe they be ſcarified and skiced ſo, as the milky ſubſtance may run out. The fruit within, is made like a fig, and hath the ſame pleaſant taſt: but it is no bigger than the Soruis.

Chap. VIII.

¶ *Of the cod or fruit called Ceraunia Siliqua* [*i. Carob.*]

THere is a kind of coddy ſhrub which the Ionians call Ceraunia, not vnlike to the Egyptian Sycomore abouesaid, for the fruit thereof comes likewiſe forth of the ſtock, but yet is contained within a cod: and thereupon it is that ſome haue called it the Egyptian fig tree, but they are groſly deceiued: for it doth not ſo much as grow in Egypt, but in Syria and Ionia, alſo about Gnidos and Rhodes. The tree hath green leaues all the yeare long: it putteth forth white floures of a ſtrong ſmell. From the root there ſpring ſhoots, and about the foot of the tree it bears many yong imps, which are ſuch ſuckers of the ſap, that they draw away all the goodneſſe, and rob the parts aboue of their nouriſhment, whereby the head is yellow, and nothing freſh and green, but fadeth in the top. The fruit of the former yere is gathered about the riſing of the Dog-ſtar the yeare following: and then preſently it brings forth new. Afterwards commeth a bloſſome, and the fruit thriueth and waxeth all Winter, vntill the occultation of Arcturus.

Chap. IX.

¶ *Of a tree in Egypt called Perſica: of Cucus, and the Egyptian thorne Acacia.*

THere is found in Egypt a certain kind of tree by it ſelf called Perſica, like to a peare tree, but that it is green all the yeare long, and ſheds not the leaues: alſo it beareth fruit continually; for gather to day, and ye ſhall find new to morrow growing forth of the place. The fruit is ripe about the Canicular daies when the Eteſian winds do blow. It reſembleth a Peare, ſaue that it is longer, and incloſed with a ſhel or green husk like the Almond: but where the Almond hath an hard ſhell without as a nut, this is ſoft in manner of a peare or plum, containing the ſtone within: and yet it differs ſomewhat both in ſhortneſſe and tenderneſſe. The fruit is very good meat: and although the exceeding ſweetneſſe thereof entice one to eat ſtill and not giue ouer, yet no danger of ſurfeit enſueth thereupon. As touching the wood of this tree, it is durable, hard, ſtrong, and black withall, in which reſpects it reſembles the Lote-wood very much. They vſed in times paſt to make images and ſtatues thereof, not ſo beautifull altogether, nor of ſo fine a grain as ſome others; but for the timber thereof, which continueth ſure and laſteth long, as that of the tree which we called Balanus. Much whereof growes curbed and crooked, and therefore is good only for ſhipwrights to make keels. But contrariwiſe, the wood of Cucus is highly eſteemed.

A tree this is not vnlike to the Date tree, in this regard eſpecially, that the leaues be good to twiſt and plait for mats & ſuch like: herein is the difference, for that it ſpreads into arms and great boughs. The fruit which it beareth is as much as a man may well hold in his hand, of colour reddiſh or deep ſhining yellow, and the taſte very commendable; for it yeelds a juice between ſoure and ſweet, and therefore wholſome for the ſtomacke. The wooddy ſtone within is great, maſſie, and exceeding hard, whereof they vſe to turne for curtain rings and ſaile pullies. In the belly of it there lieth a ſweet kernell whiles it is freſh and new. But if it be once dried it paſſeth for hardneſſe, inſomuch as no tooth can chew it, vnleſſe it be ſteeped in ſome liquour many daies before. As for the wood and timber of the tree, it hath a moſt dainty, fine, and curled grain, in which regard the Perſians ſet much ſtore by it.

In the ſame country there growes a thorny plant which the inhabitants make great account of: and eſpecially that which is in colour black, becauſe it wil abide the water, & neuer rot nor putrifie in it, and therefore excellent good for the ribs & ſides of ſhips. As for the white thorn of this kind it will ſoon corrupt and be rotten. But both the one and the other is full of prickes euen to the very leaues. The ſeed lies in certain cods or husks, wherewith curriers vſe to dreſſe their leather in ſtead of galls. The floure this thorne beareth is beautifull, whereof folke make faire garlands and chaplets; profitable alſo beſides and good for many medicines. Out of the barke of this tree there comes a gum likewiſe. But the chiefeſt commoditie and profit that it yeeldeth is this, Cut it down when you pleaſe, it wil be a big tree againe within three yeres. It groweth

20030
copy 1

A groweth plentifully about Thebes in Egypt, among Okes, Oliues, & Peach trees, for the ſpace of 300 ſtadia from Nilus: where the whole tract is all woods and forreſts, and natheleſſe well watered with fountains and ſprings among.

Chap. X.

¶ *Of the Ægyptian Plum tree, and other trees about Memphis.*

IN thoſe quarters groweth likewiſe the Egyptian Plum tree, not vnlike to the thorn of Acacia next before deſcribed: and this brings forth a fruit as big as a Medler, which neuer is ripe before mid-winter, when the daies be at ſhorteſt. The tree is alwaies greene, and ſheds
B not the leaues all the yeare long. Within the fruit aforeſaid there is a big ſtone; but the ſubſtance otherwiſe and body thereof is naturally ſo good, and ſo plenteous withall, that the inhabitants make their harueſt of it. When they haue gathered it, they clenſe it, ſtampe it, make it vp into balls and lumps, which they preſerue and keepe. The country about Memphis in times paſt was all wooddy and full of forreſts, wherein grew ſo mighty big trees, that 3 men were not able to fathom them about. But among the reſt there was one by it ſelfe moſt wonderfull, not for any ſtrange fruit that it bare, nor yet for any ſingular vſe and employment; but in regard of an accident obſerued in it, and a ſpecial qualitie that it had. For the tree (forſooth) outwardly reſembleth a thorn, but the leaues are made directly like feathers. Let a man ſhake the boughs neuer ſo little, ſhed they will and fall incontinently, but ſoon after there ſpring vp new in their
C ſteads.

Chap. XI.

¶ *Sundry ſorts of Gum. Alſo of the Cane Papyrus.*

THe beſt gum in all mens iudgement is that which comes of the Egyptian thorne Acacia, hauing veins within of checker work, or trailed like wormes, of colour greeniſh, & cleere withall, without any pieces of the bark intermingled among, and ſticking to the teeth as a man cheweth it. A pound thereof is commonly ſold at Rome for three deniers. The gumme that iſſueth from the bitter Almond trees and Cherry trees is not ſo good: but the worſt of all
D is that which the Plum tree yeeldeth. There runneth likewiſe out of vines a certaine gum that is paſſing good for the bleach, ſcabs, and ſcals in little children. And otherwhiles ye ſhall find ſome in Oliue trees, and that cureth the tooth-ache. Moreouer, the Elme growing vpon Corycus, a mountain in Cilicia, and the Iuniper there, haue a gum, but good for nothing. As for that of the Elme it breeds gnats there. Moreouer, of Sarcocolla [a tree ſo called] there diſtilleth a gum of that name, which Painters and Phyſitions both haue great vſe of. Like it is to Manna Thuris, which is the pouder of Incenſe: and therefore the white is better than the red. Sold it is at the ſame price that the other aboue named. And thus much concerning the trees growing vpon mountains and plains.

Now albeit we are not entred yet into the treatiſe of thoſe plants and ſhrubs which grow ei-
E ther in mariſh grounds or by riuers ſides; yet before we depart out of Egypt we muſt not forget the plant Papyrus, but deſcribe the nature thereof, conſidering, that all ciuilitie of this our life, the memoriall and immortalitie alſo of men after death, conſiſts ſpecially in paper which is made thereof. *M. Varro* writes, that the firſt inuention of making paper was deuiſed vpon the conqueſt of Egypt, atchieued by *Alexander* the Great, at what time as he founded the city Alexandria in Egypt, where ſuch paper was firſt made. For before that time there was no vſe at all (ſaith he) of paper, but men vſed to write in Date tree leaues firſt, and afterwards in the rines and barks of certain trees. Then in proceſſe of time they began to regiſter publique records in rolls and ſheets of lead: and ſoon after priuate perſons ſet downe their owne affaires in linnen books, or els in tables couered with wax. For we read in *Homer*, that before the warre of Troy writ-
F ting tables were vſed. And at the very time when he wrot, Egypt was not all continent & firme land, as now it is. For, as he ſaith, all the Papyrus whereof paper is made, grew in that branch or arm of Nilus, which anſwereth onely to the tract or territorie within the iuriſdiction Sebennitis: but afterward that part alſo was laid to Egypt, by the ſhelves and banks made with the inundation of the ſaid riuer. For, from the Iſland Pharos, which now ioineth cloſe vnto Alexandria,

dria by a bridge or narrow cauſey between, it was a day & nights ſailing with a good fore-wind G
at the poup, to the main land, as *Homer* hath reported. But afterwards, as *Varro* hath written, by occaſion of a certaine enuious ſtrife and emulation which aroſe betweene one of the *Ptolomees* K. of Egypt, and *Eumenes* K. of Pergamus, about the erecting of their great libraries; when *Ptolomæus* ſuppreſſed and kept in all the paper made in Egypt, there was parchment deuiſed by the ſaid *Eumenes* to be wrought at Pergamus of skins. And finally, the vſe was commonly taken vp of both, to wit Paper and Parchment, which continues the perpetuitie and euerlaſting remembrance of men and their affaires. But to returne vnto our plant Papyrus, it growes in the mariſhes of Egypt, or els in the dead ſtanding waters of Nilus, namely in certaine plaſhes and pits whereas the water did ouerflow, and remained ſtill after the riuer was fallen and down againe: and namely ſuch holes and ditches which are not aboue two cubits deep. The root is wrythen H
and crooked, of the thicknes of a mans arme: & the ſcape or ſtalk that riſeth from it hath three ſides with 3 corners trianglewiſe, not aboue 10 cubits in height, growing taper-wiſe, ſmall and ſharp in the top, where it beareth an head incloſed and round, in maner of a cabbage. Howbeit no ſeed it carrieth within, neither ſerues the floure for any purpoſe but onely for chaplets to adorne the images of the gods. The inhabitants of Egypt do vſe the root in ſtead of wood, not for fuell only, but alſo to make thereof ſundry veſſels and vtenſils in an houſe. The very bodie and pole of the Papyr it ſelfe ſerueth very well to twiſt and weaue therwith little boats, and the rinds thereof be good to make ſaile-clothes, curtains, mats, and couerlets, clothes alſo for hangings, and ropes. Nay, they vſe to chew and eat it both raw and ſodden: but they ſwallow the
iuice only down the throat, and ſpit out the groſſe ſubſtance. Moreouer, there is Papyrus found I
in Syria, about that very lake and meere whereas the ſweet Calamus aboue named grows. Neither vſed king *Antigonus* any other ropes about the tackling of his ſhips, but ſuch as were made hereof. For as yet the vſe of Spartum was not common. Moreouer, it is not long ſince that there was found growing in Euphrates about Babylon, this plant Papyrus, and knowne to ſerue for paper as well as the other in Egypt. And yet for all that, the Parthians will not leaue their old cuſtome to weaue and purfle letters in their cloathes, after the maner of embroderie. Now a touching the writing paper made of Papyrus: after they haue cut it into certaine trunkes, as long or as ſhort as the ſize of their paper, they diuide or ſliue it with the point of a needle or bodkin for the purpoſe, into very thin plates or leaues, but they driue them as broad and large K
as poſſibly they can.

Chap. XII.

¶ *Of diuers kinds of Paper, and how writing Paper is made: alſo the triall of good or bad Paper: and the glue or paſt belonging thereto.*

THe beſt ſheets or leaues of paper be thoſe which are ſet out of the very midſt or heart of the ſtem or ſtalk of Papyrus: and ſo conſequently better or worſe, according as they be nearer or farther from it. In antient time the principall paper and the largeſt was called Hieratica, [*i.* ſacred or holy] as being imployed only about religious and diuine books. But afterwards the flatterers of the Emperor *Auguſtus* named thoſe of the beſt ſort Auguſtæ: like as the ſecond Liuiæ, after the name of his wife. And hereupon it came that the paper Hieratica waſted in a third ranke. Next to them in goodneſſe was reputed the paper Amphitheatrike, which name was giuen vnto it of the place where it was made. The poliſhing and trimming of this paper *Fannius* vndertooke, who ſet vp a ſhop in Rome for the ſelling of it: and ſo skilfull was he and curious in the handling and dreſſing thereof, that by the time hee had done withall and brought it to a perfect fineneſſe, hee made the ſame of a courſe and common paper, to be royall, & fit for the beſt perſons that ſhould vſe it: in ſuch ſort, as there was none in any requeſt to ſpeak of, but it: and called after his name it was Fanniana. As for that which paſſed not thorow his hands, nor had his workemanſhip, it retained ſtill the old bare name Amphitheatrica. M
After this kind of paper followed that which they called Saitica, of a towne or city in Egypt, where great abundance was made thereof of the courſer pieces and refuſe of the ſaid Papyrus. And yet there was another paper, to wit Taniotica, ſo called of a place neere adioyning, made of the groſſer part neere to the bark and outſide: and this they ſold for the weight and no other goodneſſe that it had beſides. As for the merchant Paper or ſhop-paper, called Emporetica, it

was

20030
copy 1

A was not for to write in, onely it ſerued as waſt Paper for ſarplers to wrap and packe vp wares in: alſo for coffins or coronets to lap ſpice and fruits in, and thereupon merchants and occupiers gaue it that name. And with this, the very cane it ſelfe is to be ſeene clad outwardly: and the vtmoſt coat thereof is like to a reed or bulruſh, fit for no purpoſe but to make cordage of: and not very good for that vſe neither, vnleſſe it be for the water only, which it wil abide very wel. Now the making of all theſe Papers, was in this ſort, namely, vpon a broad bord wet with the cleare water of Nilus. For the fatty and muddie liquor therof ſerues in ſtead of glew, wherwith at the firſt the thin leafe of the cane Papyrus, ſliued from the reſt, and laid vpon the bourd to the full length (in manner of the warpe) according as the trunke will giue leaue, being cut off at both ends, namely, toward the top and the root, is wet and beſmeared: then is there another laid ouer-
B thwart it, after the order of the woofe, with a croſſe graine to the other: and ſo is the web (as it were) of the Paper performed. Preſſed afterwards it is in certaine preſſes, that both leaues may ſticke together: and then the whole ſheets are dried in the Sun. Which done, they be ſo couched together, that the beſt and largeſt lie firſt, and ſo conſequently in order as they be worſe and of leſſe ſize, vntill you come to the worſt. And one ſcape or trunke lightly of the cane Papyrus, yeelds not aboue 20 ſuch ſheets. Great difference there is in them for the breadth, notwithſtanding the length be all one. The beſt, namely which were taken out of the heart of the cane, beare 13 fingers in breadth. The Hieratica Paper wants two of that number. The Fannian is but ten fingers broad. The common Paper Amphitheatrica, but nine. Saitica yet fewer, and will not beare the ſtroke of the hammer. And as for the merchants Paper, it was ſo ſhort and
C narrow, that it went not aboue ſix fingers. Moreouer, in Paper theſe 4 things muſt be conſidered, that it be fine, well compact, white, and ſmooth. Howbeit, *Claudius Cæſar* the Emperor abated the credite of the Paper Auguſta, that it was no more accounted the beſt: for indeed ſo thin it was, that it would not abide the dent of the pen: beſides, it would not hold inke, but ſhew the letters on the other ſide; and was euermore in danger of blurring and blotting, ſpecially on the back part: and otherwiſe, vnſightly it was to the eie, for that a man might ſo eaſily ſee thorough it. And therefore he deuiſed to fortifie and ſtrengthen the ſaid Paper, and laid another courſe or coat (as it were) ouer the former, in manner of a double woofe. Hee enlarged alſo the breadth of the Paper: for he cauſed it to be a foot broad, yea, and ſome a foot and an halfe, I meane that kind which was called Macrocola, or large Roiall Paper. But herin was a fault, and reaſon found
D it out: for if one leafe of this large Paper were plucked off, the more pages took harme thereby, and were loſt. And therfore the former Claudian Paper, which had but 3 leaues of Papyrus, was preferred before all the reſt. Howbeit, that which was named Auguſtane bare the name for letters miſſiue, and the Liuiane continued ſtill in the owne credite, hauing no property of the firſt and principall, but all in a ſecond degree. The roughneſſe of Paper is poliſhed and ſmoothed either with ſome tooth, or elſe with a Porcellane ſhell: but the letters in ſuch ſlick Paper, will ſoone fade and decay. For by poliſhing, it will not receiue the inke ſo deepe as when it is not ſmoothed, although otherwiſe it will ſhine the better. Moreouer, it falls out many times, that if the humor be not artificially laid, the Paper is very ſtubborn: but this fault is ſoon found out at the very firſt ſtroke of the hammer, or elſe diſcouered by the ſmell, eſpecially if good heed
E were not taken in the tempering therof. As for the ſpots and ſpeckles, the eie will quickly ſpie them: but the long ſtreaks, and veines lying cloſe couched between the paſted places, can hardly be diſcerned before that the letter runs abroad, and ſhewes how in the ſpongeous ſubſtance of the Paper wanting that paſt, the inke will ſinke thorough, and make blots, ſo deceitfull is the making of this Paper. What remedie then? but to be at a ſecond labor to paſt it new againe another way, to wit, with the common paſt that wee vſe, made with the fineſt floure of wheat, and tempered with hote ſcalding water, and a little vinegre mingled therwith. For the ioiners glue and that made of gums, is brittle, and will not abide the rolling vp of theſe ſheets into quiers. But they that wil go more ſurely to work, and make an exquiſite paſt indeed, boile the ſoft and tender crums or leauened bread in ſeathing water, and then let it run thorough a ſtrainer, which
F they vſe to this purpoſe. For beſides that the Paper hereby will be more firme, and haue leſſe flawes, it ſurmounts alſo in ſweetneſſe the water of Nilus. Moreouer, all kind of paſt whatſoeuer for this effect, ought neither to be ſtaler than a day old, nor yet freſher and vnder that age. After that it is thus paſted, they beat it thin with the hammer: and a ſecond time runne lightly ouer with new paſt: and then being thus knit & bound faſt again, it is made ſmooth and void of wrinckles,

wrinkles,and finally beaten euen with the hammer,and driuen out in length and breadth. After this manner was that Paper made,wherin were written the bookes and records of the two *Gracchi*,*Tiberius* and *Caius*,with their owne hands,long agoe: the which I ſaw in the houſe of *Pomponius Secundus*, a noble citizen of Rome, and a renowmed Poet, almoſt two hundred yeares after their death. As for the writings of *Cicero*,of *Auguſtus* late Emperour of famous memorie,and of *Virgill*,we daily ſee and handle them,by the meanes of Paper ſo good and durable.

Chap. XIII.

¶ *Of the bookes of Numa.*

WE find many examples in ſtories, which very directly and mightily do teſtifie againſt *M. Varro*,as touching Papers. For *Caſſius Hemina* (a moſt faithfull and ancient writer) in the fourth booke of his Annales,hath reported,That one * *Cn.Terentius* a ſcribe or publicke Notarie, as he digged and delued in a ground which he had neare to Ianiculum,light vpon a chiſt, wherein lay the bodie of *Numa*, ſometime king of Rome. In the ſame alſo were found the bookes of the ſaid king. And(as he affirmeth) this happened in that yeare,when *Pub. Cornelius* the ſonne of *Lucius*, ſurnamed *Cethegus*, and *M. Bœbius* ſonne of *Quintus*, ſurnamed *Pamphilus*, were Conſuls of Rome: betweene which time and the raigne of *Numa*, by juſt computation are reckoned 535 yeres. He ſaith moreouer,That thoſe books were made of the Paper abouenamed. The greater wonder it was,how ſuch kind of books ſhould laſt ſo long,eſpecially within the earth,and not putrifie? The thing therefore being ſo ſtrange,and in manner miraculous,that Paper ſhould continue all that time,I think it not amiſſe to ſet down the very words of *Hemina* likewiſe,as he deliuers them. The world made a wonder(quoth he)how theſe books could poſſibly endure ſo many yeres? but the party who found them yeelded this reaſon:That within the ſaid coffer about the mids of it, there was a ſtone foure-ſquare:lapped all about and bound euery way with [waxe] candles in manner of a ſerecloth: vpon which ſtone, the foreſaid books were laid:and therfore it was (as he ſuppoſed) that they did not rot. Moreouer,the books alſo were embaulmed with the roſin or oile of Cedar,which might be a good reaſon in his conceit,that the moths came not to them. Now theſe bookes contained the Philoſophie and doctrine of *Pythagoras*: and for that they treated of that Philoſophical argument,burnt they were, by order from *Q. Petilius* the Pretor for that time being. The ſame ſtorie in effect doth *C. Piſo Cenſorinus* (a man who had been Cenſor) report in the firſt book of his commentaries:howbeit, he ſetteth downe their number withall:and ſaith they were fourteene in all,whereof ſeuen treated of the Pontificall law, and matters of religion; and as many diſcourſed of *Pythagoras* his Philoſophie. But *Tuditanus* in the thirteeneth booke of the Annales affirmeth, That they were the decretals only of *Numa*, and contained his ordinances. As for *Varro* himſelfe, he writeth in the fift booke of Humane Antiquities, that they were in all but twelue. And *Antias* in his ſecond booke reporteth,That two of them were written in Latine, and contained the Pontificial diuinitie and church-matters:and other twaine penned in Greeke,were full of precepts in Philoſophie. He alſo affirmes in his third booke, for what cauſe the ſaid books by vertue of a publick decree were conſumed with fire. But all Hiſtoriographers agree in this,That one of the *Sibyls* brought vnto *Tarquinius* the proud three books:of which,two were burnt by her owne ſelfe: and the third likewiſe periſhed with fire,together with the Capitol,during the troubles of *Sylla*. Ouer and beſides,*Mutianus*,a man who had been thrice Conſul of Rome,hath left on record, that of late,while he was lord gouernor or Lycia,he read in a certain temple an Epiſtle written by prince *Sarpedon* in Paper,and bearing date from Troy. And I wonder the rather at this,if ſo be that when *Homer* liued and wrate his Poeme,there was no land of Ægypt as now there is: or why,in caſe there was ſuch vſe of Paper then,himſelf ſhould write,that in the very ſame Lycia, *Bellerophon* had writing tables giuen him to deliuer as touching his owne death, and not rather letters miſſiue wrot in Paper? Wel, howeuer that be, this is certaine, that there is a ſcarſitie otherwhiles of Paper alſo, as well as of other commodities: and this cane or reed Papyrus doth many times faile. For not long ſince, euen in the daies of *Tiberius* the Emperor,in a dearth and want of Paper, there were commiſſioners deputed and appointed by the Senat of Rome,for the diſpenſing and diſtribution of it among the people: otherwiſe there had been a great mutinie, and tumult at Rome about Paper.

Chap. XIIII.

¶ *Of the trees in Æthiopia.*

AS touching Æthiopia, and namely that quarter which confineth vpon Ægypt, it hath in manner no trees at all of any name, ſaue thoſe that beare wooll or cotton, concerning the nature of which trees, we haue ſufficiently ſpoken in the deſcription of the Indians, and of Arabia: and yet in very truth, the cotton that is brought from theſe trees in Æthiopia, comes neerer to wool than any thing els; howeuer the trees be otherwiſe like to the reſt of that kinde: and the burſe or cod wherin this woollie ſubſtance lyes, is greater, and as big as a Pomegranat.
B Beſides theſe, there be Date trees alſo, like to ſuch as we haue before deſcribed. As touching other trees, and eſpecially the odoriferous woods within the Iſles that lie vpon Æthiopia round about, we haue ſaid enough in the treatiſe of thoſe Iſlands.

Chap. XV.

¶ *Of the trees growing in mount Atlas: of Citron tables: of the commendable perfections, and contrariwiſe of the defaults thereof.*

THe mountaine Atlas (by report) hath a wood in it of peculiar trees that elſewhere grow not, wherof we haue already written. The Mores that border vpon it, are ſtored with abun-
C dance of Citron trees: from whence commeth that exceſſiue expenſe and ſuperfluitie about Citron tables made thereof. And our dames and wiues at home (by way of reuenge) vſe to twit vs their husbands therwith, when we would ſeem to find fault with the coſtly pearls that they do weare. There is at this day to be ſeen a board of Citron wood, belonging ſometimes to *M. Tullius Cicero*, which coſt him ten thouſand Seſterces: a ſtrange matter, conſidering hee was no rich man: but more wonderfull, if we call to mind the ſeueritie of that age wherein hee liued. Much ſpeech there is beſides of *Gallus Aſinius* his table, ſold for eleuen thouſand Seſterces. Moreouer, there are two other, which K. *Iuba* ſold: the one was priſed at 15000 Seſterces, and the other held little vnder. Not long ſince, there was one of them chanced to be burnt, and it came with other houſhold ſtuff but from the cottages in Mauritania, which coſt 140000 Se-
D ſterces: a good round ſumme of money, and the price of a faire lordſhip, if a man would be at the coſt to purchaſe lands ſo deer. But the faireſt and largeſt table of Citron wood, that to this day hath beene ſeene, came from *Ptolomæe* king of Mauritania, the which was made of two demie-rounds or halfe circles, joined together ſo artificially, that for the cloſeneſſe of the joint (which could not be diſcern'd) it was more admirable than poſſibly it could haue been if it had been naturally of one entire peece: the diameter of it caried foure foot and a halfe, and three inches thicke it was. Likewiſe another ſuch table there was, ſurnamed Nomien, of one *Nomius* a ſlaue, enfranchiſed by *Tiberius* the Emperour: the ſquare or diametre whereof, was foure foot within 3 quarters of an inch; and the thickneſſe halfe a foot lacking ſo much. And here I cannot forget and ouerpaſſe, how that the Emperor *Tiberius* himſelfe had a table, which being two
E inches and three quarters aboue 4 foot in the diametre, and an inch and an half thick throughout, he cauſed to be plated all ouer, for that *Nomius* his freed-ſeruant had one ſo rich and magnificent, made altogether of a knot: a knot (I ſay) or a knur in the root of the tree, which is the very beautie of the wood, and giues all the grace to tables made therof; and namely, if this knot lie altogether within ground, it is without compariſon excellent, and farre more rare and ſingular than any of the timber aboue, either in the trunk and bodie, or in the armes and boughes of the tree. So that (to ſay a truth) this coſtly ware bought ſo deare, is no better than the ſuperfluous excreſcenſe of trees: the largeneſſe wherof, as alſo of their roots, may be eſteemed by the roundneſſe that they carie. Now are theſe Citron trees much like to the female Cypreſſe (eſpecially that of the wild kind) in leaf, in ſmel, and in body. A mountaine there is in high Mau-
F ritania, called Anchorarius, which was wont to yeeld the beſt and faireſt citron trees, although now it be naked and deſpoiled of them. But to returne to our tables aforeſaid; the principall be they which are either criſped in the length of the vein, or beſet here and there with winding ſpots. In the former, the wood curleth in and out along the graine, and therefore ſuch bee named Tigrinæ, [*i.* Tigre-tables.] In the other, there be repreſented ſundrie tufts as it were enfolded

folded and enwrapped round, and thoſe they call Pantherinæ, [*i.* Panther or Luzerne tables.] There be againe, whereof the worke in waineſcot reſembleth the waues of the ſea: and the better grace they haue, and be more eſteemed, if they make a ſhew of the eyes appearing in Peacockes tailes. Next in account and requeſt to theſe abouenamed, be thoſe that are friſled with ſmall ſpots ſtanding thicke, as if many graines were gathered together, which they call thereupon (of ſome reſemblance of little bees or flies) Apiatæ, as if they were ſpeckled & filed with their dung. But be the worke and graine of the wood what it will, the color makes all. Here at Rome we ſet moſt ſtore by that colour which is like to mead or honied wine, ſhining and glittering in the veines of the wood. After which conſiderations, men regard much the breadth & largenes of the whole plank, ſtanding of one entire peece which makes the table. Some take a great pleaſure to ſee in one Citron bourd many of thoſe faults which be incident to trees, to wit, the Lignum, for ſo they call the ſimple, plain, and bare wood and timber without any branched or curled graine at all, without a ſhining luſtre and glittering gloſſe, without worke to be ſeen in any order digeſted, or at the moſt (if any be) repreſenting the leaues of a Plane tree. Againe, the reſemblance either of the vein or color of a kind of Oke wood called Ilex. Moreouer, the rifts and chinks which timber is ſubject vnto, by reaſon principally of wind and Suns heat: or elſe hairie ſtreakes that be like to ſuch clifts and creuiſſes. Afterwards men were delighted with a kind of Lamprey veine trauerſing and running ouer a black croſſe way: and with an outward skin or coat marked with ſpeckes or knottie knurs, like to Poppie heads: and generally with a color all ouer, comming neer to black, or at leaſt wiſe beſpotted with ſundrie colors. The Barbarians for to ſeaſon the wood of this Citron tree, vſe to burie the green bourds or plankes thereof within the ground, and beſmeare them all ouer with wax. But the artificers and workemen do put them for 7 daies within heaps of corne, and ſtay 7 daies more ere they be wrought: & a wonder it is incredible, how much of the weight the wood loſes by this means. Meorouer, of late daies we haue found the experience by ſhipwracks, that this timber alſo wil by nothing in the world be ſooner dried nor hardened to laſt a long time without corruption, than by ſea-water. Howbeit, to maintaine theſe tables beſt, and to cauſe them for to ſhine bright, the way is to rub them with a drie hand, eſpecially after that a man is newly come out of the baines or hot houſe. Neither catch they any harme or ſtaine, if wine be ſpilt thereupon: ſo as it ſhould ſeeme they were naturally made for wine. To conclude, a tree this is ſeruing for the ornaments of this life, and the trim furniture of our houſe, few or none like to it: and therfore me thinks I do not amiſſe to continue the diſcourſe thereof ſomewhat longer than ordinarie.

Chap. XVI.

¶ *Of the tree Thya, what it is.*

WEll knowne vnto *Homer* was this tree, which in Greeke is named * θύον, but ſome call it Thya: for among other daintie odors and ſweet woods, he reports, That dame *Circe* (whom he would haue to be reputed as a goddeſſe) burnt of this Thyon. And therefore much deceiued are they, who vnderſtand by that word Thyon, perfumes and odoriferous ſpice, conſidering that in one and the very ſame verſe, the Poet maketh mention of the Cedar and Larch tree together with Thyon, whereby it appeareth plaine, that he ſpake of trees onely. *Theophraſtus*, who after the daies of *Alexander* the Great, was the firſt that wrate the hiſtorie of thoſe acts which happened about the 440 yeare from the foundation of Rome, gaue great honour euen then to this Tree, and reported, That all carpenters worke of temples in old time, was made of the ſame; as of a timber euerlaſting, and which in rouſes would continue without all putrefaction and corruption whatſoeuer. Moreouer, he writeth, That the wood of the root is ſo curled and friſled, as none more; and that of no timber beſides are more curious peeces of works made, nor of greater price. Ouer and beſides, he ſaith, That the faireſt and goodlieſt trees of this kind, doe grow about the temple of *Iupiter Hammon*: and ſome of them alſo within the countrey Cyrenaica toward the inland parts. But all this while not a word of the foreſaid coſtly tables ſpeakes he in his whole hiſtory: and verily before that of *Ciceroes*, there is no record in writers of any ſuch tables: whereby it appeareth, that they be come vp but of late daies. Another tree there is likewiſe of that name, bearing an apple or fruit, which ſome cannot abide for the ſtrong ſauor and bitternes withall, others again like and loue it as well. This tree alſo beautifieth and ſetteth out the houſe, but I purpoſe not to beſtow many more words thereof.
